The same guarding of presses should begin with the design of the dies and it is essential to design them so that the operator need not put his hands between them. The use of sliding, revolving or dial dies as compared with the old types where each separate piece had to be put under the die by hand has already been a great step forward in the direction of insuring greater safety. But even in hand-fed dies increased safety may be secured by cutting away superfluous metal from the die block, thus allowing more space for the fingers. Wherever possible the die should be designed so as to permit the operator to grasp the material by the sides instead of at the top and bottom. Whenever possible guards should be attached to the dies.

The original paper, which is extensively illustrated, discusses in some detail the operations on power presses and cites interesting instances of devices used to increase the safety of operation.

The writer comes to the general conclusion that properly designed safeguards actually increase production. It is true that in some instances the only safeguards available are such as decrease production to a certain extent in units per hour, but even in such cases it must be remembered that without the guard production may be entirely stopped by an accident to the operator. Furthermore, if a "green" operator is put on the machine, it will require considerable time to attain the rate of output, so that in the end any decrease in production due to the use of safeguards will be quite small in itself and amply compensated in other ways. (*American Machinist,* vol. 50, no. 25, June 19, 1919, pp. 1177-1184, 29 figs., *gp*)

Spontaneous Combustion, What It Is and in What Materials It Occurs

Spontaneous Combustion, Watson Smith. Discussion of the nature of spontaneous combustion and factors contributing to its occurrence.

The following definition is given: Spontaneous combustion is caused by the physical and chemical capacities of certain carbonaceous and organic matters to condense on their surfaces gases and moisture. The amount of gas thus condensed varies with the chemical nature of the gas and is also dependent on the degree or subdivision of the absorbent substances. If the atmospheric oxygen is the gas thus condensed, evolution of heat accompanies the condensation, and if this occurs within a bad conductor of heat, the heat accumulates and eventually gives rise to combustion.

As a result of this, it is pointed out that coal containing pyrites is particularly inclined to ignite when in a damp state. It is also pointed out that air shafts through the masses of coal on board ship actually favor the tendency of the coal to spontaneous combustion. On the other hand, explosions of coal gas, which may accumulate in ship bunkers, are best eliminated by passing currents of air directly over the coal and then into the open. The extinction of bunkers on fire by means of carbon dioxide was held by the British Commission of Inquiry (about 1890) to be impracticable, as this gas has no cooling effect, and the Commission was inclined to give preference to the employment of steam and water.

There are a number of contributing causes which may lead to spontaneous combustion. Thus, it is stated that fires may arise through accidental contact of water with stocks of quicklime. It has also been found that finely ground charcoal placed in a barrel attained a temperature of 75 deg. cent. after 15 hours, and after 20 hours ignition took place. Having once had the management of a wood distillery, the writer testifies to the need of great precautions to avoid the danger of outbreaks of fire in the charcoal sheds.

The statement that wet cotton is liable to break out in combustion is improbable, but a spark getting into a bale will smolder for a long time and may cause a fire eventually, which may then be improperly ascribed to spontaneous combustion.

Greasy cotton is particularly dangerous as most fatty oils absorb oxygen rapidly with generation of much heat. Heavily weighted silk is dangerously liable to heat up and burn, two cases of such occurrences being definitely known.

The firing of haystacks is also an undoubted fact. Among other things, it has been shown that fermentation caused by bacteria in hay is responsible for such occurences, and in Holland a preventative is found in common salt which is scattered between the layers of hay during the erection of the stacks. Tschirch, who gives a theory to account for the spontaneous ignition of hay, recommends thorough drying of the hay before stacking,—a process designed

to minimize enzymic action, and also thorough aeration of the stacks.

From other data collected in the paper it appears that quite a large number of substances have the ability to take fire spontaneously under certain conditions. Among such materials are mentioned tobacco, lupulin (an extract of hops), aniline dyestuffs, dried fish, bone dust, wool, and various chemicals. The paper is of particular interest in connection with the question of storing and transportation of the materials above enumerated, particularly on shipboard. (*Journal of the Royal Society of Arts*, vol. 67, no. 3474, June, 1919, pp. 500-507, *g*)

STEAM ENGINEERING

How a Difficult Problem in Measuring Air Volume Has Been Solved

Determination of the Efficiency of the Turbo-Alternator, S. F. Barclay and S. P. Smith. The efficiency of the turbo-alternator is usually expressed in terms of the rate of steam consumption in relation to the output of electrical energy. Because of this the purchaser has little direct economic interest in the accurate determination of the efficiency of the alternator, which is, nevertheless, a matter of considerable interest, as it indicates the quality of the active materials employed and the degree of excellence of the design.

The authors point out that in determining the efficiency of alternators stray losses are either deduced in some conventional way or ignored altogether, but as the size of the alternators becomes larger the stray losses become of greater importance and furthermore cannot be conveniently determined on account of the difficulty of making tests.

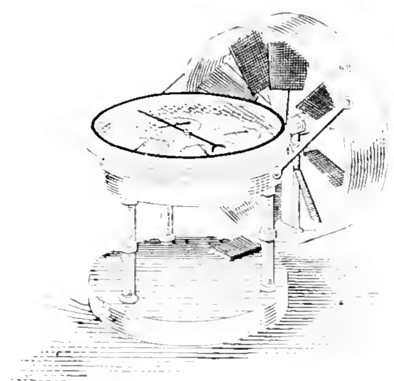

Fig. 13 Negretti & Zambra Anemometer

The present paper shows how stray losses can be deduced from measurements of the cooling air flowing through the alternator and also what precautions should be taken in order to avoid securing misleading results.

The electrical part of the paper, while of considerable interest in itself, lies beyond the strict scope of Mechanical Engineering, but the part referring to measurements of air volume and temperature is of general interest.

For measurement of air velocity the writers consider four methods—the pitot tube, venturi tube, electrical methods, and the use of an anemometer. For purposes of the tests carried out by the writers the anemometer shown in Fig. 13 was used. Because it was found that a well-made instrument when properly handled gave sufficiently accurate results and further on account of the air flow being variable in direction, the anemometer is probably better adapted to read the absolute value of the average velocity at a given point than are more exact instruments.

The two inherent defects of the anemometer are due to the effects of friction and the inertia of the moving parts. The effect of friction on the reading is, however, slight when the velocity of the air is considerable and the velocity of the air discharge from a turbo-alternator is of the order of 2000 ft. per min. With an instrument of the kind used by the authors measuring about 2.6 in. over the tips of the vanes, the frictional effect is not more than 3 per cent of the vane-wheel speed, so that even an appreciable error in the correction for friction has only a negligible effect on the result. The effect of inertia is of appreciable importance only when the air flow is variable.

The authors have checked the accuracy and consistency of the anemometer in several ways. When a fan delivers air to a given system of ducts, the volume of air discharged is a linear

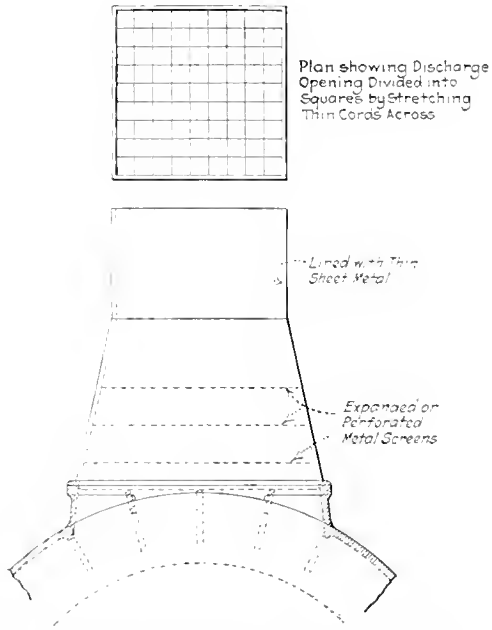

Fig. 14 Temporary Discharge Trunk Used to Facilitate Measurements of Air Volume and Temperature

function of the speed of the fan—that is, if V is the volume of air delivered in unit time, and n is the speed of revolution of the fan, then $V = Kn$, where K is a constant. Therefore, by running an alternator at various speeds and measuring the air volume in each case, the accuracy of the anemometer readings is established if they bear a constant ratio to the speed of rotation. The authors have found that the results obtained in this way are very satisfactory, as is shown in the typical case given in Table 3.

TABLE 3 TYPICAL TEST RESULTS SHOWING CONSTANT RATIO BETWEEN VOLUME OF AIR DELIVERED BY FAN AND SPEED OF ROTATION (MACHINE NO. 7634)

V	4,550	7,200	8,950	10,900
n	1,500	2,400	3,000	3,600
K	3.033	3.000	2.983	3.028
Variation from mean value of K, per cent	+0.73	−0.37	−0.93	+0.56

The accuracy of the anemometer was further checked by comparing the known loss in the alternator with the heat energy being carried away by the air; and still further, two new instruments calibrated at the National Physical Laboratory and an instrument that had been in use for two years were mounted in succession in a given position at the discharge outlet of an alternator and were run for varying periods, during which the speed of the alternator and the load were maintained as constant as possible. All these tests simply indicate quite a satisfactory performance on the part of the anemometers.

The measurement of the volume and temperature of the air discharged from the alternator proved to be no easy matter. The first difficulty encountered was a consequence of the great varia-

tion in the velocity of the air at the discharge opening of the alternator due to the peculiar shape and disposition of the openings in the stator core and frame and also of the rotation of the rotor tending to cause the air to discharge obliquely instead of vertically.

In order to equalize the air flow a temporary discharge trunk

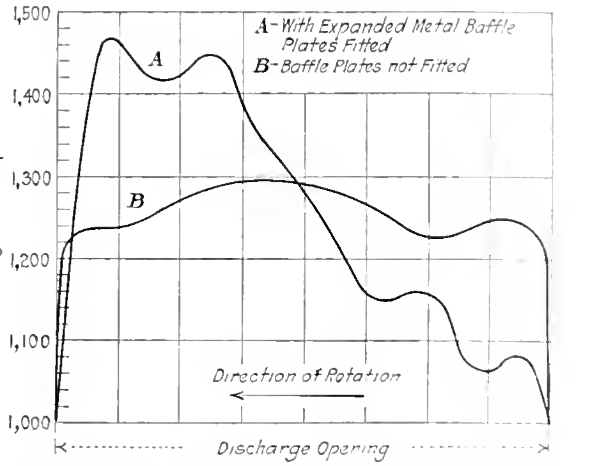

Fig. 15 Curves Plotted from Pitot-Tube Readings Taken at Opening of Temporary Discharge Trunk

such as shown in Fig. 14 was fitted and the air velocity measured by traversing the pitot tube across the discharge opening. The results obtained are shown by curve *B* in Fig. 15. To equalize the air velocity still further, close-mesh expanded-metal baffle plates were fitted in the trunk. Curve *A* in Fig. 15 shows the improvement obtained. There is still some variation, yet if the anemometer readings are taken at fairly frequent intervals, the average velocity can be found with a sufficient degree of accuracy. The resistance of the expanded-metal baffles to the flow of air was found to have no appreciable effect on the temperature of the alternator.

For the accurate measurement of the air volume it was found desirable that the discharge opening should be divided into squares not much larger than the overall diameter of the anemometer. This can be done by stretching thin guards across the trunk as shown in Fig. 14 and taking the anemometer reading over each square. For small and medium-sized machines the squares could conveniently be made with the length of side of 4 in., but for very large machines the size might be increased somewhat to avoid taking an unnecessarily large number of readings. A certain error is introduced into the readings by the delay in starting and stopping the anemometer, and also as a consequence of the manipulation of the catch that throws the recording dials in and out of gear interfering locally with the air flow. These difficulties can readily be overcome by moving the instrument rapidly from square to square without stopping it, and the average value of the air velocity is found by dividing the total reading by the number of squares. The authors have found a slight but appreciable effect in adopting this safeguard. It is desirable to run the anemometer for an appreciable period over each square, 15 sec. being the minimum desirable time, and a longer period up to one minute being preferable when circumstances permit.

The paper discusses various corrections to be made, such as effect of temperature on air density, effect of atmospheric pressure on air density, effect of humidity on air density and specific heat, and effect of temperature on specific heat.

The discussion, which was quite extensive, dealt mainly with the electrical part of the paper. (*Journal of the Institution of Electrical Engineers*, vol. 57, no. 281, April 1919, pp. 239-314, 11 figs. in the paper and 3 in the discussion, *eA*)

The Large Turbine Has Come to Stay

Status of Large Turbines. Report of Prime Movers' Committee of the National Electric Light Association.

A consideration of the practical limit in size of single-shaft machines, so far as the questions of design enter into the problem, indicates that, in general, higher efficiencies at equal or less cost per kilowatt output can be obtained as the size of the unit is increased, particularly in capacities up to 30,000 kw., but although one single unit of 45,000 kw. capacity is now in service it cannot be assumed that the size of single-shaft units can be increased indefinitely.

It would appear in the opinion of the committee that with the present prevailing frequencies and speeds and the recognized factors of safety, efficiency and cost, the size of systems today will hardly warrant units larger than 30,000 kw. capacity. The increase of percentage which the individual turbo-generator bears to the total generating capacity of a system make the reliability of this type of machine a matter of much more importance from the operating standpoint than it was previously considered, and it is becoming increasingly onerous on account of overhead charges to safeguard this capacity.

In this connection it is stated that certain of these large machines have records of continuous performances and output which surpass anything previously considered possible. For example, one of the 25,000-kw. units has completed two 77-day runs at 67 per cent load factor in the first instance and 70 per cent in the second, without shutdown.

As regards causes of troubles in units of 20,000 kw. and over, certain features of design appear to be the most frequent source of trouble. Labyrinth packings and thrust bearings belong to this class, also excessive vibration of parts, breaking of buckets and dangerous rubbing of stationary and moving elements, which, in extreme cases have resulted in permanent deflection of shafts. The most serious situation, however, has been the number of recent turbine-wheel failures.

In general, records of operating performances of these larger units tend to indicate that as high a standard of performance may be expected from them as had been obtained earlier from machines of smaller capacity. The following statement is reproduced verbatim: "The situation is now a critical one, and while any definite statement at this time would be premature, the committee wishes to indicate the necessity for early action both in safeguarding against further possible failures of machines now in operation and in definitely reaching solutions of those problems which involve important features of design and construction."

In the discussion which followed, W. L. Abbott, Mem. Am. Soc. M. E., chief engineer of the Commonwealth Edison Co., Chicago, stated that although a number of failures had occurred in large machines, nothing in the situation warranted distrust of the large units, and the trouble was due to what may be considered as incidental faults.

W. S. Finlay, Jr., Mem. Am. Soc. M. E., of the Interborough Rapid Transit Co., New York City, pointed out that his company had in operation three 30,000-kw. and one 60,000-kw. reaction turbines, but as the stations were respectively of 205,000-kw. and 195,000-kw. capacity, the huge machines were really comparatively small units considering the total station capacity. (Report of Prime Movers Committee of the National Electric Light Association, abstracted through *Power*, vol. 49, no. 21, May 27, 1919, pp. 832-834, *gA*.)

Flow of Steam Through Pipes, A. Stodola. (*Zeits. Vereines Deutsch. Ing.* 63, pp. 31-36, Jan. 11, and pp. 96-100, Feb. 1, 1919.) Describes experiments on the forms of the stream lines of high-pressure steam flowing in pipes of various shapes. The experiments are based on observations with pitot tubes at various distances from the axes of the pipes and at different positions along their lengths. (*Science Abstracts*, Section B—Electrical Engineering, vol. 22, pt. 4, No. 256, April 30, 1919, Item 233, p. 116.)

A Tribute to Mr. Wellman

It was my happy privilege to be a close friend of Mr. Samuel Thomas Wellman; to be associated with him in many organizations, and often to be his companion in traveling through Europe and the Orient. Throughout this period, covering more than a third of a century, my affection and admiration for him constantly deepened.

As one of the constructive men in this, the steel age, Mr. Wellman was known, not only in this country and in Europe, but throughout the world. I remember an incident when visiting the great steel works at Hankow, China, a few years ago. The Chinese works manager was conducting me through the plant, and when we came to one of the charging machines recently installed in connection with the heating furnaces, and stood watching the powerful arm reach into the oven as though it were human and handle the white-hot ingots, the manager remarked, "This machine is from America, and the invention of Mr. Wellman." It was indeed a pleasure to say to him that the inventor was one of my best friends.

Mr. Wellman was intensely devoted to the work of his profession; yet because of his exalted principles and his broad view of life, he was interested in all that pertained to the uplift of his fellow men.

Holley, Fritz, Wellman—a trio of contemporary engineers and pioneers in the steel industry! They have passed from among us, but because of their notable achievements and their splendid characters they will continue to live in the hearts of all those who knew them, and to be an inspiration for good as long as industry exists.

Ambrose Swasey.

What Are Your Ideas?

Is the membership of The American Society of Mechanical Engineers making the best use of its opportunity to have its views on the affairs of the Society and the conduct of those affairs considered and incorporated in the report of the Committee on Aims and Organization?

The tentative report of this Committee was presented at the Spring Meeting in Detroit and was discussed at three sessions: at the first session the attendance was reasonably large; at the second session there were only 37 present; and at the third session not half that number.

Does this mean that the Society is satisfied with its present aims and organization and not interested in its future development?

That cannot be, for they are of course interested.

Then why not give some evidence of it and take part in discussing the report and offer suggestions?

The report was published in full in the July number of Mechanical Engineering, (page 601), together with changes suggested at the Spring Meeting and a summary of the discussion. It is the duty of every member of the Society to read the report and the discussion carefully and to give the Committee on Aims and Organization the benefit of his views. This should be done at once, for between now and the Annual Meeting, early in December, the committee must prepare its final report, after which necessary changes will be made in the Constitution and By-Laws.

The Society will have had a full year to make up its mind what it wants to do in the future. If it has not made up its mind it will be the fault of the members of the Society.

These are days of great changes in almost every walk of life. The Society desires to keep abreast of these changes in order that it can render the service desired of it. It is then the duty, the immediate duty, of the members to send on their ideas, and their suggestions of the things they would like to see the Society do,—or forever after to hold their peace!

M. E. Cooley,
President.

International Standardization

Prof. Comfort A. Adams, Chairman of the American Engineering Standards Committee, has recently returned from France and England, where, in company with H. M. Hobart, also a member of the Committee, he investigated the work of standardization societies and the possibilities of establishing coöperative relations with them.

In this country, according to Professor Adams, the work of engineering standardization has up to the present time been conducted largely by independent organizations, and, although in some instances there has been fairly effective coöperation between organizations with overlapping of interests, this has been entirely voluntary and without any well-established coördinating central body. The result has been not only much confusion resulting from conflicting standards, but also in many cases the task of standardization has been undertaken with more energy than knowledge of the requirements of the work.

Standardization is a task which should either be thoroughly done or not at all. In fact, many of the efforts in this field have been largely wasted. It is impossible, for example, for any organization to enforce standards, and the only way to bring them into universal use is by enlisting the interests and services of all of the organizations involved in their application.

The need of coördination in this field has been increasingly felt for some years past, and about two and a half years ago the four national engineering societies and the American Society for Testing Materials laid plans for establishing the American Engineering Standards Committee, whose formal organization took place in October 1918. The Committee is now undergoing reorganization to the end that other societies interested in the work may be admitted, and the proposed reorganization has been fully reported in Mechanical Engineering for July (p. 638).

Standardization abroad is also receiving considerable thought. In France the organization is called a Permanent Commission on Standardization, and is appointed by the Minister of Commerce. In Holland the organization is known as the Normalization Bureau. In England it is the Engineering Standards Association. In Switzerland a similar organization is contemplated, but it has not as yet been perfected.

The organizations of Holland and France are of comparatively recent origin, but the British association has been in operation about eighteen years and is doing an enormous amount of very important work, having secured the confidence of the government and many large organizations.

Professor Adams points out that the final outcome of this movement of world-wide organization in the field of engineering standardization is likely to be accomplished in somewhat the following manner: First, the organization in each country of a national coördinating body covering the entire field of standardization; and second, the organization in each section of that field of an international body coördinating the national sections.

At the present time such an organization exists in the electrical field. It is the International Electrotechnical Commission, and an attempt is now being made to bring about a similar organization in the aircraft field, and also in the field of testing materials.

A development of such a scheme of organization will mean much to the world's industry, to the increase in the productivity of labor, to international commerce, and to the establishment of commercial ties and better international feeling.

Screw Thread Commission Sails for Europe

The work of the Screw Thread Commission in connection with the standardization of screw-thread terminology, shape of threads, systems of threads and couplings, and methods of thread measurements and tests has been referred to in several of the recent issues of Mechanical Engineering. In the April number it was stated that the Commission believed that an international conference would be necessary in order to provide a basis for arbitrary recommendations. Such an international conference will soon be held, for a delegation representing the Screw Thread Commission recently sailed on the U. S. S. *Leviathan*, which was bound for Brest, France. Upon their arrival the party will proceed first to Paris and then to London, where arrangements have been made for a conference with the British Engineering Standards Association. The delegation was to have been headed by Dr. S. W. Stratton, Director of the Bureau of Standards and Chairman of the Commission, but at the last moment he found it impossible to sail. The remaining members of the delegation are: Lt.-Col. E. C. Peck, Vice-Chairman, representative of the U. S. Army; Capt. John O. Johnson, representative of the U. S. Army; Commander L. B. McBride, representative of the U. S. Navy, and at present attached to the American Embassy, London; F. O. Wells, representative of the A. S. M. E.; Luther D. Burlingame, representative of the A. S. M. E., alternate for James Hartness; H. L. Horning, representative of the S. A. E., alternate for E. H. Ehrman; Earle Buckingham, representative of the S. A. E., alternate for H. T. Herr; and H. W. Bearce and Lieut. Robert Lacy, Technical Secretaries.

A New Attitude Toward Increased Production

In the last number of Mechanical Engineering reference was made to the resolutions adopted by the American Federation of Labor at its Atlantic City meeting (page 629) recognizing the importance of research work as the basis for industrial development. The significant passages in these resolutions were those acknowledging the necessity for increased productivity as "a most potent factor in the ever-increasing struggle of the workers to raise their standards of living." In other words, to state it conversely, that the welfare and success of workers cannot result from restriction of output so long advocated by many labor organizations.

Coincident with this action by the American Federation of Labor was an incident of similar import, even if of smaller moment, which occurred at the Industrial Relations Session of The American Society of Mechanical Engineers at Detroit. This was a statement during the discussion by Mr. Boyd Fisher, Consulting Engineer in Management, that the officers of three labor unions had agreed to employ a firm of consulting engineers jointly with their employers, to install systems of scientific management.

While this may be an isolated case—merely a straw, perhaps—this attitude has undoubtedly been helped by and is complemental to the recent movement toward shop committees, whereby workmen may share in the management of a business to a greater or less extent as it affects their own interests. It indicates a willingness on the part of labor to accept methods for promoting increased production, *provided* it may have a share in the determination of these methods and in the allotment of gains.

Many features of this matter were ably brought out by the papers and discussion at the Detroit meeting, including the fact that the first shop committee was probably organized by Mr. H. F. J. Porter, Mem.Am.Soc.M.E., in 1903-4, at the plant of the Nernst Lamp Company, Pittsburgh, although such organizations have not been generally accepted as a foundation for harmonious relations in industry until very recently.

Enemy Opinion of the Liberty Motor

Toward the end of the period of hostilities the British bomber Hyderabad No. 3, built by the Westland Aircraft Works, fell into German hands. The engine, which was a Packard-built Liberty 12 of the standard army type, was apparently uninjured and gave the German engineers full opportunity to investigate its construction and performance ability. In this issue of Mechanical Engineering are reproduced some of the results secured by them and published in a German technical periodical, *Der Motorwagen*.

It is hardly possible to suspect the Germans of partiality to the production of our War Department, which makes their opinion particularly interesting.

There is no doubt but that the German engineers were most favorably impressed with the design and performance of the engine. Their tests have confirmed practically along the whole line the results of similar tests made for example at McCook Field by the Aircraft Engineering Department of the War Department and published by special courtesy of the War Department in the March issue of this journal.

In fact, the only serious criticism made by the German engineers is that with a motor of such tremendous power, direct propeller drive was used. This criticism, however, has nothing to do with the design of the motor itself, and, as a matter of fact, is by no means new to our own engineers, as a vast amount of work was done by the Aircraft Engineering Department in the United States along lines of developing a reduction transmission for aircraft propellers to be used with the Liberty motor. Not only that, but at the time when the armistice was signed, a most interesting design was actually developed and extensively tested out and would have been probably used had not the armistice brought about a slowing down of the work of production and development.

Particular attention is called to the German data on the fuel consumption of the Liberty motor, which, if anything, are even more favorable to the motor than similar data officially published in this country.

Another First Flight

Particulars regarding the British giant dirigible R-34, which completed its round trip across the Atlantic on July 13, have been given by the column and page in the daily press, but should be recorded nevertheless as another of the remarkable demonstrations in aviation which have occurred this season in such rapid succession.

From an engineering standpoint this was a vivid and spectacular demonstration of the great value of the research activity of the Allies during the war. By united effort of the French, British and American engineers and chemists, the unwieldy and unreliable gas bags of pre-war times have been transformed into mighty dirigibles, larger than anything that the world believed to be possible only four or five years ago. A great contribution of American engineering toward the development of lighter-than-air machines lies, of course, in the perfection of a method for

producing on a commercial scale helium gas, the use of which in dirigibles is expected to revolutionize ultimately the whole art by making balloon fires and explosions practically impossible, the need for which was so shockingly demonstrated by the recent explosion of the dirigible at Chicago. (See Mechanical Engineering for February, 1919, p. 155). Helium, however, was not used in the recent trip of the R-34 from East Fortune in Scotland to Roosevelt Field, Long Island.

This performance would have been impossible in the present year of grace without the feverish work done in the research laboratories of the allied countries under the stress of the past struggle, and in that way represents the fruition of that work. It also opens up great vistas of new possibilities for the utilization of lighter-than-air machines and for the application of the great inventions in that field of engineering made in this country as well as abroad.

Important Federal Commission

It having been made clear to President Wilson that the electric railways of this country are in a very bad way with respect to their finances, he appointed a commission called the Federal Electric Railway Commission, to investigate and report. This commission consists of

Charles E. Elmquist, President and General Solicitor of the National Association of Railway and Utilities Commissioners; formerly chairman of the Minnesota Railroad and Warehouse Commission.

Edwin F. Sweet, Assistant Secretary, U. S. Department of Commerce, formerly Mayor of Grand Rapids, Michigan.

Eugene Meyer, Jr., Managing Director of the War Finance Corporation, by profession a banker. During his absence in Europe Lewis B. Wehle, counsel of the War Finance Corporation, will serve in his stead.

Royal Meeker, Statistician, U. S. Department of Labor.

George L. Baker, Mayor of Portland, Oregon, and chairman of the Organization Committee of the American Cities League of Mayors.

Charles W. Beall, Nominated by the Investment Bankers' Association, member of the firm of Harris, Forbes & Company, investment bankers of New York City.

W. D. Mahon, President of the Amalgamated Association of Street and Electric Railway Employees.

P. H. Gadsden, Chairman of the American Electric Railway Association's Committee on Readjustment and of its Committee on National Affairs, formerly chairman of the Association's War Board; Vice-President of the United Gas Improvement Company and president of the Charleston Consolidated Railway & Lighting Co.

The American Electric Railway Association has appointed a committee of 100 prominent business men engaged in a great variety of businesses. The chairman of this committee is Mr. Guy E. Tripp, of the Westinghouse Electric & Mfg. Co., New York City. Experienced men from all over the country are being called before the commission to testify. There is now the opportunity for doing great good in the country by putting forth unbiased information which will enable the utilities and the people to come to common grounds of understanding.

Considering the fact that a large number of electric railways have either gone out of business or into receivers' hands, and that vast amounts of capital are jeopardized, and that the great public dependent upon street railways for their daily journeys to and from their business are thereby seriously inconvenienced, it is truly an *important* federal commission. If its work be done well, as it is sure to be, and the public profits thereby, much will have been accomplished toward dispelling the prevailing ignorance concerning this important utility and public utilities generally.

This Commission has no power except to report and recommend —that is, it cannot enforce its decisions. It is appointed as a war time measure and its members serve without compensation. Thus it may go out of existence at the time when expenditures for war cease.

The urgency of the situation is such that the Commission feels it cannot take time to investigate the different methods of valuing properties; that its main function will have been performed when it suggests remedies which will meet the immediate needs of the electric railways in order that they can continue to exist and give service to the public.—M. E. C.

Coöperative Course in Electrical Engineering

The coöperative course in electrical engineering which was established previous to the war under the joint supervision of the Massachusetts Institute of Technology and the General Electric Company, but was discontinued because of the S. A. T. C. courses, is now to be resumed.

The course covers a period of five years, of which the first two are identical with the old and well-established course in electrical engineering at the Institute, and the last three are divided between instruction at the Institute in Cambridge and experience associated with instruction at the West Lynn and other works of the General Electric Company. The work of the final year of the course is of advanced nature, with emphasis laid on the problems of administration, the design and development of engineering projects, etc.

While students are at work at the General Electric Company they receive regular compensation but are under supervision of teachers and their work in the shops is supplemented by conferences with works department heads in which technical and administrative problems arising at the works are discussed.

Distinguished Service Cross Awarded

It is with pleasure that we give below an announcement regarding one of our junior members which has been received from France:

Capt. Horace L. Smith, Jr., First Engineers, distinguished himself by extraordinary heroism in connection with military operations against an armed enemy of the United States at Charpentry, France, on October 4, 1918, and in recognition of his gallant conduct I have awarded him in the name of the President the distinguished service cross.

Awarded on December 17, 1918.

John J. Pershing,
Commander-in-Chief.

No. 2660.

This distinguished service cross citation is the culmination of many citations received by Captain Smith for valorous deeds rendered in the line of duty. Captain Smith is at present stationed near Coblenz, Germany.

Professor Lucke Honored

Prof. Charles E. Lucke, Mem.Am.Soc.M.E., and Head of the Department of Mechanical Engineering at Columbia University, has recently been honored by promotion to the rank of Commander in the United States Naval Reserve Forces. During the war Professor Lucke had the rank of lieutenant-commander and as head of the Gas Engine School at Columbia University directed the training of large numbers of men as engineering officers for submarine chasers and coast-patrol vessels. Professor Lucke's promotion was recommended by the Official Selection Board of the Navy and he is the first reserve officer to be honored with the rank. In announcing the promotion Franklin D. Roosevelt, Assistant Secretary of the Navy, also made it known that a special citation calls attention to Professor Lucke's "valuable assistance in training personnel to meet the great demands of the war."

Notes

President Cooley appeared before the Federal Electrical Railway Commission at Washington on Thursday, July 17, to give the results of his experience of 20 years in the valuation of public-utility properties, to the number of several hundred and aggregating in value well over one and one-quarter billions. Comment on the important bearing of the Commission's work will be found in another column.

On the afternoon of June 20 a sudden storm in the vicinity of New York so completely obliterated the sun's rays that there was an unprecedented condition of darkness, equal to that of the blackest night. According to the *Electrical World*, the demand upon the New York Edison Company was the greatest in its history, increasing in a very short space of time from 250,000 hp. to 425,000 hp. In spite of the suddenness and magnitude of this change, every part of the system met the exigency without failure.

ENGINEERING COUNCIL

Engineering Council[1] is an Organization of National Technical Societies of America, Created to Consider Matters of Common Concern to Engineers, as Well as Those of Public Welfare in Which the Profession is Interested

NATIONAL SERVICE COMMITTEE

Contributed by the Washington Office[2]

Department of Public Works

As a result of a conference held at Chicago, April 23 to 25, and attended by the representatives of over seventy engineering organizations (see MECHANICAL ENGINEERING for June, p. 557, and July, p. 633), there has been introduced in each House of Congress a bill which proposes far-reaching changes in the executive machinery of the Federal Government. The new bill creates a Department of Public Works which will replace the Department of the Interior and will assemble under one head all engineering activities of the Government.

Such bureaus of the Interior Department as are non-engineering in character are to be placed under the jurisdiction of existing appropriate departments. The bill proposes that the Patent Office be removed from the Interior Department and placed under the Department of Commerce. The Bureau of Pensions is assigned to the Department of the Treasury. The Bureau of Education goes to the Labor Department. The Bureau of Indian Affairs is also transferred to the Department of Labor, but with the proviso that the engineering and construction work of the land and mineral surveys now performed under the direction of the Bureau of Indian Affairs are to be prosecuted under the Department of Public Works.

The new Department will also absorb the Supervising Architect's Office of the Treasury Department; the Construction Division, River and Harbor Improvements, Mississippi River Commission, and California Débris Commission of the War Department; the Bureau of Standards and the Coast and Geodetic Survey of the Department of Commerce; and the Bureau of Public Roads and the Forest Service of the Department of Agriculture.

The bill further provides that the Secretary of Public Works "shall by training and experience be qualified to administer the affairs of the Department and to evaluate the technical principles of operations involved in the work thereof." The measure, however, excepts from the foregoing provision the Cabinet officer who is at the head of the Department at the time of the passage of the bill.

Four assistant secretaries, each to be paid $7500 per annum, are provided and their duties outlined. One is to have administrative jurisdiction over all matters of engineering design and construction; another is to have charge of architectural design and construction; the third is to have jurisdiction over all scientific work and surveys, while the fourth is to be in immediate charge of all land and legal matters. The assistant secretaries are charged with the duty of coördinating and bringing into efficient relationship all the activities of the department so that it may be harmoniously and efficiently administered.

An important feature of the bill is the proviso that engineer officers of the U. S. Army detailed on non-military work are to be assigned by the Secretary of War to like duties under the new department, but for not over two years. This enables the Secretary of Public Works to make a gradual transfer of improvements and instrumentalities to civil administration without detriment to the public interest. Members of the Corps of Engineers may therefore, under the direction of the Secretary of Public Works, be detailed by the Secretary of War to temporary duty in the new department for such instruction, training and experience as is desired.

[1] Officers of Engineering Council; J. Parke Channing, *Chairman;* Alfred D. Flinn, *Secretary,* Engineering Societies Building, 29 West 39th Street, New York.

Water-Power Legislation

A bill to create a Federal Power Commission composed of the Secretary of War, the Secretary of the Interior, and the Secretary of Agriculture, has been passed by the House and is now awaiting action by the Senate. Since the water-power question was the subject of exhaustive hearings at the last session of Congress, the committee which reported the bill decided that no further hearings would be held. The bill is accordingly substantially the same as those previously introduced and provides for the improvement of navigation, the development of water power and the use of land. The necessity for the legislation embodied in this bill is felt in all parts of the country and especially by those engineers who are intimately connected with the projects which it will affect. The bill should therefore have the close attention and active support of every engineer. Copies of the bill will be mailed upon request made to the Washington office of the National Service Committee.

Patents Legislation

Important hearings started before the House Patent Committee on July 9, preliminary to reporting bills which propose to remove the Patent Office from the jurisdiction of the Department of the Interior and to establish a United States Court of Patent Appeals. Another bill being considered proposes increased compensation and a larger force of employees for the Patent Office.

The former bills were drafted by and have the backing of the National Research Society which has been making extensive surveys of several Government Departments during the past year. It is the purpose of the National Research Society to provide for carrying out many proposed plans to encourage inventors by making the Patent Office an independent organization.

The Patent Office is one of the few Governmental agencies which is self-sustaining. Last year saw the first deficit since this office was established in 1837. The office carries a surplus of $8,150,464.

Other minor changes are proposed by the bills, such as decrease in patent fees and the manner in which they are paid, as well as restrictions upon patent attoneys. Testimony already taken before the committee indicates that the employees of the Patent Office are greatly underpaid and that comparative inefficiency has resulted because of loss of personnel.

Appropriation for Topographic Mapping

Although Engineering Council urged the importance of increasing the Government appropriation for topographic mapping from $300,000 to $500,000, this important item was reduced to $289,000 by the House, increased to $425,000 in the Senate, and finally approved for $325,000 by the House conferees. It is understood, however, that an additional $100,000 may be obtained from the Army's topographic appropriation.

Engineering Council interested itself in having this appropriation increased because of the value of complete topographic maps to the engineering profession. It was estimated that $500,000 would enable the Geological Survey to complete the topographic-map program in twelve and a half years. It is now hoped to get the remaining appropriation necessary through as an urgent deficiency appropriation.

Army Equipment for Highway Work

In addition to the 20,000 motor trucks which were recently turned over to the Bureau of Public Roads by the War Department, arrangements are now being made to distribute among the

states a large quantity of additional engineering equipment. This equipment will be distributed without charge and in accordance with recent legislation, empowering the Secretary of War to provide the States with military equipment not needed for military purposes but valuable in highway construction work.

The additional equipment will be returned from France as soon as possible. It includes about 1500 caterpillar tractors; about 400 road rollers, steam and gas-driven; and a large number of concrete mixers, road graders, elevating graders, rock crushers, industrial locomotives, industrial-railway track, dump cars, steam shovels, hoisting engines, electric motors, and quantities of smaller equipment. In urging the immediate return of this equipment, the Secretary of Agriculture called attention to the fact that the road program was the largest scheme now being developed for the improvement of the country, for the use of materials that will help stabilize business along a number of lines, and for the employment of labor.

Air-Service Development Problems

Despite the fact that Congress failed to appropriate what many considered a sufficient amount for the development of the U. S. Air Service, the Equipment Section of the Engineering Division is nevertheless anxious for inventors and designers to lend their assistance in the development of various airplane improvements and devices. The following equipment is suggested as being of particular value and accordingly well worth development:

Gasoline Tanks. A tank is desired which will withstand a salvo of 30-caliber ammunition, equally mixed, service, tracer, incendiary and armor-piercing bullets, fired at a range of 30 yd. and at the most vulnerable angle. There are to be 10 consecutive tests on as many tanks without fire occurring. The weight should be kept as low as possible, the maximum limit being 75 per cent more than for standard tank weights.

Air-Bag Floats, Landing Skids, Etc. The object of these devices is to prevent the machine from capsizing when landing in water and to keep the machine afloat after landing. Such devices should present as small an amount of wind-resistance surface as possible, should be light and readily detachable.

Mobile Independent Cranking Device. This should be mounted on a small auto truck. The cranking device should be electrically driven and arranged so that it can be backed up to the front end of any aeroplane and attached to the propeller with a flexible arm. The electric motor is then used to crank the engine, causing it to begin firing. When the engine picks up, the device should be automatically thrown out of connection with the propeller.

Gasoline Supply Gage. This gage should be responsive, serviceable, and accurate to the last half-gallon. It may be mounted on the tank, although it preferably should be mounted on the dashboard. This gage of course must register under conditions existing in aeroplane service when the center line of the tank changes rapidly to practically every possible plane, and is often 180 deg. out of its normal position for short intervals.

Portable Hangars for Field Service. At present canvas hangars do not weather winds or rainstorms well enough to be practical and they are generally too small. The improved hangar should be capable of housing four De Haviland planes with working space. They should provide for the necessary electric lighting and small machine work.

Campaign for Uniform Traffic Regulations

The Council of National Defense, through its Highways Transport Committee, is inaugurating a nation-wide campaign for the purpose of bringing about the adoption so far as possible of suggested uniform traffic regulations and directions. An alarming number of accidents occur daily on the highways and it is the belief of the Committee that through this movement life and limb may be conserved and results of an impressive character attained.

These suggested regulations and directions represent, the Council of National Defense believe, the best and most disinterested thought on the subject of highway accidents, and their cause and remedies, possible to be had. Prepared originally by Mr. William P. Eno, an authority on traffic, these regulations and directions have since been submitted for constructive criticisms to secretaries of state, state highway commissioners, the American Automobile Association, the National Automobile Chamber of Commerce, the Highway Industries Association, the National Highway Traffic Association and to scores of individuals competent to pass upon this question.

The Council of National Defense will be glad to give the public the benefit of lessons learned in this campaign, which affects every city and village throughout the country, and inquiries as to the progress of the campaign should be addressed to the Highways Transport Committee.

Coal for Foreign Shipment

An interesting condition has arisen in the position of the American coal producers in what may be called a world trade. On the one hand, the coal producers, through their various organizations, have expressed considerable dissatisfaction in the progress made in getting export coal trade under way. They regard the methods thus far devised as not promising. There is dissatisfaction arising from the rates which the Shipping Board will charge, and fear is expressed that American exporters will be unable to compete with English rates which are so much lower.

On the other hand, the Navy has found it necessary to take special steps to provide for an adequate supply of satisfactory coal for its use on vessels engaged in the return of troops and to carry out Navy orders. Under a recent issue of proposals soliciting bids for the furnishing of steaming coal after July 1, definite offers were received for only about one-half the quantity requested, some of the operators offering only a meager supply and some failing to submit bids. This is only partly due to the stringent Navy specifications.

It is therefore clear that this country cannot successfully compete in foreign markets if it cannot supply its own Navy. Apparently there is no question but that considerable business can be done under existing conditions in Europe with Northern Europe and the Mediterranean ports. Many, however, express the idea that there is little hope of establishing permanent markets there, but there is obviously a good opportunity to take advantage of the present situation by rushing quantities of coal to those markets at very respectable profits. Besides, our coal producers would benefit from the experience. Permanent and fertile fields for this product probably can best be found in Latin America and Canada.

It is now apparent that it is an economic necessity for the country to do an export coal business, but the restrictions of the Shipping Board's high rates, a decided timidity on the part of the Government to assist, together with the fact that on the face of things our coal men are not caring for the home market, the way that such export trade is to be accomplished is not clear. Nevertheless there is concentrated effort being put forth in Washington to reduce the formidableness of the obstacles which confront coal exportation and it now seems probable that a working plan will be hit upon.

National Conference on Commercial Engineering

There was recently held at Washington, D. C., a very important conference composed of administrative professors in engineering and commerce and representatives of several national engineering and educational societies. The purpose of the conference was primarily to direct public attention to the positive need in our country for an increasing supply of well-trained young engineers to enter upon business careers in the direction of industrial and commercial management.

Dr. Glen L. Swiggett, of the Bureau of Education, Department of the Interior, was chairman of the conference, and the A. S. M. E. was officially represented by Dean R. L. Sackett, of the School of Engineering, Pennsylvania State College. The conference served largely as a clearing house for the exchange of ideas leading to common thinking and action in respect to the program of the conference, and to the end that these might be placed on record the following resolutions were passed as representing the sense of the conference:

1 Industrial and commercial development has created a demand for men with technical engineering training and business ability. Manufacturing industries are seeking engineers qualified to serve in capacities requiring sound business training. Banks and brokers also need men with business training and the engineering point of view.

This need is rapidly increasing and bids fair to demand a large number of technically trained men for both domestic and foreign commerce.

2 In order to meet this demand the economic phases of engineering subjects should be emphasized wherever possible in engineering instruction. This may be done by emphasizing the problems of values and costs in the regular technical work and by introducing or extending courses in general economics, cost accounting, business organization and business law into the engineering curricula. These courses should be designed particularly to meet the needs of the engineering student.

3 The engineering phases of economic subjects should be emphasized wherever possible in commercial instruction. Students in commercial courses should also be given opportunity to take special courses in the basic principles and practices of engineering so that they may understand in general terms the operation of power plants and transportation systems from the engineering point of view.

4 It is also urged upon all institutions with departments in engineering and economics or commerce that they consider some plan of coördination to develop a course in preparation for those careers wherein practical training in modern languages, in the essentials of engineering and business theory and practice have been found to be both helpful and necessary.

Government Activities in Engineering

The National Service Committee through its Washington office is in immediate touch with governmental affairs affecting the engineering profession in general. These are naturally of a numerous and varied nature, and it is therefore impossible to cover them all in detail, but Mechanical Engineering strives to give information regarding those which it deems of special interest and value. There may be, however, certain affairs of interest to some which we have failed to present, and on these the Washington office of the National Service Committee will gladly supply information. At the present time full and up-to-date particulars may be obtained on the following subjects:

Shipping Board's Reports and Addresses. Summer positions for college men; specifications for new ships; proportion of world's shipping; proposed plans for next fiscal year.

Road Construction Work. Latest state status; national appropriation bills; war material available; comparative U. S. and foreign program; committee arrangements for coöperation.

War Department. Contract-settlement regulations and operations; statistics series; equipment and realty advertised for sale.

Mining. Plans for completing and executing findings of War Minerals Relief Commission; Safety Engineer and Accident Statistics, by A. H. Fay, of Bureau of Mines; proposed plans to protect war minerals, potash, etc., by license and duty; detailed report of Geological Survey on shipments of coal and coke.

Railroad Administration. Latest operating and financial statements; movement of traffic in various regions.

New Sundry Civil Appropriation. Government departments and bureaus; reports for current year, etc.

Purchase of Airplanes or Motors. The Salvage and Sales Branch of the Air Service, 6th and B Streets, N. W. Washington, D. C., announce that those persons who contemplate purchasing a Government airplane or motor, should list their names in the above office, so that they may be advised when the opportunity arrives for them to make a purchase. Detailed information of equipment proposed for sale and method of sale can be obtained from the Salvage and Sales Branch.

Oil Lands in Utah. Reports from the Geological Survey, Department of the Interior, indicate that although considerable drilling has been done in the state of Utah, no oil has been produced in commercial quantities. Sandstone saturated with asphalt and other hydrocarbon compounds and small showings of oil in wells at several places suggest that oil may be found in commercial quantities where the rocks are favorable for oil accumulation.

Mineral Deposits in the United States. The United States Geological Survey recently published Bulletin 690, which contains those papers dealing with zinc and copper ores at Ophir, Utah; gravel deposits in Arkansas, with special reference to their possible utilization as a source of hard pebbles for grinding mills; phosphate deposits in the Uinta Mountains, Utah; quicksilver deposits in the Phoenix Mountains, Ariz.; and manganese deposits near Butte and in Madison County, Mont. This bulletin is completely descriptive and contains important illustrations and maps.

Outline Map of the United States. The Coast and Geodetic Survey, Department of Commerce, recently completed a new outline map of the United States on the Lambert Conformal Conic Projection, scale 1-5,000,000, dimensions, 25 in. by 39 in. This map is intended merely as a base to which may be added any kind of special information desired. The shoreline is compiled from the most recent Coast and Geodetic Survey charts. State names and boundaries, principal rivers, capitals and largest cities in the different states, are the only information otherwise embodied. This map is based on the same system of projection as that of the armies of the allied forces in the military operations in France. It is being used extensively by the Army and will probably be of interest and value to engineers.

NATIONAL RESEARCH COUNCIL

DIVISION OF ENGINEERING [1]

Dr. Henry M. Howe, Chairman of the Division of Engineering of the National Research Council, who has been serving for the past three months as Scientific Attaché to the American Embassy at Paris recently returned to New York. Time has not as yet permitted Dr. Howe to prepare a report of his work during his stay in Paris and at present details are accordingly lacking. Research abroad, however, is receiving considerable attention and plans are now being made whereby the United States may be properly acquainted with and assist in the extension of international research.

The work of the Division of Engineering in this country is progressing along many lines and recent tentative reports are now available in connection with the work of three important committees. These are briefly presented herewith.

Committee on Improvement of Metals at Blue Heat. A meeting of this committee was recently held at the new offices of the Division of Engineering at 29 West Thirty-Ninth Street, New York City. The committee has been engaged for some time past in a study of the behavior of high-speed steel when at temperatures below the critical point, and since it proposes to confine itself in the future to problems associated almost entirely with steel, the committee requested that it hereafter be known as the Committee on Physical Changes in Iron and Steel. The personnel of this committee is as follows: Zay Jeffries, Chairman, R. R. Abbott, G. H. Clevenger, J. V. Emmons, F. B. Foley, H. J. French, A. H. Miller and Albert Sauveur.

Committee on Fatigue Phenomena of Metals. This committee was created in August, 1918, for the purpose of investigating problems arising in connection with the electric welding of ships and the failures of aircraft. Prof. H. F. Moore, of the University of Illinois, is chairman of the committee and at a meeting held at Atlantic City on June 27, plans were made for an elaborate and intensive study of the problems lying within the committee's field.

Committee on Neumann Bands. This committee was formed as a result of testimony given in connection with the investigation of the molasses tank disaster at Boston. An expert stated that it was his opinion, based upon the number and formation of the Neumann bands, that the speed of impact which caused the breakage was not over 15 ft. per sec., and if the primary break was located as was claimed then the results disprove the theory of an explosion, for in such case the speed of impact would have reached well into the hundreds of feet per second and the formation of the Neumann bands would have been entirely different. This implied relationship between speeds of impact and Neumann bands was hitherto unknown to exist but upon having its attention called to the fact the Division of Engineering immediately appointed a committee to investigate the entire field. The chairman of the committee is Prof. Charles E. Munroe and although some work has been done the relationship as expressed above has not as yet been determined.

[1] Dr. H. M. Howe, *Chairman*; G. H. Clevenger, *Vice-Chairman*, Engineering Societies Building, 29 West 39th Street, New York.

NEWS OF THE ENGINEERING SOCIETIES

Reports of Annual Conventions of American Railroad Association, American Water Works Association, American Society of Civil Engineers, American Institute of Electrical Engineers, etc.

American Railroad Association

That fifty out of the three hundred exhibits shown on Young's Million Dollar Pier, Atlantic City, at the convention of the American Railroad Association held on June 18 to 25, were of machine tools, indicates how close is the relation between the machine-tool industry and the builders of railway equipment. Many of the machine tools on exhibition were new models and a casual study of their design indicates a tendency toward greater weight, making for rigidity and greater production. In the course of the numerous official sessions considerable time was given to the discussion of reports on many subjects pertaining to car and locomotive design and maintenance. Among these were such subjects as car wheels, couplers, draft gears, car trucks, tank cars, mechanical stokers, locomotive headlights, superheater locomotives, and design, maintenance and operation of electric rolling stock.

American Water Works Association

A notable feature of the thirty-ninth annual convention of the American Water Works Association, held in Buffalo on June 9 to 13, was a paper describing a new and unique reciprocating pumping engine which incorporates the uniflow principle in the operation of the pump. The engine is of the horizontal extended type having one steam cylinder and one double-acting plunger pump. Its normal working water pressure is 100 lb. per sq. in.; the suction lift is approximately 15 lb. plus the friction in about 60 ft. of suction pipe. This engine will operate in the Porter Ave. water-works pumping station of the City of Buffalo. It is anticipated that the tests will show a duty of 180,000,000 ft-lb. per 1000 lb. of steam.

The report of the Committee on Private Fire Protection Service reviewed the various physical and financial questions involved and made specific recommendations as to each. Much hearty commendation of the report followed its reading. It was voted to continue the committee instead of adopting the report and discharging the committee as it recommended.

A progress report of the American Committee on Electrolysis stated that a technical sub-committee had been created and a plan had been formulated under which experts would be engaged to study electrolysis.

National Gas Engine Association

Plans for increasing the activities of the National Gas Engine Association were laid at the twelfth annual meeting of the Association held on June 2 and 3 in Chicago. The reason for reorganizing the Association, as expressed by President O. H. Fischer, was the necessity for developing a greater coöperation between the manufacturers of internal-combustion engines in order to cope with the present situation, particularly in regard to labor conditions. Various aspects of the labor question were treated by Chris Heer in a paper entitled The Industrial Committee, Its Work and Future. Complete organization of the employer and employees of each industry affiliating with national organizations, coöperating and working in conjunction for the best interests of all, he believed, would come nearer solving and taking care of the labor question than any other method.

I. R. Todd, in a paper on Reconstruction Problems, took a most hopeful and optimistic view of the future awaiting American industry. With the balance of trade in our favor, with our growing merchant marine and our recent legislation permitting American bankers to establish foreign branches, American business men to coöperate for foreign trade, and authorizing the War Finance Corporation to extend credit to the extent of one billion dollars to promote this trade, he said, one cannot contemplate present conditions without anticipating a great future for American business.

Another paper of interest was an account of early pioneering days in the gas-engine field, by George Cormack.

American Concrete Institute

Many of the papers presented at the annual meeting of the American Concrete Institute, which was held on June 27 and 28 in Atlantic City, N. J., were devoted to the work of the Emergency Fleet Corporation. During the war the Concrete Ship Section, Emergency Fleet Corporation, developed a special light-weight aggregate for concrete, thereby obtaining a concrete of considerable strength weighing only 99 lb. per cu. ft. The possibilities of using such light concrete in building construction were discussed by A. W. Stephens in a paper entitled Economic Possibilities of Light-Weight Aggregate in Building Construction. The data and allowable costs per cubic yard in this paper would permit the higher-priced but lighter aggregate to compete with trap rock and gravel.

The report of the Committee on Standard Building Regulations for the Use of Reinforced Concrete contained the following clause:

> Cinders shall not be used as coarse aggregate in concrete for reinforced-concrete structures without tests acceptable to the Building Department showing the strength of such concrete. Cinder concrete may be used for fireproofing, for floor and roof slabs, not exceeding 8-ft. span, and for partitions. Where cinders are used as the coarse aggregate they shall be composed of hard, clean, vitreous clinker, free from sulphides, unburned coal or ashes.

This regulation brought out considerable comment. Ira H. Woolson, who has had much experience with cinder concrete, went on record to the effect that, in his opinion, 15 per cent of unburned coal was not detrimental and might be permitted in anthracite cinders, and that a small percentage of ashes could also be allowed without bad effects in the resultant concrete. The matter will be considered further by the committee in the light of the discussion.

American Society of Civil Engineers

The annual convention of the American Society of Civil Engineers was held in Minneapolis on June 17. The main topic of the business session was the report of the Development Committee, which included recommendations in regard to internal relations and local associations, technical activities and public service, and relations with other societies. It was the opinion of the committee that the identity of the four national societies known as the Founder Societies should be preserved, but they added that the time had now come when the society should adopt the principle of becoming an active national force in economic, industrial and civic affairs. To do this effectively they recommend that jointly with other engineering organizations a comprehensive organization should be formed embracing (1) the local affiliation of the branches of the national technical societies and the local technical societies, (2) a state council composed of representatives from the local affiliations, and (3) a national council consisting of representatives of the national technical societies and from the state council or state group organizations. With respect to the internal relation of the society, the committee suggested the establishment of regulations intended to develop greater activities

among the local associations. The creation of committees of the parent society and local associations charged with the responsibility for promoting greater technical activity was advised by the committee. Recommendations were also made to prepare, in coöperation with other founder societies, a standard form of bill for the licensing or registration of engineers, to be used in the framing of legislation, and to maintain an agency in Washington, D. C., or elsewhere, for the purpose of keeping advised of all proposed Federal legislation and departmental rulings and regulations involving directly or indirectly questions of engineering.

Engineering Educators Meet in Baltimore

The lessons of the Great War in matters of education were discussed at the 27th annual meeting of the Society of the Promotion of Engineering Education, held at the Johns Hopkins University, Baltimore, Md., during the last week of June.

At the opening session, following an address of welcome by President Frank J. Goodnow, of Johns Hopkins University, and the response by Professor John F. Hayford, president of the society, the Special Committee on the Report of the Joint Committee on Engineering Education presented its preliminary report in the form of six specific resolutions based on Dr. Charles R. Mann's paper on The Study of Engineering Education, which was presented to the society at its last annual meeting. These resolutions prompted considerable discussion and comment. Two of the resolutions of general interest are quoted below:

Resolved. (1) That this Society, through its Committee on Admission, or otherwise, recommend that as a matter of experiment and research psychological "objective," "trade" or other similar tests be given to all students after admission to engineering courses of study and that the ratings thus obtained be compared with their subsequent scholastic progress.

(2) That the Society should coöperate with the national and other engineering societies, with a view to establishing a classification of the work, or positions, including specifications as to necessary preparation and qualifications, into which our engineering graduates enter, so that undergraduate students would thus have a clearer understanding of the work for which they are preparing themselves and instructors have before them a constant reminder of the main purpose of their teaching work.

The subject of psychological tests was further discussed in two papers. One, entitled Mental Tests for Engineering Students, was presented by Prof. C. L. Thurston, Division of Personnel and Psychology, Carnegie Institute of Technology, Pittsburgh, Pa., and the other, entitled Vocational Intelligence Examination to Fourth-Year M. E. Students, was read by Prof. William T. Magruder, of Ohio State University. Both of these papers were enthusiastically received.

The second session of the convention was devoted to a general discussion of the Effect of the War on Engineering Education. The discussion was opened by Dean Anson Marston of Iowa State College, and was participated in by many, including the following A. S. M. E. members: Profs. Carl C. Thomas and Alexander G. Christie, of the Johns Hopkins University; Prof. William T. Magruder, Dean A. A. Potter, Kansas State Agricultural College, and Prof. Dugald C. Jackson of the Massachusetts Institute of Technology. This theme was carried into a later session when Col. F. J. Morrow, Chairman of the War Department Committee on Education and Special Training, described the Government's plan for the continuation of the Reserve Officers' Training Corps. As part of the discussion of the topic set for this session, viz., Military Training in Engineering Schools, Major Harrison Tilghman from Fort Monroe told how the Coast Artillery was already putting its plans for the R. O. T. C. into operation.

During the convention a number of the standing committees of the society made their annual reports. Of special interest to the mechanical engineering profession are those of Committee No. 16, Mechanical Engineering Courses, Prof. Oscar A. Leutwiler (Mem. Am. Soc. M. E.), Chairman, and of Committee No. 20, Standardization of Technical Nomenclature, Prof. John R. Faig (Mem. Am. Soc. M. E.), Chairman.

At the final session held on Saturday morning, Arthur M. Greene, Jr., Mem. Am. Soc. M. E., Professor of Mechanical Engineering, Rensselaer Polytechnic Institute, and Chairman of the A. S. M. E. Committee on Research, was elected president for the ensuing year, and Dean A. A. Potter, vice-president. Following the election Dr. Ira N. Hollis, Past-Pres. Am. Soc. M. E., President of Worcester Polytechnic Institute, read a paper on Engineering Colleges and Their Administration.

The social features of the convention included an annual-mixer meeting and the annual dinner, both held at the Baltimore Country Club, an informal smoker and round table discussion, and a half-day excursion to the United States Naval Academy and the Engineering Experiment Station.

C. B. Le P.

American Institute of Electrical Engineers

The program of the annual convention of the American Institute of Electrical Engineers, held at Lake Placid Club, N. Y., June 24 to 27, provided an even balancing of the business and entertainment features, and this innovation met with general approval. Of special interest were the three sessions held under the auspices of the Institute's Development Committee. The report presented by this committee, which was based on suggestions forwarded to its members by the local sections and by individual members, outlined a plan for the improvement and development of the Institute's activities. Among the recommendations proposed were the following:

1 Development of the scope of the monthly Proceedings in order to include, in addition to the high-grade electrical engineering papers which have formed the principal part of the publication up to the present time, other material of more general interest, without in any way lowering the Institute's standards.

2 Inclusion in the monthly publication of a set of abstracts of practically all papers presented at section meetings throughout the country.

3 Consideration of whether or not a satisfactory plan can be developed which will eliminate the present wasteful practice of printing practically all papers twice, once in the monthly Proceedings and again in the annual Transactions, by possibly printing the monthly in two sections, bound together in one publication when issued and so arranged that they may be separated later by the recipient, who may wish to dispense with the transient matter and retain the part containing technical matters and discussions of permanent value.

4 As a result of the improvement of the monthly publication, it will become a better advertising medium; and it is suggested that advantage be taken of this fact to develop the advertising section and thereby meet the additional cost of enlarging the editorial staff and printing more material.

5 Create a New York Section, organized and conducted along the same lines as existing sections elsewhere.

6 Extend the present practice of holding some of the Institute and Directors' meetings in different parts of the country where local sections are established, instead of holding nearly all of these meetings in New York as at present.

7 Divide the country into geographical divisions corresponding in number with the number of Institute vice-presidents; and select one vice-president from each of these districts.

8 Make it a part of the duty of each vice-president to visit the sections in his own division at least once a year.

9 Pay the traveling and living expenses of the officers and board members attending Institute meetings.

10 Increase the vice-presidents' term of office from one year to two years. Provide that no member of the Board of Directors may continuously hold office for more than six years.

11 Decentralize committee work as far as may be found feasible and desirable, by substituting section committees for some of the Institute committees. Appoint a general committee to study this question and to make recommendations.

12 Present more high-grade papers of general engineering interest.

13 Create a committee in each section charged with the duty of assigning to the younger members specific participation in designated meetings by the preparation of papers and discussions, or otherwise. By this and other methods, including appointment of a reasonable number of the younger men to membership on committees, it is hoped to stimulate the interest of the younger members and thereby increase their loyalty to the organization and their opportunity for self development.

All of these recommendations were approved in principle, with the understanding that details would be worked out by appropriate committees.

In his presidential address, Comfort A. Adams emphasized the

great need of closer cooperation in commercial, industrial and scientific transactions. After delivering his address President Adams introduced President-Elect Calvert Townley, who in a brief address called attention to the tremendous work the engineer had done during the war, and added that the possibilities for the engineer making a prosperous period of peace were many times greater.

The Power Station Committee announced that it would shortly present to the Institute the results of its labors for the last two years on Limits of Speed and Power of Single-Shaft Steam Turbo Generator Units.

In the report of the Instruments and Measurements Committee reference was made to the effect of the war on the development of the manufacture of thermoelectric couples in this country. Thermoelectric couples of American manufacture, the report indicated, "are superior in every way [to those of German manufacture] and are now available for the accurate measurement of alternating current of any frequency. Their sensibility is such that a current of one milliampere will produce a deflection of three millivolts in a direct-current voltmeter."

"The increase in the use of electrical energy in the iron and steel industry in the last few years," according to the report of the Iron and Steel Industry Committee, "has been remarkable and partly responsible for the prominent position the United States has taken in furnishing steel products to the entire world. Over 500 motor equipments are in use in this country, driving main rolls with a maximum horsepower of over 850,000, while the total horsepower of auxiliary motors exceeds 1,350,000, making a total of 2,200,000 hp. which requires about 650,000 kw. in generator capacity. In addition, electric furnaces require approximately 250,000 kw. in generator capacity, or a grand total of 900,000 kw. generator capacity in the iron and steel industry. This is by far the largest amount of electric energy required in any one industry, and from all indications will continue to increase considerably in the future."

American Society for Testing Materials

Of special interest is the action on phosphorus and sulphur limits in various specifications covering steel products taken by the American Society for Testing Materials at their 1919 meeting held in Atlantic City, N. J., June 24-27. Last year, by suggestion of the Committee on War-Emergency, the society introduced in the specifications for finished steels what is known as the phosphorus and sulphur note. This note read as follows:

> In view of the abnormal difficulty in obtaining materials in time of war, the rejection limits for sulphur in all steels and for phosphorus in acid steels shall be raised 0.01 per cent above the values given in these specifications. This shall be effective during the period of the war and until otherwise ordered by the society.

It has now been decided to restore the normal figures at once for those steels in which quality is most essentially affected by the change, and to retain the war clause in the other specifications until next year. This action may be summarized as follows:

War Clause Removed 1919:	War Clause Retained for Present:
Bridge steel	Building steel
Structural nickel steel	Ship steel
Plates for stationary boilers	Carbon-steel rails
Forgings and steel for forgings	Tie plates
Splice bars, except low-carbon	Splice bars, low-carbon
Track bolts, except low carbon	Track bolts, low-carbon
Wheels and tires (railway), all	Plates for locomotives and cars
Spring steels, all	Tubes for locomotive and stationary boilers
Tool steel	Chain
Automobile steels	Bars for concrete reinforcement
Girder and high tee rails	Castings.
Screw stock.	

A new tentative specification for plates for forge welding, which was adopted upon recommendation of Committee A-1 on steel, limits carbon to a maximum of 0.18 per cent, phosphorus to 0.04 per cent, and sulphur to 0.05 per cent. The manganese range is 0.30 to 0.60 per cent. The minimum tensile strength for plates $^3/_4$ in. or under is 48,000 lb. per sq. in., and for plates over $^3/_4$ in., 45,000 lb. per sq. in. The yield point is put at one-half the tensile strength. Modifications in elongation are made in proportion to thickness.

The results obtained from an experimental study of the effect of heat treatment on fatigue-resisting strength of nickel steel and chrome-nickel steel were presented by H. F. Moore and Arthur G. Gehrig. The nickel steel was of about 3.3 per cent nickel content and the chrome-nickel steel contained about 0.8 per cent chromium and 1.3 per cent nickel. The conclusion was reached from the performance of both static tension tests and tests under reversed bending stresses made with annealed, heat-treated, and polished specimens, that the results of a static tension test are not a reliable index of fatigue strength of a material under oft-repeated low stresses, and that high-stress, short-time fatigue tests do not give a reliable index of fatigue strength under oft-repeated low stresses. It was also established that a heat treatment may raise the elastic strength of a steel without increasing its fatigue resistance under low stresses, and that perfection of surface finish is an important factor in determining fatigue resistance under oft-repeated low stresses.

Five papers were presented in which magnetic analysis as a method of testing ferrous material for quality was discussed. The first, by C. W. Burrows and F. P. Fahy, described the methods used and the results of some measurements, emphasizing the very close relationship between the magnetic and the mechanical characteristics of steel. Various practical applications of magnetic methods were dealt with in three papers as follows: To the discovery of defects in steel rails, by P. H. Dudley; to the testing of ball-bearing races, by R. L. Sanford and M. F. Fischer; and to the location of flaws in rifle-barrel steel, by R. L. Sanford and W. B. Kouwenhoven. Finally, magnetic properties as affording a basis for determining microstructure were considered by C. Nussbaum.

Five new instruments and machines for testing were also described. T. D. Lynch and P. H. Brace, in a paper entitled Wire Testing Extensometer, explained the operation of this instrument. It grips the wire by a spring clamp at one end of a pair of distance bars, and at the other end of the bars by two small rollers which carry mirrors on their ends. These mirrors reflect a beam of light from a small collimation tube at one side of the instrument to a curved scale attached on the opposite side. Reading to 0.00002 in. is possible. A miniature Brinell machine for use in inspection of cartridge cases was described by S. L. Goodale and R. M. Banks in a paper entitled Development of Brinell Hardness Tests on Thin Brass Sheet. The impression is made by a 1/16-in. ball under a 15-kg. load. The design of a very compact repeated-stress machine for testing electrically welded ship plates was reported by F. M. Farmer in his paper on A Fatigue Testing Machine. The test piece is a rotating simple beam, loaded at the third-points, and the whole machine is only 5 in. by 19¼ in., though the specimen is 0.4 in. in diameter and 13 in. long. A new viscosimeter for gasoline, designed by W. H. Herschel, as described in his paper, A Viscosimeter for Gasoline, has an outflow tube 24 diameters in length instead of 7 as in the Engler and Saybolt instruments. An apparatus in which a slab of pitch is bent on a hinged plate while immersed in water, the temperature of which can be varied, was described by H. E. Lloyd and P. P. Sharples, in a paper on Apparatus for Determination of Breaking Point of Pitches.

There are now 620 known trade associations in the eastern half of the United States, of which 323, or over half, are located in New York City, 75 in Chicago, and the remaining 222 in smaller cities. The increase in the number of these associations has been rapid and their utility has been emphasized by the conditions of business and trade resulting from the war. A building is now being erected in New York, known as the National Association Building, on Forty-third Street, which it is expected will eventually become the headquarters of a large number of trade associations, thus bringing together many of the important business activities of the industries in the direction of interchange of data, unification of methods in specifications and accounting, direction of educational campaigns, etc.

REPORT OF THE COMMITTEE ON INDUSTRIAL RELATIONS

Appointed to Report Upon the Advisability of Establishing a Permanent Committee on the Relations Between Employer and Employee

THE following report of the Committee on Industrial Relations was presented at a meeting of the Council on February 22, 1919:

To THE PRESIDENT AND COUNCIL OF THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS,

29 West 39th Street, New York City.

Gentlemen:

In compliance with your request, the special Committee appointed by the Council of the A. S. M. E. on December 6, 1918, to report upon:

a "The advisability of establishing a permanent committee on the relations between employer and employee; and

b The best method of encouraging our membership to fulfill their high duty in that field for which their training and activities should fit them,"

held a protracted session on Friday, January 17, 1919, in New York City. Aside from the undersigned Chairman, there were in attendance: John W. Lieb, Vice-President, New York Edison Co., New York City; W. H. Manss, Director War Service Executive Committee, Chamber of Commerce, U. S. A., Washington, D. C.; Henry D. Sharpe, Treasurer Brown & Sharpe Mfg. Co., Providence, R. I., and Magnus W. Alexander, Managing Director, National Industrial Conference Board, Boston, Mass.

At the outset the Committee discussed and agreed on the importance of a desirable coöperative relation between employer and employee as a fundamental and potent factor in the efficient conduct of industry and the proper discharge of social obligations resting upon both parties. The Committee, moreover, was unanimous in the opinion that a clear understanding of the employment relation and of correlated phases of industrial activity by all classes of the population is necessary for the development of sound and sane public opinion regarding these vital issues; and that the engineers of the country, both as primary factors in the country's industrial development and as intelligent citizens, must be enlisted on the task of correctly informing the public and properly shaping its opinion in respect to industrial questions.

The Committee, therefore, urges most strongly that adequate space be provided on programs of meetings of the Society and its branches in order that qualified speakers may keep the members of the Society in close touch with the latest developments in the human relationship in industry. Speakers should be chosen, however, who do not merely propagate a personal opinion but who can speak with the authority of deep knowledge of and long experience with the subject under discussion. They should, in engineering fashion, analyze the elements of a proposition, show its feasibility and, where possible, its practical application and resultant benefits so that justified deductions may be drawn from accumulated data and experience.

The Committee will be very glad to assist the Council and the Committee on Meetings of the Society in suggesting topics and speakers on the employment relation and allied subjects.

The Committee fully discussed the advisability of establishing in the Society a standing committee on relations between employer and employee, and unanimously agreed that it does not seem advisable at this time to recommend to the Council the appointment of such a committee. In this decision is involved a consideration of the Society's purposes and the character of its membership. We submit, therefore, the following observations:

In the language of the Society's Constitution, "The object of the Society is to promote the Arts and Sciences connected with Engineering and Mechanical Construction."

We believe that The American Society of Mechanical Engineers was created for the purpose of bringing together knowledge and experience in the scientific mechanical engineering field in order to help in the promotion of the Arts and Sciences of Engineering and Mechanical Construction and in the advancement of the status and prestige of mechanical engineers. In this scientific field, The American Society of Mechanical Engineers occupies a commanding and influential position and its achievements are a credit alike to the Society as a whole and to individual members who have been active in promoting the Society's legitimate ends.

Unlike the mechanical engineer, who deals with the ascertainment of scientific facts and with their application to the mechanical arts, the sociologist in industry, if we may use this term in contradistinction, endeavors equally to ascertain facts, but, supplementary to this, he also collects opinions and finally compromises between abstract judgment founded on facts and justified consideration of prevailing public opinion and social and political conditions. We believe that as an organization The American Society of Mechanical Engineers should steer a scientific rather than a sociological course and deal more largely with facts and experience rather than with opinions and expediency compromises.

In so far as the membership of the Society is concerned, it may be conveniently divided into those who are in active administrative charge of industrial enterprises, those who are devoting their energies to scientific engineering in private or public capacity, and those who constitute the group of teachers of engineering and general science. Only the men comprising the first group, aside from some individuals in the other two groups, would have practical knowledge of and intimate experience with the many complex and often perplexing questions involved in the employment relation. But these men are usually also members of national and local trade and civic organizations and of specially organized bodies, whose chief endeavor is devoted to the considerations of the employment relation and kindred subjects. As far as these latter activities are concerned, the men of the first-named group of the A. S. M. E. function, therefore, principally through such organizations.

Merely to establish in the Society a standing committee on relations between employer and employee without giving the committee the necessary authority and large financial resources to prosecute its investigations and formulate reports with the thoroughness and accuracy which they demand, would neither contribute materially to the solution of the many vexing problems involved in the situation nor hold the Society true to its established course. It would, moreover, project the Society into a field in which there are now effectively operating several organizations especially devoted to the study of economic and sociological problems in industry.

These organizations are constantly tapping the knowledge and experience of those members of The American Society of Mechanical Engineers who are engaged in executive and administrative functions in industry. A close connection between the Society and these organizations, therefore, already exists and can be made more effective by placing before the membership of the A. S. M. E., through papers and discussions as suggested, the progress made in the study and development of the so-called Labor Problem by those who are qualified for this task.

For these reasons the committee deems it inadvisable for the Society at present to enter the controversial field of industrial economics as involved in the relationship between employer and employee. Individual members of the Society should, however, be encouraged to join organizations especially studying the human relationship in industry, and the Society as a whole may properly seek, where it is practicable, to be represented on committees of such organizations, especially the National Industrial Conference Board and the War Service Committee organizations of the Chamber of Commerce of the United States.

Respectfully submitted,

(Signed) ANSON W. BURCHARD, *Chairman,*
JOHN W. LIEB,
W. H. MANSS,
HENRY D. SHARPE,
MAGNUS W. ALEXANDER.

American Machinery in Indo-China

The following has been received by the Secretary from W. H. Rastall, Trade Commissioner, Buitenzorg, Java:

Manufacturers interested in exporting machinery will find the present situation in Indo-China very interesting. Formerly practically all equipment was imported from France and the French policy was to retain this business where practicable. War conditions have made it difficult for France to supply this colony with the necessary equipment and as American ships are now running direct to Saigon, the buyers in Indo-China are beginning to send their inquiries to America. This is prompted by a spirit of friendliness as well as business convenience.

A certain amount of American equipment is being used with very satisfactory results. Also the performance of the United States in the war has advertised to the buyers of Indo-China American manufacturing ability and the general excellence of American machinery.

A further inducement operating in favor of American goods at this time is the rate of exchange as American dollars are very much cheaper in Saigon than they were formerly.

The market in Indo-China is not large but there is a certain demand for rice mills, mining machinery, road- and railroad-building equipment, automobiles and the miscellaneous equipment needed in all countries.

NECROLOGY

SAMUEL T. WELLMAN

Samuel T. Wellman, a past-president of the Society, and a pioneer in the world's steel industry, whom Charles Schwab once characterized as "the man who did more than any other living person in the development of steel", died suddenly from heart trouble on July 11, 1919, in Stratton, Me., while on his way to camp. His death came as a shock to his very large circle of friends, many of whom had only recently met him at the Spring Meeting of the A. S. M. E., at Detroit.

Mr. Wellman was born on February 5, 1847, in Wareham, Mass. At that time his father was superintendent of the Nashua Iron Co. of Nashua, N. H. He was educated in the schools of Nashua and in Norwich University, Norwich, Vt., where he spent

SAMUEL T. WELLMAN

one year in the engineering course. During the Civil War he served as a corporal in the First New Hampshire Heavy Artillery.

Perhaps the most interesting account of Mr. Wellman's entrance into and activities connected with the steel business is that given in a letter which he wrote to the Cleveland Engineering Society at the time of his election to honorary membership in that body. Mr. Wellman wrote:

Perhaps the story of my leaving home at that time might be interesting. My father was superintendent of a small iron works among the hills of New Hampshire, which among other business included the rolling of steel locomotive tires which they made from hammered steel blooms imported from England. To properly heat these blooms, they had arranged with C. W. Siemens to build a regenerative gas furnace. The drawings were sent over and turned over to me, who had never seen a drawing of that kind before. My father asked me if I thought I could build the furnace and have it exactly like the drawings. After studying them over a little while, I told him that I thought I was equal to the task. He told me to get the furnace built at the earliest possible moment. I had just finished the furnace and had a drying-out fire in it when a big black-whiskered Englishman walked into the office and announced that he was the Siemens engineer who had been sent from England to build this particular furnace. My father turned him over to me to go out into the works and show him where the furnace was to be located, which I did, and my English friend was very much amazed to find the furnace all finished. He was pleased as well, and said, "Why, we have only to start the furnace now; you have made a proper job of building it." So everything else being ready, we started up the gas producers and the furnace and everything worked to perfection. The engineer was so pleased with what I had done that when he left he asked me to go with him to Pittsburgh as his assistant in the starting of a crucible-steel furnace which was finished and waiting for him to start. It is needless to say that I did not have to have a second invitation, but went to Pittsburgh with him. This was in 1867, and I spent over a year there. The first few months of that time were spent starting up and operating the first crucible-steel furnace built in America, at the works of Anderson, Cook & Co. To show what a tremendous saving this furnace was over the old coke-fired furnaces, I will only say that it melted a ton of steel with an average of 1000 lb. of nut coal which cost less than $1, while to melt a ton of steel in crucibles in the old-fashioned coke furnaces took three tons of the very best coke, costing anywhere from $2 to $10 per ton. This style of furnace was a great success and in a very few years had driven the coke furnace out of use.

From Anderson, Cook & Co. I went to Singer, Nimick & Co's. works, where I built two crucible-steel melting furnaces of the same type as the one which I went to Pittsburgh to start. After that I spent some time in the office of the Siemens agents in Boston, and also at steel works in different parts of the country starting crucible steel furnaces of the same type. I then built a crucible-steel melting furnace at the Chrome Steel Works in Brooklyn, N. Y., which was a success. From there I went to the Bay State Iron Works, in South Boston, Mass. (I having separated myself from the agents of the Siemens furnace some time before this), where I built the first open-hearth furnace that was a commercial success in the United States. This was a pronounced success in a great many ways, making a quality of steel which up to that time had not been reached in this country. The principal use to which it was put at that time was in the manufacture of locomotive fireboxes. From there I went back to the old works in New Hampshire where my father was still superintendent, and built for them an open-hearth furnace, a plate-rolling and bar-rolling mill.

I then came to Cleveland in 1873 to design and build the Otis Steel Works, with which I was connected as engineer and superintendent for 16 years. It is useless for me to say very much about the history of the Otis Steel Co., as it is too well known here. But there are two inventions which I worked out during the time I was connected with the Otis company that are today absolutely indespensable to the economic operation of any open-hearth steel works. I refer to the open hearth charging machine and the use of the electromagnet for handling pig iron and scrap steel. Just a few figures will give you a little idea of their importance to the trade and what they are saving every day.

There were made in this country in 1916 approximately 39,000,000 tons of pig iron and about the same quantity of steel ingots of all kinds. Very conservative figures show that at least half of this, or say 20,000,000 tons, was pig iron and scrap handled and used in open-hearth furnaces. This was all handled by the open-hearth charging machine and electromagnet at least once, the bulk of it twice, and a great deal of it three times. By the use of the electric open-hearth charging machine, the direct saving in labor is estimated by one of the large users at 25 cents per ton. This was about 10 years ago, and of course labor is much higher today. At the same time he estimated the indirect saving in handling of the material charged into the open-hearth furnace (calling it only 20,000,000 tons) of $10,000,000. If we go back 17 years, this saving amounts to not less than $85,000,000. This is a big sum of money, but the estimate is far below the maximum amount which has been actually saved. The saving in labor by the use of the electromagnet in the United States per year at the rate pig iron and scrap are being handled today is not less than $1,500,000. We can very safely say that in the last ten years at least five times that amount, or the sum of $7,500,000, has been saved; or a total for both of these inventions of nearly $100,000,000,—a saving of which any inventor might well be proud. Every open-hearth plant of any size in the world today is equipped with these inventions, and they are considered as much a necessary part of the equipment as the furnace itself.

Mr. Wellman's machine for charging open-hearth furnaces with white-hot steel was his greatest contribution to steel making and has been adopted by the steel concerns of the world, earning the inventor international fame. Machinery built under his patents is being used in Great Britain, France, India, Japan, Russia, Spain, Egypt and Germany.

Mr. Wellman was a member of the American Society of Civil

Engineers, the American Institute of Mining Engineers, the British Iron and Steel Institute, the British Institution of Mechanical Engineers and the Cleveland Engineering Society, in which latter he had held the offices of vice-president and president. He was a life member of our Society, joining in 1881, and served it respectively as manager from 1885 to 1888, vice-president from 1896 to 1898, and president in 1901.

At the age of twenty-one Mr. Wellman married Julia A. Ballard at Stoneham, Mass., who died in Cleveland, July 3, 1914. He is survived by two daughters, Mrs. A. D. Hatfield, Mrs. C. W. Comstock, and three sons, W. S. Wellman, president of the Wellman Products Co., and M. C. and F. S. Wellman, of the Wellman Bronze Co.

The funeral service was held Monday afternoon, July 14, at the Euclid Avenue Congregational Church, Cleveland, and was attended by many prominent engineers, manufacturers, and business men. Robert W. Hunt and Ambrose Swasey represented the Society. Members of the Cleveland Engineering Society and delegations from the Wellman-Seaver-Morgan Co., and Wellman Bronze Co. were present.

WILLIAM P. DONOVAN

William P. Donovan, general superintendent of the gasoline department of the Gypsy Oil Co., Tulsa, Okla., died in Philadelphia on May 30, 1919. Mr. Donovan was born on January 7, 1875, in Eagle Rock, Pa., and received his early education in the home schools. His father instructed him in telegraphy and later he attended a business school at Oil City, Pa. While studying there he found time to work as telegraph operator at Smoky Station of the National Transit Co.

William P Donovan

In 1892 he entered the employ of the Crescent Pipe Line Co., where he assisted in the construction of an oil-pipe line from Oakdale to Marcus Hook, Pa. He was later promoted to the position of stationary engineer in charge of trunk-line stations on the same pipe line. When the Gulf Refining Co. was organized in 1903, Mr. Donovan became superintendent of distribution at Bayonne, N. J., having also supervision of all additions to the plant. In 1913 he was transferred to the gasoline department of the Gypsy Oil Co., an affiliated concern. Here he designed and constructed plants in Oklahoma, Texas, Louisiana and Mexico for the production of gasoline from casinghead gas. Mr. Donovan was actively interested in the Mid-Continent Section organization. He became a member of the Society in 1916.

HENRY WILLIAM HENES

Harry W. Henes, of the Acme Steel Goods Co., Chicago, died on January 19, 1919. Mr. Henes was born in January, 1887, in New York City, and was educated in the city schools. Later he entered Columbia University from which he was graduated in 1909 with the degree of M. E.

His first position was as structural-steel estimator and inspector with A. Bolter's Sons, Chicago, where he remained for about three years, when he became associated with the Dueth-Henes Corporation, manufacturing agents in the same city, as secretary and treasurer. His next connection was with the Stromberg Motor Devices Co., also in Chicago, first as assistant purchasing agent and later as sales engineer. In July 1918 he became associated with the Acme Steel Goods Co. in charge of the manufacture of nailless box-strapping tools. Mr. Henes was a member of several social clubs in Chicago He became a junior member of the Society in 1909.

GEORGE ROBERT SHEPHEARD

George R. Shepheard, chief engineer of the Viscose Co., Marcus Hook, Pa., died on May 1, 1919. Mr. Shepheard was born on October 24, 1889, in Wilmington, Del., and received his early education in the Wilmington schools, while his later training was obtained through home study and courses in the International Correspondence Schools. He was connected at various periods in his career with the following concerns: the Taylor Iron & Steel Co., High Bridge, N. J., the Edgar Allen American Manganese Steel Co., New Castle, Del., the J. Morton Poole Co., Wilmington, Del., and with the E. I. Du Pont Co., also in Wilmington. In 1913 he became associated with the Viscose Co. and in 1916 was advanced to the position of chief engineer. Mr. Shepheard became an associate-member of the Society in 1918.

JULIAN G. GUITERAS

Julian G. Guiteras, Captain, Engineers' Corps, A. E. F., France, died of pneumonia on October 12, 1918, in Base Hospital, No. 15, Chaumont, France. Captain Guiteras was born on November 14, 1889, in New York City. He was graduated from Columbia University in 1913 with the degree of M. E. For several years he was connected with the Cadillac Motor Car Co., Detroit, Mich., as draftsman. Later he was with the Hall-Scott Motor Car Co., West Berkeley, Cal. In January 1917 Captain Guiteras passed successfully his examination for a second lieutenancy in the Regular Army and upon receiving his commission was ordered to Fort Leavenworth for training. Upon the completion of his course there he was promoted to the rank of first lieutenant and assigned to Vancouver Barracks, Washington. Before sailing for France in December 1917 he received his captain's commission. In France he was an instructor in the Pioneer School of Chatillon-sur-Seine and was later ordered to bridge reconnaissance work. It was while on this work that he contracted influenza which developed into pneumonia. Captain Guiteras became a junior member of the Society in 1916.

Julian G. Guiteras

PERSONALS

In these columns are inserted items concerning members of the Society and their professional activities. Members are always interested in the doings of their fellow-members, and the Society welcomes notes from members and concerning members for insertion in this section. All communications of personal notes should be addressed to the Secretary, and items should be received by August 15 in order to appear in the September issue.

CHANGES OF POSITION

Major Hugo Diemer, Ordnance Department, U. S. A., has resigned as professor of industrial engineering at Pennsylvania State College to accept the position of superintendent of personnel with the Winchester Arms and Manufacturing Company, New Haven, Conn.

R. L. Rowley, former advisory engineer to the district plant engineer, United States Shipping Board, S. P. District, San Francisco, Cal., resigned on April 15 and is now associated with the survey and engineering department of Johnson and Higgins, San Francisco, Cal.

C. Bateman Swasey is no longer connected with the Gorham Manufacturing Company of Providence, R. I., where he was engaged as superintendent of the Allen's Avenue plant, but is now associated with the Belcher Malleable Iron Company, of Easton, Mass., in the capacity of treasurer.

R. Renton Hind has resigned as consulting engineer for the America Factors, Ltd., Honolulu, and has assumed the duties of manager of the Pampanga Sugar Mills, Del Carmen, Pampanga, P. I.

ANNOUNCEMENTS

Morris Knowles has concluded his engagement as chief engineer of the Housing Department of the Emergency Fleet Corporation, United States Shipping Board, and has returned to Pittsburgh, Pa.

J. E. Muhlfeld and V. Z. Caracristi announce the formation of Railway and Industrial Engineers, Inc., with offices in New York, with a competent staff of experts thoroughly familiar with domestic and foreign methods and practices.

Lieut.-Colonel Henry M. Byllesby, Signal Corps, U. S. A., president of H. M. Byllesby and Company, has had the English Distinguished Service Order conferred upon him.

E. L. Maher announces the formation of the Maher Engineering Company with offices in Chicago, to handle the sales and installation of Erie Engine Works high-speed engines, the Sims Company feed-water heaters, Dayton-Dowd Company centrifugal pumps, Wagener Steam Pump Company pumps and Pratt Engineering and Machine Company fertilizer and sulphuric acid machinery.

Peter M. Smith, until recently in France as a lieutenant in the Signal Corps, is again associated with the Standard Engineering Company, Ellwood City, Pa., in the capacity of chief draftsman.

H. B. Prindle has opened an office in New York, as engineer, appraiser and adjuster of railroad loss and damage claims.

George S. Barker, formerly First Lieutenant, Aircraft Armament Division, Air Service, A. E. F., has received his discharge and is now connected with the Farnsworth Company, Conshohocken, Pa., in the capacity of mechanical engineer.

Lieut Colonel Elmer K. Hiles, Engineers, A. E. F., who went over as Captain in the 15th Engineers, has just returned after nearly two years' service in France, and has joined the Pittsburgh Testing Laboratory as manager of laboratories, with headquarters in Pittsburgh.

Christian Girl, president of the Standard Parts Company, Cleveland, has been awarded the Distinguished Service Cross by the War Department in appreciation of the aid he rendered in developing the Standard Government motor truck.

H. H. Esselstyn, commissioner of public works of Detroit, Mich., has resigned, to return to the firm of Esselstyn, Murphy and Hanford, engineers and architects, Detroit. His resignation was made necessary by the increased scope of the work of the company.

Milton F. Flewelling, Jr., has been released from the U. S. Navy on inactive duty as engineering ensign, and has been detached from the U. S. S. *Chinampa*. He has accepted the position of chief draftsman for the Ashton Valve Company, Boston, Mass.

Robert W. Hunt has been made an Honorary Member of the American Society for Testing Materials.

Major Thomas H. Allen has returned from France after two years' service with the American Expeditionary Forces and will assume his practice as consulting engineer, Memphis, Tenn.

F. E. Matthews, specializing in mechanical refrigeration, engaged for the past nine months as an expert on refrigeration by the U. S. Bureau of Markets, Washington, D. C., having to do with problems dealing with food storage and distribution under war conditions, has returned to his home at Leonia, N. J., preparatory to resuming civilian engineering work in New York.

Charles L. Allen has been made president and general manager of the Norton Company, Worcester, Mass., when the company recently took over its subsidiary the Norton Grinding Company. Mr. Allen was treasurer and general manager of the company for some time. William LaCosta Neilson, Leicester, England, foreign manager, and Carl F. Dietz, general sales manager, have been made vice-presidents, newly-created offices of the new Norton organization. Charles H. Norton, for many years chief engineer of the Norton Grinding Company, has been chosen chief engineer of the grinding machine department of the Norton Company under the reorganization plan.

C. B. Lord has resigned as general superintendent of the Wagner Electric Manufacturing Company, St. Louis, Mo., and, after a period of rest, will assume the position of consulting mechanical engineer to the company.

Jos. J. Nelis, for the past year with the Engineering Section, Emergency Fleet Corporation, Philadelphia, Pa., has accepted a position with the Power Specialty Company, New York, as marine representative for Foster boilers, superheaters and air heaters.

Myer M. Shuster who has been discharged from the Naval Air Service has associated himself as production engineer with the Clip-Bar Manufacturing Co., of Philadelphia, manufacturers of the Shuster Speed Wrench.

APPOINTMENTS

Herbert S. Eades, formerly assistant mechanical engineer, American Bridge Company, Ambridge, Pa., has been appointed assistant mechanical engineer of the Pencoyd, Pa., plant of the company.

L. C. Sprague formerly district manager of sales at New York, Chicago Pneumatic Tool Company, has been appointed manager of western railroad sales, with headquarters at Chicago, Ill.

DISCUSSION AT RESEARCH SESSION

(Continued from page 671)

funds. The securing of funds, however, for doing this work was, he believed, the smallest problem and the securing of men to do the work, the greatest. He was decidedly in favor of private or semi-private research work, but not for Federal control.

Albert Kingsbury urged a careful consideration of the resolution. There were many members of the Society, he said, who were not present at the meeting, and it seemed to him rather inadvisable to take action which would construe the whole Society as against any particular policy. He therefore suggested that the report of the Chicago Committee be brought to the attention of all members of the Society through suitable means of publication. Certainly a large number of the members were interested in the matter and they ought to receive consideration. Those present constituted but a small part of the Society and they ought not therefore to commit the entire membership to any action the meeting might take. His suggestion, therefore, was that the very interesting and valuable report of the Chicago Committee be published in Mechanical Engineering and that no definite action be taken by the meeting.

Replying to Mr. Kingsbury's objections, Doctor Mees called attention to the fact that the resolution as offered spoke only of "the sense of the meeting" and the Society could do as it chose in the matter, and the action of the meeting would not be binding upon any one. The resolution was then put to final vote and passed.

DISCUSSION AT GAS POWER SESSION

(Continued from page 681)

given up the problem of getting a good sample of a wet mixture, he said, and devoted his attention to using a dry mixture instead. The statement he had made that the best performance was secured with an air temperature of 80 deg. was to be understood to have been so when the temperature of the water in the cylinders was about 200 deg., that is, under definite running conditions.

Some one had asked whether in his experiments with the hot spot any deposit of carbon had been noticed at the higher temperature and regarding this he would say that he had not run tests under those conditions for longer than thirty or forty hours without changing the hot spot in some way or other, and that therefore he had not observed any appreciable deposit at any time. He felt, however, that with the heavier oils a deposit was likely to collect after a certain time.

LIBRARY NOTES AND BOOK REVIEWS

THE BLIND. Their Condition and the Work Being Done for Them in the United States. By Harry Best. The Macmillan Co., New York, 1919. Cloth, 6 x 8 in., 780 pp., illus., tables, $4.

The particular sections of this comprehensive survey likely to interest engineers are those treating of the industrial employment of the blind and of indemnities for the loss of sight. Both topics are given full consideration. Attention is given to the theoretical aspects of industrial establishments for the blind, the organization and results of present establishments, and the possible and present employment of the blind in general occupations. The payment of indemnities through suits at law, insurance policies and workingmen's compensation acts is also described very fully.

BOILER CHEMISTRY AND FEED-WATER SUPPLIES. By J. H. Paul. Longmans, Green and Co., New York, 1919. Cloth, 6 x 9 in., 242 pp., 1 pl., tables, diag., $4.50.

The lack of any adequate discussion of the chemical reactions which occur in high-pressure boilers fed with natural waters, and of the effects of these reactions upon the steaming capacity of the boiler and upon the metal of which it is made, have led the author to prepare this volume, in which he gives the knowledge gained by long practical experience with boilers under varied circumstances and conditions. As far as possible, he has stated the facts and his conclusions in the language of everyday life.

THE CANADIAN MINING MANUAL, 1918. A Handbook of Information Concerning the Minerals and Mines of Canada. Edited by Reginald E. Hore. Mines Publishing Co., Toronto (copyright 1919). Cloth, 9 x 11 in., 352 pp., illus., pl., por., maps, tables, diag., $5.

This is the fourth edition of this handbook of Canadian minerals, metals, mining and metallurgical companies, in which the chief objects are to present concisely matters of interest to persons connected with the mining industry, and to attract attention to the possibilities of Canadian mineral resources. A preliminary survey of progress in 1918 and a summary of the official reports for 1917 are given for each province and product. There are also a number of special articles on topics of interest, a directory of mining companies and a list of the producers of various mine products.

THE ELEMENTS OF ASTRONOMY FOR SURVEYORS. By R. W. Chapman. J. B. Lippincott Co., Philadelphia, 1919. Cloth, 6 x 8 in., 247 pp., tables, 56 diag., $1.75.

The author of this small volume has attempted to provide students of surveying with an elementary exposition not only of the practical methods of observation and computation, but also of the main principles by which the formulæ are derived. The methods of observation are illustrated by fully worked out actual observations and prominent attention is given to the effects of observational and instrumental errors.

ENGINEERING DESCRIPTIVE GEOMETRY AND DRAWING. A Treatise on Line Drawing, Descriptive Geometry, and Engineering or Mechanical Drawing, for the Use of Midshipmen at the United States Naval Academy. By Frank W. Bartlett and Theodore W. Johnson. John Wiley & Sons, Inc., New York, 1919. Cloth, 6 x 9 in., 617 pp., illus., pl., tables, $5.50.

This volume consists of three independent treatises on Line Drawing, Engineering Descriptive Geometry, and Engineering Drawing. Collectively they represent the course in drawing at the United States Naval Academy and are intended to provide a complete course for students with no previous knowledge of mechanical drawing.

Part One has been written to replace Bartlett's Mechanical Drawing. Part Two which treats of the science of orthographic projection, was issued as a separate work in 1910 and has been revised to date. Part Three, the work of Professor Johnson, deals with the application of Parts One and Two to the needs of engineers, draftsmen and mechanics, for practical construction of machines of every kind. Part Three is also issued separately for those who wish a general course in mechanical drawing.

EXCAVATION. Machinery Methods and Costs, Including a Revision of "Excavating Machinery." By Allen Boyer McDaniel. First edition. McGraw-Hill Book Co., Inc., New York, 1919. Cloth, 6 x 9 in., 560 pp., 209 illus., $5.

Frequent requests for information on recent types of excavators and the newer uses of older types, have led the author of this work to prepare it to replace his "Excavating Machinery," published in 1913. The present work is divided into two sections; the first describes the construction, method and typical cost of operation of each type of excavator, the second is a comparative study of the efficient and economic use of the different types of machines in the various fields of construction work. Highway and railroad construction, reclamation, river, harbor, canal and municipal work, quarrying, tunneling and mining are considered. References to the literature are included.

IRRIGATION ENGINEERING. By Arthur Powell Davis and Herbert M. Wilson. Seventh edition, revised and enlarged. John Wiley and Sons, Inc., 1919. Cloth, 6 x 9 in., 640 pp., 249 illus., 59 tables, $4.50.

The early editions of Wilson's Manual of Irrigation Engineering were especially valuable because of the author's familiarity with large irrigation works in India and Egypt. Subsequent activity in irrigation, particularly in the United States, and developments in related lines of municipal water supply and hydroelectric construction, have presented new problems and evolved new solutions of old ones. Social and economic differences between America and Asia have also caused distinctive changes in practice. In preparing this revised edition Mr. Davis has taken the changed situation into consideration, with the result that the book is in the main rewritten and rearranged, and contains much new material.

LIQUID FUELS FOR INTERNAL-COMBUSTION ENGINES. A Practical Treatise for Engineers and Chemists. By Harold Moore. D. Van Nostrand Co., New York, 1918. Cloth, 6 x 9 in., 215 pp., 49 illus., tables, $5.

The author describes in part one of this volume the chemical differences between the various fuels: petroleum, shale oil, coal and lignite tars, wood and peat distillation products, oils and alcohols, which are used for internal-combustion engines. In part two of the book these fuels are classified according to their suitability for use in engines fitted with carburetors, vaporizers or atomizers. Part three presents methods for the examination and valuation of liquid fuels with a view to their use in these engines, the procedure in such cases being different from that used in determining their value for external combustion.

MAGNETISM AND APPLICATIONS OF MAGNETS. By John D. Ball. (School of Practical Electricity, Book 4). Electroforce Publishing Co., Milwaukee (copyright, 1919). Cloth, 7 x 10 in., 113 pp., 95 illus., tables. $1.50.

This volume which is one of a series of textbooks for technical high schools, trade schools, etc., combines a brief description of the laws and principles of magnetism and the commercial uses of magnets with a selection of laboratory experiments to illustrate the theories of magnetism and electromagnetism. Only elementary mathematics is used.

MOTOR VEHICLE ENGINEERING. Engines (for Automobiles, Trucks, and Tractors). By Ethelbert Favary. First edition. McGraw-Hill Book Co., Inc., New York, 1919. Cloth, 6 x 9 in., 345 pp., 133 illus., 39 tables, $3.

The present volume, the first of a contemplated series intended to give designers, engineers and students a concise summary of modern practice in automobile design and construction; deals with engines. Only simple mathematics is used.

ACCESSIONS TO THE LIBRARY

The following accessions to the Library of the United Engineering Society are a selection from the large number of books which have been added during the last month. In particular the Library was the recipient of a gift from Mr. Kirby Thomas of some seventy-odd books, catalogs, and pamphlets dealing in great part with mining and mining concerns.

ROTHROCK, J. T., M. D. Areas of Desolation in Pennsylvania. Gift of Pennsylvania Forestry Association.

CAST IRON IN THE LIGHT OF RECENT RESEARCH. By W. H. Hatfield. 1918. Second edition. Purchase.

CENSUS OF MANUFACTURERS. 1914. vol. 1. Gift of Bureau of the Census.

CENTRIFUGAL PUMPS AND SUCTION DREDGERS. By E. W. Sargent. Second edition 1918. Purchase.

COLLOIDAL FUELS. By Lindon W. Bates. 1919. Properties, Tests & Costs.

COLLOIDAL FUEL. Composites of Oil and Carbon. By Lindon W. Bates. 1918. Gift of Submarine Defense Association.

THE CO-OPERATIVES IN RUSSIA. A Power for the Reconstruction of Russia's Economic Life. Gift of Alexander Zelenko.

ECONOMIC PRODUCTION PLUS INDUSTRIAL DEMOCRACY. By C. E. Knoeppel. (Reprint.) Gift of author. Two copies.

ETHICS OF DEMOCRACY. By Louis F. Post. Third edition.

THE FLYING BOOK. The Aviation World Who's Who and Industrial Directory. Edited by W. L. Wade. 1918 edition. Purchase.

GLOSSARY OF ATMOSPHERIC ELECTRICITY TERMS. By W. W. Strong. Gift of author.

HEAT TRANSMISSION TABLES. By W. R. Jones. (Reprint) Gift of The Heating and Ventilating Magazine.

HISTORY OF THE METALLURGY OF IRON AND STEEL. By Sir Robt. A. Hadfield. Gift of author.

THE IMPORTANCE OF ADEQUATE DRAINAGE AND FOUNDATIONS FOR ROAD AND STREET SURFACES. By Clifford Richardson. (Reprint.) Gift of author.

AN IMPORTANT DEVELOPMENT IN THE RAILWAYS OF SPAIN. By F. Lavis. (Reprint) Gift of author.

INDUSTRIAL ELECTROMETALLURGY, including Electrolytic and Electrothermal Processes. By Eric K. Rideal. Purchase.

INDUSTRIAL RESEARCH IN AMERICA. By Raymond F. Bacon. 1916. (Reprint.) Gift of author.

INTERNAL GEAR, THE. The Fellows Gear Shaper Co. *Springfield, Vt., 1919.* Gift of the Company.

AN INTRODUCTORY TREATISE ON DYNAMICAL ASTRONOMY. By H. C. Plummer. *1918.* Purchase.

INVENTIONS AND RECONSTRUCTION. By Lawrence Langner. Reprint from *Printer's Ink.* Gift from author, March 20, 1919.

THE ISTHMIAN CANAL. By H. H. Rousseau. 1909.

JANE'S ALL THE WORLD'S AIRCRAFT. 1918. Founded by Fred T. Jane. *London.* Purchase.

LEGAL AID SOCIETY, THE. 43rd Annual Report for the year 1918. *New York, 1918.* Gift of the Society.

LOS PETROLEOS DEL PERU Y DE PENNSYLVANIA. By Ricardo A. Deustua. *Lima, 1919.* Gift of the author.

MANCHESTER STEAM USERS' ASSOCIATION, THE. Memorandum by Chief Engineer for the year 1917-18. Gift.

THE MANUFACTURE OF INTERMEDIATE PRODUCTS FOR DYES. By John Cannell Cain. *London, 1918.* Purchase.

MAPS. Purchase.
- Croquis de los rios Napo y Putumayo por el Coronel D. Pedro Portillo.
- Planta Geral da Cidade de Sao Paulo.
- Planto del rio Tambopata.
- Geologia de las inmediaciones de Morococha, por A. Raimondi. 1861.
- Plano del rio P. staza.
- Mapa de la Navegacion del alto Maranon. 1913.
- Plano del Cuzco. 1900.
- Plano del rio Amazonas Peruano. 1908.
- Region Oriental del Perú. 1906.
- Plano del rio Huallaga. 1908.
- Mapa Histórico Geográfico de los valles de Paucartambo. 1901.
- Corte Geologico por E. I. Duenas. Siguiendo el Itinerario de Casma á Chacas.
- Carta Geral do Estado de S. Paulo. 1912.
- Plano del rio Manú. 1902.
- Croquis de los Rios Alto Ucayali y Bajo Urubamba. 1904.
- Plano del rio Morona. 1908.
- Plano del rio "Ucayali". 1904.

THE MARINE STEAM TURBINE. By J. W. M. Sothern. Fifth edition, rewritten. *Glasgow, 1918.* Purchase.

MECHANICAL HANDLING OF MATERIAL AND ITS NATIONAL IMPORTANCE DURING AND AFTER THE WAR. By George F. Zimmer. *London, 1917.* Gift of the author.

THE MENACE OF PATERNALISM. By Otto H Kahn. *1918.* Gift of author.

LES MÉTAUX ET LEURS CONDITIONS D'EMPLOI DANS L'INDUSTRIE MODERNE. 1918. J. Oertlé. Purchase.

MINERAL ENTERPRISE IN CHINA. By W. F. Collins. Purchase.

MODERN BUS AND SWITCH STRUCTURES. By C. D. Gray & M. M. Samuels. (Reprint from *Electrical World.*) Gift of J. G. White, Engineering Corp.

NATURAL GAS RATE SITUATION OF THE UNITED FUEL GAS CO. IN WEST VIRGINIA, KENTUCKY AND OHIO. By Samuel S. Wyer. Gift of author.

NATIONAL RAILROAD QUESTION OF TO-DAY, THE. By Francis Lee Stuart. An address before the American Society of Civil Engineers, Feb. 5, 1919. Gift.

THE NEW SCIENCE—THE FUNDAMENTAL PHYSICS. By W. W. Strong. Gift of author.

NEW YORK IMPROVEMENT AND TUNNEL EXTENSION OF THE PENNSYLVANIA RAILROAD, THE. *Philadelphia, Pa., 1919.* Gift of Geo. F. Fowler.

PAPER FOR THE AMERICAN INSTITUTE OF MINING AND METALLURGICAL ENGINEERS. On agronomy and fertilizers. By Woolsey McA. Johnson. Gift of author.

PAPERS BY CLIFFORD RICHARDSON. (Subject of Asphalt) 1897-1913. Gift of author.

PHOENIX FOUNDRY (later Delameter Iron Works) COPY OF DEED OF SALE, 1842. Foundry stood on Vestry and High Sts., from about 1838-50. John Ericsson was consulting Engineer. *New York.* Gift of H. J. Porter in March, 1919.

A PLAN FOR RAILROAD REORGANIZATION. By Wm. G. Raymond. *1919.* Gift of author.

POWDERED COAL AS A FUEL. By C. F. Herington. *New York, 1918.* Purchase.

POWER PLANT Installation, Upkeep and Economical Operation. By T. Roland Wollaston. *Manchester, 1918.* Purchase.

PRACTICAL SHELL FORGING. By C. O. Bower. Gift of Longmans, Green & Co.

PRINCETON ENGINEERING ASSOCIATION. Year Book, 1918-1919. Gift of the Association.

PRINCIPLES OF PHARMACY. By Henry V. Arny. 2nd edit. *Philadelphia, Pa., 1918.* Gift of the author.

PROCEEDINGS OF THE PUBLIC SERVICE COMMISSION FOR THE FIRST DISTRICT, STATE OF NEW YORK. vol. XV. From July 1 to Dec. 31, 1917. Gift of the Commission.

PRODUCTION OF QUICKSILVER IN EUROPE. By Dr. Roland Sterner-Rainer. Repriut from Chem. & Metal. Engng., vol 19, nos. 10 and 11; vol. 20, nos. 1 and 2. Gift of Chem. & Metal Engng.

PUBLIC OPINION ON THE TRACTION PROBLEM. Interborough Rapid Transit Co. *1919.* Gift.

PUBLIC UTILITIES REPORTS. Annotated, 1918, E. & F. Containing Decisions of the Public Service Commissions and of State and Federal Courts. Gift of The Lawyers Coöperative Publishing Co. 2 vols.

WAARSCHIJNLIJKHEIDSREKENING BIJ AUTOMATISCHE TELEPHONIE. 1918. Den Haag. By Urssul Philip Lely. Gift of the author.

WHAT THE NATIONAL FORESTS MEAN TO THE WATER USER. By Sam'l T. Dana. U. S. Dept. of Agriculture, Forest Service. *1919.* Gift of U. S. Dept. of Agriculture.

WHEN COAL OIL JOHNNY GOES TO SEA. By E. N. Hurley. Gift of U. S. Shipping Board.

WORKMEN'S COMPENSATION LAW OF PENNSYLVANIA. Court Decisions. Edit. by H. A. Mackey. 1916-1918. *Harrisburg, Pa.* Purchase.

YOUR STREET CAR SERVICE. New York Railways Company. 1919. Gift.

THE ENGINEERING INDEX

Published Monthly by The American Society of Mechanical Engineers

The Engineering Index was Founded in 1884 by the Association of Engineering Societies; Published from 1895 to 1919 by The Engineering Magazine Company; and Acquired January 1919 by The American Society of Mechanical Engineers

THE following pages form a descriptive Index to articles on engineering and related subjects in current periodicals. In its preparation the Society's engineering staff regularly examines all of the technical journals and society publications received by the Engineering Societies Library, which form one of the greatest and most complete collections of scientific periodicals in the world, comprising upward of 1100 distinct publications in some ten languages. Cross-references are freely introduced in the Index, and in all cases where the titles of articles are not sufficiently descriptive, explanatory sentences are appended. The main abbreviations used in the items are given at the bottom of this page.

PHOTOSTATIC COPIES OF ARTICLES LISTED

THE Society is prepared to supply photostatic copies (white printing on black background) of any of the articles listed. Copies of the periodicals themselves, or clippings of articles, cannot be supplied.

Price of each print (up to 11 x 14 in. in size), 25 cents plus postage. A separate print is required for each page of the larger-size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

Those holding coupon books for clippings formerly issued by The Engineering Magazine Company may use the coupons in payment for photostatic prints. In ordering, state plainly

(1) Page number of Index on which item appears
(2) Title of article
(3) Name of periodical.

Orders should be sent to

Harrison W. Craver, *Director,*
Engineering Societies Library,
29 West 39th Street, New York City.

DIVISIONS OF THE ENGINEERING INDEX

Note.—The abbreviations used in indexing are as follows:

Academy (Acad.)

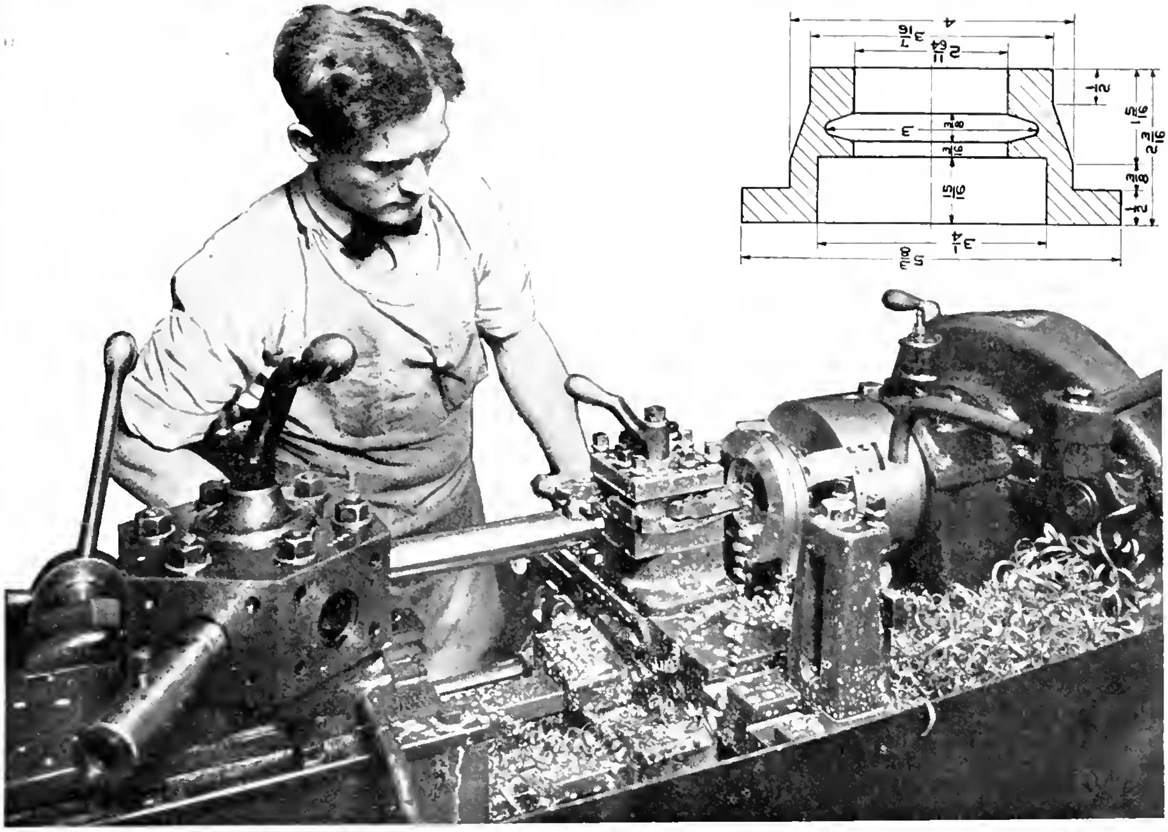
LIST OF TOPICS IN THE ENGINEERING INDEX

AUGUST, 1919



Mechanical Engineering

AIR MACHINERY

Air Conditioning

Refrigeration in Relation to Air Conditioning in War Industries, J. I. Lyle. Am. Soc. Refrig. Engrs., vol. 5, no. 5, March 1919, pp. 376-382, 4 figs. Illustrating uses of dehumidifier.

Air Valves, Compressor

Magnetic Air Valve. Iron & Coal Trades Rev., vol. 98, no. 2673, May 23, 1919, p. 702, 2 figs. For unloading automatically a motor-driven air compressor before starting and stopping driving motor. Valve is a combination of electromagnet of contactor type, a two-way valve and a small switch controlled by a dashpot.

Automatic Valves for Motor Driven Air Compressors. Elecn., vol. 82, no. 24, June 13, 1919, pp. 676-677, 2 figs. Valve patented by British Thomson-Houston Co. is said to insure that air compressor is unloaded before current is switched on to motor as well as throughout starting period.

Air Washers

Air Washer Experiences, Samuel R. Lewis and E. V. Hill. Heating & Ventilating Mag., vol. 16 no. 6, June 1919, pp. 25-31, 4 figs. Suggests scheme with two sets of sprays arranged so that they wet thoroughly entire surface of front baffles.

Air Weight and Volume Measurements

Air Weight and Volume Measurement—II, Don T. Hastings. Automotive Industries, vol. 40, no. 25, June 19, 1919, pp. 1399-1402, 1 fig. Theory of venturi meter as applied to liquids and also to gases.

Compressors

Some Recent Improvements in Air Compressor Design. Engineer, vol. 127, no. 3309, May 30, 1919, pp. 538-540, 7 figs. Rotary compressor of crescent type in which blades instead of being forced against bore of stationary casing press against interior of liner which revolves on ball bearings concentric with casing.

Flow in Pipes, Compressed Air

Flow of Compressed Air in Pipes, Johan Sarvaas. Proc. Australasian Inst. Min. Engrs., no. 31, Sept. 30, 1918, pp. 121-130, 1 fig. Tables and equation offered as serviceable in simplifying computations involved in application of Rankine's and D'Arcy's formulæ.

Pump, Marine

The Marine Air Pump as a Power Factor, Harold C. Walker. Mar. Engr. & Naval Architect, vol. 4, no. 505, June 1919, pp. 270-276, 11 figs. Also Mar. Eng., vol. 9, no. 6, June 1919, pp. 205-208, 12 figs. Discusses wet, Edwards and rotary types and their comparative efficiency. Paper read before Inst. of Marine Engrs.

Receivers

The Air Receiver, Frank Richards. Power Plant Eng., vol. 23, no. 12, June 15, 1919, pp. 554-558, 2 figs. Suggestions in regard to determining capacity and avoiding explosions.

Uses

Air Uses at Newburgh Shipyards Plant, Francis Judson Tietsort. Compressed Air Mag., vol. 24, no. 6, June 1919, pp. 9155-9160, 10 figs. Plant builds 9000-ton ships.

CORROSION

Copper and Corrosion of Steel

The Influence of Very Low Percentages of Copper in Retarding the Corrosion of Steel, D. M. Buck. Am. Soc. Testing Materials University of Penna., 22nd annual meeting, June 24, 1919 advance copy, 14 pp., 10 figs. Concluded from tests that very low amounts of copper in steel materially lower corrosion rate.

Iron Alloys

The Relative Corrosion of Cast Iron, Wrought Iron and Steel Pipe in House Drainage Systems, F. N. Speller. Plumbers' Trade Jl., vol. 66, no. 12, June 15, 1919, pp. 752 and 754-755, 2 figs. Discussion of paper by Wm. Paul Gerhard presented at Am. Soc. Mech. Engrs. meeting, Dec. 1918.

Rustproofing

Rustproofing Cast-iron Parts. Machy. (N. Y.), vol. 25, no. 10, June 1919, pp. 919-921, 5 figs. Process is based on fact that film of magnetic iron oxide is formed on surface of iron castings when heated to temperature of 700 deg. cent. or over in oxidizing atmosphere.

Metallic Coatings for Rust-Proofing Iron and Steel—III. Bibliography. Henry S. Rawdon, M. A. Grossman and A. N. Finn. Chem. & Metallurgical Eng., vol. 20, no. 11, June 1, 1919, pp. 591-592. Divided into following sections: Nature of corrosion, microstructure, methods of coating, black finishes and similar coatings, "pickling" and its effects, and methods of testing coatings.

Calorizing Process for Protection of Metal from Oxidation at High Temperatures, W. E. Ruder. Jl. Am. Steel Treaters Soc., vol. 1, no. 5, Feb. 1919, pp. 160-170, 14 figs. Notes on various processes and account of tests on carbonizing and annealing boxes.

Tests

Corrosion Tests (Essai de corrosion), H. Le Chatelier and B. Bogitch. Revue de Métallurgie, vol. 16, no. 2, Mar-Apr. 1919, pp. 129-139, 16 figs. Chemical heterogeneity of reheated or slowly cooled steels is considered as being due entirely to oxygen.

FORGING

Marine Forgings

Keeps Pace With War Requirements. Iron Trade Rev., vol. 64, no. 25, June 19, 1919, pp. 1616-1617, 3 figs. Describes Camden Forge Co's. plant which formerly manufactured railroad forgings and is now turning out marine forgings.

Shells

Forgings and Inspecting Ordnance Shells, Stanley A. Richardson. Sibley Jl. Eng., vol. 33, no. 4, May 1919, pp. 40-43 & 45. Particular reference is made to successive steps in inspecting, gaging, checking and testing.

Stamps

Drop-Stamping, Drop-Forgings, Etc.—III, Joseph Horner. Mech. World, vol. 65, no. 1691, May 30, 1919, p. 259, 6 figs. Illustrating stamps where top tools or dies are not necessary. (Continuation of serial.)

FOUNDRIES

Aluminum Castings

Casting Aluminum (Das Giessen von Aluminium), H. Stoesser. Metall, no. 5, Mar. 10, 1919, pp. 61-62. Instructions as to kind of sand to be used, construction of molds, and type of crucible.

Brass Castings, Porosity of

Some Principles Involved in Melting Metals —VI, Charles Vickers. Brass World, vol. 15, no. 6, June 1919, pp. 175-176. Cases of porosity in brass castings due to shrinkage of individual crystals made possible by their having grown abnormally large. (To be continued.)

Brass Foundry

Modern Works of The Mueller Co., Sarnia, Ontario. Can. Foundryman, vol. 10, no. 6, June 1919, pp. 139-141, 6 figs. Production of brass castings.

Cupolas

A Cupola With Novel and Interesting Features, J. F. Mullan. Can. Foundryman, vol. 10, no. 6, June 1919, p. 152, 1 fig. Wind jacket is placed inside of shell instead of outside.

Electric Steel

Electric Steel Castings made in Chicago Shop. Foundry, vol 47, no. 324, June 1, 1919, pp. 352-355, 8 figs. Battery of three electric furnaces in use at foundry of Electric Steel Co. at Chicago. Two furnaces are of Schneider type and one of Pittsburgh type.

Engine Cylinders

Patterns and Moulds for Engine Cylinder Castings—II, Joseph Horner. Foundry Trade Jl., vol. 21, no. 208, Apr. 1919, pp. 215-223, 22 figs. Discusses various practices in process of molding. (Continued.)

England

Progress in Metal Casting in England, W. R. Barcay. Metal Indus., vol. 17, no. 6, June 1919, pp. 266-268, 6 figs. Comparison of technique of casting process as carried out by steel and metal casters.

Feeder-Head Method

A "Feeder-head" Method in Non-ferrous Ingot Casting, W. R. Barclay. Metal Industry, vol. 14, no. 18, May 2, 1919, pp. 361-364, 6 figs. Draws comparison between general methods adopted in crucible-steel ingot casting and those followed in crucible non-ferrous ingot casting.

Jarring Machine

The Manufacture of Semi-steel Shells, E. A. Suverkrop. Am. Mach., vol. 50, no. 22, May 29, 1919, pp. 1041-1043, 9 figs. Shockless jarring machine adapted for molding shells.

Molding

Steel Castings for Our First Line of Defense, Walter S. Doxsey. Foundry, vol. 47, no. 9, June 15, 1919, pp. 367-372, 14 figs. Additions to foundry of naval gun factory with reference to molding methods and layout of shop.

Sand

Production of Albany Molding Sand. Iron Age, vol. 103, no. 23, June 5, 1919, pp. 1499-1501, 4 figs. Analysis of origin and composition. States that standard specifications based on grain size are difficult to draw up.

Ship Parts

Making Castings Used in Ship Construction —III, IV, Ben Shaw and James Edgar. Foundry, vol. 47, no. 8 & 9, June 1 & 15, 1919, pp. 336-339 & 388-392, 27 figs. Building rudder yoke pattern. Suggestions in regard to exercising care to obviate subsequent foundry difficulties. Methods of molding and casting rudder yokes as pursued in English steel foundries.

Waste

Modern Methods Applied to the Foundry—II, W. R. Dean. Metal Industry, vol. 14, no. 17, Apr. 25, 1919, pp. 349-350, 5 figs. Recommends classification of wastes and their causes and suggests methods for establishing a system of classification.

FUELS AND FIRING

Ash, Fusibility of

Fusibility of Ash from Pennsylvania Coals, W. A. Selvig and A. C. Fieldner. Coal Age, vol. 15, no. 24, June 12, 1919, pp. 1086-1089. Table giving results obtained. Samples tested are said to have been gathered in accordance with method adopted by Bureau of Mines.

Coal

Utilization of Fuel (Zur Frage der zukünftigen Brennstoff-Ausnutzung), De Grahl. Annalen für Gewerbe und Bauwesen, vol. 84, no. 1, Jan. 1, 1919, pp. 1-8, 7 figs. Characteristics of gasification of bituminous coal at high and low temperatures.

The Gasification of Coal and the Rational Utilization of Fuels (Kohlenvergasung und rationelle Ausnutzung der Brennstoffe), M. Dolch. Montanistische Rundschau, vol. 11, nos. 3, 4, 5 & 6, Feb. 1 & 16, Mar. 1 & 16, 1919, pp. 61-64, 93-97, 125-129, and 162-166. From the economic point of view. Importance and future of by-products. (To be continued.)

Coal, Pulverized

Use of Pulverized California Coal, Chas. H. Delaney, Nat. Engr., vol. 23, no. 6, June 1919, pp. 278-279. Discussion of its economical employment as substitute for fuel oil from standpoint of initial cost and comparative operating expense. Paper read before Nat. Elec. Light Assn.

Pulverized Coal Systems in America, Leonard C. Harvey. Elecn., vol. 82, no. 22, May 30, 1919, pp. 616-619, 3 figs. Also in Iron & Coal Trades Rev., vol. 98, no. 2673, May 23, 1919, pp. 704-705. Analysis of costs and efficiency secured leads writer to conclude that advantages of burning coal in pulverized form have been definitely proved and that heat values of coal can be utilized to a far higher degree by this means than by any other process.

The Use of Pulverized Coal, L. C. Harvey. Eng. & Indus. Management, vol. 1, no. 14, May 15, 1919, pp. 423-426, 3 figs. Quigley semi-automatic bin-filling system. It is claimed that by this system coal dust can be readily conveyed to ships in harbor or at sea.

Coal Selection

The Economical Use of Coal, T. J. Nelson. Domestic Eng. & Estate Engr., vol. 39, no. 5, May 1919, pp. 62-65. Price delivered at works, suitability to furnaces installed, calorific value and amount of ash suggested as factors governing choice of coal to be used when it has to be brought some distance by rail to works.

Coal Waste

Utilization of Coal Waste (L'Utilization des déchets de Houille), L'Echo des Mines et de la Métallurgie, vol. 47, no. 2626, May 18, 1919, pp. 298-300. A committee of the Société de l'Industrie minérale report that their experiments have demonstrated that coal having 40 per cent ash and 23 per cent volatile matter yields tar in greater quantity and of better quality than the kind generally obtained in gas works.

SERVICE

Riley Stoker Service *is more* than a cost transaction which places a given amount of equipment in your plant leaving it at your mercy ever after.

Riley Stoker Service *begins at the source;* takes your needs into consideration and *stays with you* as long as your equipment is in operation.

Before installation our engineers carefully investigate the conditions for each installation and design the equipment exactly suited to those needs. Should special developments be desired then our designing department is at your disposal.

After installation our field engineers periodically follow up each plant whether it needs it or not. They are always ready to advise, direct and remedy.

Unusual as it may seem, our sales engineers are not so much interested in volume of sales—as satisfactory operation.

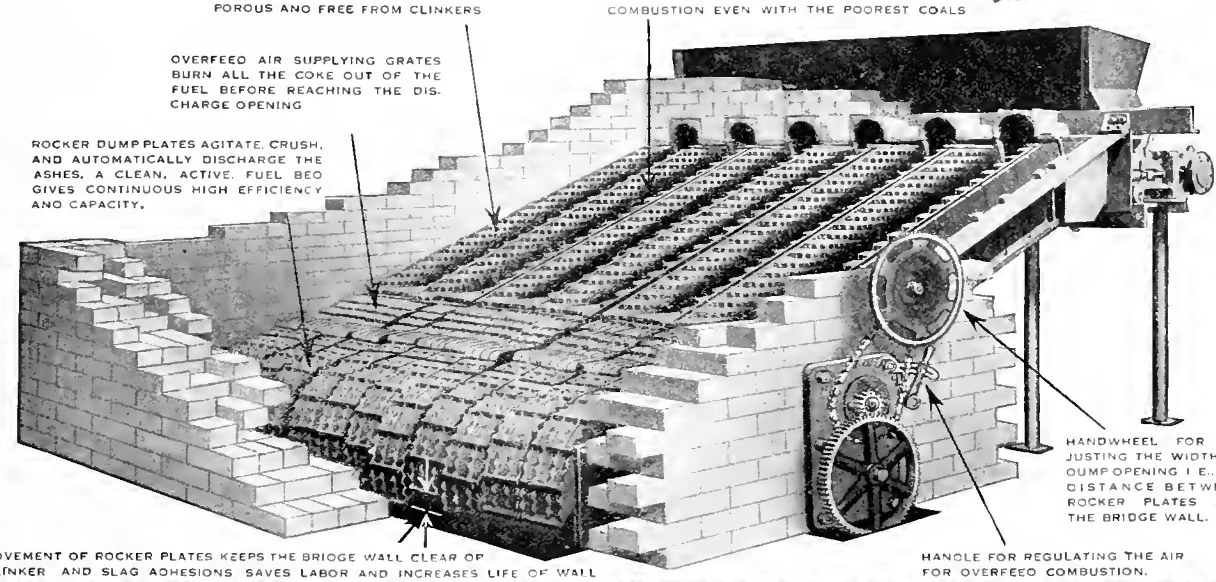
This policy protects present, as well as future customers. It is the customers' assurance that if they need advice on the operation of present equipment, or on the selection of new equipment, they can count on our being ready to serve them.

Bear in mind that the spirit of the service rendered by Riley Stoker engineers is constructive, not arbitrary nor forced, but designed as a co-operative influence to achieve the best possible results not only before but after purchase.

Catalog A-8 sent on request.

SANFORD RILEY STOKER COMPANY, WORCESTER, MASS.

British Licensees: Erith's Engineering Co., Ltd., London - French Licensees: Erith Leroy & Cie., Paris



TRADE MARK Rx REGISTERED

RILEY UNDERFEED STOKERS

TRADE MARK Rx REGISTERED

Waste Due to Excessive Ash or Non-Combustible in Coal, W. A. Shoudy. Stevens Indicator, vol. 36, no. 1, Jan. 1919, pp. 11-17, 4 figs. Reduction in heating value due to presence of ash schematically illustrated. Report prepared for Eng. Committee of National Research Council.

Utilizing Mine Waste and Inferior Fuels, F. Blache. Colliery Guardian, vol. 117, no. 3047, May 23, 1919, pp. 1225-1226, 2 figs. Plant of Société de Montcambert comprises set of two gas producers of cylindrical section and about 10 ft. in diameter, with automatic charging and distributing mechanism to spread fuel evenly over entire surface.

Colloidal Fuel

Possibilities of Colloidal Fuel. Power Plant Eng., vol. 23, no. 13, July 1, 1919, pp. 583-585, 2 figs. Methods of preparation and results of boiler tests.

Colloidal Fuel—A Chemist's Dream Come True, Robert G. Skerrett. Rudder, vol. 35, no. 6, June 1919, pp. 271-275, 12 figs. Examples of application of mixtures composed of powdered coal, liquid fuel and "fixateur," and account of instances of uses of this fuel for naval operations.

Fuel Conservation

Electricity vs. Gas in Regard to Coal Conservation, Hugh M. Goody. Elecn., vol. 82, no. 21, May 23, 1919, pp. 595-596. Examines figures on which Sir Dugald Clerk based his conclusion that "There is no case for electricity for the production and distribution of heat energy; there is a case in strong competition with gas for illumination; and as against the average reciprocating steam engine of the country, the advent of the steam turbine of high efficiency shows a distinct advantage."

Gasoline

Motor Gasoline Properties, Laboratory Methods of Testing, and Practical Specifications, E. W. Dean. Dept. Interior, Bur. Mines, Technical paper 214, Petroleum Technology 52, Feb. 1919, 33 pp., 2 figs. Based on properties which are considered desirable by Bureau. These are absence of too large a percentage of highly volatile products or of heavy or nonvolatile constituents, freedom from substances that attack metal either before or after combustion or which leave residue that collects in motor.

Hand Firing

Standard Practice of Hand Firing, Robert June. Elec. Rev., vol. 74, no. 23, June 7, 1919, pp. 937-939, 3 figs. Of the two methods of hand firing—spreading method and coking method—writer believes that modern practice leans more and more to spreading method, because, he says, of its higher efficiency, higher CO_2, lower flue gas and more uniform steam generation.

Oil

Oil Gains Importance as Ship Fuel, V. G. Iden. Mar. Rev., vol. 49, no. 7, July 1919, pp. 321-324, 5 figs. What the Government did to standardize oil burning on merchant ships.

Peat

Peat, Oil and Gas Fuel, B. J. Forrest. Jl. Eng. Inst. Can., vol. 2, no. 6, June 1919, pp. 439-445, 5 figs. Writer's opinion is that industrialization of peat could be most efficiently brought about by gasifying in gas producers, because, he says, this procedure would render feasible the recovery of several valuable by-products.

The Production of Peat Fuel, Ernest V. Moore. Jl. Eng. Inst. Can., vol. 2, no. 6, June 1919, pp. 435-438. General properties, mode of occurrence and present utilization of peat found in vicinity of Montreal.

The Future of Peat as a Fuel—II, J. B. C. Kershaw. Coal Age, vol. 15, no. 21, May 22, 1919, pp. 946-950, 7 figs. Gasification and powdering are believed to be routes of improvement along which future progress in peat utilization may be expected.

Stokers

Fuel-Burning Equipment of Modern Power Stations, Joseph G. Worker. Power House, vol. 12, no. 7, May 20, 1919, pp. 187-191, 15 figs. Data relative to installations where inclined multiple retort has been completed. With performance curves of a six-retort stoker and a 558-hp. boiler.

Economical Fuel Burning Equipment, J. G. Worker. Blast Furnace & Steel Plant, vol. 7, no. 6, June 1919, pp. 227-280, 8 figs. Steam-cylinder mechanism for operation of forward and rear dumping grates of multiple-retort inclined underfeed stokers.

Surface Combustion

Surface Combustion (La Combustion de surface), M. Desmarets. Revue Générale des Sciences, vol 30, no. 9, May 13, 1919, pp. 274-278, 5 figs. Historical account of researches and industrial applications. Geological characteristics of deposits and notes on manner of instituting their research.

Tar Oil

Tar Oil as Fuel (Teeröl als Brennstoff). Zeitschrift des Bayerischen Revisions-Vereins, vol. 23, nos. 1 & 3, Jan. 15 and Feb. 15, 1919, pp. 1-2 and 17-19. Evaporation tests.

FURNACES

Grates

Minimum Distance between Grates and Lower Part of Arch Tubes, L. M. Stewart. Ry. Jl., vol. 25, no. 6, June 1919, pp. 19-22. As depending upon grade of coal being used and whether or not firemen have been taught to shake grates and keep fire worked down. Paper before Master Boiler Makers' Assn.

Heat Treating

Heating Furnaces and Annealing Furnaces—VI, W. Trinks. Blast Furnace & Steel Plant, vol. 7, no. 6, June 1919, pp. 294-297, 7 figs. Discusses means by which fuel consumption per unit weight of steel (heated or annealed) can be reduced.

GAGES

Gage Making

Examples of Gauge Making, A. G. Robson. Engineer, vol. 127, no. 3308, May 23, 1919, pp. 499-501, 33 figs. Examples chosen are of straightforward kind. Modus operandi of gage-maker, rather than extent of calculations required, is indicated.

Hoke Gages

Government Steel Plant, S. W. Stratton. Blast Furnace & Steel Plant, vol. 7, no. 6, June 1919, pp. 268-270, 4 figs. Research work done by Bur. of Standards in connection with manufacture of Hoke precision gages.

Plate Gages

Master and Working Plate Gauges, R. Worthy. Machy. (Lond.), vol. 14, no. 346, May 15, 1919, pp. 185-193, 40 figs. Laying out, testing, hardening and lapping.

GAS ENGINEERING

Distribution Pressures

Distribution Pressures, S. C. Singer. Gas Rec., vol. 15, no. 10, May 28, 1919, pp. 343-344, 1 fig. Experience of rapid growing city. Schematic diagram or distribution system is presented.

Joints, Pipe

Wherein a Joint in the Outlet Pipe from a 2,000,000 Cu. Ft. Holder 18 Ft. from Tank Bottom and a Diver Cleans Out Bottom with Holder Full of Gas, A. H. Harris. Am. Gas Eng. Jl., vol. 110, no. 25, June 21, 1919, pp. 525-536, 7 figs. Leaky joint let in enough ground water to interfere with working of seal and cleaning was necessitated by naphthalene accumulation that tilted lifts to the extent of distorting side-guide rubber shafts.

Natural Gas

Displacing Natural Gas with Manufactured Gas, Kay C. Krick. Gas Age, vol. 43, no. 11, June 2, 1919, pp. 583-585. Anticipates failure of natural gas supply. Paper read before Natural Gas Assn.

Manufactured Gas to Supplement Natural Gas, Kay C. Krick. Gas Age, vol. 43, no. 11, June 2, 1919, pp. 567-568. Advises greater conservation through increased price. Address delivered before Natural Gas Assn.

Retorts

Steaming Retorts, H. J. Toogood. Gas Rec., vol. 15, no. 11, June 11, 1919, pp. 377-378, 2 figs. Proposes connecting retorts in different stages of carbonization to work in series.

Results from Vertical Retorts at Meriden. Gas Age, vol. 43, no. 12, June 16, 1919, pp. 633-634, 4 figs. In regard to labor required.

Standards

Gas Standards. Gas Jl., vol. 146, no. 2920, Apr. 29, 1919, pp. 238-240. Also Gas Age, vol. 43, no. 11, June 2, 1919, pp. 569-572, and Gas World, vol. 70, no. 1814, Apr. 26, 1919, pp. 312-314. Recommendations of Fuel Research Board as to "most suitable composition and quality of gas and the minimum pressure at which it should be generally supplied, having regard to the desirability of economy in the use of coal, the adequate recovery of by-products, and the purposes for which gas is now used."

Water Gas

Water-Gas Plant at Colchester, W. W. Townsend. Gas Jl., vol. 146, no. 2921, May 6, 1919, pp. 296-299 and (discussion) pp. 299-300, 4 figs. Reconstruction of plant effected by converting two sets, each of capacity of 300,000 cu. ft. per day, to capacity of 500,000 cu. ft. each. Paper read before Eastern Counties Gas Managers' Assn.

HANDLING OF MATERIALS

Ash

See Coal and Ash.

Coal and Ash

New Coal Handling Plants for Philadelphia Water Works, Harrison R. Cady. Eng. News-Rec., vol. 82, no. 23, June 5, 1919, pp. 1095-1097, 3 figs. General and detailed design for three systems supplying total of 16 boilers with total boiler capacity of 7400 hp.

Handling Coal and Ashes at the Pusey & Jones Power Plant, Henry J. Edsall. Power Plant Eng., vol. 23, no. 11, June 1, 1919, pp. 483-487, 5 figs. Details of system employing bucket conveyor.

Coal and Ore

The Coal Shortage and Handling by Gravity, George Fred. Zimmer. Eng. & Indus. Management, vol. 1, no. 13, May 8, 1919, pp. 413-416, 3 figs. Gravity-driven band conveyor for loading ore erected by Fraser & Chalmers, Ltd., of Erith and London, and similar installations for handling of concrete, etc.

Handling Plant of the Galveston (Tex.) Coal Co., Chas. Fowler, Jr. Coal Trade Jl., vol. 50, no. 25, June 18, 1919, pp. 737-739, 4 figs. Equipped with Lidgerwood installation, coal being handled by one Hayward 3-cu. yd. clamshell bucket on one transfer and a 2-cu. yd. bucket on the other.

Electricity as Applied to Loading and Unloading Coal and Ore Boats, R. H. McLain. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 352-365, 26 figs. Notably at coal-loading pier of Baltimore & Ohio R. R. Co. at Curtis Bay and at ore docks of Duluth and Iron Range R. R., Two Harbors, Minn. Paper read before Soc. Terminal Engrs.

Conveyors

Economical Handling of Materials. Can. Manufacturer, vol. 39, no. 6, June 1919, pp. 27-28, 6 figs. Uses of portable scoop conveyor.

Belt Conveyors for Ore Handling. Chem. Eng. & Min. Rev., vol. 11, no. 124, January 5, 1919, pp. 95-98, 4 figs. Plan showing general layout of bins and conveyors in connection with handling of charge for blast furnace.

Grain

Mechanical Grain-Loading Devices on the Roumanian Danube, George Frederick Zimmer. Eng. & Indus. Management, vol. 1, no. 15, May 22, 1919, pp. 477-480, 5 figs. Include means for unloading of railway trucks by mechanical shovels. (To be continued.)

Live Stock

Proper Loading and Handling of Live Stock, W. J. Embree. Off. Proc. St. Louis Ry. Club, vol. 23, no. 12, Apr. 11, 1919, pp. 289-296. Disease and injury received by smaller cattle from larger cattle in same car are considered as chief losses from shipment of cattle.

Ore

See Coal and Ore.

Truck Loading

Truck Loading Devices Reduce Lost Time, J. Edward Schipper. Automotive Industries, vol. 40, no. 24, June 12, 1919, pp. 1346-1350, 12 figs. Examples of installation of apparatus for handling loose or bulky material.

HEAT-TREATING

Duralumin

Heat Treatment of Duralumin, P. D. Merica, R. G. Waltenberg, and H. Scott. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 150, June 1919, pp. 913-949, 26 figs. Experiments carried out in laboratory of Bureau of Standards and partly in cooperation with Aluminum Co. of America. Temperature of quenching, it is concluded, should not be above that of the aluminum eutectic which is usually about 520 deg. cent., but should be as near to this as possible without danger of eutectic melting.

Forging, Large

Temperature Observations on Heating, Quenching and Drawing of a Large Steel Forging, O. A. Knight and F. F. Hansen. Chem. & Metallurgical Eng., vol. 20, no. 11, June 1, 1919, pp. 590-591, 3 figs. Experiments conducted at heat-treating plant of Watertown Arsenal.

Furnace

New Features in Heat Treating Plant. Iron Age, vol. 103, no. 23, June 5, 1919, pp. 1493-1495, 4 figs. Car type furnace with chamber 30 ft. by 6 ft. for annealing large parts of automobile frames in plant of Parish & Bingham Co., Cleveland.

See also Furnaces, Heat-Treating.

Quenching

Influence of Quenching Temperature on Structural and Mechanical Characteristics of Steel (Influenza della temperatura di ricottura sulle caratteristiche strutturale e meccaniche degli acciai), Pietro Forcella. Rivista Tecnica della Ferrovie Italiane, vol. 15, no. 4, Apr. 15, 1919, pp. 144-150, 23 figs. on three supplement plates. Researches undertaken under auspices of Instituto Sperimentalo della Ferrovie.

Quenching Cracks in Carbon Steels, Kôtarô Honda and Tozajirô Matsusata. Science Reports of the Tôhoku Imperial University, vol. 8, no. 1, Apr. 1919, pp. 31-42, 8 figs. Experimental. It is concluded that cause of retarded cracks in quenched carbon steel is neither thermal stress caused by unequal cooling of specimens nor impulsive stress due to differential expansion of adjacent parts caused by rapid cooling through a range of the A_1 point, but it is the persistent stress due to differential expansion of adjacent parts caused by different degree of martensitization.

Steel

Heat Treatment of Steel, C. O. Bannister. Jl. & Trans. Soc. of Engrs., vol. 10, no. 4, 1919, pp. 163-179, and (discussion) pp. 179-184, 9 figs. Suggestions in regard to various accepted practices based on examination of specimens and results obtained in tests.

Heat Treatment of Alloy Steel, K. A. Juthe. Am. Mach., vol. 50, no. 233, June 5, 1919, pp. 1077-1079. Suggestions based on writer's experimental research.

Theory

Some Notes on Heat Treatment Theory, W. F. Edwards. Jl. Am. Steel Treaters Soc., vol. 1, no. 5, Feb. 1919, pp. 141-159, 12 figs. Considerations intended to show that phase law is of little value in explaining phenomena of heat treatment of steel. It is believed that rates of heating, cooling or changes of pressure, etc., are of much more significance than usual interpretations of equation diagram.

HEATING AND VENTILATION

Engine Houses

The Heating and Ventilation of Engine Houses, T. W. Reynolds. Ry. Age, vol. 66, no. 21, May 23, 1919, pp. 1245-1248, 3 figs. Discusses use of underground concrete air ducts as applied to a 30-stall engine house, having concrete floors, brick walls and timber frame and roof.

Mechanics' Liens

Heating and Ventilating Plants and Mechanics' Liens, Arthur L. H. Street. Heat. & Vent. Mag., vol. 16, no. 5, May 1919, pp. 19-23. Review of Appellate Court decision defining circumstances under which security is available. (To be continued.)

Radiation, Computation

Standard Rules for Computing Required Radiation. Metal Worker, vol. 91, no. 25, June 20, 1919, pp. 790-792. Also Heat. & Vent. Mag., vol. 16, nos. 5 & 6, May & June 1919, pp. 23-26 & 36-39. Proposed regulations for figuring steam and hot-water radiation in heating systems. Reprint from Bul. Nat. District Heating Assn.

Radiators, Flow of Water to

Care of Heating and Ventilating Equipment, Harold L. Alt. Power, vol. 49, no. 24, June 17, 1919, pp. 932-933. Discusses various methods of controlling flow of water to radiators.

Steam Heat

Preventable Economies in the Use of Steam Heat, Lloyd Howell. Heating & Ventilating Mag., vol. 16, no. 6, June 1919, pp. 22-24. Damages caused by incorrect installation are pointed out.

Workshops

The Heating and Ventilation of Workshops. Engineer, vol. 127, no. 3308, May 23, 1919, pp. 504-506, 8 figs. System in plant having reinforced-concrete roof.

HOISTING AND CONVEYING

Cranes

Heavy Shop Framing for 250-ton Traveling Crane. Eng. News-Rec., vol. 82, no. 24, June 12, 1919, pp. 1172-1173, 3 figs. Columns carry double-deck runways with T-section girders for overhead crane handling locomotives.

Electrically Operated Travelling Cranes. Elec. Rev., vol. 25, no. 5, May 1919, pp. 316-321, 17 figs. The different types of modern traveling cranes are defined with idea of bringing out inherent features of each. Included also is a short history of evolution of electric traveling cranes from hand-operated jib cranes.

Freight Elevators

Freight Elevators, Charles H. Weeks. Safety Eng., vol. 37, no. 6, June 1919, pp. 307-313, 4 figs. Statistics of accidents and their causes as collected by Dept. of Labor of New Jersey; also instructions for elevator operators.

Hoists

Progress in the Electrification of Mine Hoists, R. S. Sage. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 332-341, 17 figs. Brief historical survey and description of modern hoist equipments used at various mines.

Electrically Operated Hoists. Elec. Rec., vol. 25, no. 6, June 1919, pp. 386-394, 21 figs. Constructional and operating features of hoists as used in different industries.

A New Electrically-Driven Winding Equipment. Elecn., vol. 82, no. 20, May 16, 1919, pp. 570-571, 2 figs. Designed for 720-ft. shaft. It has cylindro-conical drum 11 ft. to 15 ft. in diameter. (To be concluded.)

Steam and Electric Mine Hoists, Frank C. Perkins. Nat. Engr., vol. 23, no. 6, June 1919, pp. 264-266, 2 figs. Types used at various plants, especially direct-acting steam type used at Michigan Copper Co. and electric hoist of 1,850 hp. employed by North Butte Mining Co.

Overspeed Prevention

A New Electrically-Driven Winding Equipment. Elecn., vol. 82, no. 21, May 23, 1919, pp. 593-594, 3 figs. Description of overspeed preventer device. (Concluded.)

Overwinding

Safety in Winding Operations, J. A. Vaughan. South African Jl. Sci., vol. 15, no. 4, Nov.-Dec., 1918, pp. 207-216. Remarks are confined to question of safe handling of winding engine and particularly statistical records of accidents due to overwinding.

Winches

Applications of the Williams-Janney Variable Speed Gear. Engineering, vol. 107, no. 2787, May 30, 1919, pp. 693-695, 10 figs. Advantages claimed for application of this gear to winches. (Continuation of serial.)

HYDRAULIC MACHINERY

Pipe Lines

The 25-Mile Gravity Pipe Line of Everett, Washington, W. A. Scott. Eng. World, vol. 14, no. 12, June 15, 1919, pp. 41-46, 14 figs. Pipe line has length of 133,000 ft., and between intake and reservoir there is net head of 252 ft.

Economical Size of Pipe for Given Loss of Head, E. W. Rettger. Cornell Civil Engr., vol. 27, no. 4, Apr. 1919, pp. 83-92, 2 figs. Formula derived on Adams principle which writer states as follows: That type is most economically designed for which interest and depreciation on first cost of pipe, plus annual value of power loss due to friction in pipe, is a minimum.

Sluices

Automatic Sluices (Les barrages automatiques), E. Freté. Génie Civil, vol. 74, no. 22, May 31, 1919, pp. 429-433, 21 figs. Diagramatic representation of various types.

Surges

Graphical Records of Surge Pressures in Pipe Lines, Ralph Bennett. Eng. News-Rec., vol. 82, no. 22, May 29, 1919, pp. 1048-1050, 9 figs. Tests made for determining effect of varying air-chamber conditions and changing choke-gate area.

The Surge-Chamber Problem, E. Parry. New Zealand Jl. of Sci. & Technology, vol. 2, no. 2, Mar. 1919, pp. 78-86, 2 figs. Derivation of formula when limited in its application to chamber with parallel sides.

Williams-Janney Speed Gear

The Williams-Janney Variable Speed Gear. Engineering, vol. 107, no. 2786, May 23, 1919, pp. 662-666, 14 figs. Device consists of two similar hydraulic units each of which comprises a group of cylinders, mounted upon a shaft revolving in a fixed casing, one unit fulfilling function of pump and supplying fluid to other which acts as motor. (To be continued.)

INTERNAL-COMBUSTION ENGINES

Carburation

The Carburation of Low-Grade Distillates, H. O. Eneign. Pac. Mar. Rev., vol. 16, no. 6, June 1919, pp. 121-124, 7 figs. Carburetor development in California and having as distinguishing factors, according to writer, that maximum air velocity equals in all cases that of engine manifold, and that fuel is delivered to center of metering chamber at point where velocity is practically zero.

Diesel Engines

Internal Combustion Engines for Submarines. Constructed by Messrs. Franco Togi, Engineers, Legnano, Milan. Engineering, vol. 107, no. 2788, June 6, 1919, pp. 732-734, 8 figs. Results of tests with two types: Two-cycle engine with six working cylinders and a four-cycle type with eight working cylinders.

An All-American Diesel. Pac. Mar. Rev., vol. 16, no. 6, June 1919, pp. 111-114, 7 figs. Winton 8-cylinder engine.

The Diesel Engine, Charles Day. Automobile Engr., vol. 9, no. 127, June 1919, pp. 169-171, 6 figs. Features and limitations. Paper presented to Instn. Automobile Engrs.

Vickers High-Powered Submarine "Diesel" Engines. Motorship, vol. 4, no. 6, June 1919, pp. 35-36, 3 figs. Eight- and twelve-cylinder, 1,800 b.hp. motors of "solid injection" type. Cast-steel cylinder heads said to be used successfully.

Slow-Combustion Engines and Their Uses, J. Drosne. Motorship, vol. 4, no. 6, June 1919, pp. 43-45, 1 fig. Together with details of Schneider crosshead type merchant-marine and naval Diesel engines.

An American Diesel Engine. Motorship, vol. 4, no. 6, June 1919, pp. 30-32, 7 figs. Six-cylinder Winton marine engine. Outstanding features are enclosed crankcase, trunk-pistons, and crankshaft bolted up to its bearings.

Dorman Engines

The Dorman Engines. Automobile Engr., vol. 9, no. 127, June 1919, pp. 191-193, 9 figs. Post-war program includes six engines, ranging in power from 10 hp. to 40 hp. Power curves for these types are given.

Flame Propagation

A New Method of Determining Rate of Flame Propagation, P. M. Heldt. Automotive Industries, vol. 40, no. 24, June 12, 1919, pp. 1256-1258, 3 figs. Based on principle that when flame surrounds pair of spark terminals electrical pressure required to break down resistance of gap is reduced.

Fuels and Performance

Engine Performance, H. L. Horning. Jl. Soc. Automotive Engrs., vol. 4, no. 5, May 1919, pp. 344-345 and (discussion) pp. 345-348, 1 fig. Diagram of power available in a 60-hp. engine with different fuels.

The Future of Internal-Combustion Engines (De toekomst der verbrandingsmotoren), P. Meyer. De Ingenieur, vol. 34, no. 17, Apr. 26, 1919, pp. 313-318. Discusses future from technical as well as from economic point of view. Special attention given to the fuel question.

The Fuel Question of Internal-Combustion Engines (Zur Betriebsstoffrage der Verbrennungsmotoren), Hugo Brach. Oelmotor, vol. 8, no. 3, Mar. 1919, pp. 65-69. Special consideration is given to the automobile motor. Tables.

Gas Engines

Installation and Working of Large Horizontal Gas-Engines, H. Pilling. Gas Jl., vol. 146, no. 2919, Apr. 22, 1919, pp. 191-193. Possibility of utilizing 20,700 cu. ft. gas per min. for blowing and power purposes in a supposed blast-furnace installation producing 2,000 tons of iron per week. Paper read before Cleveland Instn. Engrs.

Gile Engine

A New Combustion Engine. Mar. Eng. & Can. Merchant Service Guild Rev., vol. 9, no. 5, May 1919, pp. 177-178, 4 figs. Gile engine. Fuel is mixed in cylinder by forcing charge of compression around subpiston head through series of small restricted passages to combustion chamber against cylinder head.

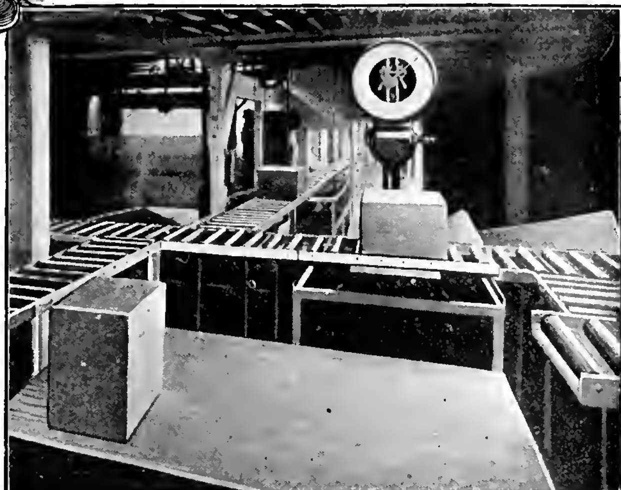
High-Speed Engines

High-Speed High-Efficiency Engines, D. McCall White. Jl. Soc. Automotive Engrs., vol. 4, no. 5, May 1919, pp. 327-334, 18 figs. Fundamentals of high-speed engines, survey of various types manufactured in United States, and uses which have been given to these engines, particularly during the war.

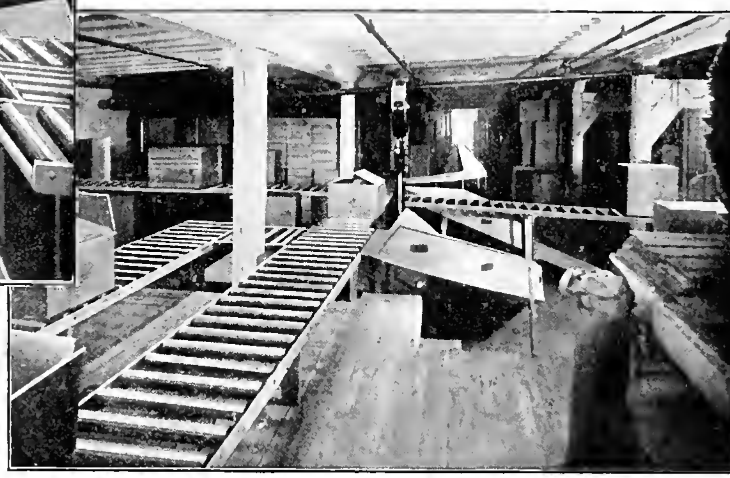
Hot-Surface Oil Engines

Hot Surface Oil Engines for Industrial Purposes, A. H. Goldingham. Jl. Soc. Automotive Engrs., vol. 4, no. 6, June 1919, pp. 482-485, 1 fig. Engines of horizontal or vertical design arranged for direct connection or by belting to electrical or pumping and other machinery are discussed from viewpoints of reliability, first cost, and economy.

Lamson Conveyors



The picture below shows the general arrangement of top floor. The "booster" from first floor delivers cases to the two roller conveyors in the foreground. Notice that the boxes pass to scales and to chutes and distributing conveyors in the background, without lifting by human hands.



The picture above shows a "close-up" of the conveying section at the weighing scales. Cases are weighed automatically without leaving conveyor. Notice the chute at the right. This is one of the two that lead to storage and to shipping-platforms below, where cars are loaded in one-sixth the time it took before the Lamson System was installed.

Right Packing and Shipping Methods Quicken Production

IN the plant of the John Hoberg Company, Green Bay, Wis., rolls of tissue paper are cut, wrapped and packed on the first floor. Originally, the cartons and cases were sealed or nailed on this same floor.

But the volume of work outgrew the space available. There was a jam of carrying, trucking and toting, which slowed up the packers, and delayed the cutting, wrapping, storing and shipping departments in their work.

Lamson Conveyors cleared up the packing floor by removing the pasting and nailing to the top floor. Now, cartons and cases, the moment they are packed, are automatically conveyed to the top floor where all pasting and nailing is quickly done while moving along the conveyor. The cartons and cases then gravitate to storage and shipping—from the time they are packed they are not lifted by human hands.

Lamson Conveyors are increasing production and lowering the unit cost of production in hundreds of factories through similar rearrangements of work and departments, and more efficient operation.

Is part of your plant delayed by the congestion of materials or products, while another part, easily reached by conveyors, is comparatively free? Are the employees in your plant wasting valuable time because of confusion, congestion and delay in transit of materials? Are your raw materials, parts in process, finished goods and packing cases being conveyed from machine to machine, department to department, and out to storage and shipping at that steady, even flow that insures the highest efficiency in production and contentment of workmen?

Think these things over, then ask our engineering department to report just how Lamson Conveyors can become automatic organizers of your production. There is no obligation.

Write for book on Conveying, illustrating the versatility of the Lamson System for carrying all kinds of things.

LAMSON SERVICE

Kessler Super-Charge Engine

The Kessler Super-Charge Engine Developed for Automobile Purposes. Automotive Industries, vol. 40, no. 24, June 12, 1919, pp. 1289-1293 and 1308, 9 figs. Uses four-stroke cycle with ramming charge of excess air; time compression crankcase employed.

Marine Engines

Automotive Applications of Marine Engines in the War, George F. Crouch. Jl. Soc. Automotive Engrs., vol. 4, no. 5, May 1919, pp. 349-357, 20 figs. partly on supp. plate. Particularly of 220-hp. Internal-combustion engine used on United States 110-ft. submarine chaser. Reference is made to British M L submarine chasers.

Motorcycle Engines

Two-Stroke Engines for Motorcycles, E. Tilston. Automotive Industries, vol. 40, no. 24, June 12, 1919, pp. 1304-1305, 2 figs., also Automobile Engr., vol. 9, no. 127, June 1919, pp. 185-187, 4 figs. Model with distinct type exhaust valve designed by writer. Paper presented to Instn. Automobile Engrs.

Still Engine

A New Prime Mover of High Efficiency and British Origin, Frank E. D. Acland. Jl. Roy. Soc. Arts, vol. 67, no 3472, June 6, 1919, pp. 463-475 and (discussion) pp. 475-482, 6 figs.; also Engineer, vol. 127, no. 3309, May 30, 1919, pp. 540-541, 2 figs.; Automotive Industries, vol. 40, no. 25, June 19, 1919, pp. 1404-1405, 1 fig.; Elec. Rev., vol. 84, no. 2165, May 23, 1919, pp. 643-646, 4 figs.; Shipbuilding & Shipping Rec., vol. 13, no. 22, May 29, 1919, pp. 697-698, 2 figs., and Eng. & Indus. Management, vol. 1, no. 18, June 12, 1919, pp. 567-573, 6 figs. Engine is said to be capable of using any form of liquid or gaseous fuel and to make use of recoverable heat which passes through surfaces of combustion cylinder as well as of exhaust gases. Combines features of steam and gas engine.

Thermal Efficiencies

Recent Developments in the Internal Combustion Field, A. L. Taylor. Utah Soc. Engrs., vol. 5, no. 3, Mar. 1919, pp. 54-61. Thermal efficiency of various types.

Valves

New Valve Operating System. Autocar, vol. 42, no. 1231, May 24, 1919, pp. 814-815, 4 figs. Rotary reciprocating valve engine with single-sleeve valve in each cylinder which both rotates and reciprocates, dual motion being obtained through action of gears and cams respectively.

Valves, Air-Flow Through

Study of Air Resistance and Air Flow. H. Levy. Automotive Industries, vol. 40, no. 24, June 12, 1919, pp. 1260-1264, 10 figs. Laws of air resistance determined for various air speeds; applications to aircraft and automobile problems.

LUBRICATION

Bureau of Standards

Lubricating Oil Program of the Bureau of Standards. Automotive Industries, vol. 40, no. 23, June 5, 1919, pp. 1230-1232. Outline of problems which bureau proposes to solve by experimental research work.

Experiments

Notes on Lubrication. S. Skinner. Proc. Phys. Soc., Lond., vol. 31, part III, Apr. 15, 1919, pp. 94-100, 2 figs. Experiments on pressure of air in neighborhood of a flywheel running in contact with a flat, long board are presented as exhibiting properties of a compressible lubricant.

MACHINE ELEMENTS AND DESIGN

Ball Bearings

Ball Bearings, H. D. McGuire. U. S Naval Inst., Proc., vol. 45, no. 196, June 1919, pp. 973-986, 16 figs. Advantages claimed for them.

Ball Bearings' Application in Industry. Raw Material, vol. 1, no. 4, June 1919, pp. 222-226, 14 figs. Application to two machine shop tools. (Continued.)

Cams

Cam Design and Construction—V, Franklin de R. Furman. Am. Mach., vol. 50, no. 24, June 12, 1919, pp. 1123-1126, 5 figs. Deals with swinging follower arms, with both roller and sliding contact and method of finding length of shoe of sliding arm.

Cam Profiles, A. Johnson. Automobile Engr., vol. 9, no. 127, June 1919, pp. 166-169, 12 figs. Technical. Types used to operate valves of internal-combustion engines.

Gears

Horse-Power Chart for Spur and Bevel Gears. Machy. (Lond.) vol. 14, no. 347, May 22, 1919, p. 232, 1 fig. Plotted from Lewis and Barth formulæ.

Angles for Spiral Bevels. Machy. (Lond.), vol. 14, no. 349, June 5, 1919, pp. 282-283. Tables giving increment angles for spiral bevel pinions.

Radio-Thrust Bearings

Load Characteristics of Radio-Thrust Bearing, F. W. Gurney. Am. Mach., vol. 50, no. 26, June 26, 1919, pp. 1233-1236, 4 figs. Description of chart for finding capacity of ball bearings of radio-thrust type.

Springs

Tables for Calculating Helical Springs, J. H. Sullivan. Machy. (N. Y.), vol. 25, no. 10, June 1919, pp. 961-964. Showing maximum loads in pounds and corresponding compressions in inches in helical round bar springs.

MACHINE SHOP

Chucks

Collet Chucks—IV, Fred Horner. Mech. World, vol. 65, no. 1690, May 23, 1919, p. 243, 3 figs. Advantages of hinged collet construction. (To be continued.)

College Machine Shop

Machine Work at the Ohio State University, W. A. Knight. Eng. Education, vol. 9, no. 10, June 1919, pp. 446-460, 9 figs. Electrical and mechanical engineering students required to take 6 hr. per week in a school year. Of this time 5 hr. per week are spent in shop and 1 hr. in classroom for lectures and recitations. Aim is to bring student in contact with such features in shop production as organization, interchangeable parts, work limits, inspection, standard time and progress reports.

Finishing Operations

Finishing Operations on Liberty Motor Cylinders, H. A. Carhart. Am. Mach., vol. 50, no. 25, June 19, 1919, pp. 1197-1201, 11 figs. Various operations involved are taken separately and reference is made to special fixtures used.

Jigs and Tools

Jigs, Tools and Special Machines, with their Relation to the Production of Standardized Parts, Herbert C. Armitage. Jl. Instn. Mech. Engrs., no. 4, May 1919, pp. 213-253 and (discussion) pp. 253-320, 18 figs., also Can. Machy., vol. 21, nos. 22 and 23, May 29 and June 5, 1919, pp. 542-544, and 576-580, 17 figs., and Model Engr. & Elecn., vol. 40, no. 943, May 22, 1919, pp. 393-399, 11 figs. Advantages and disadvantages of use of jigs and special tools in repetition work are discussed from viewpoint of relationship between output and cost of components and study of possible scheme for securing maximum efficiency from standardization of machines and methods.

Templets, Jigs and Fixtures—XXIV, Joseph Horner. Engineering, vol. 107, no. 2785, May 16, 1919, pp. 622-624. Limitations imposed on jig and fixture work by dimensions, shapes or numbers required. (Concluded.)

Metal Finishing

Progress in Metal Finishing, P. S. Brown. Metal Indus., vol. 17, no. 6, June 1919, pp. 274-276, 3 figs. Operations as practiced at Corona Typewriter Co., Groton, N. Y.

Milling

Planer Milling Practice in Automobile Plants, Edward K. Hammond. Machy. (N. Y.), vol. 25, no. 10, June 1919, pp. 965-971, 7 figs. Milling operations on crankcases. (First of two articles.)

Methods of Milling and Boring Yoke and Cap, F. Scriber. Can. Machy., vol. 21, no. 25, June 19, 1919, pp. 630-632, 9 figs. Illustrating jigs employed in various operations.

Shafting

Shaft Alignment and Its Importance, J. Y. Dahlstrand. Power, vol. 49, no. 23, June 10, 1919, pp. 882-886, 6 figs. Reasons are presented as to why two or more members of a unit mounted on the same bedplate lose their alignment. Uneven strain on the anchor bolts, incorrect foundation, improper and insecure doweling and wearing are causes for misalignment.

Tinsmithing

What a Tinsmith Can Do in a Machine Shop, Peter F. O'Shea. Am. Mach., vol. 50, no. 23, June 5, 1919, pp. 1067-1076, 21 figs. Example of homemade time and labor savers at tinsmith shop of New England plant.

MACHINERY, METAL-WORKING

Chucks

The Design of Concentric Chucks, A. Clegg. Machy. (Lond.), vol. 14, no. 349, June 5, 1919, pp. 277-281, 11 figs. Concerned with power, truth and durability and strength.

Some Interesting Features of the Massey-Harris Brantford Plant, J. H. Moore. Can. Machy., vol. 21, no. 21, May 22, 1919, pp. 509-511, 8 figs. Among jigs and fixtures described, a quick-action chuck and automatic milling machine are considered as distinctive features of shops.

Counterboring and Reaming

Automatic Machines, H. E. Thomas. Page's Eng. Weekly, vol. 34, no. 769, June 7, 1919, pp. 309-310, 3 figs. Tools recommended for counterboring and reaming. (Concluded.) Paper read before Manchester Assn. Engrs.

Milling Machines

The No. 4 Cincinnati Vertical High-Power Milling Machine. Am. Mach., vol. 50, no. 26, June 26, 1919, pp. 1229-1232, 7 figs. Intended for extremely heavy work and patterned after No. 5.

Designs Novel Continuous Miller. Iron Trade Rev., vol. 64, no. 21, May 22, 1919, pp. 1559-1560, 3 figs. Work is carried on a rotary platen which is set at 15-deg. angle to facilitate loading and unloading.

"Ohio" Tilted Rotary Milling Machine. Machy. (N. Y.), vol. 25, no. 10, June 1919, pp. 979-982, 5 figs. Provision is made for employing either continuous rotary method of milling or for applying an indexing principle of operation by which successive pieces of work are brought opposite cutter.

A New System of Thread Milling. Machy. (Lond.), vol. 14, no. 348, May 29, 1919, pp. 271-272, 4 figs. Headstock carries chuck in which work is held and has hollow spindle for accommodating rods that require their ends screwed.

Continuous Rotary Milling. Machy. (Lond.), vol. 14, no. 348, May 29, 1919, pp. 245-252, 14 figs. Davis & Thompson, Kearney & Trecker, and Becker Milling Machine Co. milling machines. Article deals chiefly with design of fixtures, methods of operation and statement of rates of production which are obtained in handling various classes of work.

MACHINERY, SPECIAL

Balancing Machines

Balancing Machines, F. G. Hechler. Jl. Am. Soc. Naval Engrs., vol. 31, no. 2, May 1919, pp. 405-419, 6 figs., partly on supp. plates. Carwen dynamic balancing machine, made by Carlson Wenstrom Co., and combined static and dynamic balancing machine, built by Vibration Specialty Co. examined in reference to requirements writer believes should be fulfilled by ideal balancing machine.

Capstan Lathe Tools

Capstan Lathe Tools—III, E. W. Field and A. E. Simpson. Machy. (Lond.), vol. 14, no. 347, May 22, 1919, pp. 227-231, 11 figs. Recessing tool-holders, centering and facing tools; floating reamers.

Cooling Towers

Natural Draught Cooling Towers, Harold Nielsen, Engineer, vol. 127, no. 3309, May 30, 1919, pp. 526-527, 1 fig. Making transverse free section as large as possible in order, writer contends, to give air proper time to get saturated with vapor. He offers modifications in Rankine's formula to make it apply in determining force of draft for natural-draft water-cooling towers.

Crushers and Pulverizers

Power Requirements of Rock-Crushing Plants, Mark H. Reasoner. Min. & Sci. Press, vol. 118, no. 24, June 14, 1919, pp. 819-820. Table showing approximate power requirements of various types of crushers and pulverizers.

Evaporators

Modern Commercial Evaporators, W. L. Badger, Mich. Technic, vol. 32, no. 2, May 1919, pp. 77-88, 14 figs. Comparison between horizontal and vertical types. (To be continued.)

Industrial Vacuum Evaporators—VIII, Frank Coxon. Mech. World, vol. 65, no. 1693, June 13, 1919, p. 282, 5 figs. Test figures on use of evaporators.

Piercing and Shearing Tool

An Automatically Indexed Piercing and Shearing Tool, L. L. Dodds. Am. Mach., vol. 50, no. 24, June 12, 1919, pp. 1133-1135, 4 figs. Laminated copper contact brush made up of twelve strips of leaves, all of which are of equal length, but riveted together so as to give each end of brush a beveled appearance.

Pile Drivers

"Daza" Electric Pile-Driver (Machina eléctrica, sistema Daza, para hinca de pilotes), J. Eugenio Ribera Revista de Obras Públicas, vol. 67, no. 2271, Apr. 3, 1919, pp. 157-160, 5 figs. Comparison with "Lacour" machine. Writer

For the economical operation of Modern Machinery just the right combination of positive oiling, durability, and power saving is found in Hyatt Roller Bearings.

prefers "Taza," which he says is designed specially for driving reinforced-concrete piles, but can be also used for driving piles of other materials.

Typewriters

The Principles of Typewriter Mechanism, Nathan Sharpe. Model Engr. & Elecn., vol. 40, nos. 940 and 941, May 1 and 8, 1919, pp. 327, 330-332 and 354-360, 16 figs. Diagram showing various actions and details of mechanism. Several American types are considered.

MATERIALS OF CONSTRUCTION AND TESTING OF MATERIALS

Binders

Viscosity and Sticking Strength of Binders, Allen Abrams. Textile World Jl., vol. 55, no. 26, June 28, 1919, pp. 41-45, 6 figs. Stated on basis of experiments that usually full sticking strength of textile binders is obtained only by heating to at least 90 deg. cent.

Brass

Notes on the Influence of Certain Variables Associated with the Anneal of Cold-Worked Alpha Brass, Arthur Phillips and George C. Gerner. Chem. & Metallurgical Eng., vol. 20, no. 12, June 15, 1919, pp. 622-628, 16 figs. Engine tests on annealed samples. Concluded that while grain size before final reduction has some influence on mechanical properties to anneal brass, magnitude of effect is small, especially in metal annealed at high temperatures.

Structural Characteristics of Rolled Sheet Brass, H. A. Eatick, Metal Industry, vol. 14, no. 19-20, May 9-16, 1919, pp. 381-383 and 402-404, 8 figs. Study of cumulative hardening effect of cold work by examination of characteristic curves of various alloys. Study of equilibrium diagrams. (Concluded.)

Bronze

Use of Bronze for Valve Snap Rings and Piston Surfaces, and Bull Rings in Large Cylinders, C. E. Fuller. Ry. Age, Daily Edition, June 26, 1919, pp. 1791-1793, 2 figs. Experiments performed and results obtained by Union Pacific.

See also Copper and Bronze, Copper Aluminum Alloys.

Copper-Aluminum Alloys

Physical Properties of Copper Aluminum Alloys, A. H. Robinson and S. C. Zylstra. Mich. Technic, vol. 32, no. 2, May 1919, pp. 134-140, 9 figs. Tests performed on copper-aluminum-iron and copper-aluminum alloys established, it is reported, that the former is the stronger of the two at ordinary temperatures but has only a slight advantage at higher temperatures; also that the iron alloy is more free from blow-holes and slag-inclusions than the straight alloy.

Copper and Bronze

Copper and Bronze—a Technological Study Regarding the Effects of Heat Treatment with Special Reference to the Duration of the Tensile Test (Kupfer und Bronze—eine technologische Studie über die Wirkung des Reckens und Glühens unter besonderer Berücksichtigung der Zerreissversuchsdauer), Willy Müller. Forschungsarbeiten auf dem Gebiete des Ingenieurwesens, no. 211, 1918, pp. 3-47, 16 figs. General remarks regarding the behaviour of metals when breaking. Metals tested were copper, manganese bronze and tin bronze.

Elasticity

Note on the Elasticity of Metals as Affected by Temperature, A. Mallock. Proc. Roy. Soc. Series A, vol. 95, no. A671, Apr. 1, 1919, pp. 429-437, 6 figs. It is reported that the ratio of Young's modulus were measured for 15 methods between temperatures of liquid air and 100 deg. cent.

Hemp

Sisal and the Plaint for Extracting the Fiber, South African Eng., vol. 30, no. 1, Jan 31, 1919, pp. 3-4 and p. 8, 4 figs. Size of hemp obtained from leaves of agava as cordage fiber.

Machine Construction, Materials for

Materials of Machine Construction, G. H. Kendall. Machy., (N. Y.), vol. 25, no. 10, June 1919, pp. 944-947. Properties and uses of principal materials.

Steel

Influence of Rolling and of Initial Thickness of Ingot on Quality of Steel (Influence du corroyage et de la grosseur du lingot initial sur la qualité d'une pièce en acier), André Pouilloux. Bulletin et comptes rendus de la Société de l'Industrie Minérale, vol. 15, no. 5, 1919, pp. 311-337, 9 figs. Based on experiments conducted at Firminy Steel Works. Forming an article from the smallest possible ingot is advocated principally because larger ingots are said to be necessarily of inferior quality.

Gear Steels, J. Heber Parker. Automotive Industries, vol. 40, no. 23, June 5, 1919, pp. 1220-1221. Classifications of gears according to application, materials and treatment. Methods employed in carbonizing and heat treatment. Paper read before Am. Gear Mfrs. Assn.

The Mechanical Properties of Steel, W. H. Hatfield. Engineering, vol. 107, no. 2785, May 16, 1919, pp. 634-636 & 638, 14 figs. Evidence substantiating occurrence of steels possessing true brittleness. (Continuation of serial.) Paper read before Instn. Mech. Engrs.

Steel, High Speed

The Properties of High Speed Steel, G. J. Horvitz. Iron Age, vol. 103, No. 26, June 26, 1919, pp. 1711-1714. 13 figs. Its metallography and heat-treatment; crucible and electric process in its production; effect of uranium; theory of hardening. Paper presented at New York chapter of Am. Steel Treaters' Soc.

Toughness

Static, Dynamic, and Notch Toughness, Samuel L. Hoyt. Iron & Steel of Can., vol. 2, no. 5, June 1919, pp. 126-131, 10 figs. A high degree of notch toughness to insure against failure is recommended because, it is said, that even a hasty examination of such machines as locomotives, automobiles, stationary gas engines, steam engines, etc., reveals an amazingly large number of notches.

MEASUREMENTS AND MEASURING APPARATUS

Abrasion Meters

The Abrasion Meter, Raymond Francis Yates. Sci. Am. Supp., vol. 87, no. 2267, June 14, 1919, pp. 372-373, 7 figs. Device for determining cutting efficiency of abrasive wheels.

Air Flow

The Determination of the Efficiency of the Turbo-Alternator, S. F. Barcay. Jl. Instn. Elec. Engrs., vol. 57, no. 281, Apr. 1919, pp. 293-304 and (discussion) pp. 305-314, 14 figs. Shows that actual losses on load can be deduced conveniently and accurately from measurements of cooling air flowing through alternator. It is further shown, however, that although such methods are sound in principle, misleading results may be obtained unless certain precautions are taken in applying them.

See also Air Machinery.

Flatness

Flatness Tests at Bureau of Standards, R. L. Rankin. Am. Mach., vol. 50, no. 26, June 26, 1919, pp. 1218-1220, 3 figs. Optical method based on principle of light interference.

Hardness

Methods of Testing for Hardness, Dean Harvey. Elec. Jl., vol. 16, no. 6, June 1919, pp. 264-266, 2 figs. Advantages and limitations of various test methods presented with suggestions for selecting test for given application.

Heat Penetration

Studies on Canning. An Apparatus for Measuring the Rate of Heat Penetration. W. T. Bovie and J. Bronfenbrenner. Jl. of Indus. & Eng. Chemistry, vol. 11, no. 6, June 1919, pp. 568-570, 5 figs. Apparatus consists of constant thermo-junction which is maintained at temperature of 0 deg. cent. and is located just outside of can.

Manometer

An Optical Lever Manometer, J. E. Shrader and H. M. Ryder. Physical Rev., vol. 13, no. 5, May 1919, pp. 321-327, 6 figs. Type devised for measuring vapor pressures in range between that which can be measured by Knudsen gage (0.001 mm) and ordinary mercury manometer.

Notched-Bar Impact Test

The Single Blow Notched Bar Impact Test as Used in the American Industry, E. H. Dix, Jr. Am. Soc. for Testing Materials, Univ. of Pa., annual meeting, June 24-27, 1919, 36 pp., 12 figs. Research conducted in effort to standardize tests. It was concluded that striking distance for Olsen and Izod machines should be made 0.866 in., and span of Charpy machine, 40 mm. (1.575 in.); no broad method of converting results of one machine from terms of another was found possible.

Pendulum Meters

Theory of the Aron Meter; A Note on the Effect of Impulsive Forces on Pendulums, H. G. Rowledge. Elecn., vol. 82, no. 22, May 30, 1919, pp. 622-624. Concludes that such errors as may arise by using a pendulum to measure an irregular attraction are compensatory, and that in a large number of periods the compensation, by the law of averages, tends to become exact, so that the time integral of the attraction is correctly registered by the oscillations of the pendulum.

Pitch, Apparatus to Determine Breaking Point of

Apparatus for Determination of Breaking Point of Pitches, H. E. Lloyd and P. P. Sharples. Am. Soc. for Testing Materials, Univ. of Pa, annual meeting, June 24-27, 1919, 8 pp., 3 figs. Metal hinge on which pitch cast in mold is placed, is bent while submerged in cold water at constant rate until pitch is fractured. Temperature of water is then raised and process repeated until no fracture occurs.

Prony Brakes

Construction and Dimensions of Prony Brakes (Ueber die Abmessungen und die Bauart von Bremszäumen), W. Wilke. Oelmotor, vol. 8, no. 3, Mar. 1919, pp. 57-65, 9 figs. Calculation of dimensions. Equations and curves. (To be continued.)

Pyrometer

Practical Fundamentals of a Pyrometer, W. A. Gatward. Jl. Am. Steel Treaters Soc., vol. 1, no. 5, Feb 1919, pp. 172-178, 3 figs. Suggests protecting couple from contamination from furnace gases or fumes and advises that most satisfactory leads are those made from same alloys as couple.

Refractometer

Refractometers. Nature, vol. 103, no. 2582, Apr. 24, 1919, pp. 145-147, 4 figs. Instrument as construed by firm of Zeiss and other types, such as the Pulfrich and the Bellingham & Stanley refractometers.

Spectrophotometer

A New Sector Spectrophotometer, Samuel Judd Lewis. Jl. Chem. Soc., vols. 115 & 116, no. 678, Apr. 1919, pp. 312-319, 2 figs. Apparatus designed with object of combining accuracy and refinement in resulting spectra and also to be able to use instrument alternately with photometer and for other purposes.

Steam Meters

Reduced Model of Steam Meter (Présentation d'un modèle réduit du compteur de vapeur), H. Parenty. Comptes rendus des Séances de l'Académie des Sciences, vol. 168, no. 17, Apr. 28, 1919, pp. 835-837, 2 figs. Further observations on the apparatus described in Comptes Rendus, vol. 168, 1919, p. 492.

Tile, Drain

An Investigation of Tests of Iowa Shale Drain Tile, W. J. Schlick. Off. Pub. Iowa State College of Agriculture, vol. 16, no. 43, Mar. 27, 1919, bul 49, 71 pp. 18 figs. Object was to determine best method for making actual accelerated freezing, thawing and absorption tests upon drain tile.

MECHANICS

Beams, Theory of Bending

The Stresses in Braced Structures with Rigid Joints, John Case. Flight, vol. 11, no. 22, May 29, 1919, pp. 704-706, 7 figs. Extends theory of bending of beam under combined action of lateral distributed load and longitudinal thrust to treatment, as complete unit, of braced structures with stiff joints.

New Method of Calculating Stresses in Continuous Beams (Nouvelle méthode de calcul et propriétés diverses des poutres à travées solidaires), P. Sonier. Génie Civil, vol. 74, no. 16, Apr. 19, 1919, pp. 312-315, 8 figs. Suggested modifications in graphical method.

Lines of Influence of a Continuous Girder on Three Supports (Die Einflusslinien des kontinuierlichen Tragers auf drei Stutzen), Ernst Laube. Schweizerische Bauzeitung, vol. 73, no. 20, May 17, 1919, pp. 225-227, 10 figs. Simple method for determining the lines of influence of continuous girders on three supports at different spans.

Joints, Pinned

An Investigation Into the Strength of Pinned Joints, V. C. Davies. Machy. (Lond.), vol. 14, no. 346, May 15, 1919, pp. 194-195, 4 figs. Results of tests on plain shafts.

Shafts, Whirling

The Whirling of an Eccentrically Loaded Overhung Shaft, S. Lees. Lond., Edinburgh, and Dublin Phil. Mag., vol. 37, no. 221, May 1919, pp. 515-523, 3 figs. Derivation of expression of kinetic energy and potential energy of system and subsequent application of Lagrange's equations.

The Whirling of an Airscrew Shaft, J. Morris. Flight, vol. 11, no. 21, May 22, 1919, p.

679, 1 fig. Technical determination of whirling speed in cases of uniform shaft and conically tapered shaft.

MECHANICAL PROCESSES

Adding Machine

A Mechanical Mathematician. Ellsworth Sheldon. Am. Mach., vol. 50, no. 25, June 19, 1919, pp. 1185-1188, 13 figs. Construction and assembling of Monroe machine. Second article.

Bearings, Roller

Making the Timken Roller Bearing, Edward K. Hammond. Machy. (N. Y.), vol. 25, no. 10, June 1919, pp. 953-956, 20 figs. Methods of heat-treating, machining and inspecting. Second article.

Clocks

Clock Escapements. Nature, vol. 103, no. 2582, Apr. 24, 1919, pp. 155-168, 3 figs. Description of various types and manner of overcoming sources of error.

Drill Chucks

Manufacturing a Drill Chuck, Fred R. Daniels. Machy. (N. Y.), vol. 25, no. 10, June 1919, pp. 948-952, 11 figs. "Etco" drill chuck manufactured by Eastern Tube & Tool Co. Main features are said to be that it may be operated without use of wrench and that it is self-tightening.

Engine Cylinders

Modern Methods of Making Motor Cylinders, Fred H. Colvin. Am. Mach., vol. 50, no. 23, June 5, 1919, pp. 1099-1103, 15 figs. Cylinder department of Locomobile Co where, it is said, handling has been reduced to a minimum.

Engine, Hispano-Suiza

The Hispano-Suiza Airplane Engine—I, H. O. C. Isenberg. Am. Mach., vol. 50, no. 26, June 26, 1919, pp 1213-1217, 16 figs. Process in manufacture followed at New Brunswick plant, Wright-Martin Aircraft Corp., especially in regard to securing accuracy.

Engines, Marine

Efficiency in Marine Engine Production, G. N. Somerville. Pac. Mar. Rev., vol. 16, no. 6, June 1919, pp. 83-87, 6 figs. Illustrating practice of various Pacific Coast shops.

Building Marine Engines on a Quantity Basis, F. B. Jacobs. Mar. Rev., vol. 49, no. 7, July 1919, pp. 338-343, 7 figs. Manufacturing operations on lighter units such as valve gear, bearings, air pump, crosshead, etc. (Continuation of serial.)

Files

Some Points in the Manufacture of Files—II, Geo. Taylor. Machy, (Lond.), vol. 14, no. 348, May 29, 1919, pp. 273-276, 14 figs., also Iron Age, vol. 103, no. 25, June 19, 1919, pp. 1631-1636, 9 figs. How to deal with four defects in grinding which are said to exercise a deletrious influence in cutting process. These are: (1) Surface of blank ground slightly concave, (2) slightly convex, (3) wavy appearance giving series of depressions, (4) surface covered with scratches due to course gritstone.

Gold Leaf

The Manufacture of Gold Leaf and Metal Foil, W. Theobald. Metal Industry, vol. 14, nos. 16 & 17, Apr. 18 & 25, 1919, pp. 321-324 and 341-346, 15 figs. Historical account of beating industry, based on series of articles appearing in Annalen für Gewerbe and Bauwesen.

Rolling-Mill Practice

Alloy Steels for Helmets and Armor, John A. Coyle. Chem. & Metallurgical Eng., vol. 20, no. 12, June 15, 1919, pp. 618-620, 1 fig. Details of electric furnace and rolling-mill practice.

Rolling of Beams Having Profiles Made Up of Three Elements Converging in a Point (Sur le calibrage des profils à trois branches convergent en un même point). Norbert Metz. Revue de Métallurgie, vol. 16, no. 2, Mar.-Apr. 1919, pp. 89-127, 38 figs. Analysis of methods given by various writers in France and Germany and exposition of method devolved by writer, in which he endeavors to simplify the determination of elongation coefficients.

Roofing Products

Manufacturing Brantford Roofing Products, J. H. Moore. Can. Machy., vol. 21, no. 22, May 29, 1919, pp. 537-541, 6 figs Plant, buildings and yard cover area of seven acres. Concern conducts its own forge shop, toolroom and steam-fitting department.

Spheres

Automatic Machines, H. E. Thomas. Page's Eng. Weekly, vol. 34, no. 768, May 31, 1919, pp. 297-298, 6 figs. Method for producing a sphere. (Continuation of serial.)

Springs

Spring Making on a Quantity Basis, F. B. Jacobs. Iron Trade Rev., vol. 64, no. 21, May 22, 1919, pp. 1343-1348, 13 figs. Methods of Raymond Mfg. Co., Ltd., Corry, Pa., in manufacture of various classes of springs.

Westinghouse Marine System

Building the Westinghouse Marine System. Edward K. Hammond. Machy. (N. Y.), vol. 25, no. 10, June 1919, pp. 929-937, 28 figs. At Westinghouse plant in South Philadelphia, Pa. Second article.

Wrenches

Making an Automobile Wrench in Two Operations, Hugo F. Pusen. Am. Mach., vol. 50, no. 24, June 12, 1919, pp. 1147-1148, 3 figs. Valuable feature in follow dies of this nature is system of sliding stops for guidance of stock until regular latch stop comes into action

MOTOR-CAR ENGINEERING

Brakes

Building the Westinghouse Marine System, C. Baker. Jl. Soc. Automotive Engrs., vol. 4, no. 6, June 1919, pp. 508-511, 2 figs. By means of brake-rod gage which consists of several interchangeable rods of various lengths, graduated every inch and operating through a dial gage that indicates lengthening or shortening of rods when placed by attachments in position of brake rods themselves.

Carburetors

The Godward Carburetter. Autocar, vol. 42, no. 1231, May 24, 1919, p. 787, 3 figs. Designed, it is said, to provide easy starting, flexibility, and economical running.

Car Performance

Research of Car Performance, P. W. Steelsmith. Mich. Technic, vol. 32, no. 2, May 1919, pp. 125-133, 9 figs. Tests conducted in accordance with standard rules of Society of Automobile Engineers.

Car-Speed Chart

Engine and Car Speed Chart. Motor Age, vol. 35, no. 23, June 5, 1919, p. 45, 1 fig. Chart to determine car speed in miles per hour when engine speed in revolutions per minute, high-gear reduction ratio and wheel diameter are known.

Exhaust

Odorless Exhaust Gases (Verusche zur Erzielung geruchloser Abgase), Praetorius. Motorwagen, vol. 22, no. 2, Jan. 20, 1919, pp. 28-30, 6 figs. Suggests passing gases through colcium chloride and then through quicklime. Describes apparatus used for this purpose.

Fans

Radiator Cooling Fans, George W. Hoyt. Jl. Soc. Automotive Engrs., vol. 4, no. 5, May 1919, pp. 335-339, 8 figs. Writer observes that no one unit can do all the engine cooling and suggests that manufactnrers of motor vehicles cooperate with accessory manufacturers to such an extent that the latter can help to solve mechanical difficulties.

Gasoline-Electric Cars

The Stevens Petrol-Electric Vehicle. Electrical Review (Lond.), vol. 84, no. 2164, May 16, 1919, pp. 557-559, 4 figs. Electrical generator of four-pole interpolar type is direct coupled by means of flexible coupling to the gasoline engine, which is fitted with centrifugal governor, adjustable as to speed by handwheel on middle of dashboard.

Governors, Speed

Variable Speed Governors, W. W. Wells. Jl. Soc. Automotive Engrs., vol. 4, no 5, May 1919, pp. 375-379, 7 figs. Description of tests made by Clyde Cars Co.

Tractor Engine Governors, G. L. Moyers. Jl. Soc. Automotive Engrs, vol. 4, no. 5, May 1919, pp. 364-366, 1 fig. Centrifugal and vacuum types.

Kardell

Kardell Utility Tractor. Automotive Industries, vol. 40, no. 22, May 29, 1919, pp. 1162-1163, 3 figs. A two-plow tractor designed to be also suitable for cultivation aud other farm work.

Speedometers

Temperature Control of A-C Speedometer. Automotive Industries, vol. 40, no. 23, June 5, 1919, pp. 1228-1229, 2 figs. Magnetic instrument fitted with thermostatic compensator.

Tractive Resistance

Tractive Resistances to a Motor Delivery Wagon on Different Roads and at Different Speeds, A. E. Kennelly and O. R. Schurig. Mass. Inst. Technology, bul no. 10, June 1916, pp. 1011-1039, 19 figs. Also Am. Inst. Elec. Engrs., 33rd Annual Convention, June 30, 1916, bul. Investigation with wagon equipped with solid rubber tires: (1) overall efficiency of truck mechanism and (2) tractive resistance of a number of typical urban roads.

Tractors

Motor Plows, Tractors, etc., in Switzerland (Erprobung landwirtschaftlicher Maschinen in der Schweiz). Allgemeine Automobil-Zeltung, vol. 20, no. 1, Jan 5, 1919, pp. 6-12, 5 figs. Competitve tests of American and Swiss makes held at Orbe, Switzerland. Official figures of results.

Small Motors for Agricultural Purposes (Der Kleinmotor), Max Apel. Motorwagen, vol. 22, no. 4, Feb. 10, 1919, pp. 62-72, 16 figs. Points of design based on study of nature of work to be performed by machine as tractor, cultivation machine, or machine for driving others.

The Principles of the Wheeled Farm Tractor, Edward R. Hewitt. Gas Engine, vol. 21, no. 6, June 1919, pp. 182-185, 3 figs. Laboratory tests checked with work on machine in the open are said to have demonstrated that the maximum drawbar pull is a definite function of the weight per inch of width, amount available on sandy ground with a smooth metal wheel being about 30 per cent of weight on wheel when soil is dry and about 43 per cent when it is damp.

Farm Tractor Design—I & II, Joseph Jandasek. Automotive Industries, vol. 40, no. 24 & 25, June 12 & 19, 1919, pp. 1265-1273 & 1406-1407, 10 figs. Examples of calculations preceding design. Tabulated data on power requirements, soil packing and other items.

Agricultnral Motor Tractors, G. Hildick-Smith. Jl. of Chem., Metallurgical & Min. Soc. of South Africa, vol. 19, no. 10, Apr. 1919, pp. 195-200, 3 figs. Notes on work and organization of Technical Section of Food Prodnction Dept., England.

Tractor, Drawbar Location on

The Influence of Hitches and Drawbar Location on Tractor Design, A. W. Scarratt. Automotive Industries, vol. 40, no. 24, June 12, 1919, pp. 1334-1335 and 1359, 2 figs. Method of calculating weight required on front wheels to prevent rearing of tractor under full load on level or steep grades.

Trucks

Motor Lorry Design. Times Eng. Supp., vol. 15, no. 535, May 1919, p. 157. Lessons to be drawn from experience under war conditions as to construction of chassis of motor lorries; present article deals with engine and transmission gear.

Voisin

Voisin's Initial Chassis, W. F. Bradley. Automotive Industries, vol. 40, no. 22, May 29, 1919, pp. 1178-1179, 4 figs. Four-cylinder, 30-hp. Knight engine car, built in small volume with view to increasing quality.

War Vehicles

Utilization of War Vehicles for Industries and Agricultural Purposes (Was können die aus dem Kriege zurückkehrenden Feldkraftwagen für Industrie und Landwirtschaft leisten), P. Sauio. Motorwagen, vol. 22, no. 5, Feb. 20, 1919, pp. 84-85. Directs attention to the fact that rail and railless vehicles of all kinds will have received such rough usage at the front, improper treatment through overloading, and bad handling and use of unsuitable materials in their manufacture that many of them will be unsuitable for civil purposes.

The Employment of Motor Trucks After the War—I & II (Zur Frage der Verwendung von Motorlastwagen nach dem Kriege), Th. Wolff. Zeitschrift für Transportwesen & Strassenbau, vol. 35, nos. 35 & 36, Dec. 10 & 20, 1918, pp. 412-416 and 426-431. Discusses advantages of motor trucks for various industrial purposes.

POWER GENERATION

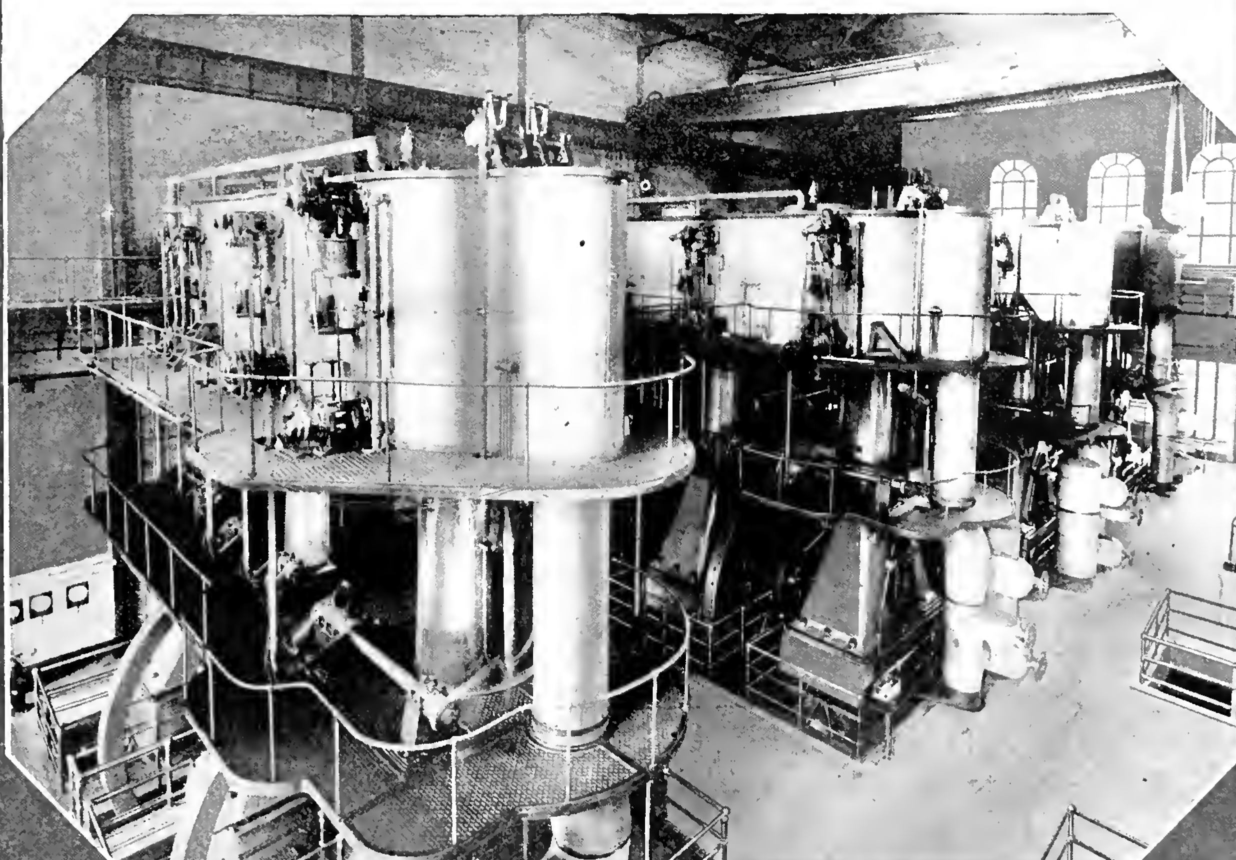
Canada

Hydro-Electric Development on Nipigon River. Can. Engr. vol 36, no. 24, June 12, 1919, pp. 529-531, 8 figs. Reported that Hydro-Electric Power Commission of Ontario will install five units, totaling 60,000 hp., at Cameron's Pool. A concrete dam 200 ft. long, 43 ft. high, is to be erected.

France

Intended Legislation on Water Power in France (Le nouveau pojet de loi sur les force hydrauliques). Houille Blanche, vol. 18, nos. 27-28, Mar.-Apr. 1919, pp. 41-46. Concerning state control of hydraulic energy developments.

Pumping Engine, Four Vertical Triple Expansion Units, for the Ridgewood Pumping Station, Brooklyn, New York



Great Britain

Electrical Energy from the River Dee. Engineer, vol. 127, no. 3309, May 30, 1919, pp. 524-526, 3 figs. Diagrams and plans of proposed utilisation of river between Llangollen and Chester.

The Supply of Electricity, John Somerville Highfield. Jl. Roy. Soc. Arts, vol. 67, no. 3469, May 16, 1919, pp. 408-420 and (discussion), pp. 420-424. Analysis of reports of Coal Conservation Sub-Committee, Elec. Trades Committee and Elec. Power Supply Committee, with tables showing amounts of capital expenditure and gross profits in various company- and municipally-owned electricity undertakings.

Isolated Plant

Effect of the War Upon Isolated Plant Costs. Elec. Rev., vol. 74, no. 25, June 21, 1919, pp. 1024-1027, 2 figs. Comparison of expenses of central station and isolated plant.

Niagara Falls

Structural Details of Plant Extension at Niagara Falls. Elec. Rev., vol. 74, no. 25, June 21, 1919, pp. 1028-1033, 9 figs. Addition of 40,000 hp. which involved construction of conduit 13.5 ft. in diameter.

Regional Planning of the Niagara District, Thomas Adams. Contract Rec., vol. 33, no. 25, June 18, 1919, pp. 563-566. Question examined from viewpoint of (1) industrial development, (2) economic use and regulation of sub-division of land and character and density of structures in rural and urban areas, (3) housing, sanitation, convenience and amenity (4) transportation—railways, highways and waterways, (5) sources and distribution of power, (6) water supplies and sewerage, (7) general amenities—including parks and boulevards and development of tourist facilities.

Norway

Hydroelectric Power Station near Hardanger, Norway (Storindustrien paa Vestlandet). Teknisk Ukeblad, vol. 66, no. 17, Apr. 25, 1919, pp. 211-212, 3 figs. Project for installing machinery to utilize 25,000 hp. out of 75,000 hp. available at Osa waterfalls.

Industrial Development in Norway (Den nye Tid i Norge. Nogen Track av det industrielle Gjennembrudds Historie). Teknisk Ukeblad, vol. 66, no. 18, May 2, 1919, 223-229, 14 figs. Figures showing effect of harnessing waterfalls.

Spain

Water Power Utilization in Spain (Salto de agua "Ribadelago" en el rio Tera), B. Oliver y Román. Revista de Obras Publicas, vol. 67, no. 2276, May 8, 1919, pp. 218-229, 3 figs. on supp. plate. Project to utilize 1880-ft. waterfall.

United States

The Energy Resources of the United States; A Field for Reconstruction, Chester G. Gilbert and Joseph E. Pogue. Smithsonian Instn., U. S. Nat. Museum, bul. 102, vol. 1, 1919, 165 pp., 23 figs. Extended discussion of coal and water as sources of power and their present utilization in the U. S. A. Claimed need of (1) provision of common-carrier system for transmission of electrical energy and (2) application of constructive economic policy to conditions surrounding petroleum.

Water-Power Legislation

Need for and Status of Water Power Legislation. Elec. Rev., vol. 74, no. 22, May 31, 1919, pp. 893-894. Summary of situation prepared by Nat. Service Committee of Eng. Council.

Wisconsin River

Hydroelectric Development on Wisconsin River at Stevens Point, William F. Snyder. Elec. Rev., vol. 74, no. 22, May 31, 1919, pp. 881-884, 7 figs. Flow of Wisconsin River is used as effective head of 14 ft. A total of 5700 hp. made up of six 950-hp. hydraulic turbines of the vertical type is comprised.

Zinc Industries

Conditions in Electrometallurgical and Electrochemical Zinc Industries (L'état actuel des industries électrométallurgique et électrochimique du zinc), M. Lemarchands. Houille Blanche, vol. 18, nos. 27-28, Mar.-Apr. 1919, pp. 46-53. In England, France and the U. S., both before the war and at present. Opinions of various writers in regard to advantages secured by utilizing hydraulic energy in zinc industries are presented.

PIPE

Concrete

Reinforced-Concrete Pressure Pipe for Hydroelectric Plants (In Japanese), A. Inokuty. Denki Gakkwai Zasshi, no. 370, May 10, 1919.

See also CIVIL ENGINEERING, Sanitary Engineering (Sewer Pipe.)

Sewer Pipe

See CIVIL ENGINEERING, Sanitary Engineering (Sewer Pipe.)

POWER PLANTS

Boiler Operation

The Practical Operation of Industrial Boilers, W. E. Snyder. Proc. Engrs. Soc. Western Pa., vol. 35, no. 2, March 1919, pp. 59-101 and (discussion) 101-116. With regard to safety and economy. A manual of instruction for boiler foremen is suggested.

Boiler Troubles; Their Origin and Remedy, T. H. Fenner. Power House, vol. 12, no. 7, May 20, 1919, pp. 183-186, 5 figs. Note on pitting, grooving and external corrosion.

Boiler Room

Improving Operation in Typical Industrial Plant Boiler Room, J. T. Beard, Jr. Power, vol. 49, no. 25, June 24, 1919, pp. 967-969, 6 figs. Replacing the pinhole grate with grate of proper design for coal to be burned; installing uptake dampers and operating them by hand independent of other regulators, and other similar changes.

Boiler Furnaces and Boiler Furnace Design, D. S. Jacobus. Stevens Indicator, vol. 36, no. 1, Jan. 1919, pp. 1-10. Recommend avoiding construction in which brickwork is heated on both sides when under too great stress; also torch-like action of flames on walls. Paper presented at Phila. Conv. of Am. Boiler Mfrs. Assn.

Boiler Room of the Sheet Metal Products Co, Ltd., W. F. Sutherland. Power House, vol. 12, no. 9, June 20, 1919, pp. 245-247, 5 figs. With reference to efficiency of operation.

Combustion Control

Combustion Control in Mill Boiler Plant—I, Robert June. Blast Furnace & Steel Plant, vol. 7, no. 6, June 1919, pp. 274-276, 2 figs. Analysis of causes of losses.

Condensers

Parkersburg Station, Monongahela Valley Traction Co. Power Plant Eng., vol 23, no 13, July 1, 1919, pp. 575-578, 8 figs. Condenser pit provided in which circulating system operates as a syphon.

Dominion Power Co.

Steam Electric Plant of the Dominion Power and Transmission Company, Hamilton—II. Elec. News, vol. 28, no. 11, June 1, 1919, pp. 28-30, 3 figs. Description of turbines and auxiliary steam equipment.

Electrical Equipment

Electrical Equipment in a Model Y. M. C. A. Building. Elec. Rec., vol. 25, no 6, June 1919, pp. 365-367, 4 figs. Brooklyn, N. Y., central building. Generating equipment includes two 200-kw. and one 75-kw. d.c. machines driven by side-crank reciprocating steam engines. B. & W. water-tube boilers supply steam for operating engine.

Improvements in Industrial Plant Operation, E. F. George. Elec. World, vol. 73, no. 23, June 7, 1919, pp. 1207-1209, 2 figs. Methods of electrical construction and operation at plant of Lodge & Shipley Machine Tool Co., Cincinnati.

Exhaust Utilization

The Contrallo System of Utilizing Exhaust. Mar. Eng., vol. 9, no. 6, June 1919, pp. 209-211, 4 figs. Illustrating various arrangements of system.

Hydraulic Operating Board

Operation at Holtwood—Features of Station Operation and Maintenance, Charles H. Bromley. Power, vol. 49, no. 23, June 10, 1919, pp. 892-896, 9 figs. Hydraulic operating board which indicates operation of pumps, governor valves, etc., is located on turbine-room floor and is visible to switchboard operator.

Ice Difficulties

Operation at Holtwood, Charles H. Bromley. Power, vol. 49, no. 22, June 3, 1919, pp. 850-854, 4 figs. Handling ice difficulties at plant.

Instruments

Boiler and Turbine Room Instruments. Power Plant Eng., vol. 53, no. 13, July 1, 1919, pp. 786-588, 2 figs. Their value in maintaining high degree of operating efficiency. From report of Committee on Prime Movers, presented at convention of Nat. Elec. Lighting Assn.

Johns Hopkins University

Mechanical Equipment at Johns Hopkins University, Julian C. Smallwood. Power, vol. 49, no. 21, May 27, 1919, pp. 811-814, 7 figs. Power plant designed with view to providing economical and continued service, and also facility for undergraduate experimentation and means for research, usual and special.

Muscle Shoals Plant

United States Nitrates Plant No. 2, Muscle Shoals, Am.—Station Heat Balance, Edward R. Welles and H. C. Lockwood. Power, vol. 49, no. 21, May 27, 1919, pp. 802-805, 8 figs. Hotwell water, which varies between 80 and 100 deg. fahr. used for cooling lubricating oil for main turbine. This turbine is of 60,000 kw. continuous capacity and is electrically in parallel with two noncondensing house turbines, which furnish power for driving auxiliaries.

Starting and Stopping Large Units

Operation at Holtwood, Charles H. Bromley. Power, vol. 49, no. 25, June 24, 1919, pp. 973-976, 6 figs. Procedure and precautions used in starting and stopping large main units.

Steam Traps

Notes on Steam Traps, F. G. Hechler. Jl. Am. Soc. Naval Engrs., vol. 31, no. 2, May 1919, pp. 430-437, 1 fig. Insisting upon regular inspection of all traps is advised.

Universal Portland Cement Co.'s Plant

Universal Portland Cement Co.'s Largest Plant, William B. Eastwood. Cement, Mill & Quarry, vol. 14, no. 11, June 5, 1919, pp. 17-19, 2 figs. Waste-heat power plant consists of 12 Babcock & Wilcox boilers, each individually fed with waste gases from rotary kilns.

POWER TRANSMISSION

Belting

Proper Use and Care of Leather Belting, Guy B. Smith, Cement, Mill & Quarry (Belting Section), vol. 14, no. 11, June 5, 1919, pp. 13-15, 1 fig. Contends that slippage is due chiefly to incorrect choice and an improper width of belt, undersized pulleys, poor alignment, insufficient precautions against oil from leaky bearings and use of poor belt dressings.

PRODUCER GAS

Gas Producers

Recent Development in Gas Producers (Ueber Gaserzeuger und ihre neuste Entwicklung), Dr Markgraf. Technische Blätter, vol. 9, nos. 13-13, Mar. 31, 1919, pp. 60-62, 4 figs. Historical review of use of gas for technical purposes. According to writer, so far the hope to use low-grade fuels has not been realized and the best fuel at present for revolving grates is washed nut coal. (To be continued.)

PUMPS

Bilge Pumps

Turbine-Driven Pipeless Salvage Bilge Pumps. Engineering, vol. 107, no. 2787, May 30, 1919, pp. 698-700, 8 figs. Vertical standard type with capacity of 1000 tons of water per hour.

Centrifugal Pumps

Steam Turbine-Driven Centrifugal Pumps. Fire & Water Eng., vol. 65, no. 23, June 4, 1919, pp. 1392-1393, 3 figs. Considered as advantageous for city water supply.

Design of Motor-Driven Centrifugal Pumps, A. T. Clark. Can. Engr., vol. 36, no. 25, June 19, 1919, pp. 548-549, 5 figs. Characteristic curves for different types under identical conditions.

Gear Reduction Drive

Helical Gears Solve Cornwall's Pumping Problem, R. N. Austin. Can. Engr., vol. 36, no. 23, June 5, 1919, pp. 507-509, 5 figs. High-speed single-stage centrifugal pumps are driven by low-speed hydraulic turbines, with pumping efficiency of 73 per cent including gear loss.

Louisville

Louisville's New Pumping Station. Mun. Jl. & Public Works, vol. 46, no. 23, June 7, 1919, pp. 398-402, 8 figs. Latest increase said to be 30,000,000 gal. vertical, triple flywheel pump.

Rotary Fire Pump

New Type Rotary Fire Pump. Fire & Water Eng., vol. 65, no. 25, June 18, 1919, pp. 1546-1547. With lateral intake and discharge and hardened steel pilot gears.

Salvage Pumps

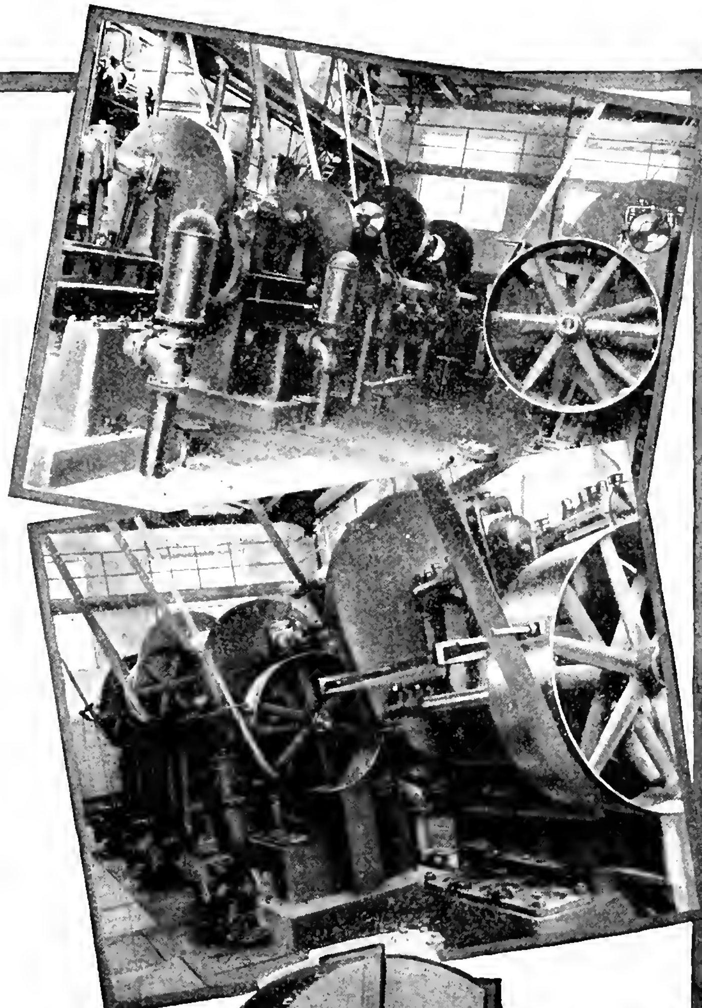
See Bilge Pumps.

San Francisco

San Francisco Pumping Stations, Charles W. Geiger. Power Plant Eng., vol. 23, no. 12, June 15, 1919, pp. 527-536, 7 figs. Details of two so-called earthquake-proof salt-water pumping stations.

16 GOULDS PUMPS

in the Minnequa Coke Plant of the Colorado Fuel & Iron Co.



A striking illustration of the great popularity of Goulds Pumps with large industrial organizations is the pumping equipment of the Minnequa Works of the Colorado Fuel & Iron Co. at Pueblo. Sixteen "Goulds" are operated for various purposes.

Three Fig. 1128, size 12 x 12, Triplex Pumps pump tar over ovens; a Fig. 1694, size 8 x 10 Triplex pumps tar to cars; three Fig. 1694, size 7 x 10, Triplex pump liquor to tanks and stills; two Fig. 3030, Centrifugals size 5 S, lift water to tank; three Fig. 3011, Centrifugals, size 2, pump lime water to tanks; and three Fig. 3030, size 6 S, and two Fig. 3030, size 5 S, recirculate water over cooler towers and gas coolers.

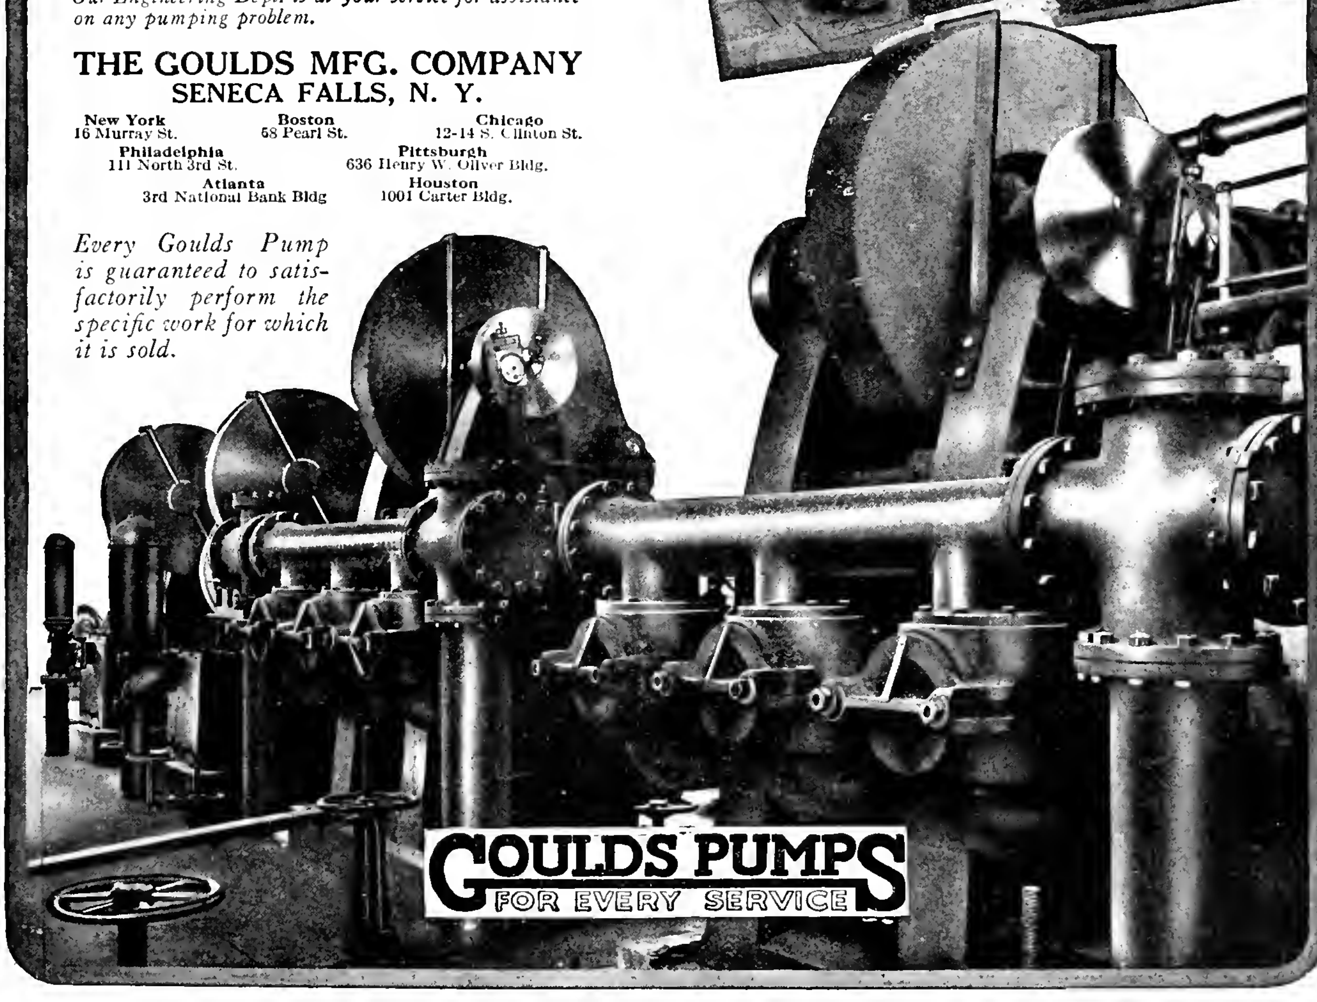
Goulds Pumps are built in many types and sizes—there is a Goulds Pump of remarkable efficiency for every pumping purpose.

Our Engineering Dept. is at your service for assistance on any pumping problem.

THE GOULDS MFG. COMPANY
SENECA FALLS, N. Y.

New York 16 Murray St. **Boston** 68 Pearl St. **Chicago** 12-14 S. Clinton St.
Philadelphia 111 North 3rd St. **Pittsburgh** 636 Henry W. Oliver Bldg.
Atlanta 3rd National Bank Bldg **Houston** 1001 Carter Bldg.

Every Goulds Pump is guaranteed to satisfactorily perform the specific work for which it is sold.



Toronto Waterworks

Main Pumping Station Toronto Waterworks, W. F. Sutherland. Power House, vol. 12, no. 7, May 20, 1919, pp. 177-182, 10 figs. Present capacity is 200,000,000 gal. per 24 hr.

REFRACTORIES

Dolomite

Experiments in Dead-Burning Dolomite, H. G. Schurecht. Jl. Am. Ceramic Soc., vol. 2, no. 4, Apr. 1919, pp. 291-305, 13 figs. Roll scale reported to have been found very effective in dead-burning dolomite without decreasing its refractoriness too much.

Firebrick

Firebrick-Manufacture and Use, W. H. Grant. Can. Manufacturer, vol. 39, no. 6, June 1919, 23-25. Particularly in steel and clay-products industries.

Porcelain

The Comparative Value of Kneading and Pugging in the Preparation of Porcelain Bodies, L. E. Barringer. Jl. Am. Ceramic Soc., vol. 2, no. 4, Apr. 1919, pp. 306-312, 2 figs. Results of tests are claimed to demonstrate that the center of pug-mill blank contains more air than the edge, this being due to greater pressure on blank where it comes in contact with die.

Some Physical Properties of American Commercial Porcelain Bodies, J. W. Wright and S. I. Sewell. Jl. Am. Ceramic Soc., vol. 2, no. 4, Apr. 1919, pp. 282-290, 3 figs. Numerical results obtained from determination made upon commercial bodies.

Zirconia

Fused Zirconia—The New Refractory, A. J. Franklin. Metal Industry, vol. 14, no. 20, May 16, 1919, pp. 401-402. Analysis of various varieties of Brazilian baddelyite and bibliography of zirconia including principally articles published in German magazines.

REFRIGERATION

A. E. F. Refrigerating Plant

Refrigerating Plant No. 1, American Expeditionary Forces, John V. Fisher. Power, vol. 49, no. 24, June 17, 1919, pp. 920-922, 7 figs. Capacity of 600-ton.

Refrigeration for the Army, L. R. Phillips. Ice & Refrigeration, vol. 56, no. 6, June 1919, pp. 369-375, 14 figs. Ice-making and cold-storage plants erected in France. Also plants erected at cantonments, notably one with large freezer capacity at Chicago.

Abattoir

The Municipal Abattoir of the City of Reichenberg (Der städtische Schlachthof in der Stadt Reichenberg). Zeitschrift für Eis-und Kälte-Industrie, vol. 11, no. 8, Feb. 1919, pp. 113-116, 3 figs. Total area occupied is 29,400 sq. m., of which 8,730 sq. m. is used for stock yards.

Code, Refrigerating

Tentative Refrigerating Code. Refrigerating World, vol. 54, no. 6, June 1919, pp. 11-14, 2 figs. For Municipal and State Regulations for refrigerating machines and refrigerants proposed by Refrigerating Regulations Committee and approved by Council of the A.S.R.E.

Marine Refrigeration

Notes on Marine Refrigeration, A. H. Baer. Am. Soc. Refrig. Engrs., vol 5, no. 5, March 1919, pp. 383-386. Results obtained by the Government.

Williams Refrigerating Machine

The Williams Refrigerating Machine, Wm. L. DeBaufre. Jl. Am. Soc. Naval Engrs., vol. 31, no. 2, May 1919, pp. 454-469, 10 figs. Test to determine capacity under various temperatures of refrigeration, also to note general operating characteristics and durability of parts.

RESEARCH

Industrial Laboratories

Lynite Laboratories of the Aluminum Castings Company Embody Most Progressive Ideas and Up-to-Date Equipment in the Field of Industrial Research. Aerial Age, vol. 9, no. 14, June 16, 1919, pp. 678-683, 11 figs. Organization and work undertaken by the three sections—research, development and technique—into which laboratory is divided.

Furnace Manufacturers' Research Plant. Metal Worker, Plumber & Steam Fitter, vol. 91, no. 23, June 6, 1919, pp. 727-729, 6 figs. Investigation at University of Illinois Engineering Experiment Station for which Nat. Warm Air Heating & Vantilating Assn. appropriated $8000 at its 1918 convention.

Works Laboratory Organization, J. E. Hurst. Foundry Trade Jl., vol. 21, no. 208, Apr. 1919, pp. 224-227, 1 fig. Chart of principal technical departments of a modern engineering works, showing relationship between scientific and production department. Paper read before Lond. Branch British Foundrymen's Assn.

Municipal Testing Laboratories

The Organization of a Standard Municipal Testing Laboratory, J. C. Preston. Can. Engr., vol. 36, no. 23, June 5, 1919, pp. 520-522, also Eng. & Contracting, vol. 51, no. 23, June 4, 1919, pp. 592-594, 1 fig. It is concluded that standard testing laboratory is an economical investment for any municipality, that its field or service is of almost unlimited expansion. Concluded in Can. Engr. from May 22 issue.

Naval Research

Naval Research, C. S. McDowell. U. S. Naval Inst. Proc., vol. 45, no 196, June 1919, pp. 895-908. List of problems in which it is considered desirable to undertake research work and enumeration of advantages

Norway

Christiania Experimental Testing Station (Kristiania Materialproveanstalt). Teknisk Ukeblad, vol. 66, no. 16, Apr. 18, 1919, pp. 204B-204D. Applications for tests on strength of metals, wood, rope and belts, and on building materials totalled 984 for 1917-1918. Instances are quoted indicating nature of tests required. (To be continued.)

Switzerland

Mechanical, Physical and Chemical Testing Laboratory of the Engineering School at Lausanne (Le laboratoire d'essais mécaniques, physiques et chimiques de l'École d'ingénieurs de l'Université, à Lausanne). Bul. Technique de la Suisse Romande, vol. 45, no. 9 & 10, May 3 & 17, 1919, pp. 79-81, 489-91, 47 figs. Compression press with capacity of 150 tons built similarly to tension machine described in preceding installment. Description of Amsler pendulum dynamometer. (Continuation of serial.)

STANDARDS AND STANDARDIZATION

German Motor Industry

Standardization and Specialzation in the German Motor Industry (Normalisierung-Spezialisirung), B. von Lengerke, Motorwagen, vol. 22, no. 3, Jan. 31, 1919, pp. 50-51. Although regarding outlook as rather dark for motor industry, writer thinks position could be improved by adopting American methods of quantity production.

Plate Industry, Steel

Features of the Steel Plate Industry. Raw Material, vol. 1, no. 4, June 1919, pp. 206-212, 7 figs. Guides to specification of various grades of plates and advice concerning specifications necessary to obtain solid homogeneous metal free from defects.

Quarry Products

Standardizatoin of Quarry Products (Die Normung der Steinbruchserzeugnisse), Freystedt. Zeitschrift für Tranportwesen & Strassenbau, vol. 36, no. 7, Mar. 1, 1919, pp. 75-84. From the viewpoint of the quarry operator. Tables of standard sizes.

Threads, Pipe and Screw

New Series of Pipe and Screw Threads. Jl. Soc. Automotive Engrs., vol. 4, no. 5, May 1919, pp. 358-360, 1 fig. Tables giving standards proposed by Nat. Screw Thread Commission.

STEAM ENGINEERING

Boiler Baffling

Suggestions for Correct Boiler Baffling, A. D. Williams. Blast Furnace & Steel Plant, vol. 7, no. 6, June 1919, pp. 283-286, 10 figs. Regulating gas velocity to permit maximum heat transfer.

Boiler Heads

Alignment Charts for Finding the Dimensions and Volumes of Bumped Heads, C. H. Berry. Power, vol. 49, no. 24, June 17, 1919, pp. 926-927, 5 figs. Deals in diameter, radius of spherical surface and height of bump.

Boiler Setting

Suspension and Concrete Setting of Boilers at the Robert Gair Plant, Brooklyn. Power, vol. 49, no. 24, June 17, 1919, pp. 934-935, 2 figs. Building columns, and boiler-support columns, will be exposed to furnace temperatures.

Compound Engines

The Design of Compound Engines, F. S. Bauer. University of Colorado, Jl. of Eng., vol. 15, no. 3, Apr. 1919, pp. 25-37, 2 figs. Curves showing relations between absolute boiler pressure and cylinder-volume ratio, total ratio of expansion and receiver pressure of various back-pressures.

Turbines

Westinghouse-Rateau Marine Geared Turbines. Engineering, vol. 107, no. 2786, May 23, 1919, pp. 666-668, 6 figs., partly on two separate plates. Turbine consists of independent high and low pressure cylinders, giving 2,500 shaft hp. Steam is supplied from three single-ended marine type boilers, 15 ft. in diameter, and 11 ft. 9 in. long.

Steam Turbine Reviewed Historically—II. Universal Engr., vol. 29, no. 3, Mar., 1919, pp. 29-45, 25 figs. Governor control employed by Westinghouse Co. Arrangement developed for automatic operation of bypass valves to enable turbine to carry heavy overloads.

Turbine Blade Fastenings—II. Mech. World, vol. 65, no. 1692, June 6, 1919, pp. 271-272, 7 figs. Blading reaction turbines in segments. (Continuation of serial.)

Uniflow Engines

Modern Advancement in Steam Prime Movers, E. H. Beckstrand. Utah Soc. Engrs., vol. 5, no. 3, Mar. 1919, pp. 45-54. Believes that prime mover best adapted to high pressure end of steam diagram would be Uniflow engine with poppet valves.

The "Uniflow" Pumping Engine, D. A. De Crow. Can. Engr., vol. 36, no. 25, June 19, 1919, pp. 557-558, 2 figs. Claims simplicity of construction, low cost of production as compared with compound and triple-expansion reciprocating pumping engines, and economy in use of steam. Paper read at convention of Am. Water Works Assn.

THERMODYNAMICS

Heats of Fusion, Latent

A Note on Latent Heats of Fusion and their Relation to Molecular Composition, Harbord George Wayling. Lond., Edinburgh, and Dublin Phil. Mag., vol. 37, no. 221, May, 1919, pp. 495-497. Expressing Trouton's rule as ratio of product of latent heat of fusion by molecular number, to melting point on absolute scale, writer finds that for several compounds this ratio is equal to number of atoms in molecule.

WELDING

Acetylene Generating Plant

Acetylene Generating Plant for Large Welding Shops. Acetylene & Welding Jl., vol. 16, no. 188, May, 1919, pp. 93-94, 1 fig. It consists of seven generators, gas collector, moisture separator, two condensers, gasometer capable of storing 350 cu. ft. of gas and four large purifiers with bypasses for working in pairs.

Acetylene Welding

Acetylene Welding. Ry. Jl., vol. 25, no. 6, June, 1919, pp. 18-19. Committee report before Master Boiler Makers' Assn.

Great Britain's Acetylene Welding Industry—its Birth, Growth and War Record, Norman MacLeod. Jl. Acetylene Welding, vol. 2, no. 12, June, 1919, pp. 601-606, 8 figs. Founding of Northern Polytechnic Inst., and featuring courses in autogenous welding. Among samples of welding applications, the reconstruction of a bomb dropped in London by a German zeppelin is described.

Shutdown of Great Steel Plant Avoided by Oxwelding, L. M. Malcher. Jl. Acetylene Welding, vol. 2, no. 12, June, 1919, pp. 611-614, 5 figs. Repairing wrecked low-pressure cylinder which was cracked at head end in seven different places.

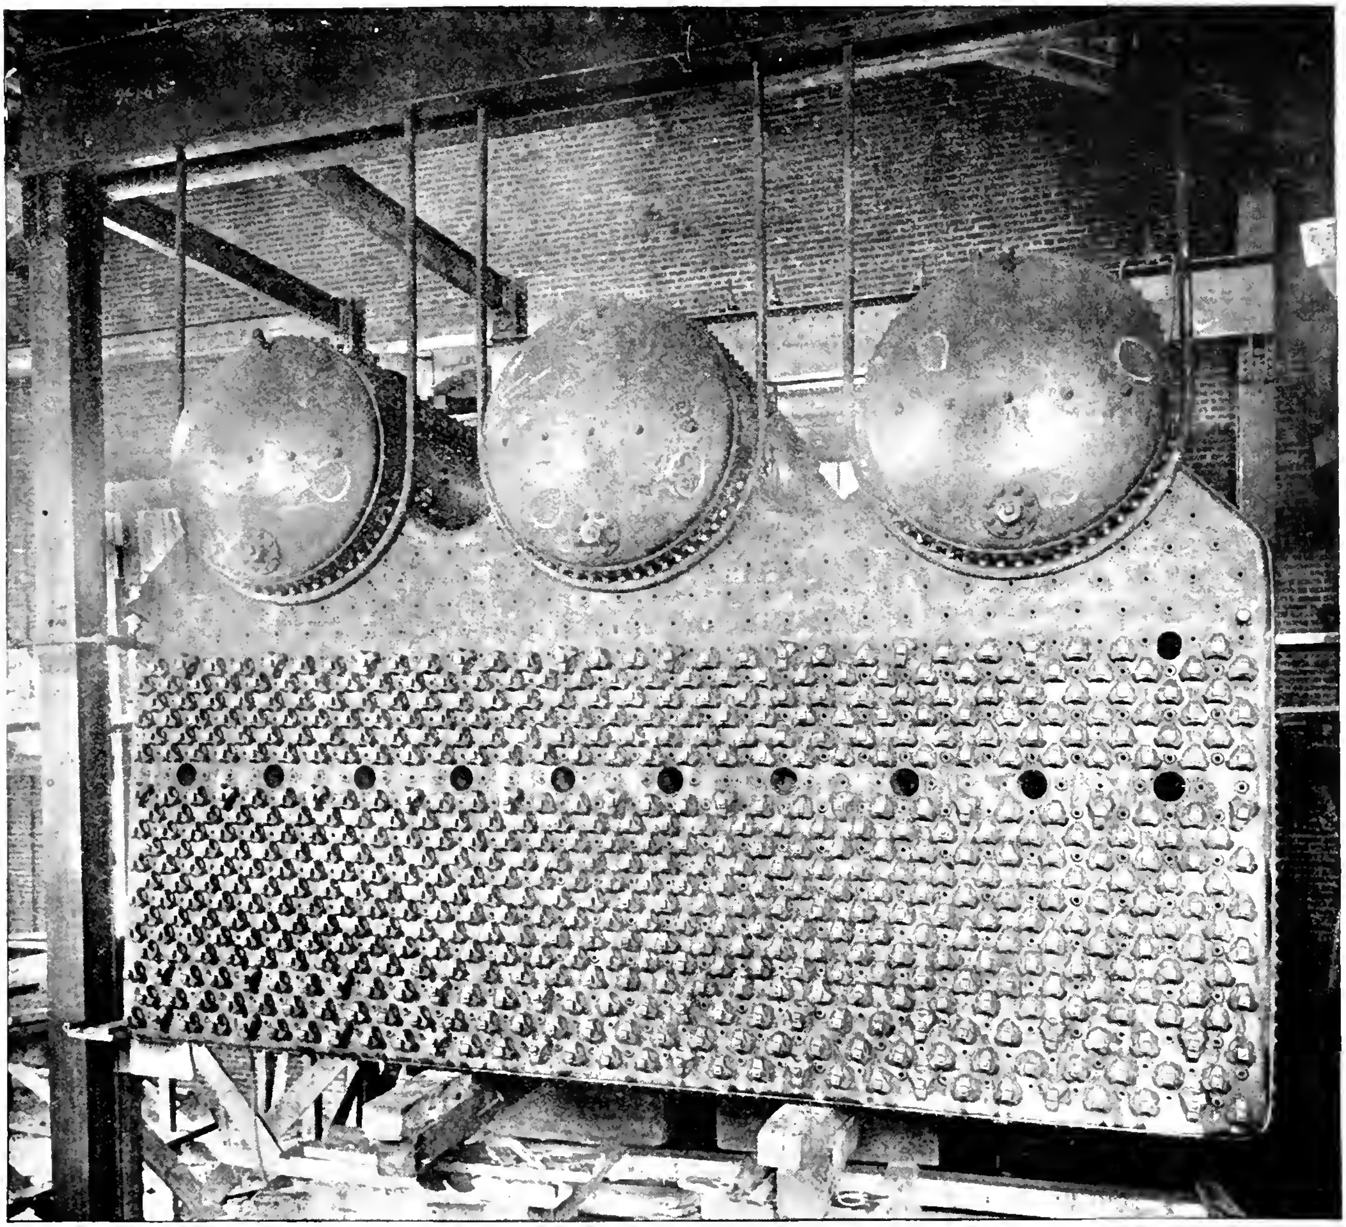
A Difficult Cylinder Bloc Job, David Baxter. Jl. Acetylene Welding, vol. 2, no. 12, June, 1919, pp. 607-610 & 622, 10 figs. Presented as case in which welding operator was handicapped by intense heat radiating against tip at close quarters from every direction and very limited space in which to manipulate.

Notable Repairs on Large Cylinder by Oxy-Acetylene Welding, L. M. Malcher. Pac. Mar. Rev., vol. 16, no. 6, June, 1919, pp. 104-105, 4 figs. Cylinder of Allis-Chalmers twin compound reversing engine, 70 in. diameter, badly fractured. Cost of repair estimated about one-third of that of a new cylinder.

Welding by the Oxy-Acetylene Method—III, J. F. Springer, Automobile Eng., vol. 4, no. 5, May, 1919, pp. 238-239, 2 figs. Examples of successful welds in cast-iron frames, with remarks on methods of making welding groove and filling it with new metal.

Aluminum Welding

The Vertical Welding of Aluminum. Acetylene & Welding Jl., vol. 16, no. 188, May, 1919, pp. 94 & 99, 2 figs. Tests made on sheet aluminum of 11 and 14 gage.



1000 H. P. HEINE BOILER

For Walter Reed Hospital, Washington, D. C.

During the war the entire force and plants of the Heine Safety Boiler Co. gave full service to Uncle Sam. We closely approached the half million h.p. production mark.

Today, we are far from idle. We are furnishing boilers for hospitals. We are doing everything in our power to care for our wounded boys. We are building boilers for ships to bring our boys home, and to assist Uncle Sam in the forthcoming commercial struggle.

The three-drum Heine boiler shown above and now being installed, contains 580 tubes, is 18 ft. long, and is built for a working pressure of 200 lb. per square inch. It is being set 10 feet high. The furnace, which is 17 ft. 10 in. wide, will be fed by a Westinghouse stoker. Both front and rear are supported from overhead. The method of supporting the front is clearly shown.

Note the one-piece header and the large throat connections made with the drums allowing abundant space for free and complete circulation. The Heine boiler does not contain small passages which restrict the flow of mixed water and steam to or from any tubes.

If in the market for a boiler you should study the merits of all constructions. Our treatise—"Boiler Logic" discusses these details. Write for a copy giving your position or responsibility.

Heine Safety Boiler Co.
5321 Marcus Avenue
St. Louis, Mo.

HELIOS

19

Boiler Repairs

Repairs to Boilers and Engines by Welding, E. G. Hiler. Can. Machy., vol. 21, no. 21, May 22, 1919, pp. 520-521, 2 figs. Examples such as repairing wrought steel, hot-water boiler which was fractured at fire hole and building up by electric welding flanged seams of flue tube for Lancashire boiler. Paper read before Instn. Mech. Engrs.

Concrete, Reinforced, Construction

Autogenous Welding in Reinforced-Concrete Construction (Die Flammenverschmelzung im Eisenbetonbau). Autogene Metallbearbeitung, vol. 12, no. 1, Jan. 1919, pp. 26, 12 figs. Description of method of construction said to be especially suited for concrete vessels and large tanks. (To be continued.)

Cylindrical Bodies

Welding Performed on Cylindrical Bodies, Ernest Schwartz. Can. Machy., vol. 21, no. 22, May 29, 1919, pp. 552-553, 4 figs. Concerning welding of seams and of head and bottom cylindrical bodies.

Dredges

Oxy-Acetylene and Electric Welding on Dredges, H. G. Blankman. Min. & Sci. Press, vol. 118, no. 21, May 24, 1919, p. 716. Also Metal Trades, vol. 10, no. 6, June, 1919, p. 257. Can. Klondyke Mining Co. operates three large dredges and has installed in its machine shop an oxy-acetylene weldink equipment. Article quotes results obtained.

Electric Welding

Electric Welding: Its Theory, Practice, Application and Economics, H. S. Marquand. Elecn., vol. 82, nos. 20, 21, 23 & 24, May 16 & 23, June 6 & 13, 1919, pp. 565-567, 591-593, 645-647, and 681-683, 19 figs. Best results with Bernardos system are said to be obtained with current supplied at about 75 to 80 volts; it is noted, however, that when this potential is obtained from a higher voltage circuit through resistance, there is great loss of energy and quality of work is likely to be impaired. (Continuation of serial.)

Electric Welding and Welding Appliances—XIII. Engineer, vol. 127, no. 3306, May 9, 1919, pp. 441-446, 5 figs. Machines manufactured by A1 Manufacturing Co., of Industry Works, Bradford. They produce machines and accessories for resistance welding only.

Electric Welding in Warships, W. H. Gard. Mar. Engr. & Naval Architect, vol. 41, no. 500, May, 1919, pp. 238-244, 7 figs. Among various examples of repair work, restoring of cast steel sternpost of battleship is quoted as significant development of process. Paper read before Inst. Naval Architects.

Electric Welding, Arc

Important Factors for Efficient Arc Welding, E. Wanamaker and H. R. Pennington. Ry. Elec. Engr., vol. 10, no. 6, June, 1919, pp. 179-185, 13 figs. Concerning flexibility of installations, location of accessories and eye and body protection.

Relation of Arc Phenomena to Electric Welding, C. D. Fawcett. University of Colorado, Jl. of Eng., vol. 15, no. 3, Apr. 1919, pp. 15-24, 2 figs. Suggestions in regard to welding practice with table giving approximate relation of electrode diameter, plate thickness, etc.

Electric Arc Welder for Portable and Stationary Use. Automotive Industries, vol. 40, no. 23, June 5, 1919, p. 1233, 2 figs. Outfit designed for operation on either direct current or alternating current lines.

Electric Welding, Plastic Arc

The Plastic-Arc System of Welding, J. O. Smith. Coal Age, vol. 15, no. 26, June 26, 1919, pp. 1162-1166, 7 figs. Also Ry. Rev., vol. 64, no. 24, June 14, 1919, pp. 898-900, 9 figs. Description of outfit and examples of repairs effected by this system. Paper presented before meeting of Coal Min. Elecns. and Mechanics Inst.

Engine Cylinders, Liberty

Welding Operations on Liberty Motor Cylinders, H. A. Carhart. Am. Mach., vol. 50, no. 22, May 29, 1919, pp. 1019-1025, 13 figs. Mixtures and apparatus used by Lincoln Motor Co.

Gas Cutting Torches

Modern Welding and Cutting. Am. Mach., vol. 50, no. 23, June 5, 1919, pp. 1084-1087, 15 figs. Difference between gas cutting torches and those used for welding; details of various makes of gas cutting torches. 13th article.

Modern Welding and Cutting—XIV, Ethan Viall. Am. Mach., vol. 50, no. 26, June 26, 1919, pp. 1237-1243, 15 figs. Gas-pressure regulators and working assemblies; directions for lighting of torch; charts showing various flame characteristics with different gas combinations.

Preheating Work

Pre-Heating Work for Oxy-Acetylene Welding, J. F. Springer. Ry. & Locomotive Eng., vol. 32, no. 6, June, 1919, pp. 184-185, 1 fig. On prevention of cracking.

Ship Construction

Welding as a Process in Ship Construction, S. V. Goodall. Gen. Elec. Rev., vol. 22, no. 3, Mar. 1919, pp 213-216. Observes that riveting being greatest single labor item, any improvement in method of binding together whole structure offers fruitful field for economy.

Strength of Welds

Electric Welding and Welding Appliances—XIV. Engineer, vol. 127, no. 3307, May 16, 1919, pp. 471-473, 1 fig. Acconnt of tests which have been devised for determining strength of electric welds. (Concluded.)

Stresses in Seams

Stresses in Seams in Autogenous (Wie wird beim Autogenschwissen die Schweissnaht beansprucht). Autogene Metallbearbeitung, vol. 12, no. 1, Jan. 1919, pp. 6-8. Phenomena observed in welding mild steel.

Thermit Welding

Thermit Process Used on Big Welding Job on Northern Pacific. Mar. News, vol. 6, no. 2, July 1919, pp. 96-97, 5 figs. Illustrating repair on cast-steel stern frame which was cracked through just above upper post gudgeon, the break forming roughly a triangle, each side of which was about 2 ft. long.

Restoring Steel Machinery to Service by the Thermit Process. Welding Engr., vol. 4, no. 6, June 1919, pp. 29 and 32-33, 14 figs. Examples of repairs of large pieces of work for Pittsburgh Steel Co.

Welding Jigs

Some Examples of Welding Jigs and Methods for Overcoming Distortion, C. S. Milne. Acetylene & Welding Jl., vol. 16, no. 187, Apr. 1919, pp. 66-73, 33 figs. Illustrates various kinds of defects that are usually remedied by welding and discusses practices in reducing cooling stresses. Paper read before British Ace'ylene & Welding Assn.

WOOD

Girders, Lattice

Wooden Lattice Girders (Boltede Gitterkonstruktioner af Trae med "Bufobrikker"). Ingeniøren, vol. 28, no. 30, Apr. 12, 1919, pp. 196-199, 8 figs. Corrugated steel "Bufo" washers are used between tie rod and beams.

Spruce, Seasoning

Emergency Seasoning of Sitka Spruce, L. A. Welo. Sci. Am., Supp. vol. 87, no. 2269, June 28, 1919, pp. 404-405, 2 figs. Strength of kiln-dried and air-dried spruce compared.

VARIA

Engineering Profession

The Engineer and the Community, E. H. Sniffin. Elec. Jl., vol. 16, no. 6, June, 1919, pp. 249-251. Writer asks why the engineer who has "made the world more habitable than was even dreamed of by the greatest imaginations of former ages" is not "a more conspicuous member of the community."

Proper Recognition of the Engineering Profession, W. W. K Sparrow. Ry. Rev., vol. 64, no. 18, May 3, 1919, pp. 668-670. Believes that prime requisites to obtaining greater recognition of engineering profession are organization, licensing and broader education.

Metric System

The Metric System in Engineering, Frederick A. Halsey. Eng. Education, vol. 9, no. 10, June 1919, pp. 491-499. Argues that value of introducing metric system should be measured by results to be expected from its introduction; as no special benefit is seen in changing already standardized mechanical constructions from their present values to metric units, acceptance of metric system in engineering is not considered practical.

National Dept. of Public Works

The Movement to Establish a National Department of Public Works, Frederic H. Fay. Jl. Boston Soc. Civ. Engrs., vol. 6, no. 6, June 1919, pp. 235-244 and (discussion) pp. 244-264. Prospect of establishing national budget system visualized as sound argument in favor of aiding Nat. Dept. of Public Works.

Stereoautograph

The Stereoautograph, Model 1914, Its Correction and Application (Der Stereoautograph Modell 1914, seine Berichtigung und Anwendung), H. Löscher. Zeitschrift für Instrumentenkunde, vol. 39, no. 1, Jan. 1919, pp. 2-19, 11 figs. Instrument for mechanical utilization of stereoautographic pictures. (To be continued.)

Tanks, Capacity

The Capacity of Cylindrical Tanks, Motor Age, vol. 35, no. 24, June 12, 1919, p. 51, 1 fig. Chart for computing contents of tanks of usual lengths and diameters or size required for desired capacity.

Organization and Management

ACCOUNTING

Cost Accounting

Cost Accounting to Aid Production—IX, G. Charter Harrison. Indus. Management, vol. 57, no. 6, June 1919, pp. 483-487, 1 fig. Predicts revolution in which retrospective systems will disappear because unfitted to meet demands of an industrial executive who must know before he can do.

Inventory

How We Keep Our Inventory Correct, H. F. Harris. Factory, vol. 22, no. 6, June 1919, pp. 1181-1185, 17 figs. Practice of Republic Motor Truck Co. Record forms illustrated.

EDUCATION

Cripples

Human Rehabilitation and Its Value, Douglas C. McMurtrie. Min. & Oil Bul., vol. 5, no. 6, May 1919, pp. 325-326 & 328, 4 figs. Method of dealing with men followed at Red Cross Inst. for crippled and disabled men at New York City.

Electrical Fittings

The Training of the Disabled Man from the Electrical Engineer's Point of View, F. H. Taylor. Electrictiy, vol. 31, no. 1491, June 6, 1919, pp. 349-352, 5 figs. Example illustrating training given in electrical fitting, installation, maintenance, repair work and similar occupation at various educational centers.

Executives

The New Science, James A Bowie. Eng. & Indus. Management, vol. 1, pp. 17, June 5, 1919, pp. 519-520. Discusses need of training for industrial administration and refers to work in this direction at College of Technology at Manchester.

Shipyard Labor

Intensive Training of Shipyard Labor, Harry H. Tukey. Indus. Management, vol. 57, no. 6, June 1919, pp. 452-456, 4 figs. Methods and results of Submarine Boat Corporation.

FACTORY MANAGEMENT

Committee System

Committee System in American Shops, William Leavitt Stoddard. Indus. Management, vol. 57, no. 6, June 1919, pp. 473-476. Review of acceptance of some form of representative shop committee, with reference to experience in Great Britain. Three types of such committees are differentiated, and the relations of trade unionism and shop committees are discussed.

Control Boards

How Control Boards Can Help Manage, B. L. Van Schack. Factory, vol. 22, no. 6, June 1919, pp. 1172-1176, 6 figs. Control boards, it is said, must back up facts with proof without too much detail or they will tend to confuse rather than explain.

Control of Production

Graphic Control on the Exception Principle, Frank B. Gilbreth. Eng. & Indus. Management, vol. 1, no. 14, May 15, 1919, pp. 433-434, 2 figs. No cost system or charge system should be considered as really satisfactory, in opinion of writer, unless it determines (1) what quantities of individual output should be, (2) prompt records of individual outputs, (3) what costs should be, (4) prompt records of costs, (5) causes of fluctuations and deviations of outputs aad costs from prophesied outputs and costs.

Dispatching Department

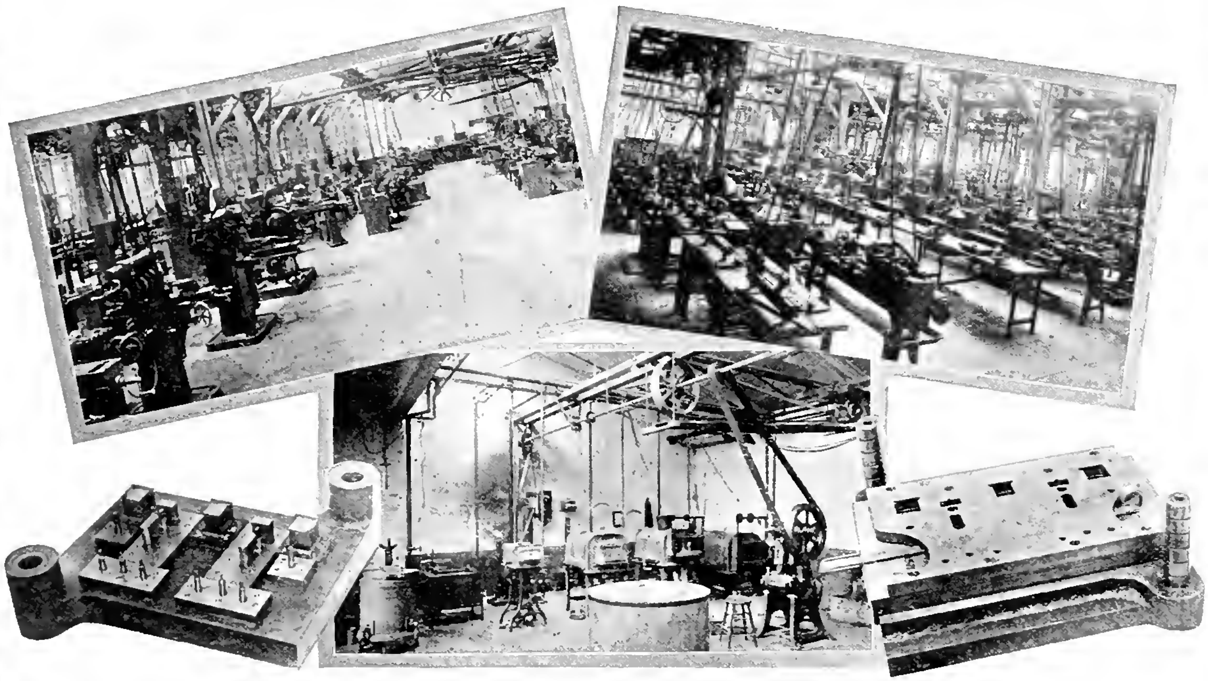
Organization of a Carburetor Plant, Fred H. Korff. Machy. (N. Y.), vol. 25, no. 10, June 1919, pp. 916-918. Work of mechanical and dispatching departments and practice in foundry. Second article.

Let us solve Your Problem

Our Tool Room—

where accurate, long-wearing tools are made—the kind that help you to improve and increase your production.

Designing and making special tools is one of the big features of our business. The illustrations below of our tool room, in which are provided every modern facility for producing accurate special tool work, gives a fair idea of our capacity for producing work of this character. Our many years of experience in solving mechanical and engineering problems covering almost every line of manufacturing insures a service that cannot be duplicated.



Tool Work for those who demand *the Best*

The fundamental principle of our business is to furnish the best tool work for those who want none but the best. Our staff of workers are experts and are careful in their methods. Every detail of the work is carried on with skill and precision. As the life of tools depends on proper heat treatment, this part of the work is given more than usual consideration. The result—perfect, accurate tools—dependable and long-wearing.

We are prepared to design and make special tools, dies, jigs, gages and fixtures, or to make such tools from your own designs.

Let the S A S Laboratories make your next tools.

This is the fifth of a series of advertisements showing our plant, our methods and the work we are doing—Production shops in the next issue.

SLOCUM, AVRAM & SLOCUM
LABORATORIES, Inc.

Production Plant: NEWARK, N.J. *New York Office*: Woolworth Bldg., N.Y.

Special Machinery QUANTITY PRODUCTION Jigs, Fixtures and Gages

SLOCUM-AVRAM-SLOCUM MANAGEMENT

Employee Cooperation

Co-operation Profitable to Employer and Worker, Harry Tipper. Automotive Industries, vol. 40, no. 23, June 5, 1919, pp. 1208-1209. Plan of "industrial democracy" as operated at tobacco-pipe manufacturing plant of Wm. Delmuth & Co. at Richmond Hill, Long Island, where 900 men and women are employed.

Employment Management

Employment-Management at the Eagle Mines, Robert Nye. Min. & Sci. Press, vol. 118, no. 24, June 14, 1919, pp. 821-822. Labor turnover said to have dropped from 32.9 per cent to 11.58 per cent after power of hiring and firing of all men was taken from superintendent and foremen and given to employment manager.

Factories

The Design and Construction of Factories—III, Arthur F. Wickenden. Eng. & Indus. Management, vol. 1, no. 16, May 29, 1919, pp. 498-499, 1 fig. Types of structure.

Fatigue

Devices to Prevent Unnecessary Fatigue, James F. Butterworth. Eng. & Indus. Management, vol. 1, no. 18, June 12, 1919, pp. 556-558, 9 figs. Studies in planning out work so as to shorten number of motions that arms and hands should make while under load, arranging materials to be dealt with in sequence of use and placing materials in such positions that they can be grasped, transported and released in shortest possible time and with least possible effort.

Industrial Efficiency from the Psychological Standpoint—III, Charles S. Myers. Eng. & Indus. Management, vol. 1, no. 13, May 8, 1919, pp. 395-397. Investigations of industrial fatigue, particularly Taylor's research of loads a man can carry; also security against danger as psychological factor tending to increase output. Lecture delivered at Imperial College of Sci. & Technology.

Foremen's Cooperation

C. P. R. Shop Production Methods, E. T. Spidy. Ry. Mech. Engr., vol. 93, no. 6, June 1919, pp. 320-326, 9 figs. Establishes that it is absolutely impracticable to get any results from any system unless coöperative effort from all foremen in all departments is secured. Canadian Pacific practice is quoted as instance of efficient coöperation, and how its productive department ties into the shop organization is shown by diagram.

French War Industries

Taylor Methods in French War Industries. Bul. Taylor Soc., vol. 4, no. 3, June 1919, pp. 8-15 and (discussion) pp. 29-35. Circular of the Ministry of War to the Under-Secretaries of State for Aeronautics, for Health and for Military Justice, the Military Governors General of Paris and Lyons, the Generals commanding districts and the General commanding the French troops of North Africa.

Garment Trades

Factory Management in Garment Trades, Mack Gordon. Indus. Management, vol. 57, no 6, June 1919, pp. 446-451, 10 figs. Purchasing and storekeeping methods.

Layout

The Design and Construction of Factories—II, Arthur F. Wickenden. Eng. & Indus. Management, vol. 1, no. 15, May 22, 1919, pp. 458-459, 1 fig. Arrangement of site and general layout.

Machine-Tool Plant

Organization and Management of a Machine Tool Plant. Machy (Lond.), vol. 14, no. 347, May 22, 1919, pp. 213-219, 11 figs. Principles of management discussed in case of medium-size machine-tool manufacturing plant making single line of machines. First article.

Machinery Selection

Continental Plant Layout Facilitates Production—II, J. Edward Schipper. Automotive Industries, vol. 40, no. 22, May 29, 1919, pp. 1168-1173, 11 figs. Exemplifying machines used to facilitate production. Deals with semi-automatic compound machine in piston department, said to be capable of turning and grooving 100 pistons per hour.

Office Management

Application of Scientific Principles to Office Management, Walter D. Fuller. Bul. Taylor Soc., vol. 4, no. 3, June 1919, pp. 8-15 and (discussion), pp. 15-28. Method of procedure adopted by Standardization Division of Curtis Publishing Co. It includes provision for paying employees extra for all production above a determined standard at a fixed rate.

Output Restriction

Industrial Efficiency from the Psychological Standpoint—IV, Charles S. Myers. Eng. & Indus. Management, vol. 1, no. 14, May 15, 1919, pp. 427-429. Factors which may bring about a restriction of output. Question is discussed with reference to causes arising both from side of employer and that of employee. (Concluded.) Lecture delivered at Imperial College of Science & Technology.

Planning

High Production Tooling Methods as Applied to the Machine-Gun Tripod, Model 1918, Albert A. Dowd and Donald A. Baker. Am. Mach., vol. 50, no. 22, May 29, 1919, pp. 1029-1036. Planning and organization. First article.

A Planning System for Non-Repetition Work. Machy. (Lond.), vol. 14, no. 347, May 22, 1919, pp. 223-225, 4 figs. Nucleus of system proposed for application to ship machinery assembly consists of card index of items and a series of specially prepared sheets made from arrangement drawings of the various systems of machinery and piping in vessel under construction.

Speeding-up Production, John A. Davenport. Eng. & Indus. Management, vol. 1, no. 13, May 8, 1919, pp. 391-394, 8 figs. Working out a time chart and rearranging it, in order to study possibilities for improvement.

Planning the Industrial Plant—I, Hugh M. Wharton. Indus. Management, vol. 57, no. 6, June 1919, pp. 433-437, 4 figs. Discussion of industrial plants as a whole, including general scheme, design, construction, layout and permanent equipment of buildings and yards. Three types of construction are shown and adaptability of each one pointed out. (To be continued.)

Planning a Machine Tool Shop for Systematized Manufacture, Erik Oberg. Machy. (N. Y.), vol. 25, no. 10, June 1919, pp. 905-913, 20 figs. Discussion based upon ideas embodied in plant of R. K. LeBlond Machine Tool Co., Cincinnati.

Production Department

Details of Production Department, M. H. Potter. Iron Trade Rev., vol. 64, no. 22, May 29, 1919, pp. 1410-1412, 7 figs. Method of classifying and checking work at every important stage, with suggested forms of transferring material in course of production.

Progress Department

Planning a Progress Department I & II, W. J. Hiscox, Eng. & Indus. Management, vol. 1, nos. 15 & 17, May 22 & June 5, 1919, pp. 472-474 & 526-528, 3 figs. Illustrating scope for activities of department afforded in manufacture of airplane engines. Forms of record cards.

Promotion

The Three Position Plan of Promotion, Frank B. Gilbreth and L. M. Gilbreth. Eng. & Indus. Management, vol. 1, no. 17, June 5, 1919, pp. 521-523. Emphasizes (1) necessity of attracting desirable applicants, (2) necessity of holding, fitting and promoting those already employed and (3) the interdependence of these two.

Transfer and Promotion of Employees. Iron Age, vol. 103, no. 23, June 5, 1919, pp. 1518-1519. Classifying capabilities and characteristics of workmen for the purpose of effecting transfers and promotions. Report prepared by Transfer and Promotion Committee of Chicago council, Nat. Employment Managers' Assn.

Routing

Where Power Transmission Machinery is made. Foundry, vol. 47, no. 324, June 1, 1919, pp. 325-328, 7 figs. Special attention is given to arrangement of plant for routing of material from pattern shop through foundry and cleaning room into machine shop.

Savings

Savings Facilities for Employees Make for Stability of Organization, Harry Tipper. Automotive Industries, vol. 40, no. 22, May 29, 1919, pp. 1180-1181. Suggests that plan be without taint of paternalism and that workers be allowed freedom of dealing at will with regularly recognized financial institutions.

Scientific Management

The Determination of Standards in Scientific Management, Henry W. Allingham. Eng. & Indus. Management, vol. 1, no. 17, June 5, 1919, pp. 536-540. Claims that much of opposition to scientific management is based upon misunderstanding, and, in a measure, to manner in which it has been advocated. Paper read before Indus. Reconstruction Council.

Scientific Management, with Especial Reference to Incentives and Motion Study, James F. Butterworth. Eng. & Indus. Management, vol. 1, nos. 16 & 17, May 29 and June 5, 1919, pp. 502-505 and 534-535, (6 figs.) 1. Emphasizes particularly adoption of standards throughout works, not only for machinery and tools, but also in method of performance, mnemonic symbols, phrasing on instruction cards, and even standard clothing to be provided by management. II. Henry R. Towne's system of gain sharing, H. L. Gantt's task with bonus system, Gilbreth three rate, with increased rate, F. A. Parkhurst's differential bonus system of compensation and Taylor's differential-rate piece system.

Productive Capacity and Industrial Property, H. L. Gantt. Eng. & Indus. Management, vol. 1, no. 16, May 29, 1919, pp. 487-489, 1 fig. "Idleness expense chart," indicating cost of inefficient management. Based on writer's paper, Efficiency and Democracy (Mech. Eng., Jan. 1919, p. 43), read before Am. Soc. Mech. Engrs.

Skill of Workers and Production

Modern Methods of Transferring Skill, Frank B. Gilbreth and L. M. Gilbreth. Eng. & Indus. Management, vol. 1, no. 18, June 12, 1919, pp. 559-560. After pointing out that increased productivity is usually attempted from angle of longer hours or more rapid rate of production, writers urge instead fundamental necessity of increasing skill of workers.

Telautograph

The Close Control of Steel Processes. Iron Age, vol. 103, no. 24, June 12, 1919, pp. 1569-1571, 3 figs. Uses of telautograph as substitute for telephone communication and transmitting figures and diagrams.

Tool Stores

The Modern Tool Stores, Herbert C. Armitage. Eng. & Indus. Management, vol 1, no. 18, June 12, 1919, pp. 551-553, 6 figs. Arrangement, organization, construction and equipment. (To be continued.)

INSPECTION

Chemicals and Explosives

Inspection of Explosives and Chemicals During the War Period, J. Richardson Donald, Can. Chemical Jl., vol. 3, no. 6, June 1919, pp. 187-191. As carried out for Imperial Ministry of Munitions, Can. Address delivered at Convention of Chemists, Montreal.

LABOR

Clubs

An Employees' Engineering Club, F. O. Wells. Indus. Management, vol. 57, no. 6, June 1919, pp. 443-445. Membership is paid for, dinners are given, speakers are invited in —all for purpose of developing and increasing spirit of organization to deal with technical problems. Plan devised on lines of organization of Am. Soc. Mech. Engrs.

Luxurious Factory Club and Roof Garden. Iron Age, vol. 103, no. 24, June 12, 1919, pp. 1575-1577, 9 figs. All employees are eligible to membership after 30 days in service. Officers and board of directors elected by individual vote of all employees.

Discontent

The Human Side of Engineering, F. Danvers Power. Proc. Australasian Inst. Min. Engrs., no 31, Sept. 30, 1918, pp. 131-144. Following causes of discontent are analyzed: Desire for better ratio between rate of pay and cost of living; bosses whose idea of efficiency is to speed up work and cut down wages; men put to class of work for which they are unsuited; monotony of work and uncongenial surroundings.

Industrial Relations

Relations between Employers and Labour, Evelyn Wallers. South African Jl. of Industries, vol. 2, no. 4, Apr. 1919, pp. 376-380. Question is dealt with more particularly with reference to mining industry. Address delivered before Transvaal Chamber of Mines.

League to Enforce Industrial Peace

A League to Enforce Industrial Peace, L. K. Comstock. Elec. World, vol. 73, no. 22, May 31, 1919, pp. 1164-1167. Tentative legislative program concerning private industry upon which it is proposed to build league.

Radicalism

Humanity and Tolerance will solve U. S. Labor Problems, Harry Tipper. Automotive Industries, vol. 40, no. 25, June 19, 1919, pp 1394-1398. Writer contends that radicals in labor circles have flourished through being opportunists and endeavors to ascertain causes which have produced recent strikes.

Announcement

We are prepared to demonstrate that the Fay Automatic Lathe offers the best known means for performing certain operations on the following automobile, truck, tractor and internal combustion engine parts:

Tractor belt pulleys
Cam shafts
Steering knuckles
Ring bevel gears
Pistons
Transmission Gears
Hubs
Stem pinions, both spur and bevel.

Our practice in machining these parts has been developed by specialized study, experiment and actual experience in the shops of our customers.

The advantages gained relate to labor cost, initial investment, ease of set up and cost of maintenance.

In each case the reasons for superiority are simple and definite, and will be immediately appreciated by the experienced mechanic.

If you are preparing to increase your output of any of the above parts you will find it to your advantage to consult with us.

JONES & LAMSON MACHINE COMPANY

SPRINGFIELD, VERMONT, U. S. A.

109 Queen Victoria Street, London, E. C.

France, Spain and Belgium: F. Auberty & Co., 91 Rue de Maubeuge, Paris
Holland: Spliethoff, Beeuwkes & Co., Rotterdam

SEE OUR DATA IN 1918 A.S.M.E. CONDENSED CATALOGUES OF MECHANICAL EQUIPMENT

Restaurants

Feeding Factory Workers. Iron Age, vol. 103, no. 24, June 12, 1919, pp. 1579-1580, 2 figs. Plan said to be arranged for minimum route from storeroom to serving counters.

Technical Features of Disston Cafeteria, Arthur N. Blum. Safety Engineering, vol. 37, no. 5, May 1919, pp. 247-253, 1 fig. Direct benefits claimed to be derived from industrial restaurants in report drawn by committee appointed by Ministry of Munitions are: (1) marked improvement in health of worker; (2) less sickness; (3) less absence and broken time; (4) less tendency to alcoholism; (5) increased efficiency and output. Plant in Philadelphia is quoted as example of results.

Stock Ownership by Employees

Coming Status of the Employee in Industry, Charles F. Lang. Eng. News-Rec., vol. 82, no 22, May 29, 1919, pp. 1050-1051. Points out advantages of stock ownership by employees, and credits employee with ability to exercise salutary influence upon management of company. From address before Convention of Nat. Machine Tool Builders' Assn.

Temperament

Getting the Employee, Ralph Elsman. Am. Gas Eng. Jl., vol. 110, no. 21, May 24, 1919, pp. 437-438. Believes that temperament is important factor, but which nevertheless has not received sufficient attention from executives of Utility Companies.

Turnover

Principles of Employing Labor, E. H. Fish. Indus. Management, vol. 57, no. 6, June 1919, pp. 478-482. Devoted to non-financial conditions, influences and details of shop policy that causes men to leave and seek work elsewhere. (Concluded.)

Wages

Fundamentals of Wage Payment. Ry. Mech. Engr., vol. 93, no. 6, June 1919, pp. 297-299, 3 figs. Equations and graphs aiming to prove that all systems of labor compensation, including piece work and the various bonus systems, as well as the straight time basis, if properly administered, are nearly equally effective.

My Objections to the Piece Rate Method of Wage Payment—I, Harrington Emerson. Indus. Management, vol. 57, no. 6, June 1919, pp. 470-472. Author discusses practical or immediate objections, administrative or proximate objections, and psychological or ultimate objections.

Women

Attendance and Turnover Records of Women Workers. Automotive Industries, vol. 40, no. 23, June 5, 1919, pp. 1222-1224. Comparison of lost-time factors with male and female operators; effects of illness, hours of labor and idle shop time; value of rest rooms and rest periods. Statistical data are quoted from 115 establishments.

LEGAL

Compensation

Computation of Earnings, Chesla C. Sherlock. Am. Mach., vol. 50, no. 22, May 29, 1919, pp. 1037-1039. Determining for purpose of compensation to injured workman what should constitute annual earning for year preceding accident.

Dependency

The Riddle of Dependency—I & II, Chelsea C. Sherlock. Am. Mach., vol. 50, nos. 25 & 26, June 19 & 26, 1919, pp. 1174-1176 & 1226-1228. Distinguishing between persons whose dependency is conclusively presumed and who have only to establish their relationship to deceased workman to obtain compensation, and those others who must prove their dependency in order to recover.

France

Compilation of Laws, Decrees, Devisions and Other Acts Concerning Mines, Quarries, Sources of Mineral Waters, Steam Apparatus and Operation of Railroads, published under authority of Minister of Public Works (Recueil de lois, décrets, arrêtes et autres actes concernant les mines, les carrières, les sources d'eaux minérales, les appareiks à vapeur et l'exploitation des chemins de fer). Annales des Mines, 11th series, vol 7, Oct. 4 1918, pp. 337-478. Article deals with the last quarter of 1918.

Heating and Ventilation

Heating and Ventilating Plants and Mechanic's Liens, Arthur L. H. Street. Heating & Ventilating Mag., vol. 16, no. 6, June 1919, pp. 32-35. Review of Appellate Court decisions defining circumstances under which security is available. (Concluded.)

Mines and Mining

Abstracts of Current Decisions on Mines and Mining, J. W. Thompson. Dept. of Interior, Bur. Mines, bul. 179, law serial 18, 1919, 166 pp. Report extends over period from September to December 1918. It includes subjects of minerals and mineral lands, quarry operations, damages for injuries to miners, interstate commerce and explosives.

LIGHTING

Reconstruction Period

Illumination During the Reconstruction Period, S. E. Doane. Trans. Illuminating Eng. Soc., vol. 14, no. 4, June 10, 1919, pp. 209-214. Sees problems for near future as largely educational.

Shops

Shop Illumination (L'éclairage dans les usines), Jacques Deschamps. Technique Moderne, vol. 10, no. 9, Sept. 1918, pp. 413-417, 8 figs. Technical study with reference to selection of type of lamp and reflector and determination of total lighting power required in works.

RECONSTRUCTION

Machinery, American

Business Outlook for American Industry, Frederick H. Payne. Indus. Management, vol. 57, no. 6, June 1919, pp. 465-468. Particularly in machinery building and metal-working.

Municipal Engineering

Municipal Engineers and Problems of Reconstruction, E. J. Elford. Surveyor, vol. 55, no. 1427, May 23, 1919, pp. 379-380 and (discussion) pp. 380-381. Labor-saving appliances and cost reduction. Paper read before Instn. Mun. & County Engrs.

Social Reconstruction

Social Reconstruction. Survey, vol. 42, no. 10, June 7, 1919, pp. 402-409. Proposals for Federal Legislation affecting education, civil rights, probation, insurance and pensions, health, country life, conservation, labor, housing, public works, etc. Report of Committee on Nat. Program.

SAFETY ENGINEERING

Accidents, Industrial

The Prevention of Industrial Accidents, H. M. Vernon. Eng. & Indus. Management, vol. 1, no. 16, May 29, 1919, pp. 494-495, 1 fig. From records of four large industrial plants. Lecture delivered before Roy. Soc. of Medicine.

Chemical Compounds

The Chlorates, F. M. Griswold. Safety Eng., vol. 37, no. 6, June 1919, pp. 291-295, 2 figs. Dangers of fire and explosion from chemical compounds. Suggestions and references to accidents.

Dust

Health Risks from Dust caused by Buffing, Polishing and Grinding Metals, John Roach. Safety Eng., vol. 37, no. 5, May 1919, pp. 236-243, 3 figs. Relation between vitality and normal lung function illustrated by respiration during average workday in terms of expenditure of energy; thus it is said that respiration during average workday corresponds to lifting 7 tons 1 ft.

Grain Dust Explosions and Fires, David J. Price. Safety Eng., vol. 37, no. 6, June 1919, pp. 296-300, 1 fig. Direct appeal to workmen and the results.

Fencing

The Silent Watchman Over Industry. Iron Trade Rev., vol. 64, no. 25, June 19, 1919, pp. 1609-1612, 6 figs. Quotes from experience of protecting industries during war time and considers question of protecting them in peace times in light acquired by experience in war.

Fire Protection

San Francisco's High Pressure Fire Service. Mun. Jl. and Public Works, vol. 46, no. 25, June 21, 1919, pp. 454-455, 4 figs. Formerly maintained as reserve supply, now used as main fire-fighting system.

Private Fire Protection. Mun. Jl. and Public Works, vol. 46, no. 25, June 21, 1919, pp. 449-451. Report of Committee of Am. Waterworks Assn. giving recommendations for installation of private fire devices.

Fire Prevention in the Metal Trades—II, R. E. Sweeringen. Metal Trades, vol. 10, no. 6, June 1919, pp. 261-263. Principles to be observed when installing automatic sprinkler system.

The Fire at Millennium Mills, Victoria Docks Silvertown, London, on January 19th, 1917. A memorandum prepared by Ellis Marsland for "Red Books" of the British Fire Prevention Committee—no. 208, London, 1917, 46 pp., 38 figs. Points out that reinforced-concrete frame remained standing throughout fire said to have been of exceptional severity—without material portion collapsing, while all other materials were practically consumed or destroyed.

Gas Masks

Use of Army Gas-Masks in Atmospheres Containing Sulphur Dioxide, A. C. Fieldner and S. H. Katz. Min. & Sci. Press, vol. 118, no. 23, June 7, 1919, pp. 773-777, 5 figs. Results of tests. Warning is issued against indiscriminate use of gas masks for any and all purposes; poisonous gases used in warfare are chemically active and therefore combine readily with absorbents of mask, but they will easily penetrate mask when present in quantities of 1 or 2 per cent.

Health, Industrial

Industrial Health and Efficiency. U. S. Dept. Labor, Bur. Labor Statistics, bul. 249, Feb. 1919, 374 pp., 20 figs. Final report of the British Health of Munition Workers' Committee, published at request of Council of National Defense, in order to "investigate conditions affecting health and welfare of workers . . . so that the salient features thereof may be made applicable to conditions pertaining in the U. S. A. . . ."

Mine Accidents

Metal-Mine Accidents in the United States during the Calendar Year 1917, Albert F. Fay. Dept. of Interior, Bur. Mines, technical paper 224, 1919, 80 pp. Including supplemental labor and accident tables for the years 1911 to 1917, inclusive.

Power Presses

Safety Practice in Power-Press Work. Am. Mach., vol. 50, no. 25, June 19, 1919, pp. 1177-1184, 29 figs. Discussion and illustrations of various types of guards. From pamphlet published by Nat. Safety Council.

Safety Codes

National Industrial Safety Codes. Safety Eng., vol. 37, no. 5, May 1919, pp. 231-235. Proposal for an American Standards Association. Report of Committee of Three, appointed by conference on industrial safety codes at Bureau of Standards.

Transmission Machinery

Safety Precautions for Transmission Machinery. Eng. & Indus. Management, vol. 1, no. 13, May 8, 1919, pp. 398-402, 12 figs. Based upon reports by Home Office inspectors of dangerous trades.

TRANSPORTATION

Army Terminals

Army Supply Bases Useful Adjuncts to Railroads. Ry. Age, vol. 66, no. 26, June 27, 1919, pp. 1809-1812, 6 figs. Adapting port and terminal facilities made necessary by war to peace-time conditions.

Rural Motor Express

Development of Rural Motor Express, F. W. Fenn. Can. Engr., vol. 36, no. 24, June 12, 1919, pp. 539-541. Including statements in regard to motor-truck performances. Paper read at Can. Good Roads Congress.

Trucks, Electric

Electric Trucks and Transportation, E. E. Laschum. Elec. Rev., vol. 74, no. 23, June 7, 1919, pp. 931-933. Operating data of American Railway Express Co.

EXPORT

Brazil

Entering the Latin American Markets, Percy F. Martin. Eng. & Indus. Management, vol. 1, no. 15, May 22, 1919, pp. 474-476. Opportunities offered by Brazil.

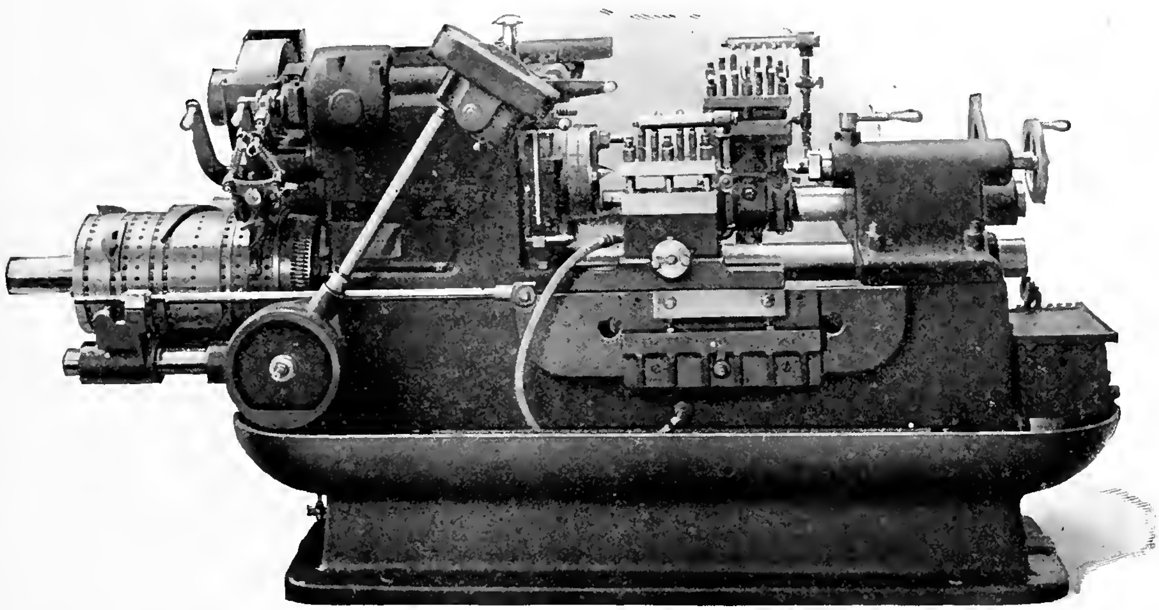
Europe

American Machine Tools in Many Markets, L. W. Alwyn-Schmidt. Am. Mach., vol. 50, no. 24, June 12, 1919, pp. 1135-1137. Survey of European field.

Payment for Exports

Export of Industrial Products, Edward Prizer. Am. Mach., vol. 50, no. 24, June 12, 1919, pp. 1130-1132. Establishes that U. S. A. must learn to take foreign stocks and bonds and share interest in local enterprises, in payment of her exports. Paper read before Sixth Nat. Foreign Trade Convention.

The Fay Automatic Lathe



An automatic machine for simultaneous turning, facing and shouldering cuts on bar stock and centered forgings, such as pinion shafts, steering knuckles, cam shafts, etc.

An automatic machine for second operations on work held on centered arbors, such as spur and bevel gear blanks, hubs, pulleys, etc.

Designed with strength and driving power to carry all the tools, speed, and feed the work will stand under balanced cuts.

Jones & Lamson Machine Company

SPRINGFIELD, VERMONT, U. S. A.

Electrical Engineering

ELECTROCHEMISTRY

Electrolytic Dissociation and Duplex Affinity

The Theory of Duplex Affinity, Samuel Henry Clifford Briggs. Jl. Chem. Soc., vols. 115 & 116, no. 678, Apr. 1919, pp. 278-291. Its application to electrolytic dissociation. It is said that the cause of electrolytic dissociation is combination of solute and solvent by means of unsaturated secondary affinity.

ELECTRODEPOSITION

Metal Plating

Metal Plating, W. G. Knox. Metal Indus., vol. 17, no. 6, June 1919, pp. 269-271. Tables indicating time required to deposit a given thickness of metal.

ELECTROPHYSICS

Electromagnetic Wave Absorption

The Absorption of Electromagnetic Waves on Two Parallel Wires (Über die Absorption elektromagnetischer Wellen an zwei parallelen Drähten), W. Arkadiew. Annalen der Physik, vol. 58, no. 2, 1919, pp. 105-138, 12 figs. On two parallel wires writer obtained pure, damped electric waves of 72.7 to 1.27 cm. in length. Energy of waves decreases on account of absorption according to exponential law. Method was worked out for measuring the absorption coefficient. Tables.

Electrostatic and Magnetic Fields

On a Reciprocal Relation Between the Electrostatic Fields of Certain Distributions of Electricity and the Magnetic Fields of Corresponding Uniform Currents, A. Gray. Lond., Edinburgh, and Dublin Phil. Mag., vol. 37, no. 221, May 1919, pp. 472-480, 4 figs. Establishes various reciprocal theorems of coaxial circles.

Oscillations, Electrical

Electrical Oscillations Under the Action of Any Given Forces (Oscillations Electriques sous l'action de forces données de forme quelconque), John R. Carson and J. B. Romey. Revue Générale de l'Electricité, vol. 5, no. 20, May 17, 1919, pp. 715-717. With reference to theory of propagation of current in telephone and telegraph lines, writers show that it is possible to take as fundamental solution either that relating to the case when acting forces are of exponential form or that in which a constant force is suddenly introduced in a circuit.

Overvoltage, Hydrogen

Hydrogen Overvoltage, Duncan A. MacInnes and Leon Adler. Proc. Nat. Acad. Sciences, vol. 5, no. 5, May 15, 1919, pp. 160-163, 2 figs. Concerning fluctuation observed by writer while determining overvoltage of small electrodes of "platinized" platinum.

Parallel Cylindrical Conductors

Electrical Theorems in Connection with Parallel Cylindrical Conductors, Alexander Russell. Proc. Phys. Soc. Lond., vol. 31, part III, Apr. 15, 1919, pp. 111-130, 5 figs. Relations connecting three capacity coefficients when cylinders are external to one another.

Vector Diagrams

Vector Diagrams of Some Oscillatory Circuits Used with Thermionic Tubes, W. H. Eccles. Proc. Phys. Soc. Lon., vol. 31, part III, Apr. 15, 1919, pp. 137-150, 8 figs. Vector diagrams used in study of a.c. circuit applied to assemblage made up of oscillator, the thermionic relay maintaining it in oscillation and the devices linking these two parts.

FURNACES

Booth-Hall Furnace

The Booth-Hall Electric Furnace, W. K. Booth. Can. Foundryman, vol. 10, no. 6, June 1919, pp. 142-145, 7 figs. Conducting-hearth electric furnace having auxiliary electrode for starting and automatic control.

California

Electric-Steel Furnaces in California. Metal Trades, vol. 10, no. 6, June 1919, pp. 245-247, 3 figs. Héroult furnace practice. First article.

Heat-Treating Furnaces

Electric Furnaces for Heat-Treating and Shrinkage, A. M. Clark. Metal Trades, vol. 10, no. 6, June 1919, pp. 259-260, 4 figs. Built in sections. Developed by General Electric Company.

Medium Temperature Furnace

How Electric Furnaces are Built. Iron Trade Rev., vol. 64, no. 24, June 12, 1919, pp. 1545-1548, 7 figs. Type developed by Electric Furnace Co., Alliance, Ohio, designed for melting non-ferrous metals and other work not requiring excessive temperature; claimed to be especially suitable for steel treating.

Sahlin Furnace

A New Type of Electric Furnace, Axel Sahlin. Elec. News, vol. 28, no. 11, June 1, 1919, pp. 32-34, 1 fig. Designed with view to embodying advantages of both arc and free-burning arc furnaces. Paper read before Instn. Elec. Engrs.

A New Type of Electric Furnace, Axel Sahlin. Electrical Review, vol. 84, no. 2165, May 23, 1919, pp. 591-593, 6 figs. General principle of furnace described is solid hearth which becomes conductive of electricity when hot. Furnace is built as circular ladle with contracted top and dished bottom. Abstract of paper read before Instn. Elec. Engrs.

GENERATING STATIONS

Ance, France

Ance Hydroelectric Station of the Compagnie Electrique de la Loire et du Centre (L'usine hydro-électrique de l'Ance de la Compagnie électrique de la Loire et du Centre), Jacques de Soucy. Revue Générale de l'Electricité, vol. 5, no. 19, May 10, 1919, pp. 689-700, 14 figs. Attention is directed to controlling devices which permit connecting 14,800 kw. to network of company, or else dividing it into various units which are separately connected to other steam or hydroelectric power houses. (Concluded.)

Brule River

Brule River Hydro-Electric Development, C. V. Seastone. Power, vol. 49, no. 22, June 3, 1919, pp. 842-845, 4 figs. Three-unit plant generating three-phase 60-cycle current at 6600 volts. Vertical shaft turbines operate under approximate head of 60 ft.

Buenos Aires

Generating and Distributing Stations of Buenos Aires (Les nouvelles installations de production et de distribution d'électricité de Buenos Aires.) Bulletin Technique de la Suisse Romande, vol. 45, no. 10, May 17, 1919, pp. 85-89, 4 figs. Three turbo-alternators of 5000 kv. each are used. (To be continued.)

Denver

New Electric Generating Station at Denver, T. O. Kennedy and H. H. Kerr. Elec. Eng., vol. 53, no. 6, June 1919, pp. 253-255, 3 figs. Enlarged by installing a 12,500-kw. 4000-volt General Electric turbo-generator.

Genoa

Electric Traction in Italy (La grande trazione elettrica in Italia). Industria, vol. 33, no. 8, Apr. 30, 199, pp. 232-236, 4 figs. Central thermo-electric station of the state railways at Genoa.

Individual Stations

Ontario Power Co.'s Plant Extension, H. A. Gardner. Eng. World, vol. 14, no. 11, June 1, 1919, pp. 27-31, 9 figs. Enlargement consisted of installation of third conduit, parallel to the two existing conduits and additional occupational space constructed in old power house.

G. E. C. Plant at the Winchester Corporation Power House. Electricity, vol. 31, no. 1492, June 13, 1919, pp. 367-368, 4 figs. Installation of 450-kw. geared d. c. turbine generator.

Dominion Power and Transmission Co.'s Plant. Contract Rec., vol. 33, no. 21, May 21, 1919, pp. 469-471, 6 figs. Also Elec. News, vol. 28, no. 12, June 15, 1919, pp. 25-27, 5 figs. Designed for ultimate capacity of 75,000 kva. and to deliver its output at 44,000 volts. Special attention is given to coal-handling and boiler-house equipment. Generators are of revolving field type, direct-connected to steam turbine and of 12,500 kva. each.

Power Factor

Increasing the Power Factor (Relevement du facteur de puissance), B. Guerschinovitch. L'Industrie Electrique, vol. 28, no. 646, May 25, 1919, pp. 184-187. Transformers. (Concluded.)

Turbo-Electric Stations

Economic Operation of Turbo-Electric Stations.—I. & I. C. T. Hirshfeld and C. L. Karr. Universal Engr., vol. 29, nos. 4 and 5, Apr. and May, 1919, pp. 33-37, and 27-33, 5 figs. Graph given shows water-rate curves for various relations of load and steam consumption and different station loads. Asserts that smallest thermal cost of auxiliary power is secured when generated by steam with complete absorption in feedwater.

AUXILIARY EQUIPMENT

Switches

New Features in Switch Construction (Neuerungen im Weichenbau), E. Borst. Annalen für Gewerbe & Bauwesen, vol. 84, no. 4, Feb. 15, 1919, pp. 38-40, 6 figs. Compares advantages and disadvantages of spring tongue and pivot switches.

GENERATORS AND MOTORS

Air Gap and Ball Bearings

The Use of Ball Bearings for Electrical Machinery, H. M. Trumbull. Power House, vol. 12, no. 8, June 5, 1919, pp. 222-224, 10 figs. Points out that ball bearings enable builder to use smaller air gap.

Boosters

On Harada's Booster (In Japanese), K. Harada. Denki Gakkwai Zasshi, no. 370, May 10, 1919.

Commutation

How Spacing and Thickness of Brushes Affect Commutation, Warren C. Kalb. Power, vol. no. 25, June 24, 1919, pp. 970-972, 9 figs. How spacing, alignment and thickness of brushes may cause circulating currents to flow in armature windings and thereby develop poor commutation.

Commutation Troubles—H. F. Ashton. Mech. World, vol. 65, no. 1690, May 23, 1919, p. 244. Using copper dampers in rotary converters.

Emcol Motor

The "Emcol" Motor. Elecn., vol. 82, no. 22, May 30, 1919, pp. 619-621, 7 figs. Said to provide a greatly increased cooling surface, amounting in some cases to ten times the effective area as compared with the ordinary totally enclosed motor.

Fan Motors

The Development of Fan Motor Windings, E. W. Denman. Elec. Jl., vol. 16, no. 6, June 1919, pp. 257-260, 10 figs. With reference to advantages of split-phase winding.

Fires in Generators

Generator Fires. Power Plant Eng., vol. 23, no. 12, June 15, 1919, pp. 547-550, 4 figs. Means of minimizing occurrence and limiting extent of damage. From report of Committee on Elec. Apparatus. read before Nat. Elec. Light Assn.

Generators, Large

Reinsulation of Large Generators. Elec. World, vol. 73, no. 25, June 21, 1919, pp. 1316-1318, 1 fig. To provide against interrupted service during period of heavy winter. Practice of Milwaukee Elec. Ry. & Light Co.

Features of Mammoth Waterwheel Generator. Elec. World, vol. 73, no. 22, May 31, 1919, pp. 1156-1158, 4 figs. Method of construction employed in one of the 32,500-kva. generators which are being built for Niagara Falls Power Co.

Induction-Motor Magnetizing Current

Calculating Induction-Motor Magnetizing Current, C. M. Laffoon. Elec. World, vol. 73, no. 24, June 14, 1919, pp. 1258-1262, 25 figs. Equation connecting magnetomotive force and effective magnetizing current, and magnetizing currents for polyphase induction motors are calculated from relation between counter electromotive force, flux and magnetomotive force.

The Design of Large Induction Motors for Steel Mill Work, H. L. Barnholdt, Elec. Jl., vol. 16, no. 6, June 1919, pp. 251-255, 9 figs. Success in this industry attributed to continuity of service which alone electricity is capable of giving over long periods of time.

Mill-Type Motors

Direct Current Mill-Type Motors for Steel Mill Auxiliary Drives, J. D. Wright. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 323-331, 19 figs. Compares details of construction of enclosed-frame and open-frame type motors, and furnishes information concerning ratings, brushes, bearings, and poles of various sizes of motors.

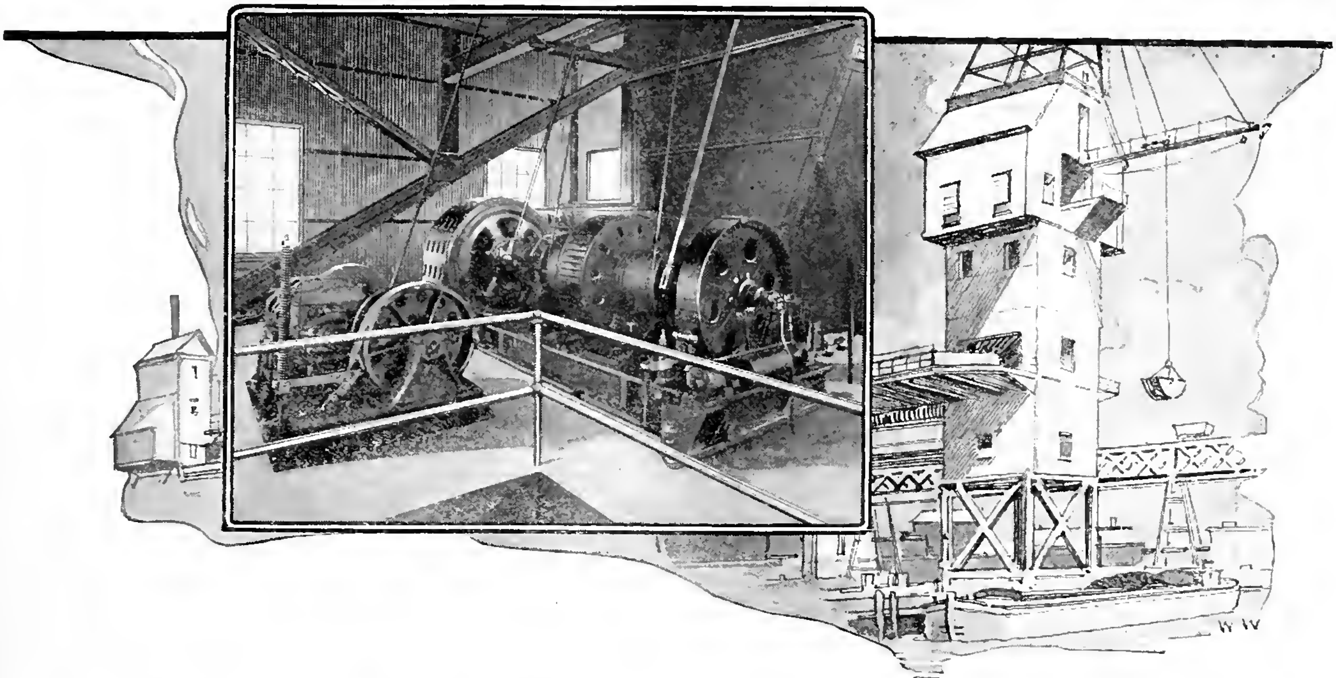
Mine-Type Motors

Mine-Type Motors, L. C. Mosley. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 348-351, 8 figs. Distinctive features claimed are: Heavy construction and mounting of back-gear bracket on stator frame.

Rating

The Continuous-Rated Motor and Its Application, L. F. Adams. Sci. Am. Supp., vol. 87, no. 2268, June 21, 1919, pp. 398-400. Interpretation of the A. I. E. E. standardization rules as applied to motors.

Electric power equipment is handling coal under the greatest natural handicaps, faster and at less cost than is possible with steam engines.



Over 100-foot lift of two-ton bucket for three round-trips per minute

AT the Baltimore Consolidated Gas, Electric Light and Power Company this hoist can handle a two-ton bucket with a vertical lift of 115 feet at the rate of three round-trips per minute. This is a capacity in excess of anything which has been claimed for similarly constructed steam-operated towers. It has been made possible by designing a motor with low fly-wheel effect, to permit rapid starting, stopping and reversing.

In applying electrical apparatus to coal and ore handling equipment, our engineers study the detailed requirements of each builder's machine, and co-operate to bring out its best individual features.

General Electric Company

General Office **Schenectady, N.Y.**

43-217

Regulation

Regulation Without Loss of Energy of Three-Phase Motors in Rolling Mills (Ueber den derzeitigen Stand der Frage der verlustlosen Regelung von Drehstrom-Walzenzugmotoren). H. Hermans. Elektrotechnische Rundschau, vol. 36, nos. 3-4, Jan. 22, 1919, pp. 9-10, 2 figs. Refers to various methods of regulation with special reference to the three-phase-commutator motor which can be regulated by changing the turning force of the rotating field, by displacing the brushes on the commutator, or by changing the rotor tension.

Ship-Propulsion Motors

The New Mexico's Motors, A. D. Badgley. Gen. Elec. Rev., vol. 22, no. 4, Apr. 1919, pp. 255-260, 8 figs. Single winding used to give variable poles with 2.3 speed ratio. Motors are cooled by forced draft. Ratio of rotor diameter to length, largely reduced from usual practice.

Synchronous Motors

The Synchronous Motor as a Means of Reducing Costs, Rob. Treat. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 407-412, 7 figs. It is claimed that under usual conditions where induction motors on a circuit have lowered its power factor, the addition of a properly selected synchronous motor will improve service and increase power capacity.

Thermionic Tubes in D. C. Motor

A Small Direct-Current Motor Using Thermionic Tubes Instead of Sliding Contacts, W. H. Eccles and F. W. Jordan. Proc. Phys. Soc., Lond., vol. 31, part III, Apr. 15, 1919, pp. 151-153, 1 fig. Rotating part is ebonite disk with iron teeth on its periphery and stationary part comprises two electromagnets with their poles close to two teeth.

IGNITION APPARATUS

Bureau of Standards

Ignition Work at the Bureau of Standards, Francis B. Silsbee. Automotive Industries, vol. 40, no. 24, June 12, 1919, pp. 1294-1299. Investigation has included brief study of effects of various types of spark discharge upon power developed by gasoline engine. Conclusions have been drawn in regard to condition of temperature and voltage at which a spark plug is required to operate.

Break

Notes on the "Break" of a Magneto or Induction-Coil, Norman Campbell. Lond. Edinburgh, and Dublin Phil. Mag., vol. 37, no. 221, May 1919, pp. 481-494, 2 figs. Experiments extending over various ranges of speed mentioned as demonstrating that greatest current which can be broken without sparking is independent of speed of separation of contacts.

LIGHTING AND LAMP MANUFACTURE

Argon Lamps

Argon Lamps (Du régime de fonctionnement électrique des lampes au tungstène en atmosphère d'argon), H. Pecheux. Revue Générale de l'Electricité, vol. 5, no. 19, May 10, 1919, pp. 683-686. Influence of voltage excess on luminous intensity, with study of variations of characteristic coefficient of filaments in terms of nature of filaments and, for a given material, in terms of time during which it is subjected to action of current.

Buildings

The Lighting of Buildings. Eng. & Contracting, vol 51, no. 22, May 28, 1919, pp. 568-573. From an architectural point of view.

Colored Lights in Fog

Transmission of Colored Light through Fog, C. L. Utterback. Trans. Illuminating Eng. Soc., vol. 14, no. 3, Apr. 30, 1919, pp. 133-140 and (discussion) pp. 140-145, 2 figs. Measurements made are interpreted as indicating that an automobile light, or any searchlight, will have maximum transmission through fogs if light is composed of wave lengths from 5,300 to 5,900 only.

Engine-Terminal Lighting

Illumination of Toledo & Ohio Central Engine Terminal at West Columbus, O., R. E. Rice. Ry. Rev., vol. 64, no. 23, June 7, 1919, pp. 815-816, 2 figs. Flood lighting system adopted for illumination of adjacent yards.

Industrial Lighting

Selecting Equipment for Industrial Lighting, J. Ward Harrison and H. H. Magdsick. Elec. World, vol. 73, no. 25, June 21, 1919, pp. 1319-1321, 5 figs. Problems of color and elimination of glare. Technical data concerning lamps.

Lamp Operation and Maintenance

Data on Lamp Operation and Maintenance, C. H. Shepherd. Elec. World, vol. 73, no. 23, June 7, 1919, pp. 1215-1216, 2 figs. Data secured of system at Lincoln Park, Chicago, indicate that life of lamps depends greatly on switching in circuit.

Lighting Codes

Present Status of Industrial Lighting Codes, G. H. Stickney. Trans. Illuminating Eng. Soc., vol. 14, no. 4, June 10, 1919, pp. 153-171 and (discussion), pp. 172-208, 5 figs. Also Am. Architect, vol. 115, no. 2268, June 11, 1919, pp. 835-836. Writer looks with apprehension on laws or regulations emanating from the professions whose business they affect most directly. He claims that investigation and experience indicate need of Government regulation for factory lighting. Codes adopted in various States and in Federal establishments are discussed. Location of controlling switches. Bibliography.

Mercury-Arc Tube

Mercury Arc Tube Operation, R. W. Kidd. Jl. Electricity, vol. 42, no. 11, June 1, 1919, pp. 527-528, 3 figs. Diagram of connections and remarks on care required by apparatus.

Street Lighting

A Modern Ornamental Street Lighting System, Wm. O. Kleine. Am. City, City Edition, vol. 20, no. 6, June 1919, pp. 535-537, 5 figs. Cast iron standards about 13 ft. 4 in. high carrying 600 c-p. Mazda C lamps used in Cincinnati.

MEASUREMENTS AND TESTS

Alternator Testing

Alternator Testing Under Reduced Power (Essai à puissance réduite des alternateurs), M. Togna. Revue Générale de l'Electricité, vol. 5, no. 22, May 31, 1919, pp. 779-787, 22 figs. Method for determining magnetization and short circuit diagram by generalization of diagrams of Potier and Blondel.

Axle Generators

How One Road Tests Its Axle Generators, J. Doornbein. Ry. Elec. Engr., vol. 10, no. 6, June 1919, pp. 169-171, 5 figs. Testing equipment of Grand Trunk Ry., which is said to have been designed to operate under all varying conditions of speed, stop and reversals, the same as in actual operation.

Meters

A Method of Calibrating Meters, H. Gewecke and W. von Krukowski. Elecn., vol. 82, no. 23, June 6, 1919, pp. 644-645, 1 fig. Method by which revolutions of disk are automatically recorded. From Elektrotechnische Zeitschrift, no. 36, 1918.

Installation and Testing of Primary Meters, Halbert R. Thomas. Elec. World, vol. 73, no. 23, June 7, 1919, pp. 1212-1214, 3 figs. More attention is believed to be demanded at present time than formerly because tendency is to supply large consumers with energy at 2,200 volts, metering on the primary side.

Phase Rotation

Power Factor and Phase Rotation, Leslie F. Curtis. Jl. Electricity, vol. 42, no. 11, June 1, 1919, pp. 530-533, 8 figs. Suggests laboratory methods for determining phase rotation of voltages, phase position of currents and effective power factor.

Radiometer

An Application of the Radiometer to the Measurement of Electric Current, Thomas D. Cope. Jl. Franklin Inst., vol. 187, no. 6, June 1919, pp 734-744, 3 figs. Experiments are said to have established usefulness of instrument in measuring currents.

Voltameters

The Richards Form Silver Voltameters, Jūichi Obata. Researches of Electrotechnical Laboratory, Tōkyō, Japan, no. 76, May 1919, 21 pp., 4 figs. Richards voltameters using least permeable porous-cup septum compared with Smith form; latter reported to have given heavier deposit (about 2 parts in 100,000) than Richards. Cause of difference attributed to effect of anode liquid and not to electrostenolysis.

MATERIALS OF CONSTRUCTION

Mica

Raw Materials Needed in Electrical Industries—Mica (De quelques matières premières nécessaires à l'industrie électrique: mica), Désiré Pector. Revue Générale de l'Electricité, vol. 5, nos. 19, 20 and 21, May 10, 17 and 24, 1919, pp. 701-706, 735-740 and 769-771. Deposits in Africa, America and Oceania. Notes compiled from various official publications. Dielectric properties; extraction and preparation. Combination with various substances for making insulator. Prices quoted at various markets of the world. (Concluded.)

Paper and Cloths

On Deterioration of Insulating Papers and Cloths (In Japanese), R. Mitsuda. Denki Gakkwai Zasshi, no. 370, May 10, 1919.

POWER APPLICATIONS

Agriculture

Electrical Plowing and Mechanical Agriculture in France. Elec. Rev., vol. 74, no. 24, June 14, 1919, pp. 985-987, 4 figs. Description of equipment and comparison of costs of plowing by gasoline engine and electric motor. From Revue Générale de L'Electricité.

Centrifugal-Machine Drive

Centrifugal Machines and their Adaptability to Electric Motor Drive, H. W. Rogers. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 413-420, 9 figs. Formulæ and curves offered as help in selecting proper motor for a given installation.

Heating

Experience with Electric Heating in the Northwest, J. D. Ross. Jl. Electricity, vol. 42, no. 12, June 15, 1919, pp. 566-568. Data presented as part of testimony before Idaho Public Utilities Commission in connection with study of economical generation of electric energy.

Heating of Buildings by Electricity, V. H. Greisser. Jl. Electricity, vol. 42, no. 12, June 15, 1919, pp. 564-566, 2 figs. Data of possibilities in electric heating for homes and office buildings; prepared by Washington Water Power Co.

Electricity in Household Service, H. C. Hoyt. Gen. Elec. Rev., vol. 22, no. 3, Mar. 1919, pp. 156-195, 55 figs. Illustrating various uses in lighting, supplying power for driving domestic utilities and heating and cooking.

Melting

Application of Electrical Energy to the Melting of Metals, W. A. Greaves. Eng. & Indus. Management, vol. 1, no. 15, May 22, 1919, pp. 462-464, 8 figs. Induction furnace is not considered as commercially satisfactory, owing to loss in efficiency caused by metal being in form of ring, which is said to bring about extremely high heat losses.

Oil Wells

The Operation of Oil Wells by Electric Power and the Resulting Gain to the Oil Producer, W. G. Taylor. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 384-394, 20 figs. Safety, reliability and convenience mentioned as advantages. Tables of comparative costs are presented.

Paper Mills

Electrification of Paper Mill Finishing-room Machinery, W. T. Edgell, Jr. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 399-406, 13 figs. Results obtained by Strathmore Paper Co., Woronoco, Mass.

Rod and Wire Mills

Electricity in the Making of Copper Wire. Jl. Electricity, vol. 42, no. 12, June 15, 1919, pp. 569-570, 3 figs. Rod and wire mill of Anaconda Copper Mining Co. with capacity of 100,000 lbs. of rods and 50,000 lbs. wire every 8-hour shift.

Soaking Pits

Electric Soaking Pits and Furnaces, T. F. Bailey. Blast Furnace & Steel Plant, vol. 7, no. 6, June 1919, pp. 264-267, 1 fig. Labor saving, precision of treatment produced and elimination of rejection of parts due to defective heat treatment. Paper read before Am. Iron and Steel Inst.

Steel Mills

Electric Drive for Steel Mill Main Rolls, K. A. Pauly. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 308-322, 23 figs. Examples of various installations with tables indicating characteristics of units employed.

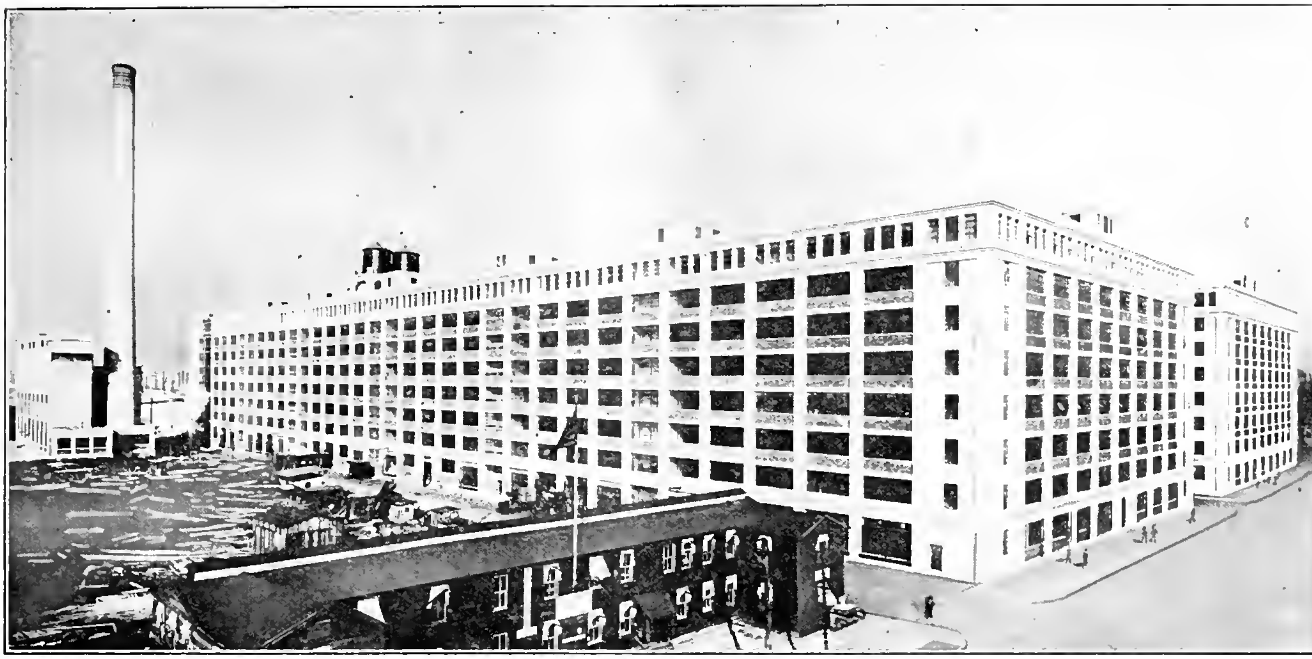
Transportation

Use of Electrical Equipment on San Francisco Water Front, Charles W. Geiger. Elec. Rev., vol. 74, no. 24, June 14, 1919, pp. 977-981, 4 figs. Methods of operating electric trucks, tractors, conveyors and piling machines to relieve traffic.

STORAGE BATTERIES

Lead Storage Batteries

On Lead Storage Batteries (In Japanese), J. Iwashiro. Denki Gakkwai Zasshi, no. 370, May 10, 1919.



U. S. Naval Supply Base, South Brooklyn, N. Y.

equipped with three Green's Fuel Economizers.
Turner Construction Co., Contractors.

U. S. Government Saving Money

BY USING

GREEN'S FUEL ECONOMIZERS

The economizers are grouped in three units, one being installed above each battery of two 440 H. P. boilers.

They raise the temperature of the incoming heating returns and make up water 100° F. under boiler pressure, insuring the highest practical feed temperature.

The fuel which would otherwise be used for heating this water in the boilers is saved and the ultimate steaming capacity is materially increased.

Power plant equipment that passes the rigid specification and tests by the U. S. Navy is safe for you to buy. Millions of boiler horse-power equipped with Green's Fuel Economizers are the best proofs of their reliability and high fuel economy established in public service, institutional and industrial plants.

Our engineers will be pleased to furnish full details regarding their application to your boiler plant. Write.

THE GREEN FUEL ECONOMIZER Co.
BEACON, N. Y.

TELEGRAPHY AND TELEPHONY

Radio

Antennæ

Radiation and Direction of Field of Certain Types of Unenclosed Antennæ (Die Strahlung und Richtwirkung einiger Luftdrahtformen im freien Raum), W. Burstyn. Jahrbuch der drahtlosen Telegraphie und Telephonie, vol. 13, no. 5, Jan. 1919, pp. 362-378. Radiation characteristics of various forms for different directions in space.

Quantitative Experiments with Coil Antennas in Radio-telegraphy, L. W. Austin. Jl. Wash. Acad. Sciences, vol. 9, no. 12, June 19, 1919, pp. 335-339. Equations show that, other things being equal, if an antenna be used, both for sending and receiving, the received current falls off as the wave length, while if one coil be used, it falls off as the square of the wave length and with two coils as the cube of the wave length.

Audions

See Vacuum Tubes.

Measurements

A New Method of Using Contact Detectors in Radio Measurements, Louis W. Austin. Proc. Inst. Radio Engrs., vol. 7, no. 3, June 1919, pp. 257-259, 1 fig. Based on use of low-resistance shunt across detector and galvanometer and calibration of arrangement using radio frequency currents which can be measured with hot-wire instruments.

Musical Sounds

Emission of Musical Sound in Radio Telegraphy (Note sur un problème d'émission musicale en radiotélégraphie), T. Minohara. Revue Générale de l'Electricité, vol. 5, no. 21, May 24, 1919, pp. 747-752, 4 figs. Technical determination of conditions for producing it.

Oscillations

Electrical Oscillations in Antennas and Inductance Coils, John M. Miller. Proc. Inst. Radio Engrs., vol. 7, no. 3, June 1919, pp. 299-326, 12 figs. After considering theory of circuits having uniformly distributed constants, writer shows graphically frequency-variation of reactance of such circuits and, after further analysis, those of inductance-loaded and capacity loaded antennas.

Poldhu Wireless Station

Great Wireless Stations, Poldhu. Wireless World, vol. 7, no. 73, Apr. 1919, pp. 1-5, 5 figs. Plant is rated at 75 kw.; normal transmitting wave length is 2,800 meters and the daylight range is given as 1,800 miles.

Poulsen

On the Poulsen Arc and Its Theory, P. O. Pedersen. Proc. Inst. Radio Engrs., vol. 7, no. 3, June 1919, pp. 293-297, 2 figs. Continuing discussion of sustained oscillation of the first or second type produced by Poulsen arcs (see roc. Inst. Radio Engrs., vol. 5, no. 4, p. 25) writer derives approximate value of peak voltage required for maintenance of such oscillations.

Receivers

Radiotelegraphic Receivers of the Italian Navy (Ricevitori radiotelegrafici della R. Marina), G. Vallauri and G. de Luigi. Elettrotecnica, vol. 6, no. 13, May 5, 1919, pp. 254-258, 5 figs. Description of three types used by Italian Navy.

The Possibilities of Concealed Receiving Systems, A. Hoyt Taylor. Proc. Inst. Radio Engrs., vol. 7, no. 3, June 1919, pp. 261-266, 2 figs. Closed 3-meter square loop of 16 turns of wire hung about 1.5 meters from ground, said to have given good service for reception from stations as distant as 3,000 miles.

Static

Reception through Static and Interference, Roy A. Weagant. Proc. Inst. Radio Engrs., vol. 7, no. 3, June 1919, pp. 207-244 and (discussion) pp. 245-256, 31 figs. Effect produced by static (stray) considered and Eccles classification of static as "grinders," "clicks" and "hissing" adopted.

Weagant's Anti-Static Invention—II, Elmer E. Bucher. Wireless Age, vol. 6, no. 10, July 1919, pp. 11-21, 25 figs. Experiments made with two loops, each consisting of a single turn of wire extending out from station and back again, as measure to overcome troubles incident to use of loops with long low leads; forms of Weagant's antennæ.

Telephone Transmitters

Wireless Telephone Transmitter for Seaplanes. Wireless Age, vol. 6, no. 9, June 1919, pp. 14-19, 7 figs. Flying Boat type S. E. 1,100, developed by American Marconi Co. for navy use during war.

Telephony

Recent Progress of Wireless Telephony (Sur les recents progès de la téléphonie sans fil), C. Gutton. Bulletin de la Société Française des électriciens, vol. 9, no. 80, May 1919, pp. 323-332, 6 figs. In Europe and in the U. S. A.

Trees

Tree Telephony and Telegraphy, George O. Squier. Jl. Franklin Inst., vol. 187, no. 6, June 1919, pp. 657-687, 13 figs. From experiments it is concluded that a growing tree is a highly organized piece of living earth which can be used in the same manner as the earth is used now as a universal conductor for telephone, telegraph and other electrical purposes.

Vacuum Tube

Cascade Amplification by a Single Vacuum Tube. Wireless Age, vol. 6, no. 10, July 1919, p. 23, 2 figs. Principle of operation is: Input e.m.f. is impressed between first section of cathode and its associated input element, and serves to vary discharge from cathode section to another electrode which is maintained positive with respect to cathode section.

The Three-Electrode Audion Lamp as Amplifier in Ordinary Telephony (La lampada a tre elettrodi (Audion) come ripetitore-amplificatore nella telefonia ordinaria), G. Marchesi. Elettricista, vol. 8, no. 10, May 15, 1919, pp. 73-77, 6 figs. Account of research undertaken by various experimenters.

External-Anode Vacuum Tube, H. P. Donle. Elec. World, vol. 73, no. 23, June 7, 1919, pp. 1204-1206, 9 figs. Filament, control electrode and anode are disposed as follows: Filament is surrounded by control electrode which consists of helical coil of drawn tungsten wire; these two elements are the only ones inside tube, anode being a silver coating applied directly to outside of vacuum tube on that portion surrounding filament and control electrode.

Wire

Cables

Accelerating Operation of Submarine Cables (Exploitation accélerée sur les longs câbles sous-marins). Revue Générale de l'Electricité, vol. 5, no. 22, May 31, 1919, pp. 802-804, 3 figs. Heurtley amplifier. German account of British apparatus. Translated from Archiv für Post und Telegraph.

Ocean Cable Receiving Instruments. Telegraph & Telephone Age, no. 11, June 1, 1919, pp. 255-258, 4 figs. Wiring diagrams of Gulsted relay, Brown "drum" relay and Heurtley magnifier.

Induction, Self-

Regarding the Propagation of High-Speed Telegraph Signals on Lines with Increased Self-Induction (Über die Fortplanzung schnelltelegraphischer Zeichen auf Leitungen mit vergrösserter Selbstinduktion), Ragnar Holm. Archiv für Elektrotechnik, vol. 7, nos. 9 and 10, Feb. 17, 1919, pp. 263-292, 6 figs. Discussion of formulæ on hand of curves. The law of reflection of a coil. Main equations for pupinized lines.

Measurements

On Measurement of Signal Strength, W. H. Eccles. Proc. Inst. Radio Engrs., vol. 7, no. 3, June 1919, pp. 257-280, 11 figs. "Shunted telephone" method for measuring audibility of received signals.

Relays

Relays Used in Taansoceanic Telegraphy (Relais employés en télégraphie sous-marine), J. B. Pomey. Revue Générale de l'Electricité, vol. 5, no. 22, May 31, 1919, pp. 797-801, 7 figs. With remarks on resonance relays.

Telephones, Service

The Telephone Service of Large Cities, with Special Reference to London, E. A. Laidlaw and W. H. Grinstead. Electrical Review, vol. 84, no. 2165, May 23, 1919, pp. 641-643. While holding as true that subscriber's estimate of telephone service is only criterion of satisfactory service, writer points out, however, certain factors inherent to human deficiencies of operators and concludes that there is a limit in exactness which can be expected from equipments of manual type.

TRANSFORMERS, CONVERTERS, FREQUENCY CHANGERS

Converter, Cabot

The Cabot Converter, Claude F. Cairns. Proc. Inst. Radio Engrs., vol. 7, no. 3, June 1919, pp. 281-291, 4 figs. Describes combination of a few-phase primary and many-phase secondary transformer and a secondary circuit commutator driven by a synchronous motor.

Transformer Connections

Parallel Running of Transformers Fed from the Same System or from Different systems (La pratique de la mise en parallele des transformateurs alimentes par le meme reseau ou par deux reseaux), B. Guerschinovitch. L'Industrie Electrique, vol. 28, no. 645, May 10, 1919, pp. 164-167, 4 figs. Tests required when connecting two systems in parallel. (Concluded.)

The Essentials of Transformer Practice—XXIII, E. G. Reed. Elec. Jl., vol. 16, no. 6, June 1919, pp. 267-268, 3 figs. Curve showing how vector sum of currents in two transformers connected in parallel compares to numerical sum with variable phase angle between currents.

Transformer Costs

Cost Comparison of Transformer Types, B. C. Dennison. Elec. World, vol. 73, no. 22, May 31, 1919, pp. 1152-1155, 5 figs. Comparison between five types of single-phase transformer designed from same specifications. It is concluded that for any type of transformer the design for dimensions that will reveal a given rating at minimum cost should be based upon (1) ratio of core section to coil section, (2) ratio of height of opening to width of opening, and (3) ratio of core depth to core width.

Transformer Dimensions

The Numerical Solution of the Equations of Transformer Dimensions, A. R. Low. Elecn., vol. 82, no. 24, June 13, 1919, pp. 671-673, 3 figs. Reduction of conditions for minimum loss with given output and cost found by application of Lagrange's method and outlined in Elecn., Nov. 15, 1918.

TRANSMISSION, DISTRIBUTION, CONTROL

Arresters, Electrolytic

Experiences with Electrolytic Arresters. Elec. World, vol. 73, no. 24, June 14, 1919, pp. 1269-1272, 5 figs. Tests at 110 stations of Southern California Edison Company are interpreted as indicating need of giving particular attention to condition of horn gaps, film and electrolyte, oil, and line and ground connections.

Cable Characteristics

High-Tension Single-Conductor Cable for Polyphase Systems, W. S. Clark and G. B. Shanklin. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 6, June 1919, pp. 663-715, 24 figs. Dielectric, inductive and general line characteristics of three-conductor and single-conductor cable are compared. It is asserted that line voltages of 44,000 and 55,000 are perfectly practical and mean a saving in copper over three-conductor cable of as much as 70 per cent.

Cables, Underground and Overhead

Underground and Overhead Alternating Current Maximum Power Cables (Unterirdische und oberirdische Wechselstrom-Hochstleistungskabel), W. Kummer. Schweizerische Bauzeitung, vol. 73, no. 19, May 10, 1919, pp. 213-216, 3 figs. Discusses advantages and disadvantages of overhead and underground cables, with special reference to advantages of underground cables as per technical data of Dr. Paul Humann.

Condensers, Synchronous

Notes on the Application of Synchronous Condensers to Large Power Systems, G. V. Adendorff. Trans. South African Inst. Elec. Engrs., vol. 10, part 3, Mar. 1919, pp. 33-43, and (discussion) pp. 43-48, 5 figs. and supp. plate. Rotary condenser treatment is held to be necessary only in such cases where original design of generating plant has not been specified to type of demand it has to meet.

Distribution, Factory

The Electrical Equipment of H. M. Factory, Gretna, A. S. Cross. Electrical Review, vol. 84, no. 2167, June 6, 1919, pp. 652-654, 6 figs. Lighting, performance and distribution. High-tension supply fed to eight substations extending about 4½ miles from power house over two overhead systems situated 150 ft. apart. (Concluded.)

Electrolysis

Electrolysis and Modern Cable Construction, W. W. Walsh. Assn. Iron & Steel Engrs., Apr. 1919, pp. 7-24 and (discussion) pp. 24-32, 1 fig. General conclusions drawn from study of case in which pipe is considered as running parallel to track, in which case potential between rails and pipe is considered as positive at end farthest from power house, polarity being reversed in region adjacent to power house.

Feeders

Losses in Feeders (Pertes dans les feeders), W. Vuillemier. Bul. Technique de la Suisse Romande, vol. 45, no. 9, May 3, 1919, pp. 7-8 and 80. Graphs for determining ohmic and induction losses. Percentage of losses is consid-

The Taylor Stoker

–more than a "Stoker"

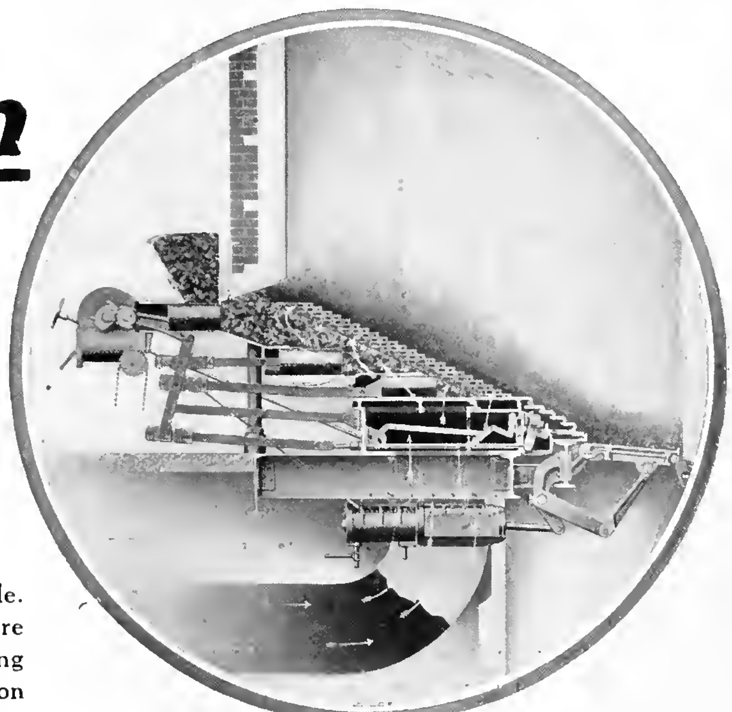
A Complete SYSTEM of Scientific Combustion

How the

Taylor System

meets the 6 basic demands of boiler plant efficiency:

3-Utmost Simplicity



The Taylor Stoker is remarkably rugged and simple. There are no moving parts in the fire. There are only 4 mechanical elements—(A) a series of sloping passages, called retorts. (B) a series of cast-iron tuyere boxes and tuyeres, (C) a series of low-moving rams for feeding and distributing the coal, (D) a dump plate, hand or power operated. To burn any given **grade** of coal, or meet any given **steam demand**, you simply regulate the rate of coal feeding and the forced draft, so that they are correctly proportioned. In this way, it is a simple matter to jump Taylor-Stokered boilers quickly from 50 to 300% of rating. And to clean the fire (while running) simply move the levers controlling the dump plates and get a CLEAN dump in 20 seconds. The Taylor Stoker is **simple.**

Send for the new Taylor Stoker Catalog, Engineers' Edition

THE 6 DEMANDS

When the American Smelting and Refining Co. of Omaha, Neb., installed Taylor Stokers, these were their six boiler plant requirements:

1. Continuous operation
2. Minimum Labor
3. Utmost simplicity
4. Ready Accessibility
5. Maximum capacity
6. Provision for future plant growth

How Taylor Stokers meet these demands is told in this series of advertisements.

ÆCO

American Engineering Company

Philadelphia

Foreign Licensee: Babcock & Wilcox, Ltd., Oriel House, Farringdon Street, London, England

The TAYLOR System of Scientific Combustion **The Taylor Stoker**

ered as varying inversely with square potential and directly with power.

Grounding

Grounding the Neutral of Generating and Transmission Systems, H. R. Woodrow. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 6, June 1919, pp. 745-749, 4 figs. Admitting his experience has shown that stresses on cables are relieved materially by grounding, writer, however, further believes that it is desirable to limit this grounding current as much as possible, thereby, he says, reducing stresses on system and particularly burning of lead sheath on grounding connections.

Interconnection

Interconnection of California Power Systems, P. M. Downing. Power Plant Eng., vol. 23, no. 13, July 1, 1919, pp. 580-582, 2 figs. Divided into a northern and a southern group of connected lines. Map indicating scheme of connections is presented.

Phase

Three-Phase Four-Wire Distribution, G. E. Wagner. Power Plant Eng., vol. 23, no. 11, June 1, 1919, pp. 507-510, 7 figs. Discussion of possible advantages and disadvantages and suggestions in regard to preventing troubles.

The Electrical Properties of Three-Phase Transmission lines, E. Parry. New Zealand Jl. of Sci. & Technology, vol. 2, no. 2, Mar. 1919, pp. 127-150, 3 figs. Tables applicable to sizes of conductors generally employed for transmission line work.

Power Transmission Practice

Power Transmission, H. B. Vincent. Jl. Engrs. Club of Philadelphia, vol. 36, no. 175, June 1919, pp. 220-227, 9 figs. General study of problems and obstacles confronting operating man whose function is to provide continuity of service on high-tension power transmission lines. Paper read before Assn. Iron & Steel Elec. Engrs.

Relay Protection

Transmission Line Relay Protection, H. R. Woodrow, D. W. Roper, O. C. Traver and P. MacGahan. Proc. Am. Inst. Elec. Engrs. vol. 38, no. 6, June 1919, pp. 631-662, 19 figs. Summary of replies received from 32 operating companies by Protective Devices Committee of Am. Inst. Elec. Engrs., in answer to questionnaire asking for their experience and present practice in regard to relay protection.

Substations

900 Kw. Substation, installed in 3-phase, 5,250 Volt, 50 Cycle Network of the Compagnie d'Electricité de Marseille (Poste de 900 kw. installé sur les canalisations triphasées, 5,250 v. 50 p:sec. de la Compagnie d'Electricité de Marseille), A. Racapé. Revue Générale de l'Electricité, vol. 5, no. 21, May 24, 1919, pp. 757-768, 7 figs. General plan and details of installation.

A Novel City Substation, Roy R. Kime. Elec. Eng., vol. 53, no. 6, June 1919, pp. 260-263, 4 figs. By reason of station being located in thickly populated New York district, dimensions of floor plan are only 24 ft. x 100 ft., although building is to contain 12,500 kva. of electrical apparatus.

Switchgear

European High-Voltage Switchgear, W. A. Coates. Elec. Jl., vol. 16, no. 6, June 1919, pp. 243-248, 13 figs. Pointing out particularly difference between British designs and those of Continental Europe. While in Great Britain transmission voltages over 15,000 to 20,000 are rarely needed, on the Continent there are in operation systems working at pressures up to 110,000 volts.

Transient Phenomena

The Effect of Transient Voltages on Dielectrics II. The Effect of Lightning Voltages on Arrester Gaps, Insulators and Bushings on Transmission Lines, F. W Peek, Jr. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 6, June 1919, pp. 717-744, 17 figs. It is concluded that there is a great difference in the relative lightning spark-over voltages of different gaps as well as in the settings imposed by operating conditions, and it is advised that both of these factors be considered in comparing relative protective values.

Transmission-Line Surveys

The Location of Long-Distance Electric Transmission Lines, G. F. Anderson. New Zealand Jl. of Sci. & Technology, vol. 2, no. 2, Mar. 1919, pp. 95-108, 7 figs. Methods which are said to have been found necessary in field and in office in order to expedite work of surveying and of plotting results.

WIRING

Hotel

Electric Service in World's Largest Hotel — II. Elec. World, vol. 73, no. 22, May 31, 1919, pp. 1159-1163, 7 figs. Electric laundry installation; details of wiring on portion of a guest-room floor.

Mines

Wiring at Mines, Jack L. Ball. Coal Age, vol. 15, no. 23, June 5, 1919, pp. 1040-1041, 1 fig. It is suggested that wiring of mine be installed with as much care as in a residence, factory or similar building. This, it is said, will contribute to securing better results and large measure of safety.

Pulling Conductors Into Conduits

Pulling Conductors into Conduits, Terrell Croft. Power, vol. 49, no. 22, June 3, 1919, pp. 846-848, 10 figs. Discusses various matters and offers suggestions in regard to precautions to observe during work.

Standardization

Industrial Maintenance and Rehabilitation Methods, E. E. George. Elec. World, vol. 73, no. 22, May 31, 1919, pp. 1167-1170, 2 figs. Arguments for use of 115 volts direct-current supply instead of 230 volts; savings affected by standardization of methods and materials.

Wire, Insulated

Insulated Conductors in Relation to Cheap Wiring, C. Beaver. Elecn, vol. 82, no. 24, June 13, 1919, pp. 679-680, 2 figs. Describes method of manufacturing twin wire for circular section in which a central strip of vulcanized rubber insulates wires.

VARIA

Electromagnets and Solenoids

The Construction of 120- and 240-Volt Electromagnets and Solenoids, Henry W. Townsend. Power, vol. 49, no. 23, June 10, 1919, pp. 888-890, 6 figs. Data are given of construction of a number of 120- and 240-volt electromagnets and solenoids.

Lightning Protection

Protecting Oil Storage Tanks from Lightning Oliver Lodge. Petroleum World, vol. 16, no. 224, May 1919, pp. 198-199; also in Petroleum Times, vol. 1, no. 19, May 17, 1919, pp. 409-410. Attachment of lightning conductors to tanks not considered advisable. It is held that metal tanks, not over-elevated and not specially earthed, with good joints and free from leaks, are safe from lightning. Report of chief of petroeum executive containing views of various owners of petroleum tank installations.

Civil Engineering

BRIDGES

Barriers

Yielding Barriers Close Roads at Drawbridges. Eng. News-Rec., vol. 82, no. 24, June 12, 1919, pp. 1168-1170, 2 figs. Impact of vehicles absorbed by traveling gate to stop motor trucks, and by cables to stop automobiles.

Bascule Bridges

New Bascule Bridge at La Seyne. Engineer, vol. 127, no. 3308, May 23, 1919, p. 502, 10 figs. partly on supplement plates. Lifting truss about 138 ft. long is movable around horizontally placed pin, housed in forward feet of trestle-like structure which is so situated than when truss is in vertical position entrance to harbor is entirely unobstructed.

Caissons

Pneumatic Caissons with Wooden Cylinders for Sinking Bridge Piers. Eng. & Contracting, vol. 51, no. 22, May 28, 1919, pp. 562-564, 3 figs. Pneumatic caisson of pivot pier was octagon 30 ft. on side, and walls consisted of one width of 10 x 10-in. timbers planked outside and inside.

Concrete Bridges

Reinforced Concrete Bridges and Their Architectural Treatment, F. G. Engholm. Cement & Eng. News vol. 31, no. 6, June 1919, pp. 21-23, 2 figs. Writer emphasizes what he terms "error of trying to produce a living structure by using forms associated with other materials."

Safe Stress in Reinforced-Concrete Bridge Arches (Zur Frage der zulässigen Spannungen in Beton-Brückengewölben), A. O. Lasser. Schweizerische Bauzeitung, vol. 73, no. 18, May 3, 1919, pp. 201-205, 4 figs. Compares safe stresses in plain and reinforced concrete. Reference is made to experiments by Bach and Graf. Curves showing breaking load of plain concrete columns and that of columns with 0.5 per cent iron reinforcement.

Delaware River Bridge

The Placement of the Delaware River Bridge, Warren P. Laird. Jl. Engrs. Club of Philadelphia, vol. 36, no. 175, June 1919, pp. 209-219, 9 figs. Based upon investigation conducted by writer as consulting architect to Delaware River Bridge and Tunnel Commission of Pennsylvania and Interstate Bridge and Tunnel Commission of New Jersey.

Electrical Equipment

Electrical Equipments for Movable Highway and Railway Bridges, H. H. Vernon. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 373-383, 31 figs. Equipments applicable to various types of movable span bridges are illustrated.

Genesee River Bridge

Rebuilding the Genesee River Bridge, Lehigh Valley R.R., at Wadsworth, N. Y. Ry. Rev., vol. 64, no. 25, June 21, 1919, pp. 947-950, 5 figs. Total length of structure, about 1311 ft. Reconstruction work is said to have involved purchase of new steel to the total weight of 3,308,000 lb.

Inspection

Points Requiring Special Observation and Investigation in Bridge Inspection, Herbert C. Keith. Eng. & Contracting, vol. 51, no. 26, June 25, 1919, pp. 681-683. Secondary stresses due to large gusset plates, investigation of compression members, decay of timber stringers, corrosion of beams and similar points. Paper presented before Brooklyn Engrs. Club.

Pontoon Bridges

Improved Form of Pontoon Bridge for Public Use. Eng. & Contracting, vol. 51, no. 26, June 25, 1919, pp. 689-691, 5 figs. Bridge over Rhine river composed of 14 sections—two draw sections equipped with steam winches, eight regular fixed sections, and at ends two short ramp sections.

Swing Bridges

Graphic Study of Stresses in Swing Bridges (Swing Bridges. Análisis racional y gráfico de sus resistencias), Rafael Agudelo C. Boletin de la Sociedad Antioquena de Ingenieros, vol. 4, nos. 4-5, pp. 52-63, 13 figs. Illustrates method of Professor F. la Rue by applying it to bridge of 12 spans, each 20 ft. long.

BUILDING AND CONSTRUCTION

Beams

How to Find the Proper Size Steel Beams for various Spans, George E. Thackary, and W. A. Giesen. Building Age, vol. 41, no. 6, June 1919, pp. 183-184. Table showing steel beams required for given span.

Churches

A Reinforced Concrete War Memorial Church. Building News, vol. 116, no. 3360, May 28, 1919, pp. 327 and 334-337, 6 figs. Semi-elliptical vaults of uniform thickness and springing directly from floor level take place of walls and roofs. Method is patented.

Concrete Structures

The Fitting of Machinery, etc. to Ferro-Concrete Structures—III. Mech. World, vol. 65, no. 1690, May 23, 1919, p. 246, 8 figs. Type used in case where it is desired to give light from a floor to a room or compartment below, as in the fore or after peak of vessels. (Concluded.)

Cost

Overhead and Time Cost to Erect Elevated Railway, A. P. Roscoe. Eng. News-Rec., vol. 82, no. 24, June 12, 1919, pp. 1164-1166. Nine hours per ton said to have been required to haul, erect, rivet and paint 13,500-ton structure.

Factories

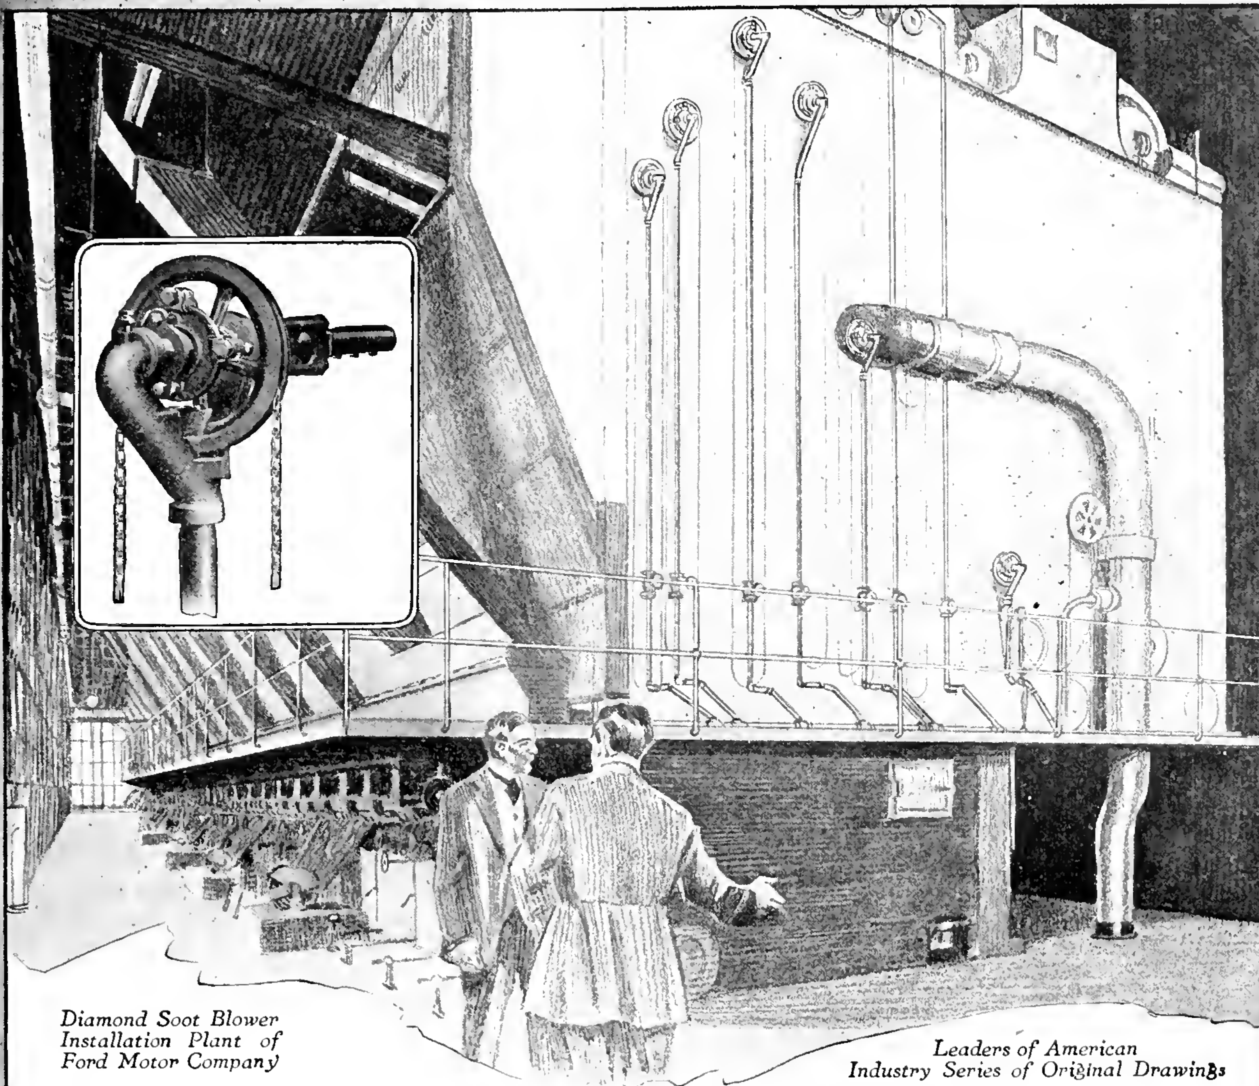
The Building of Factories—IV, Arthur F. Wickenden. Eng. & Indus. Management, vol. 1, no. 17, June 5, 1919, pp. 528-529, 1 fig. Methods of construction; choosing between brick structure with timber or concrete floors and with timber or steel roofs; composite buildings of steel and brickwork, with similar varieties of roofs and floors as above; steel-framed structures; reinforced-concrete buildings.

Foundry

A Model Brass Foundry Building, Charles Vickers. Brass World, vol. 15, no. 6, June 1919, pp. 187-191, 6 figs. Structure providing facilities for comfort of workers both in summer and winter.

Plumbing

Back Venting versus Simplified Plumbing.



Diamond Soot Blower Installation Plant of Ford Motor Company

Leaders of American Industry Series of Original Drawings

Am. Architect, vol. 115, no. 2267, June 4, 1919, pp. 795-804, 6 figs. Various systems are illustrated, notably those in use in U. S. Government buildings and conforming to N. Y. City regulations.

Stacks

Reinforcing Steel Stacks with Gunite Concrete. M. C. Sherman. Power, vol. 49, no. 21, May 27, 1919, pp. 808-809, 4 figs. Work carried out by building reinforcing self-supporting shells around the stacks and then employing cement guns.

Steel Structures

The Design of Steel Structures. Albert S. Spencer. Surveyor, vol. 55, no. 1424, May 2, 1919, pp. 326-327. General remarks on various points which writer advises to consider carefully in applying theory of structures. Paper read before Concrete Inst.

Tanks

Tank Construction—XXVIII. Ernest G. Beck. Mech. World, vol. 65, no. 1692, June 6, 1919, p. 270, 6 figs. Side walls of rectangular tanks. (Continuation of serial.)

Vibrations

Methods of Preventing the Transmission of Vibrations in Buildings. A. B. Eason. Electrical Review, vol. 84, no. 2168, June 13, 1919, pp. 684-685, 7 figs. Suggests that when different materials are being used for supports, hard materials, such as iron, be placed next soft ones, such as felt and cork.

Walls

Wall Construction at Norfolk Army Supply Base by Cement Gun Process. Eng. & Contracting, vol. 51, no. 22, May 28, 1919, pp. 574-575, 4 figs. Over 500,000 sq. ft. of walls, fire stops, roofs, etc., are said to have been built by this process.

Wind Pressure

Wind Pressure on Arched Roofs (Calcul de l'effort du vent dans les toitures en arcs). F. Grua. Genie Civil, vol. 74, no. 22, May 31, 1919, pp. 441-443, 5 figs. Equations.

CEMENT AND CONCRETE

Aggregate Testing

Concrete in Roads, Bridges and Culverts. H. Eltinge Breed. Can. Engr., vol. 36, no. 22, May 29, 1919, pp. 493-495, 1 fig. Recommends that fine aggregate be tested for (1) organic impurities, (2) gradation, (3) mortar strength, and (4) volume of silt or loam.

Tests Do Not Bear Out Surface-Aggregate Method. Duff A. Abrams. Eng. News-Rec., vol. 82, no. 25, June 19, 1919, pp. 1203-1207. Research conducted at Lewis Inst., Chicago.

Grading

The Surface Area and Fineness Modulus Methods of Grading Concrete Aggregates. Duff A. Abrams. Eng. & Contracting, vol. 51, no. 26, June 25, 1919, pp. 673-676. Tests at Lewis Inst., Chicago said to have shown that with given materials and conditions of test, quantity of mixing water determines strength of concrete, so long as (1) concrete is plastic with method of placing used, (2) aggregate not too coarse for quantity of cement used, and (3) mixture not so wet that all water cannot be held by concrete.

Gunite Concrete

See Building and Construction (Stacks, Walls).

Pipe

Concrete Pipe Made and Laid for Winnipeg Aqueduct. Concrete, vol. 14, no. 6, June 1919, pp. 209-213, 16 figs. Eighty-five miles of it built of monolithic concrete and 12½ miles of reinforced concrete pipe.

Portland Cements

Portland Cements (Les Ciments Portland). E. Candlot. Chimie & Industrie, vol. 2, no. 4, Apr. 1, 1919, pp. 371-384, 19 figs. Account of manufacture with reference to practices followed at Roche, Switzerland.

Proportion in Concrete Tests

Tests of Two Recent Theories for Proportioning Concrete. Eng. News-Rec., vol. 82, no. 24, pp. 1142-1147 and (discussion) 1147-1149, June 12, 1919, 6 figs. Fineness-modulus and surface-aggregate methods, both of which depend on water-cement ratio, are said to have been found not to insure necessary workability of mix. Tests were made at U. S. Bureau of Standards

Slag Aggregate

Slag Aggregate in Concrete and Mortar. Em. Mavant. Concrete, vol. 14, no. 6, June 1919, pp. 239-240, 4 figs. Crushing-strength tests made of basic steel slag, limestone and bane rouge as coarse aggregates.

Slag Cement

Manufacture of Cement from Blast-Furnace Slag. Wm. Poole. Proc. Australasian Inst. Min. Engrs., no. 31, Sept. 30, 1918, pp. 81-97 and (discussion) pp. 97-100. Also Queensland Gov. Min. Jl., vol. 20, no. 227, Apr. 15, 1919, pp. 157-161. Processes of manufacturing, (1) puzzolan, (2) slag Portland ceme, (3) iron cement, and (4) special varieties of cement.

Tunnel Lining

Concrete Tunnel Lining by Steam Jet. Ry. Rev., vol. 64, no. 23, June 7, 1919, pp. 818-820, 3 figs. Nozzle car mounted on truck carried by ordinary flat car and controlled by two hand winches.

Underground Work

Use of Concrete in Underground Works. Eng. & Min. Jl. vol. 107, no. 25, June 21, 1919, pp. 1071-1073, 4 figs. Swelling ground and consequent crushing of shaft timbers led to experiment of lining section of shaft with reinforced concrete at mine in South Australia. From Chem. Eng. & Min. Rev.

EARTHWORK, ROCK EXCAVATION, ETC.

Aqueduct

Italian Aqueduct (L'Acquedotto Pugliese), Ingegneria Italiana, vol. 3, no. 57, May 30, 1919, pp. 67-70, 7 figs. Total length 2602 kilometers.

Caissons

Pneumatic Caissons Sunk Through Moving Ground. Eng. News-Rec., vol. 82, no. 24, pp. 1160-1162, June 12, 1919, 4 figs. Constant movement of earth forced contractor to face problem of sinking pneumatic caissons in such a way that allowance could be made for possible movement of ground through which they were to be lowered.

Causeways

Construction of New Arch Section of Galveston Causeway. Eng. News-Rec., vol. 82, no. 25, June 19, 1919, pp. 1190-1192, 7 figs. Centrifugal and jet pumps mounted on derrick platforms. Old causeway walls used for cofferdam.

Dams

Weighing Concrete Materials Saved Cement on Three Big Dams. H. H. Hunt. Cement & Eng. News, vol. 31, no. 6, June 1919, pp. 36-38, 2 figs. Proportioning by weight claimed to have given better concrete with less cement and without loss of speed.

Excavators

United Fuel & Supply Co.'s Plant. Cement, Mill & Quarry, vol. 14, no. 11, June 5, 1919, pp. 13-15, 6 figs. Arrangement used permits separate operation of excavator and main plant.

Reservoirs

Economics of Reinforced Concrete Walls for Uncovered Reservoirs. H. E. Babbitt. Eng. & Contracting, vol. 51, no. 24, June 11, 1919, pp. 618-620, 16 figs. Designs said to be based on factors of safety of two against overturning. Formulæ used for details of walls are given.

Retarding Basin

Delivering Mixed Concrete by Industrial Railway. Paul Teas. Concrete, vol. 14, no. 6, June 1919, pp. 218-221, 6 figs. Constructing retarding basins to prevent recurrence of Dayton's flood of March 1913.

Tunnels

Proposed Vehicular Tunnel under the Hudson at New York. Ry. Rev., vol. 64, no. 25, June 21, 1919, pp. 926-938, 11 figs. From discussion of "The Proposed New York and New Jersey Vehicular Tunnel" at meeting at Am. Soc. Civil Engrs., proc., May.

Tosas Tunnel. Jose M. Fuster. Revista de Obras Publicas, vol. 67, no. 2275 and 2277, May 1 and 15, 1919, pp. 205-210 and 233-237, 13 figs. Shows methods of timbering.

Utilization of Waste Heat of Tunnels. F. J. Postel. Heat & Vent. Mag., vol. 16, no. 5, May 1919, pp. 26-30, 6 figs. Test made at Chicago State Hospital using hot air from pipe-tunnel system.

The Catskill Tunnels—III. Railway Engineer, vol. 40, no. 473, June 1919, pp. 115-118, 6 figs. Bonticou and Eastview tunnels. (Continuation of serial.)

Chicago's Tunnels for Electric Light and Power Cables. G. B. Springer. Elec. Rev., vol. 74, no. 25, June 21, 1919, pp. 1019-1023, 10 figs. Of standard size 6 ft. 6 in. high and 6 ft. wide, top half being semi-circular. Construction methods employed.

Underwater Construction

Underwater Construction of Outshore Launching Ways. E. D. Buel. Eng. News-Rec., vol. 82, no. 23, June 5, 1919, pp. 1121-1123, 3 figs. Speed and economy of work are said to have justified choice of diver method in place of cofferdam construction at Government fabricated shipyard at Bristol, Pa.

MATERIALS OF CONSTRUCTION

Brick, Paving

See Road Materials.

Building Materials

Second Report on the Work of the Underwriters' Laboratories. Am. Architect, vol. 115, no. 2268, June 11, 1919, pp. 829-834, 9 figs., also Safety Eng., vol. 37, no. 4, Apr. 1919, pp. 163-170, 8 figs. Committee was appointed at convention of Am. Inst. of Architects "for the purpose of observing tests made on building materials at the Underwriters' Laboratories at Chicago, and reporting to the architects such data and results as might be of value."

Road Materials

Road Material in New Hampshire. J. W. Goldthwait. Good Roads, vol. 17, no. 22, May 31, 1919, pp. 233-234. Report of State Highway Dept. on materials available with discussion of their value.

What Paving Brick Should Be and Do. C. C. Wiley. Brick & Clay Rec., vol. 54, no. 12, June 17, 1919, pp. 1067-1070, 4 figs. Comparative tests made with monolithic brick road having bottom course of 1:3:5 concrete and with concrete slabs proportioned 1:2:3, are quoted as having demonstrated that equal strength is possessed by such brick and concrete roads.

RECLAMATION AND IRRIGATION

Drainage System, Moore Park

Drainage System for Moore Park, Toronto, W. G. Cameron and R. W. Dickie, Contract Rec., vol. 33, no. 24, June 11, 1919, pp. 541-544, 6 figs., also Can. Engr., vol. 36, no. 23, June 5, 1919, pp. 510-511, 4 figs. About 2,000 ft. of 4 ft. 3 in. and 3 ft. 9 in. two-ring brick sewer laid. Total length, 2,500 ft. Costs of operations quoted, capacity believed to be required was 173 c. f. s.

Irrigation, Egypt and Sudan

Irrigation Schemes in Egypt and the Sudan—II, II and III. Engineer, vol. 127, nos. 3306, 3309 and 3310, May 23 and 30 and June 6, 1919, pp. 497-499, p. 536, and pp. 556-558, 11 figs. Proposed Sennar dam on the Blue Nile. Scheme to effect combination irrigation and protection works. Irrigation schemes in lower Egypt.

ROADS AND PAVEMENTS

Asphalt

A Treatise on Hot Mix Asphalt Pavements, Francis P. Smith. Contract Rec., vol. 33, no. 23, June 4, 1919, pp. 529-534. Remarks on foundation, sub-grade and mineral aggregate requirements. Construction and properties of various types.

Bituminous Pavements

Hot Mix Bituminous Pavements. F. P. Smith. Eng. & Contracting, vol. 51, no. 23, June 4, 1919, pp. 599-601. General considerations regarding foundations. Paper presented before Can. Good Roads Congress.

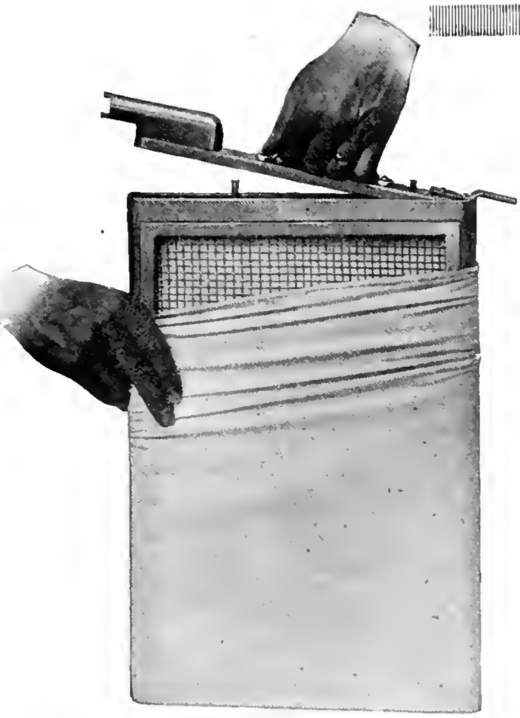
Suggestions for Concrete Pavement Construction. Clyde E. Learned. Mun. Jl. & Public Roads, vol. 46, no. 24, June 14, 1919, pp. 434-436, 2 figs. Based on writer's experience on concrete road construction in Southwest. (To be continued.)

Drainage

Drainage of Roads and Streets—I & II, (Wasserbeseitigung von Strassen und Wegen). Eduard Schneider. Zeitschrift für Transportwesen & Strassenbau, vol. 35, nos. 19 and 20, July 1 and 10, 1918, pp. 219-220 and 231-232, 3 figs. Writer recommends drainage by means of open ditches, where possible, or conduits discharging into a pond built for the purpose.

Financing

Methods of Financing Highway Improve-



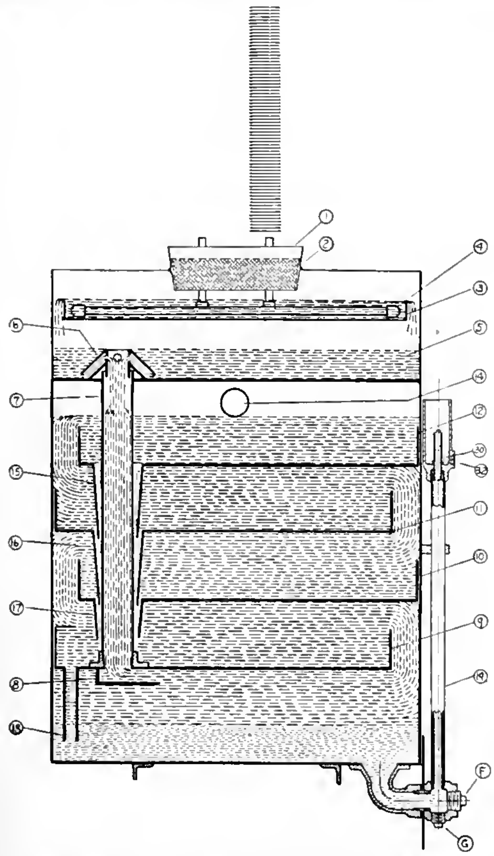
Showing method of placing filter bag over the frame. Note that the edges are smooth, making it easy to slip the bag on and off.

All Impurities Are Removed By A Peterson Power Plant Oil Filter

Look again at the illustrations to the left of this page! Fig. 1 shows a Peterson Filter Unit. There are several in each filter. Each unit can be removed and cleaned in one minute without interfering with the operation of the filter. The Peterson Filter Unit is the most scientifically designed and practical filter unit in the world.

An oil filter is as efficient as its ability to remove entrained water. Figure 2 shows the scientific design of the water separation compartment of the Peterson Oil Filter. All entrained water precipitated from the oil is automatically ejected from the filter.

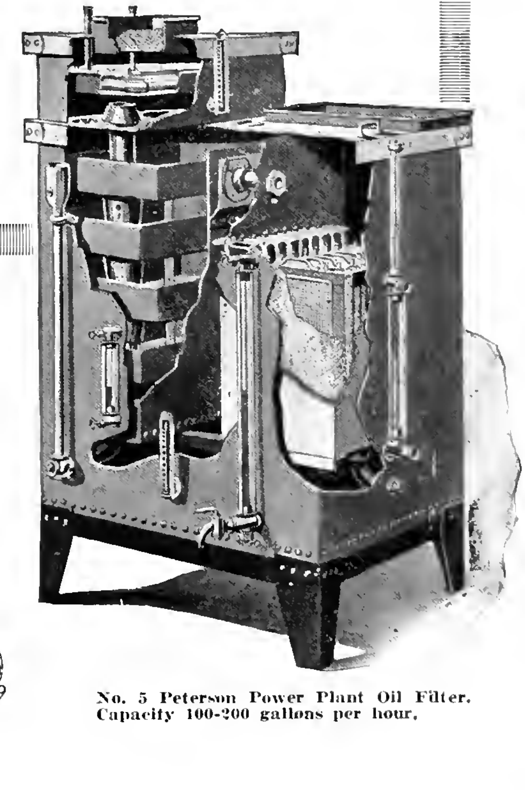
Peterson Power Plant Oil Filters are built in capacities from 100 to 2500 gallons per hour. They are essential for economical and efficient lubrication in the modern power plant.



Cross Section of water precipitation compartment. The separated water collects in the bottom of the different trays and is by-passed directly to the bottom of the precipitation compartment by means of funnels (15), (16), (17) and (18) does not have to come in contact with the traveling oil where it might be picked up again.

The catalog we have prepared for you on this filter is complete in information.

We want to put a copy of it in your hand—just send your address on a postal.



No. 5 Peterson Power Plant Oil Filter. Capacity 100-200 gallons per hour.

THE RICHARDSON-PHENIX CO.

LUBRICATION ENGINEERS AND MANUFACTURERS

WORKS 130 RESERVOIR AVE., MILWAUKEE, WIS.

ments. Eng. & Contracting, vol. 51, no. 23, June 4, 1919, pp. 608-609. Summary of various methods that have been used in this country. From committee report at convention of Am. Road Builders' Assn.

France

War-time Highways of France, John B. Woods. Power Wagon, vol. 22, no. 175, June 1919, pp. 31-32, 3 figs. How they were maintained.

Grading

Grading with Tractors and Heavy Blade Graders. Am. City, Town & Country Ed., vol. 20, no. 6, June 1919, pp. 521-526, 4 figs. Combination said to have proven satisfactory in Wisconsin county road work.

Gravel Roads

The Place and Possibilities of Gravel Roads. Chas. Talbot. Contract Rec., vol. 33, no. 22, May 28, 1919, pp. 509-511. Writer does not consider advisable to screen or in any way attempt to treat ordinary pit gravel.

Surface Treatment of Gravel Roads with Refined Tar, Philip P. Sharples. Good Roads, vol. 17, no. 22, June 7, 1919, pp. 241-242, 2 figs., also Contract Rec., vol. 33, no. 24, June 11, 1919, pp. 550-551, 1 fig. It is reported that with this treatment State highway laid between Kittery and Portland has carried as high as 200 to 2,000 vehicles per day during summer months without requiring too high upkeep costs. Paper presented before Sixth Can. Good Roads Congress.

Gravel Roads, Chas. Talbot. Can. Engr., vol. 36, no. 22, May 29, 1919, pp. 499-502, 1 fig. Specifications of gravel road construction employed in building Middlesex roads in 1854. The surfaces of these roads are said to be still maintained in serviceable condition.

Integraph

Predhumeau-Secretan Integraph (Intégraphe Predhumeau-Secretan), M. Predhumeau. Annales des Ponts et Chaussées, partie technique, vol. 48, no. 1, Jan.-Feb. 1919, pp. 54-76, 9 figs. Apparatus which is said to determine directly profile changes to be effected in road project and extent of work required by construction of embankments and cuts.

Level Raising

Road Building—I, II & III (Strassenbau), Curt Merckel. Zeitschrift für Transportwesen & Strassenbau, vol. 35, nos. 10, 11, 12, Apr. 1, 10, 20, 1919, pp. 111-114, 123-126 and 135-137, 6 figs. Niveau raising. Refers especially to experience of city of Hamburg.

Macadam

Bituminous Macadam Road Construction, A. W. Dean. Am. City, Town & Country Ed., vol. 20, no. 6, June 1919, pp. 517-520, 2 figs., also Good Roads, vol. 17, no. 22, May 31, 1919, pp. 231-232, and Contract Rec., vol. 33, no. 25, June 18, 1919, pp. 566-568. Regulations in regard to drainage, sub-grade, foundation, using dumping platform and patching holes. It is advised that bottom course should not be less than 4 in. in thickness after rolling, and, if heavy loads are to be sustained, a thickness of 6 in. is desirable. Paper read before Can. Good Roads Congress.

Maintenance

Highway Maintenance, J. A. Duchastel. Can. Eng., vol. 36, no. 22, May 29, 1919, pp. 497-499. Advises establishing and continuing system of maintenance beginning from day road has been completed.

Road Machinery

Road Machinery, Arthur H. Blanchard. Good Roads, vol. 17, no. 22, June 7, 1919, pp. 243-245, also Can. Engr., vol. 36, no. 22, May 29, 1919, pp. 502-504, and Eng. & Contracting, vol. 51, no. 23, June 4, 1919, pp. 605-606. Factors on which writer advises selection of equipment. Paper presented at Sixth Can. Good Roads Congress.

Stone Pavement

Building a Stone Road (Die Herstellung des Steinpflasters), George Klose. Zeitschrift für Transportwesen & Strassenbau, vol. 35, no. 17, June 10, 1918, pp. 195-197, 2 figs. Writer claims that replacement of stone pavements by compressed asphalt is for purpose of reducing noise and not because stone pavements are not able to carry increased traffic.

Street Cleaning

Street Cleaning (Strassenreinigung), Zeitschrift für Transportwesen & Strassenbau, vol. 35, no. 10, Apr. 1, 1919, pp. 114-115, 3 figs. The automobile sprinkler and cleaner.

Surfacing

Road Surfacing with Sand Clay from Salt Flats. Eng. & Contracting, vol. 51, no. 23, June 4, 1919, pp. 595-596. Data covering use of sand clay in Aransas County, Tex.

Tarred Roads, Poisoning Streams by

The Poisoning of Fish by Road Washings, W. J. A. Butterfield. Surveyor, vol. 55, no. 1423, Apr. 25, 1919, pp. 307-308. Tarred roads are said to be dangerous to fish life where river runs through valley and is crossed by road which drains from inclines from either side of river.

SANITARY ENGINEERING

Sewer Flushing

The Flushing of Sewers—I, II, & III (Die Spülung der Kanäle), W. Schwaab. Zeitschrift für Transportwesen & Strassenbau, vol. 35, nos. 29, 30 and 31, Oct. 10, 20 and Nov. 1, 1918, pp. 339-342, 351-353, 365-367, 28 figs. Flushing, in order to clean the pipes of slime and mud deposits, requires higher water velocity than that which caused these deposits. Best results are obtained if flushing is done at frequent intervals. In order to keep sewers free of solid waste particles, a constant water velocity of 0.6 to 0.7 m. per sec. is necessary. (Concluded.)

Sewer Pipe

Ground Water Disintegrates Sewer Pipe, Arthur George Dalzell. Contract Rec., vol. 33, no. 23, June 4, 1919, pp. 522-524. Investigations into causes of internal incrustation and scale on machine-made pipes. Paper presented at Can. Nat. Clay Products Conv.

Sewers

Chicago's Standard of Sewer Construction, C. D. Hill. Eng. World, vol. 14, no. 11 and 12, June 1 and 15, 1919, pp. 17-23 and 21-23. With 2467 miles of sewer costing $50,000,000, total cost of maintenance is said to have been $79,000,000, which includes expenditures for new manholes, catch basins and similar items. Considerations made in determining location of relief sewers.

SURVEYING

Geometric Leveling

Geometric Leveling by Dr. Wilhelm Seibt's Method (Nivelación geométrica por el método del Dr. Wilhelm Seibt), Tomás González Roura. Ingeniería, vol. 23, no. 8, Apr. 16, 1919, pp. 516-523. Concerning approximate error of single observation. (Continuation of serial.)

WATER SUPPLY

Brantford

The Brantford Waterworks System. Power House, vol. 12, no. 9, June 20, 1919, pp. 240-244, 9 figs. Mechanical features.

Chlorination

Progress of Water Disinfection in Maryland, Robert B. Morse. Mun. Jl. & Public Works, vol. 46, no. 23, June 7, 1919, pp. 405-407. General description of plants and of results of chlorination. Paper presented before New England Water Works Assn.

Cool-Drinking-Water Systems

Cool Drinking Water Systems, Charles L. Hubbard. Power Plant Eng., vol. 23, no. 11, June 1, 1919, pp. 489-494, 8 figs. Systems in use and data for computing dimensions of equipment, piping, etc.

Factories

What It Pays to Know About Factory Water Supply—IV, Charles L. Hubbard. Factory, vol. 22, no. 6, June 1919, pp. 1165-1168, 7 figs. Concerning amount of water to be heated.

Buffalo Water Supply, with Special Reference to the Filtration Problem, H. F. Wagner. Can. Engr., vol. 36, no. 25, June 19, 1919, pp. 551-552 and 559. Contamination by excursion boats passing near intake crib in Emerald Channel necessitates addition of maximum amount of chlorine at all times. Question is whether under such conditions and after reducing waste to minimum, building of filtering plant should be advisable. Paper read before Am. Water Works Assn.

Filters

Desrumaux Drinking Water Filter of Large Capacity and Automatic Cleaning (Filtres à grand débit et à nettoyage automatique pour l'épuration des eaux potables. Système Henry Desrumaux), A. Bidault des Chaumes. Génie Civil, vol. 74, no. 23, June 7, 1919, pp. 460-461, 6 figs. Turbine rotates sand rakes.

Garages

A Typical Complete Water Supply System for Installation in Garage Basements, J. Albert Deyo. Am. Architect, vol. 115, no. 2269, June 18, 1919, pp. 861-865, 5 figs. Installation of one 6-ft. by 36-ft. pneumatic tank having working capacity of 5,140 gal.

Hamilton

Hamilton Waterworks; Some Features of Design, F. C. Perkins. Power House, vol. 12, no. 8, June 5, 1919, pp. 203-205, 4 figs. High-head electric pumping station with four motor-driven units.

Meters

Reduction of Water Consumption by Means of Pitometer Survey and Constant Inspection, George C. Andrews. Can. Engr., vol. 36, no. 25, June 19, 1919, pp. 555-557. Experiences which led Buffalo Bureau of Water to adopt pitometer work as special department. Paper read at convention of Am. Water Works Assn.

Water Meter Data. Mun. Jl. & Public Works, vol. 46, no. 23, June 7, 1919, pp. 407-421. Tables showing data gathered by means of questionnaire sent out to 450 water-works superintendents. Data deal with location, reading, testing and maintenance of meters.

Study of Revenue from Sale of Water to Metered Domestic Consumer, Philip Burgess. Eng. News Rec., vol. 82, no. 23, June 5, 1919, pp. 1116-1119, 3 figs. New England Water Works Assn. form based on service and output charge.

Sooke Lake, B. C.

Sooke Lake Water Supply, Victoria, B. C., C. H. Rust. Jl. Eng. Inst. Can., vol. 2, no. 6, June 1919, pp. 446-450, 9 figs. Construction of six siphons and necessary concrete trestles, and temporary wooden trestles to carry track is specially taken up in outline of project for utilizing lake, which is 4 miles long and about half a mile wide.

Tastes and Odors

Coal Tar Derivative Waste Products Cause of Obnoxious Taste of Milwaukee Water Supply. Eng. & Contracting, vol. 51, no. 24, June 11, 1919, pp. 629-630. Investigation conducted by Water Works disclosed that taste and odor were not due to use of chlorine alone, but to action of chlorine on some of the organic matter present in polluted lake water, which formed compound producing taste and odor.

WATERWAYS

Coast Erosion

Lake Michigan's Encroachment on its Coast, Hu Maxwell. Sci. Am., vol. 120, no. 26, June 28, 1919, pp. 687 and 699-700, 4 figs. How currents are stealing land from western shore and giving it back at Southern end.

Flood Waters

Impounding Flood-Waters, E. Parry. New Zealand Jl. of Sci. & Technology, vol. 2, no. 2, Mar. 1919, pp. 121-127, 4 figs., partly on supp. plate. Deals only with rise and fall of water level in lake reservoir as flow in river increases and decreases. Charts of h/H for various cases are presented.

Maas Canalization

The Maas Canalization (Eenige mededeelingen over de Maaskanalisatie), F. L. Schlingmann. De Ingenieur, vol. 34, no. 17, Apr. 26, 1919, pp. 305-313, 5 figs. Canalization started 1915 from Linne to Grave; including the Wessen-Nederweert and Maas-Waal canal, the costs were estimated at about $30,000,000, but in writer's opinion this sum will be materially surpassed on account of general rise in prices.

VARIA

Oversea War Work

Civil Engineering in the War, George K. Scott-Moncrieff. Times Eng. Supp., vol. 15, no. 535, May 1919, p. 156. Work overseas.

Salonika, Rebuilding of

The Rebuilding of Salonika. Times Eng. Supp., vol. 15, no. 535, May 1919, pp. 158-159, 1 fig. Project involves expenditure of $100,000.

Mining Engineering

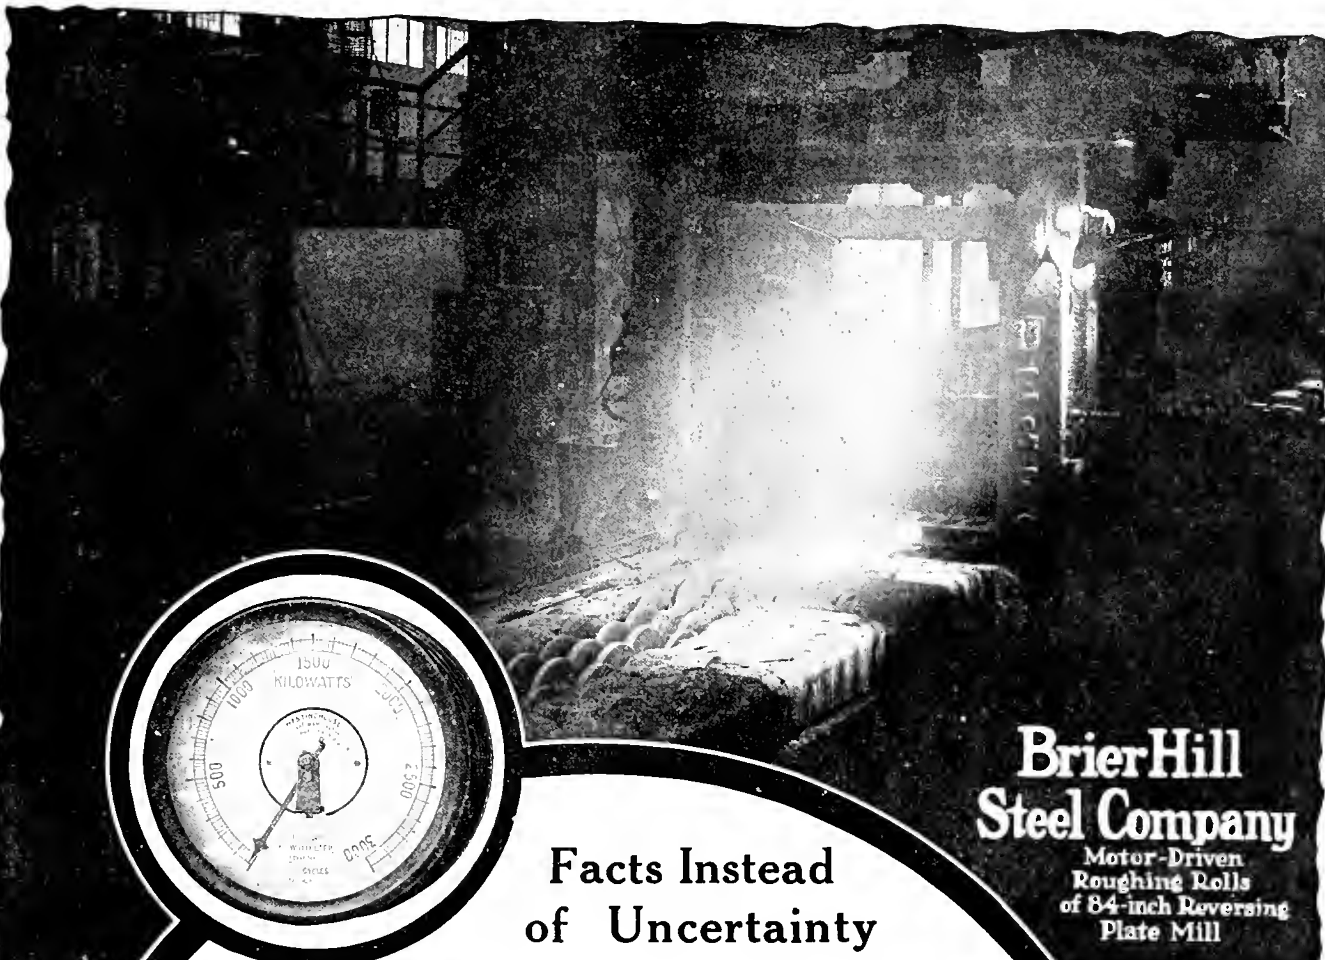
BASE MATERIALS

Bauxite

Bauxite Mining in Arkansas, Tom Shiras. Eng. & Min. Jl., vol. 107, no. 25, June 21, 1919, pp. 1074-1075, 5 figs. Ore comes from ground in pieces weighing from few ounces to several hundred pounds and is crushed to a maximum size of 1½ in.

Limestone

The Chart of the Wreford and Foraker Limestones along the State Line of Kansas



Facts Instead of Uncertainty

In the steam-driven mills, it is difficult accurately to ascertain the cause, or causes, for excessive steam consumption. Hence, wastes are tolerated in a steam plant that are promptly detected and checked in the motor-driven mill.

The electric meter is the most accurate means of measuring power consumption over long periods of time and where load fluctuations are sudden and severe.

The electric meter instantly shows when the mill is taking more power than normally required.

The electric meter warns the roller of friction losses, of inaccuracies in alignment, or of other objectionable conditions, and opens the way to important savings through better care, lubrication and adjustment of the mechanical equipment of the mill.

The benefits, therefore, extend beyond the greater flexibility, adaptability and dependability of the motor-driven roll itself. The improvement in plant operation is general, and directly or indirectly traceable to the superior facilities afforded by electric operation.

Westinghouse engineers will gladly give you the benefit of their broad experience in the solution of any power problem.

WESTINGHOUSE ELECTRIC & MANUFACTURING CO.
East Pittsburgh, Pa.

W
WESTINGHOUSE ELECTRIC

Westinghouse

and Oklahoma, W. H. Twenhofel. Am. Jl. of Sci., vol. 47, no. 282, June 1919, pp. 407-429. Claims that observed facts do not harmonize with theories postulating an origin for these charts consequential to weathering, or one of replacement, or of cavity-filling in solid rocks.

Quarries

Modern Methods at McCook Quarry, William B. Eastwood. Cement, Mill & Quarry, vol. no. 10, May 20, 1919, pp. 11-14, 4 figs. Plant of U. S. Crushed Stone Co. Output is 500 tons of crushed rock per hour.

Labor Saving in Limestone Quarrying, Oliver Bowles. Dept. of Interior, Bur. Mines, War Minerals Investigation Series no. 1, Sept. 1918, 18 pp. Using labor-saving devices. Consideration is given only to methods and type of equipment that are represented as having been tried and approved by quarry operators.

An Electrically-Operated Quarry and Plant for Production of Broken Stone at Gary, Ill. Cement & Eng. News, vol. 31, no. 5, June 1919, pp. 24-26, 5 figs. Electrical operation includes that of loading shovels and haulage system in quarry, and equipment of crushers, rolls, screens and conveyors.

COAL AND COKE

Belgium

Coal Deposits of Belgium (Les Gisements de la Belgique), Armand Renier. Annales des Mines de Belgique, vol. 20, no. 2, 1919, pp. 433-540. Stratigraphic studies of mode of formation. (Third installment.)

Boring

Intensive Boring on the Wonthaggi Coal Field, Victoria, H. Herman. Australasian Inst. Min. Engrs., Proc., no. 32, Dec. 31, 1918, pp. 145-154, 12 figs. partly on 3 supp. plates. Mining under difficulties due to sudden changes in thickness and quality, and presence of dirt bands in seams.

By-Product Plants

Coppee Coal washing and By-Product Coking Installation in Course of Erection at Burnside Colliery. South African Eng., vol. 30, no. 4, Apr. 30, 1919, pp. 66-68, 5 figs. By-product plant designed to deal with gases from 2100 tons of coal per week.

Clarion County, Pa.

Recovering the Neglected Coal Fields, J. O. Durkee. Coal Industry, vol. 2, no. 6, June 1919, pp. 221-224, 4 figs. Deposits in Clarion County, Pa.

Coke Plants

Late Addition to Youngstown Coke Plant. Iron Age, vol. 103, no. 26, June 26, 1919, pp. 1691-1695, 9 figs. Two new batteries, each consisting of 51 Koppers cross-regenerative ovens of 500 cu. ft. capacity.

Mammoth Coke Plant, Frank F. Marquand. Coal Industry, vol. 2, no. 6, June 1919, pp. 224-231, 6 figs. Construction, organization, operation and recovery of by-products at Clairton by-product coke works of Carnegie Steel Co. Paper read before Am. Iron & Steel Inst.

Composition

The Chemistry and Constitution of Coal, A. C. Fieldner. Coal Age, vol. 15, no. 26, June 26, 1919, pp. 1150-1158, 22 figs. Principally from microscopic investigations carried on in Bur. of Mines Experimental Station.

On the Four Visible Ingredients in Banded Bituminous Coal: Studies in the Composition of Coal, no. 1, Marie C. Stopes. Proc. Roy. Soc., Biological Sciences, vol. 90, no. B-633, May 15, 1919, pp. 470-487, 17 figs. partly on separate plates. Concerning macroscopic and microscopic recognition and separation of Fusain, Durain, Clarain and Vitrain bands.

Costs, Mining

Anthracite Mining Costs, R. V. Norris. Coal Age, vol. 15, no. 25, June 19, 1919, pp. 1124-1128, 5 figs. Based on reports for six months, Dec. 1917 to May 1918 inclusive, as compiled by Federal Trade Commission.

Electrical Apparatus

Routine Examinations and Testing of Colliery Electrical Apparatus, L. Fokes. Colliery Guardian, vol. 117, no. 3043, Apr. 25, 1919, pp. 953-955, 4 figs. Divides general examination under headings of (1) power house, (2) transformers, (3) motors, and (4) cables, and offers suggestions to accomplish each of these.

Formation

The Formation of Coal, J. D. Kendall. Can. Min. Inst. Bul., no. 86, June 1919, pp. 600-606, 5 figs. Writer presents arguments in support of his theory that coal has been produced from woody matter that was drifted into position by water and afterward altered by pressure, heat and chemical change in its present substance. (To be continued.)

Geology

The Geology and Economics of Coal, J. R. Finlay. Eng. & Min. Jl., vol. 107, no. 22, May 31, 1919, pp. 945-950. Geological aspects of coal formation, occurrence and location of peat swamps, extent of existing deposits and main features of coal-forming period; statistics on coal consumption and distribution.

Kent Coalfields

The Evolution and Development of the Kent Coalfield, A. E. Ritchie. Iron & Coal Trades Rev., vol. 98, nos. 2672, 2673 and 2674, May 16, 23 & 30, 1919, pp. 665, 700-701, and 735-736, 2 figs. From 1913-1918. From 1907-1918. Establishment and growth of South Eastern Coal Field Extension, Ltd. Plan showing comparative positions of the Greensand and Hastings strata and the "junction" sand bed at three important points of the coalfield.

Mixing Plant

Coxton Coal Mixing Plant, Lehigh Valley R.R. Ry. Rev., vol. 64, no. 24, June 14, 1919, pp. 885-887, 4 figs. General plan and elevation. Plant mixes bituminous and anthracite silt.

New South Wales

The Coal Industry of New South Wales, A. A. Atkinson. Proc. Australasian Inst. Min. Engrs., no. 31, Sept. 30, 1918, pp. 41-70 and (discussion) pp. 71-80. "Bord and pillar" is adopted method of working, removal of coal effected by aid of electrically-operated coal-cutting machines and ventilation produced by means of exhaust fans.

Preparation

Preparation of Bituminous Coal—I, III, IV & V, Ernst Prochaska. Coal Age, vol. 15, nos. 21, 23, 24 & 25, May 22, June 5, 12 & 19, 1919, pp. 943-945, 1030-1035, 1080-1085, and 1118-1122, 19 figs. Writer believes that for best results final screening should be done after washing. Chart showing comparative efficiency of different types of washers. Size of jig screen, comparative size of plunger, length of plunger stroke, rapidity of stroke and thickness of jigging bed considered as factors that influence efficiency in washing. Methods of drives, apparatus for discharge of products and arrangement of jigs.

Pyrites

Coal Pyrite Resources of Tennessee, E. A. Holbrook and Wilbur A. Nelson. Coal Age, vol. 15, no. 24, June 12, 1919, pp. 1077-1079, 3 figs. Experiments are believed to have indicated that pyrite occurring in coal may be commercially extracted.

Sealing Up

Sealing Up Old or Abandoned Workings in Gaseous Mines, C. Thompson. Coal Age, vol. 15, no. 25, June 19, 1919, pp. 1110-1111. Method proposed for securing proper ventilation. Paper presented before Ill. Min. Inst.

COPPER

Blast Furnaces

Exit the Blast Furnace, Oliver E. Jager. Min. & Sci. Press, vol. 118, no. 25, June 21, 1919, pp. 843-844. Disadvantages that have been urged against blast and reverberatory furnaces under Anaconda conditions.

Monel Metal

Monel Metal and Its Uses, Hugh R. Williams. Iron Age, vol. 103, no. 26, June 26, 1919, pp. 1703-1704, 2 figs. Chemical composition is nickel 67 per cent, copper 28 per cent, and other elements 5 per cent (latter chiefly iron from original ore, and manganese, silicon and carbon added during process of refining metal matter).

Native Copper

Native Copper and Silver in the Nonesuch Formation, Michigan, Keijiro Nishio. Economic Geology, vol. 14, no. 4, June 1919, pp. 324-334, 6 figs. Their association with carbonaceous matter in sandstone explained by reaction of acetylene gases or like gases upon metallic solutions.

Deposits of Native Copper in Arctic Canada, J. J. O'Neill. Min. & Sci. Press, vol. 118, no. 24, June 14, 1919, pp. 807-811, 5 figs. Outlines conditions to be met in carrying out examination of deposits, such as (1) means of access, (2) amount of time available for actual work, together with time consumed in travel and enforced idleness, (3) climate and general working conditions.

GEOLOGY AND MINES

Brecciation

Brecciation in the Niagara Limestone at Rochester, New York, Albert W. Giles. Am. Jl. of Sci., vol. 47, no. 281, May 1919, pp. 349-354, 2 figs. Attributed to irregular cavities distributed through strata.

Chester Emery Mine

Famous Mineral Localities: The Chester Emery Mine, Earl V. Shannon. Am. Mineralogist, vol. 4, no. 6, June 1919, pp. 69-72. Notes on field gathered during writer's expedition.

Colorado Rockies

The Building of the Colorado Rockies, Rollin T. Chamberlin. Jl. Geology, vol. 27, no. 3, Apr-May 1919, pp. 145-164, 3 figs. By application of method given in Chamberlin and Salisbury's Geology for deducing thickness of earth shell involved in given case of folding. (To be continued.)

Earthquakes

The Mechanics of Earthquakes, Carlo Somigliana. Sci. Am. Supp., vol. 87, no. 2269, June 28, 1919, pp. 402-403 & 407. Summary of attempts to explain nature of seismic disturbances. From Scientia.

Georgia

Notes on the Geology of Georgia, S. W. McCallie. Jl. Geology, vol. 27, no. 3, Apr-May 1919, pp. 165-179, 4 figs. Classification of geological systems.

Gnomonic Projection

On the Use of the Gnomonic Projection in the Calculation of Crystals, G. F. Herbert Smith. Mineralogical Mag., vol. 18, no. 86, May 1919, pp. 317-323, 5 figs. Composite gnomonic production suggested.

Hydrated Ferric Oxides

The Hydrated Ferric Oxides, Eugen Posnjak and H. E. Merwin. Am. Jl. of Sci., vol. 47, no. 281, May 1919, pp. 311-348, 4 figs. Compilation of synthetic chemical work leads to assertion that no series of hydrates of ferric oxide exists among natural minerals.

Minerals, Determination in Rock

On the Accuracy of the Rosiwal Method for the Determination of the Minerals in a Rock, Albert Johannsen and E. A. Stephenson. Jl. Geology, vol. 27, no. 3, Apr-May 1919, pp. 212-220. Repetition of experiments made by Ira A. Williams (Amer. Geol., XXV, 1905, pp. 34-36) in order to compare accuracy of various methods.

Missouri

Geology of Missouri, E. B. Branson. Univ. of Missouri Bul., vol. 19, no. 15, May 1918, 172 pp., 58 figs. Compilation of reports of Missouri geological surveys and those of State Bur. of Geology and Mines, including extensive series of references to articles in scientific journals treating various phases of Missouri geology.

Pre-Cambrian

Some Stratigraphic and Structural Features of the Pre-Cambrian of Northern Quebec—II, H. C. Cooke. Jl. Geology, vol. 27, no. 3, Apr-May 1919, pp. 180-203, 12 figs. Detailed areal descriptions. (To be continued.)

Pyrite Crystals

Pyrite Crystals from Bald Mountain, Colorado, Herbert P. Whitlock. Am. Mineralogist, vol. 4, no. 6, June 1919, pp. 67-68, 2 figs. Measurements made on a Fuess No. 2 goniometer.

Sedimentary Formations

The Sedimentary Formations of the Panama Canal Zone, with special Reference to the Stratigraphic Relations of the Fossiliferous Beds, Donald Francis MacDonald. Smithsonian Instn., U. S. Nat. Museum, bul. 103 (extract), 1919, pp. 525-545, 2 figs.

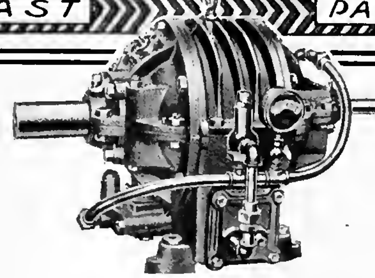
The Biologic Character and Geologic Correlation of the Sedimentary Formations of Panama in their Relation to the Geologic History of Central America and the West Indies, Thomas Wayland Vaughan. Smithsonian Inst., U. S. Nat. Museum, bul. 103 (extract), 1919, pp. 547-612. Including tabular statement of age relations to formations.

Septarian Structure

On the Origin of Septarian Structure, W. Alfred Richardson. Mineralogical Mag., vol. 18, no. 86, May 1919, pp. 327-338, 9 figs., partly on supplemental plate. Endeavor is made to establish that septarian structure consists of polygonal system of cracks corresponding to a mud desiccation structure and that cracking of nodule is due to desiccation by chemical means of a colloidal center.

TURBOGEAR

FAST PATENTS



The Ideal Drive
Capacities
1 to 20,000 HORSE POWER

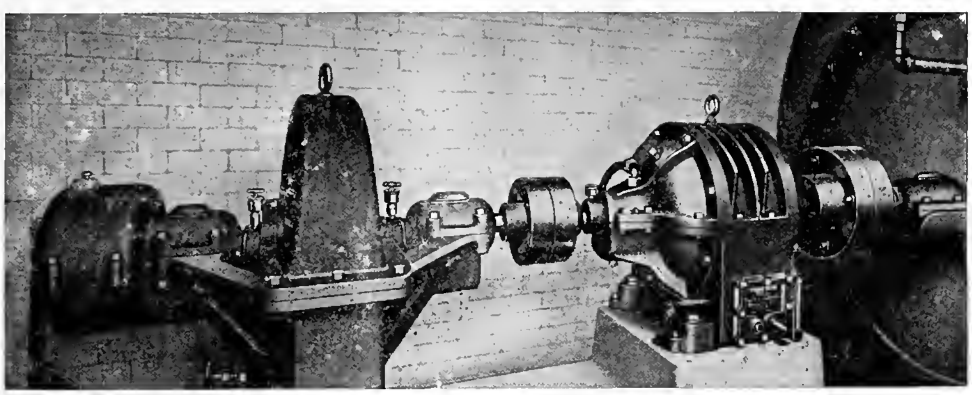
The Modern Way
to connect
DRIVING and DRIVEN UNITS

Modernized Transmission

"Turbo-Gear," the ideal drive—because of its simplicity, low upkeep and supreme reliability—has been adopted by many representative plants of the leading industries of America.

Because of simplicity of construction of "Turbo-Gear" and elimination of trouble producing equipment, there is a remarkable decrease in operating and maintenance expense.

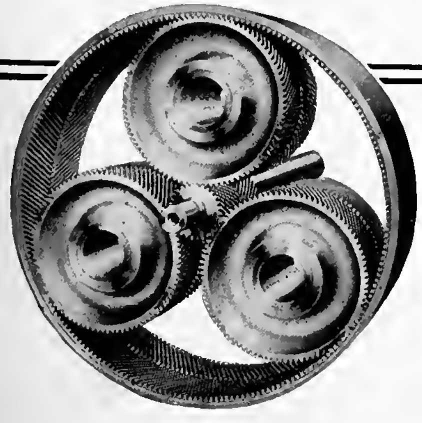
Because of positive transmission of power by "Turbo-Gear"—uniform and certain—there is a remarkable decrease in trouble due to faulty transmission and variation of speed.



50 H. P. Turbo-Gear direct connected to Turbine Drive Jet Condenser.
Speed Reduction 3400 to 425 R. P. M.

Durability, maximum service and continuous performance make "Turbo-Gear" the ideal drive. Hundreds of Turbo Gears are serving today to provide low cost power transmission.

Let us give you facts concerning some of these installations—send for these facts and our "Turbo-Gear" Bulletin No. 101.



POOLE ENGINEERING and MACHINE COMPANY

Manufacturers of Gears and Power Transmission Machinery since 1843

BALTIMORE, MD., U.S.A.

General Sales Office: 50 Church St., New York, N.Y.

Tridymite Crystals in Glass

Tridymite Crystals in Glass, N. L. Bowen. Am. Mineralogist, vol. 4, no. 6, June 1919, pp. 65-66, 2 figs. on supp. plate. Formation which took place in French works where, by reason of temporary German occupation and workmen having left fires burning in expectation of returning shortly, glass was maintained at temperature in the neighborhood of 800 deg. cent. for twenty days.

IRON

Canada

Making Steel in Canada. Can. Machy., vol. 21, no. 23, June 5, 1919, pp. 567-572, 7 figs. With special reference to ore deposits in Eastern section. (To be continued.)

LEAD, ZINC, TIN

Spelter Statistics

Spelter Statistics for 1918, W. R. Ingalls. Eng. & Min. Jl., vol. 107, no. 22, May 31, 1919, pp. 958-962. Total production of spelter by ore smelters in 1918 was 525,350 tons against 682,411 tons in 1917.

MAJOR INDUSTRIAL MATERIALS

Manganese

Cost of Producing Ferro-Grade Manganese Ores, C. M. Weld. Dept. of Interior, Bur. Mines, Minerals Investigation Series, no. 13, Mar. 1919, 22 pp. Figures compiled with point of view of probable competition between domestic production and Cuba and Brazil.

Uses of Manganese Other Than for Steel Making, W. C. Phalen. Dept. of Interior, Bur. Mines, Minerals Investigating Series, no. 16, May 1919, 14 pp. Divided into (1) uses of manganese dioxide ore and (2) uses of manganese bronze.

MINES AND MINING

Cyanidation and Chlorination

A Metallurgical Journey to Shasta, California—II, Herbert Lang. Min. & Sci. Press, vol. 118, no. 24, June 14, 1919, pp. 812-818, 1 fig. Further historical notes particularly on cyanidation and chlorination.

Drills

Notes on Economics in Hand Drill Steel, H. A. Read. Jl. Chem., Metallurgical & Min. Soc. of South Africa, vol. 19, no. 9, Mar. 1919, pp. 168-177, 6 figs. One of principal losses in hand drilling at Witwatersrand was believed to be that due to shanking of steel under blows of hammer.

Progress in the manufacture of Stoping Drills. Eng. & Min. Jl., vol. 107, no. 22, May 31, 1919, pp. 964-966. New designs are said to conform to essential conditions required in field which are said to be: Light weight and small size, automatic rotation, satisfactory regulation of strength of feedwater when drilling in sulphur-bearing ores.

New Type of Stoping Drills. Min. & Sci. Press, vol. 118, no. 23, June 7, 1919, pp. 797-799, 4 figs. Sullivan types.

Drives, Depth

The Increase in the Average Length of a Round in Modern Development, Jas. H. P. Bilbrough. Jl. South African Instn. Engrs., vol. 17, no. 10, May 1919, pp. 211-217. Vertical depth of drives referred to ranged between 5280 ft. below datum for the 24th drive and sea level for the 29th drive.

Explosives

The Use of Explosives in Mines, H. Y. Russel. Can. Min. Inst. Bul., no. 86, June 1919, pp. 589-600. Practices of various mines. Employing special blasters is considered advantageous even in small mines.

Mining Laws

Acquisition of Rights and Powers in Connection with Mines and Minerals. Iron & Coal Trades Rev., vol. 98, no. 2674 & 2675, May 30 & June 6, 1919, pp. 730-731 and 770-771. Report of Acquisition and valuation of Land Committee of Ministry of Reconstruction. Committee does not think it is in national interest that question, whether minerals should be worked or not, should be left to decision of adjoining owner or mineral worker. (Concluded.)

Some Common Violations of the Mining Laws, W. J. Heatherman. Coal Age, vol. 15, no. 26, June 26, 1919, pp. 1159-1160. Recklessness and ignorance believed to be chief obstacles to mine safety. Many mine officials, according to writer, lack proper conception of their responsibility and do not attempt to enforce precautionary measures.

Waste in Working Minerals. Colliery Guardian, vol. 117, no. 3048, May 30, 1919, p. 1290, also Quarry, vol. 24, no. 268, June 1919, pp. 156-159. Recommendations of Land Committee for acquisition and valuation. (Continued.)

Prospectors

Returned Soldiers as Prospectors, C. M. Harris. Queensland Government Min. Jl., vol. 20, no. 227, Apr. 15, 1919, pp. 149-151, 7 figs. Scheme arranged jointly by Mines Dept. of Western Australia and Federal Repatriation Board.

Shafts

The Advantages of Circular Shafts—II, H. Stuart Martin. South African Min. & Eng. Jl., vol. 28, part 2, no. 1438, April 19, 1919, pp. 217-218. Effect of area and friction resistance; circular vs. rectangular shafts. First part appeared in issue of January 18.

Shaft Sinking

A Peculiar Experience in Shaft-Sinking, Arthur Jarman. Min. & Sci. Press, vol. 118, no. 25, June 21, 1919, pp. 851-854, 4 figs. Sinking made difficult by pocket of mud encountered at depth of 35 ft.

Squeeze Prevention

Method Employed in Working the Crescent Mine, Ralph W. Mayer. Coal Age, vol. 15, no. 23, June 5, 1919, pp. 1028-1029, 3 figs. Prevention of squeeze accomplished through combined use of machine and pick mining.

Timber

Preservation of Mine Timber, Noah Williams. Colliery Guardian, vol. 117, no. 3046, May 16, 1919, pp. 1145-1146. Decay and insects are estimated to cause 50 per cent of loss of timber used in mines; as much of this loss is considered preventable by adoption of preservation treatment. American method of treating wood with sodium fluoride is recommended as efficient and economical.

Ventilation

The Ventilation of Coal Mines, H. W. Chadbourne. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 341-347, 7 figs. Natural, furnace and mechanical methods of ventilation; electric-motor-driven fan equipment and air courses.

Washington (State)

A Summary of Mining in the State of Washington, Arthur Homer Fischer. Eng. Experiment Station, Univ. of Wash., bul. no. 4, Nov. 1918, 124 pp. Including bibliography of 547 articles relating to mining and mineral resources in State of Washington.

MINOR INDUSTRIAL MATERIALS

Saltpeter

Saltpeter in Guatemala, Hoyt S. Gale. Eng. & Min. Jl., vol. 107, no. 24, June 14, 1919, pp. 1025-1031, 6 figs. Made from leachings of soils about native villages, work of separating and refining salt being performed mostly by women.

Magnesium

Magnesium Sulphate Deposits at Basque, B. C., George C. Crux. Can. Chemical Jl., vol. 3, no. 6, June 1919, pp. 179-181, 3 figs. Salts occur in solidified masses of various shapes and sizes, surrounded by mud rings.

Natural Deposits of Salts of Magnesium and Sodium near Clinton, B. C., L. Reinecke. Can. Chemical Jl., vol. 3, no. 6, June 1919, pp. 182-186, 4 figs. Texture and structure, topographical and geological relations, composition, origin, commercial value. Deposits consist of calcium carbonate, magnesium carbonate, gypsum and epsomite.

OIL AND GAS

Asphaltum

Physical Tests of Asphaltum, John W. Newton and F. N. Williams. Petroleum Age, vol. 6, no. 6, June 1919, pp. 241-245, 1 fig. Discusses value of such tests as pliability, volatility, penetration, melting point, etc. Fourth article. Previous articles detail tests for gasoline, illuminating oils and fuel oil respectively.

California

Proposed Safety Orders for Petroleum Industry in California. Min. & Oil Bul., vol. 5, no. 6, May 1919, pp. 331-332 & 351, 2 figs. As revised by Safety Orders Committee of Industrial Accident Committee.

Crude-Oil Statistics

Summary of the Crude Oil Situation. Oildom, vol. 10, no. 6, June 1919, p. 9. Statistics of production during February and March 1919.

Ecuador

Petroleum in Ecuador, Walter M. Brodie. Eng. & Min. Jl., vol. 107, no. 22, May 31, 1919, pp. 941-944, 3 figs. Account of geology and occurrence, together with data as to legal aspects of concessions in that republic.

Florida

Observations of a Florida Sea-Beach with Reference to Oil Geology, J. F. Kemp. Economic Geology, vol. 14, no. 4, June 1919, pp. 302-323, 7 figs. Tests and surveys conducted in order to explain what appeared to writer puzzling accumulation of land and marine organic remains.

Gasoline

Status of Refinery Practice with Regard to Gasoline Production, E. W. Dean. Jl. Soc. Automotive Engrs., vol. 4, no. 5, May 1919, pp. 372-374. Estimates made by Bur. of Mines apparently indicate that refiner may be able to augment his production of gasoline from crude petroleum by from 35 to 40 per cent.

Microscope

Petroleum Under the Miscroscope, James Scott. Petroleum World, vol. 16, no. 224, May 1919, pp. 194-197, 3 figs. In reference to geological aspect of search for oil. (Concluded.)

Natural Gas

Safeguarding the Future Natural Gas Supply, Clifton W. Sears. Gas Age, vol. 43, no. 11, June 2, 1919, pp. 588-590. Discusses effect of price for gas upon quantity consumed. Paper presented before Natural Gas Assn.

Oil Pools

Petroliferous Provinces, E. G. Woodruff. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 150, June 1919, pp. 907-912, 1 fig. Analyses, from regional standpoint, conditions that control presence or absence of oil pools.

Roumania

Roumanian Oil Fields. Universal Engr., vol. 29, no. 5, May 1919, pp. 37-46, 8 figs. Problems presented to producers by conditions arising from extensive subdivision of fields. Oil produced is of high gravity with paraffine base.

Shales

Value of American Oil Shales, Charles Baskerville. Bul. Am. Inst. Min & Metallurgical Engrs., no. 150, June 1919, pp. 957-960. Discusses fundamental features concerning economic development of shale-oil industry.

The Winning of Oil from Rocks, Arthur J. Hoskin. Min. & Sci. Press, vol. 118, no. 21, May 24, 1919, pp. 697-707, 10 figs. Practices followed in oil-shale industry in Scotland, France and Germany are quoted and conclusions drawn as to what writer believes we may and should accomplish with similar shales in this country.

Oil-Shales, Dean E. Winchester. Jl. Franklin Inst., vol. 187, no. 6, June 1919, pp. 689-703. Optimism is expressed concerning capability of furnishing from shales the oil needed for future operation of motors; it is observed, however, that before this raw material can be used some treatment must be devised that will permit efficient and economical elaboration.

Statistics

Statistical Treatise on Petroleum, Fred A. Lichtenheld. Colorado School of Mines Mag., vol. 9, no. 6, June 1919, pp. 143-150, 1 fig. Stratigraphic distribution of petroleum production and notes on early history. (To be continued.)

Water in Petroleum

The Evaporation and Concentration of Waters Associated with Petroleum and Natural Gas, R. Van A. Mills and Roger C. Wells. Dept. Interior, U. S. Geol. Service, bul. 693, 1919, 104 pp., 9 figs. Conclusion arrived at as result of investigation in regard to association of saline waters with petroleum and natural gas is that brines are result of a complex and long-continued evolution in which waters of sedimentation, together with ground waters from other sources have undergone deep-seated evaporation and concentration accompanied by chemical changes.

Water in Oil and Gas Wells, F. B. Tough. Petroleum Times, vol. 1, nos. 17 & 18, May 3 & 10, 1919, pp. 357-358 & 391, 1 fig. Dump-bailer method for cementing hole. Remarks on tubing method. (Concluded.)

PRECIOUS MINERALS

Gold, British Columbia

Notes on the Placer Mines of Cariboo, British Columbia, J. B. Tyrrell. Economic Geo-

FAFNIR

BALL BEARINGS

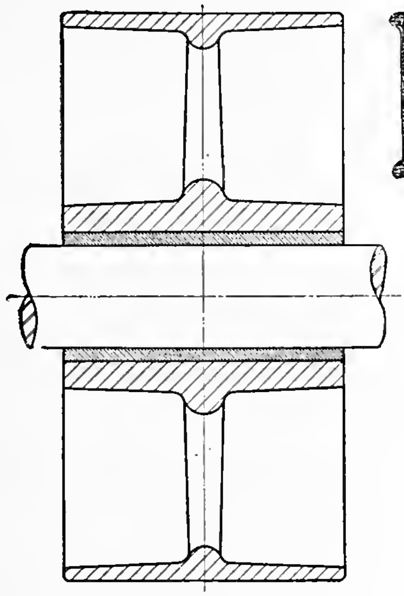


Figure 1

How to Re-equip a Standard Plain Bushing Loose Pulley With Ball Bearings

To convert a standard plain bushing loose pulley into a ball bearing pulley—as illustrated in figures 1 and 2—first, remove plain bushing. Then face back each end of pulley hub sufficiently to make room for ball bearing and cap. Turn outside diameter of hub and square up shoulders at the spokes on each end.

Next, fit ball bearing housing over turned section at each end of hub. It is important that the housing be made a press fit on hub and pinned in place, in order to prevent slippage.

After they are in place on hub, bore out the housings to a press fit for outer rings of ball bearings selected. If pulley is very large, the housings can be bored out before fitting them to pulley, but in that case caution must be used to insure perfect alignment of bearing sections—otherwise, pulley will not run true.

Assemble ball bearing in housing at each end of pulley. Then insert cap which should be provided with grease or felt groove to prevent escape of lubricant. Finally, snap into place ⅛-inch spring wire, which acts as a holding unit.

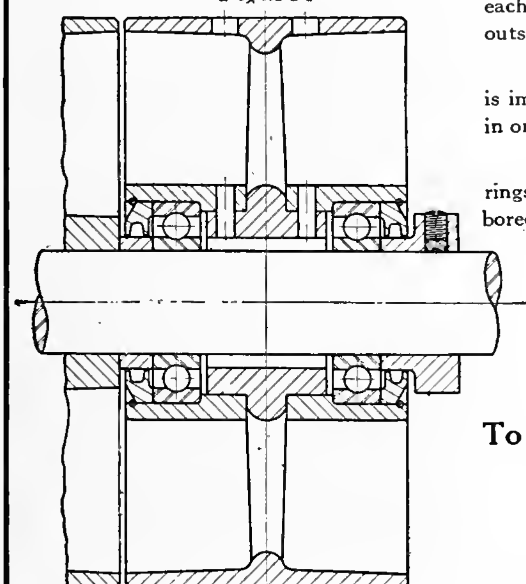

Figure 2

To Mount Pulley On Shaft—

(1) Slide spacer bushing over shaft against tight pulley.
(2) Slide assembled bearings and pulley as a unit over shaft against spacer bushing.
(3) Finally, slide thrust collar into position against outside inner ring—but do not crowd—and tighten set screw.

A Loose Pulley Originally Designed For Ball Bearings

Figure 3 illustrates a loose pulley designed by our Engineering Department especially for ball bearings. This particular pulley is easily constructed and has many fine qualities to recommend it. It will be observed that there are no shoulders and that it is only necessary to bore a straight hole through the hub and make grooves for cap retaining wires.

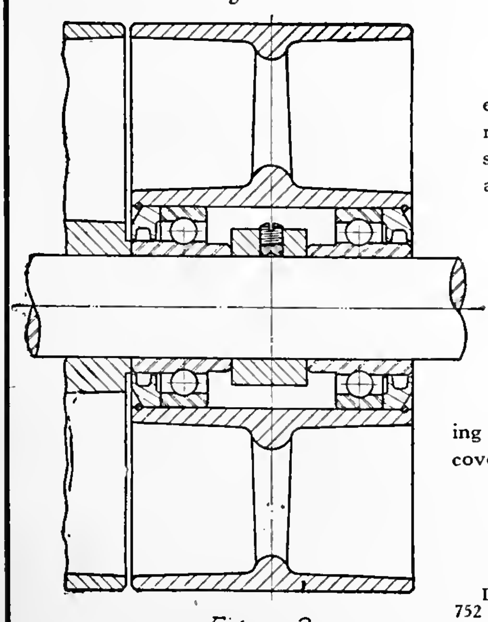

Figure 3

To Mount Pulley On Shaft—

(1) Locate thrust collar on shaft and tighten set screw.
(2) Slip pulley over shaft.
(3) Slide left hand bearing into position; put cap in place, and insert retaining wire.
(4) Install opposite bearing in same way.

On receipt of blue print or sketch and sufficient working data, our Engineering Department will be glad of the opportunity to make recommendations covering in detail any specific application.

THE FAFNIR BEARING COMPANY

Conrad Patent Licensee

DETROIT Office: 752 David Whitney Bldg. | **New Britain, Conn.** | CHICAGO Office: 1301 So. Michigan Ave.

logy, vol. 14, no. 4, June 1919, pp. 335-345, 4 figs. Historical account, topography, conditions and development of drainage.

Gold, Ontario

The Origin of the Gold Deposits of Matachewan District, Northern Ontario, H. C. Cooke. Economic Geology, vol. 14, no. 4, June 1919, pp. 281-301, 6 figs. Internal structure of ore bodies, described as pegmatic vein, middle zone of mineralized and altered rock on each side, and outer zone of altered rock without mineralization, which grades into unaltered country rock with irregular and embayed contacts, assumed as evidence that deposits in schist have been formed by alteration and mineralization of country rock by solutions coming up along Central vein.

Silver Mining, Nevada

Revival of Silver Mining at Cherry Creek, Nevada, Geo. H. Ryan. Salt Lake Min. Rev., vol. 21, no. 4, May 30, 1919, pp. 19-22, 4 figs. Geology of ore deposits and remarks as to possibilities of camp.

South Wales

Sulphide Corporation Limited Works, Cockle Creek, S. W. Proc. Australasian Inst. Engrs., vol. 31, Sept. 30, 1918, pp. 2-39, 27 figs. Nine articles covering various phases of treatment and manipulation of ore. Upwards of 200,000 tons of various materials are dealt with annually, there being produced from treatment of this tonnage about 31,000 oz. of gold, 2,500,000 oz. of silver, 28,000 tons of lead and 320 tons of antimonial lead.

TRANSPORTATION

Locomotive Headlights

Headlights for Locomotives in Mines, K. W. Mackall. Coal Industry, vol. 2, no. 6, June 1919, pp. 232-233, 3 figs. Spring suspension claimed as principal feature of new type described.

Mine Haulage

Vesta Coal Co.'s Modern System of Mine Haulage, Ralph W. Mayer. Coal Age, vol. 15, no. 24, June 12, 1919, pp. 1072-1076, 5 figs. System includes electric-motor transportation from coal face to central underground station where motors leave their loads, and tailrope which handles the cars from this point to tipple.

Metallurgy

ALUMINUM

Aluminum Alloys

Special and Commercial Light Aluminum Alloys, Robert J. Anderson. Dept. of the Interior, Bur. of Mines. Minerals Investigation Series, no. 14, April 1919, 22 pp. Description with chemical analyses and enumeration of physical properties of various alloys submitted to government bureaus. Writer does not feel that the majority of so-called "new" alloys possess properties claimed for them, or that it is economical to manufacture them.

BLAST FURNACES

British 800-Ton Plant

800-Ton Blast Furnace Plant at the Park Gate Works, Rotherham, and the Staveley Works, Chesterfield. Iron & Coal Trade Rev., vol. 98, no. 2675, June 6, 1919, pp. 759-760, 12 figs. partly on supp. plates. Also Engineer, vol. 127, no. 3310, June 6, 1919, pp. 564-566, 10 figs. on supp. plates. Furnace said to have been designed with a view to secure even distribution around large bell, equal distribution of large and fine, gas-tight top, means for changing bell rods and other gear with minimum loss of time.

Charging

Charging Raw Material into Blast Furnaces, J. A. Mohr. Iron Age, vol. 103, no. 22, May 29, 1919, pp. 1432-1434 and (discussion), pp. 1434-1436, 3 figs., also Iron Trade Rev., vol. 64, no. 22, May 29, 1919, pp. 1413-1415, 1 fig., and Blast Furnace and Steel Plant, vol. 7, no. 6, June 1919, pp. 298-305, 6 figs. On coördinating and arranging different phases of charging and mixing of raw material so as to achieve uniformity in their disposition and arrangement that will best suit conditions of individual plant.

Electric Smelting

Commercial Feasibility of Electric Smelting of Iron Ores in British Columbia, Alfred Stansfield. Chem. & Metallurgical Eng., vol. 20, no. 12, June 15, 1919, pp. 630-636. Also Iron & Steel of Can., vol. 2, no. 5, June 1919, pp. 132-145. Excerpts from bul. no. 2, 1919, British Columbia Department of Mines. Electric pig iron.

Cleveland (England) Ore Smelting

The Smelting of Cleveland Iron-Stone, S. G. Smith. Foundry Trade Jl., vol. 21, no. 208, Apr. 1919, pp. 229-232. General outline of process of converting ore into pig iron, as followed at district embracing coast from Saltburn to Whitby, also Normandy and Eston Hills. Paper read before Lancashire Branch British Foundrymen's Assn.

Steel Turnings

Utilization of Steel Turnings in the Blast Furnace (L'emploi des tournures d'acier au haut fourneau), M. Tripier. Bulletin et comptes rendus de la Société de l'Industrie Minerale, vol. 15, no. 5, 1919, pp. 275-297. Experience acquired in munition works.

FERROUS ALLOYS

Ferro-Alloys

Ferro-Alloys in Alloy Steel Production. Raw Material, vol. 1, no. 3, May 1919, pp. 177-181, 8 figs. Survey of situation, specially of impetus given to alloy industry during the war.

Iron-Cobalt Alloys

On Some Physical Constants of Iron-Cobalt Alloys, Kōtarō Honda. Science Reports of the Tōhoku Imperial University, vol. 8, no. 1, Apr. 1919, pp. 51-59, 4 figs. Experimental. Measurement of thermal and electrical conductivity, moduli of elasticity and rigidity, and intensity of magnetization.

FLOTATION

Copper

Recovery of Copper from Flotation by Leaching, Percy R. Middleton. Min. & Sci. Press, vol. 118, no. 23, June 7, 1919, pp. 771-772. Results of roasting and leaching flotation concentrate.

Hardwood Tar Oils

Flotation Experiments on Hardwood Tar Oils, L. F. Hawley and O. C. Ralston. Chem. & Metallurgical Eng., vol. 20, no. 11, June 1, 1919, pp. 586-587. Experimental tests. It is concluded that a mixture of different oils is more likely to do good flotation work than any one product alone.

Practice

Flotation for the Practical Mill Man, Frederick G. Moses. Chem. & Metallurgical Eng., vol. 20, no. 11, June 1, 1919, pp. 571-577. Suggestions in regard to overcoming factors tending to produce unsatisfactory results in flotation plant.

Sulphur

Concentration of Native Sulphur Ores by Flotation, James M. Hyde. Dept. of the Interior, Bur. of Mines, Minerals Investigations Series, no. 18, April 1919, 18 pp. Reported that ores from several districts were treated successfully by flotation. It is claimed that under favorable conditions better than 80 per cent of sulphur should be recoverable as concentrate containing more than 80 per cent of sulphur.

FURNACES

Electric

Electric Furnace for Melting Non-Ferrous Metals—II, E. F. Collins. Foundry, vol. 47, no. 324, June 1, 1919, pp. 329-333, 4 figs. Statement of melting cost of electric and fuel-fired furnaces.

A New Electric Rotating Brass Furnace, Carl H. Booth. Iron Age, vol. 103, no. 26, June 26, 1919, pp. 1699-1702, 4 figs. Booth in which door has been placed in one end of furnace and tapping hole in other end in order to overcome difficulty which is said to have been experienced in previous models in maintaining lining around combination spout and door.

Powdered Fuel

Powdered Fuel for Firing Metallurgical Furnaces and Steam Boilers, J. S. Atkinson. Iron & Coal Trades Rev., vol. 98, no. 2672, May 16, 1919, pp. 651-652, 15 figs. on supp. plate. Success in burning powdered coal secured, writer believes, by first drying coal down to a point where there is not more than one per cent of moisture left in it, pulverizing to such a degree of fineness, that 95 per cent of coal will pass through a 100-mesh sieve, and intimately mixing powdered coal with air before admitting it to combustion chamber. Paper read before Sheffield Soc. of Engrs. and Metallurgists.

Use of Pulverized Coal, with Special Reference to Its Application in Metallurgy, L. C. Harvey. Colliery Guardian, vol. 117, no. 3046 & 3047, May 16 & 23, 1919, pp. 1146-1148 & 1228-1229, 16 figs. "Holbeck" (Bonnot) system, "Quigley," "Fuller," "Bergman," "Covert" and "Stroud" systems. Graphs showing comparison of approximate utilization and waste of fuel supplied to locomotive boiler with hand and powdered-coal firing, taking fuel as delivered to engine tender.

Recuperative Furnace

A New Type of Recuperative Furnace, Walter Rosenhain. Engineering, vol. 107, no. 2787, May 30, 1919, pp. 702-704, 8 figs. Recuperator consists of nest or battery of tubes through which incoming air is drawn while products of combustion circulate about interior of tubes.

IRON AND STEEL

Aircraft Steel

Shop Practice in Respect to Aircraft Steel, H. P. Philpot. Aeronautical Jl., vol. 23, no. 99, Mar. 1919, pp. 112-129, 45 figs. Equilibrium diagrams of solutions of sodium nitrate and water, also iron-carbon equilibrium diagram and graphs indicating variations and physical properties of nickel-chrome steel with varying quenching temperatures.

Allotropy of Metals

The Allotropy of Metals in the Light of Recent Research—II, Clifford W. Nash. Chem. Eng. & Min. Rev., vol. 11, no. 127, Apr. 5, 1919, pp. 192-194. Evidence in favor of existence of allotropic forms of iron. (Concluded.)

Borax

See Fluxes.

Cast Iron, Impurities in

Cast-Iron Under Heat Influences, E. Adamson. Jl. of West of Scotland Iron & Steel Inst., vol. 26, part 6, Feb., session 1918-1919, pp. 80-84 and (discussion) pp. 84-88, 2 figs. partly on supp. plate. Experimental tests in regard to separation of impurities.

Cast Iron, Oxygen in

Oxygen in Cast Iron and Its Application, Wilford L. Stork. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 150, June, 1919, pp. 951-956. Also Iron Age, vol. 103, no. 25, June 19, 1919, pp. 1636-1637. Purports to give further evidence in support of theories advanced by J. E. Johnson, Jr., in regard to influence of oxygen on strength of cast iron, and to show their application to cupola mixtures.

Cooling of Hypoeutectic Steels

Effect of Cooling on Micrographic Structure of Hypoeutectic Steels and Alloys of Similar Constitution (Effet du revenu sur la structure micrographique des aciers hypoeutectiques et des alliages de constitution similaire), M. A. Portevin. Revue de Metallurgie, vol. 16, no. 2, Mar.-Apr., 1919, pp. 141-148, 16 figs. Examination of photomicrographs of various specimens.

Duplexing

Metallurgical Considerations of Duplexing,—II, Richard S. McCaffery. Blast Furnace & Steel Plant, vol. 7, no. 6, June 1919, pp. 287-288 and 297. Suggestion for removal of sulphur and phosphorus.

Fluxes

Boron Derivatives in Relation to Metallurgy. Metal Industry, vol. 14, no. 18, May 2, 1919, pp. 367-369. Uses of borax glass for fluxing purposes at South African, American and Australian gold mines and other applications of borax.

Gathman Process of Ingot Production

Commercial Production of Sound Steel Ingots, Emil Gathman. Raw Material, vol. 1, no. 4, June 1919, pp. 213-216, 5 figs. Gathman process.

Grain Size and Rolling

The Grain Size in Steel as Influenced by Rolling. Iron & Steel of Can., vol. 2, no. 2, Mar. 1919, pp. 42-43, 4 figs. Experiments at Welland Plant of Can. Steel Foundries. It is concluded that composition of all unhardened steel is either pearlite alone, or pearlite associated with ferrite or cementite.

Heat Treatment

Alteration of Steels at Temperatures in the Neighborhood of 500 Deg. Cent. (Sur l'Alteration des aciers aux températures voisines de 500°), M. Grenet. Bulletin et comptes rendus de la Société de l'Industrie Minerale, vol. 15, no. 5, 1919, pp. 339-353, 4 figs. These temperatures were found to be particularly harmful to nickel-chrome steels containing carbon and

manganese; while not so injurious to other steels, it is nevertheless advised not to keep unnecessarily any steel at this temperature.

Impurities, Non-Metallic

Non-Metallic Impurities in Steel, Henry D. Hibbard. Iron Age, vol. 103, no. 22, May 29, 1919, pp. 1427-1429 & (discussion) pp. 1429-1432. While admitting that to forecast effect of sonims on the properties of steel much work is required to be done and interpreted, writer believes that quantity and composition must be ascertained by chemical means, and mode of occurrence as far as possible be by the microscope.

Open Hearths, Cooling Devices for

Cooling Devices for Open Hearths, Wm. C. Coffin. Iron Trade Rev., vol. 64, no. 21, May 22, 1919, pp. 1356-1358, 3 figs. States that furnace life is increased by installing water-cooling equipment having brick covering. Recent developments in door, buckstay, skewback, port and bulkhead coolers are indicated.

Rolling Mills

The New Steel Works and Rolling Mill at Witkowitz (Die neue Stahl- und Walzwerksanlage des Eisenwerkes Witkowitz). Montanistische Rundschau, vol. 11, no. 6, Mar. 16, 1919, pp. 156-162, 9 figs. Plant completed in 1916 consists of a 300-ton mixer, three 200-ton Talbot furnaces and thirty-three 60-ton Martin stationary type furnaces. (To be continued.)

Soaking Pit, Electrically Heated

Electrically Heated Soaking Pit, Thaddeus F. Baily. Iron Age, vol. 103, no. 22, May 29, 1919, pp. 1419-1421 and (discussion) pp. 1421-1422, 4 figs., also Iron Trade Rev., vol. 64, no. 22, May 29, 1919, pp. 1416-1418, 1 fig. Writer sees coming acceptance of electric soaking pits in commercial operations.

Steel, High-Speed

The Manufacture and Working of High Speed Steel, J. H. Andrew. Engineering, vol. 107, no. 2787, May 30, 1919, pp. 715-720, 36 figs. It is believed that improvement in casting might be made by increasing a thickness of mold walls and lowering the pouring temperature of the metal; also it is recommended that forging temperatures be increased considerably. Similarly other suggestions are offered and various defects occurring in high-speed steel are reviewed and commented on. (Concluded). Paper read before Iron & Steel Inst.

High-Speed Tool-Steel Efficiencies, John O. Arnold and Fred Ibbotson. Iron Trade Rev., vol. 64, no. 22, May 29, 1919, pp. 1419-1421, 3 figs. Determined by lathe operations and chemical analyses. Micrographic study of difference between annealed and quenched specimens. Paper presented before Iron & Steel Inst.

Steel, Liquid and Solid

On the Solid and Liquid State of Steel, Cosmo Jones. Engineering, vol. 107, no. 2787, May 30, 1919, pp. 721-722. The properties of an optically clean surface of liquid steel described and similarity to that of polished metallic surface with vitreous film pointed out. Preservation of this surface of liquid steel attributed to presence of atmosphere of iron vapor. Means to determine surface tension qualitatively suggested and it is said that surface tension value varies largely with volume of gases occluded. From lecture delivered to West of Scotland Iron & Steel Inst.

NON-FERROUS ALLOYS

Bronzes, Aluminum

Aluminum Bronzes (L'Etude des propriétés des bronzes d'aluminium), Jean Durand. Génie Civil, vol. 74, no. 16, Apr. 19, 1919, pp. 315-317. Warns against complicating composition of alloy. It is claimed that in all cases a simple alloy can be found of better known properties and possessing advantages equal to those of the complicated alloy.

Bronze and Brass, Inclusions in

Non-Metallic Inclusions in Bronze and Brass, G. F. Comstock. Metal Industry, vol. 14, no. 16, Apr. 18, 1919, pp. 330-333, 21 figs. Photomicrographs. Method employed consists in overheating and oxidizing small charge of copper, then cooling it and adding a suitable amount of the element whose oxide it was desired to observe.

Cupro-Nickel, Decarbonization of

Notes on Carbon in 80/20 Cupro-Nickel Melted in the Electric Furnace, F. C. Thompson and W. R. Barclay. Jl. Soc. Chem. Indus., vol. 38, no. 10, May 31, 1919, pp. 130T-132T, 4 figs. Account of trouble experienced before decarbonizing process was included in melting.

Gold-Copper Alloys

Hardness and Resiliance of Gold-Copper Alloys (Note sur la dureté et le résilience des alliages or-cuivre), A. Portevin and Jean Durand. Revue de Métallurgie, vol. 16, no. 2, Mar.-Apr. 1919, pp. 149-151, 3 figs. Results of experiments.

Monel Metal

Monel Metal the Natural Alloy, Hugh R. Williams. Raw Material, vol. 1, no. 4, June 1919, pp. 217-221, 4 figs. Alloy contains 67 per cent nickel and 28 per cent copper and is said to be non-corrodible by ordinary atmospheric agencies and to have unparalleled resistance to chemicals.

OCCLUDED GASES

Degasified Steel

Safeguarding Steel Ingot Production. Raw Material, vol. 1, no. 3, May 1919, pp. 172-176, 5 figs. Process outlined consists of production of a "degasified" steel before teeming into mold, by means of ferro-silicon, aluminum or titanium added for purpose of "scavenging" oxides and reduction of size of ingot pipe to minimum by giving lower portion of mold greater heat-absorbing and radiating capacity than top.

METALLOGRAPHY

Non-ferrous Metals

Metallography Applied to Nonferrous Metals—V & VI, Ernest J. Davis. Foundry, vol. 47, no. 8 & 9, June 1 & 15, 1919, pp. 345-349 & 395-398, 19 figs. Lead alloys and bearing metals discussed from viewpoint of their microstructure; also equilibrium diagram of lead-tin, lead-antimony, copper-lead, nickel-copper and nickel-silver series, and micrographs of various alloys.

Photomicrography

The Study of Alloys (L'Etude des Alliages). Métaux, Alliages et Machines, vol. 12, no. 4, Apr. 1919, pp. 7-12, 9 figs. After discussing what is termed irrational order of conducting investigations of these structures, applications of photomicrography and the thermic analysis are taken up. Extracts from book published by Witold Broniewski at Librairie Delagrave.

Radio Metallography

Radio Metallography. Times Eng. Supp., vol. 15, no. 535, May 1919, p. 165. Methods of examining metals and various types of material by means of X-ray photography.

The X-ray Examination of Metals, E. Schneider. Engineering, vol. 107, nos. 2784 & 2785, May 9 & 16, 1919, pp. 613-614, and 641-644, 23 figs., also Elecn., vol. 82, no. 20, May 16, 1919, pp. 568-569. Research into industrial X-ray examination of metals at laboratory of Schneider Works is represented as demonstrating that radio-metallography enables visual examinations to be made of ordinary steels, provided their thickness does not exceed 45 mm., this limit in thickness being reduced when steel contains at least one constituent of higher atomic weight. Method developed at Hatfield research laboratory in Sheffield. German work on subject. (Concluded.)

Aeronautics

AIRCRAFT

Cemented Seams

See Balloon Construction.

Balloon Construction

Notes on Cemented Seams and Rubber Cements with Reference to Balloon Construction, J. D. Edwards. Aerial Age, vol. 9, no. 14, June 16, 1919, pp. 688-690, 8 figs. Concluded from tests and examination of microsections of cemented seams that next to a good cement it is necessary to smooth and clean surfaces to be cemented and to apply cement in fine coat of uniform thickness, in order to secure satisfactory results.

Balloons and Solar Radiation

Effect of Solar Radiation Upon Ballons, Junius David Edwards and Maurice Blaine Long. Technologic Papers of Bur. Stand., Dept. Commerce, no. 128, June 13, 1919, 29 pp., 6 figs. Measurements said to have shown absorption power of radiation to vary from 45 to 95 per cent.

APPLICATIONS

Cape-to-Cairo Air Route

Cape-Cairo Air-Way. Flight, vol. 11, no. 24, June 12, 1919, pp. 775-776, 1 fig. Scheme for organizing route.

Mapping

See Surveying.

Speed

Making the Airplane a Utility, Grover C. Loening. Jl. Soc. Automotive Engrs., vol. 4, no. 6, June 1919, pp. 489-493, 2 figs. Speed considered as element needed to give real sound utility to airplane.

Surveying and Mapping

The Aeroplane in Surveying and Mapping, E. Lester Jones. Flying, vol. 8, no. 5, June 1919, pp. 438-441, 2 figs., also Science, vol. 49, no. 1277, June 20, 1919, pp. 575-582, and Sci. Am. Supp., vol. 87, no. 2268, June 21, 1919, pp. 386-387 and 391. Value expected chiefly in reconnoissance surveys and maps. Past experiments considered as forecasting successful development of revising charts by airplanes. Address delivered before Second Pan-American Aeronautic Convention.

AUXILIARY SERVICE

Hangars

The Heating of Hangars (Die Heizung van Flugzeughallen), F. Kaiser. Zeitschrift des Bayerischen Revisions-Vereins, vol. 23, nos. 1, 2 & 3, Jan. 15, 31 & Feb. 15, 1919, pp. 2-4, 11-13, and 19-22, 8 figs. Compares systems of heating with a stove, by hot air, steam, and a combination of these.

Reinforced-Concrete Hangars for the Hyroplanes of the Port of Algiers (Hangar en béton armé pour les hydravions du centre maritime d'Alger), E. Carret. Génie Civil, vol. 74, no. 21, May 24, 1919, pp. 409-413, 15 figs., partly on supp. plate. Dimensions are 104 ft. free opening by 130 ft. useful depth.

Landing Stations

Finding Aircraft Landing Stations by Means of Audio Frequency Receivers, Earl C. Hanson. Flying, vol. 8, no. 5, June 1919, pp. 442-443, 6 figs. Scheme suggested comprises combination of radio directive transmission system to guide aircraft at high speed in direct course between separated cities or other points, audio frequency signal means to project audio frequency energy to predetermined altitudes, but restricted to area of landing field, and indirectly illuminated zone in center of landing field.

Motorship

The Seaplant Carrier "Argus." Sci. Am., vol. 120, no. 24, June 14, 1919, pp. 630-631, 7 figs. Ship with 500 ft. starting and landing platform for seaplanes. It carries 20 seaplanes in hangar below deck, and has upper flying deck for launching and landing, which is clear of masts, smokestacks and deck structures.

Radio Telephones

The Radio Telephone Equipment of the NC-4, Edgar H. Felix. Aerial Age, vol. 9, no. 13, June 9, 1919, pp. 638-639 & 652, 5 figs. Design is said to permit transmission of three types: (1) voice currents, (2) continuous or undamped waves, (3) damped waves of audio frequency.

DESIGN

Air Mileage

See Cruising Radius.

Cruising Radius

Air Mileage of Aeroplanes Intended for Long Distances and for Transport, J. Dennis Coales. Engineering, vol. 107, no. 2785, May 16, 1919, pp. 621-622, 1 fig. Effect of winds on air mileage. (Concluded.)

Cooling System

The Loomis Cooling System for Aircraft. Aeronautics, vol. 16, no. 290, May 8, 1919, pp. 479-480, 3 figs. Expansion tank surrounds core and injector is located in water connection between main and booster radiators for keeping constant volume of water in circulating system. From Bul. U. S. Experimental Dept., Aeroplane Eng. Div.

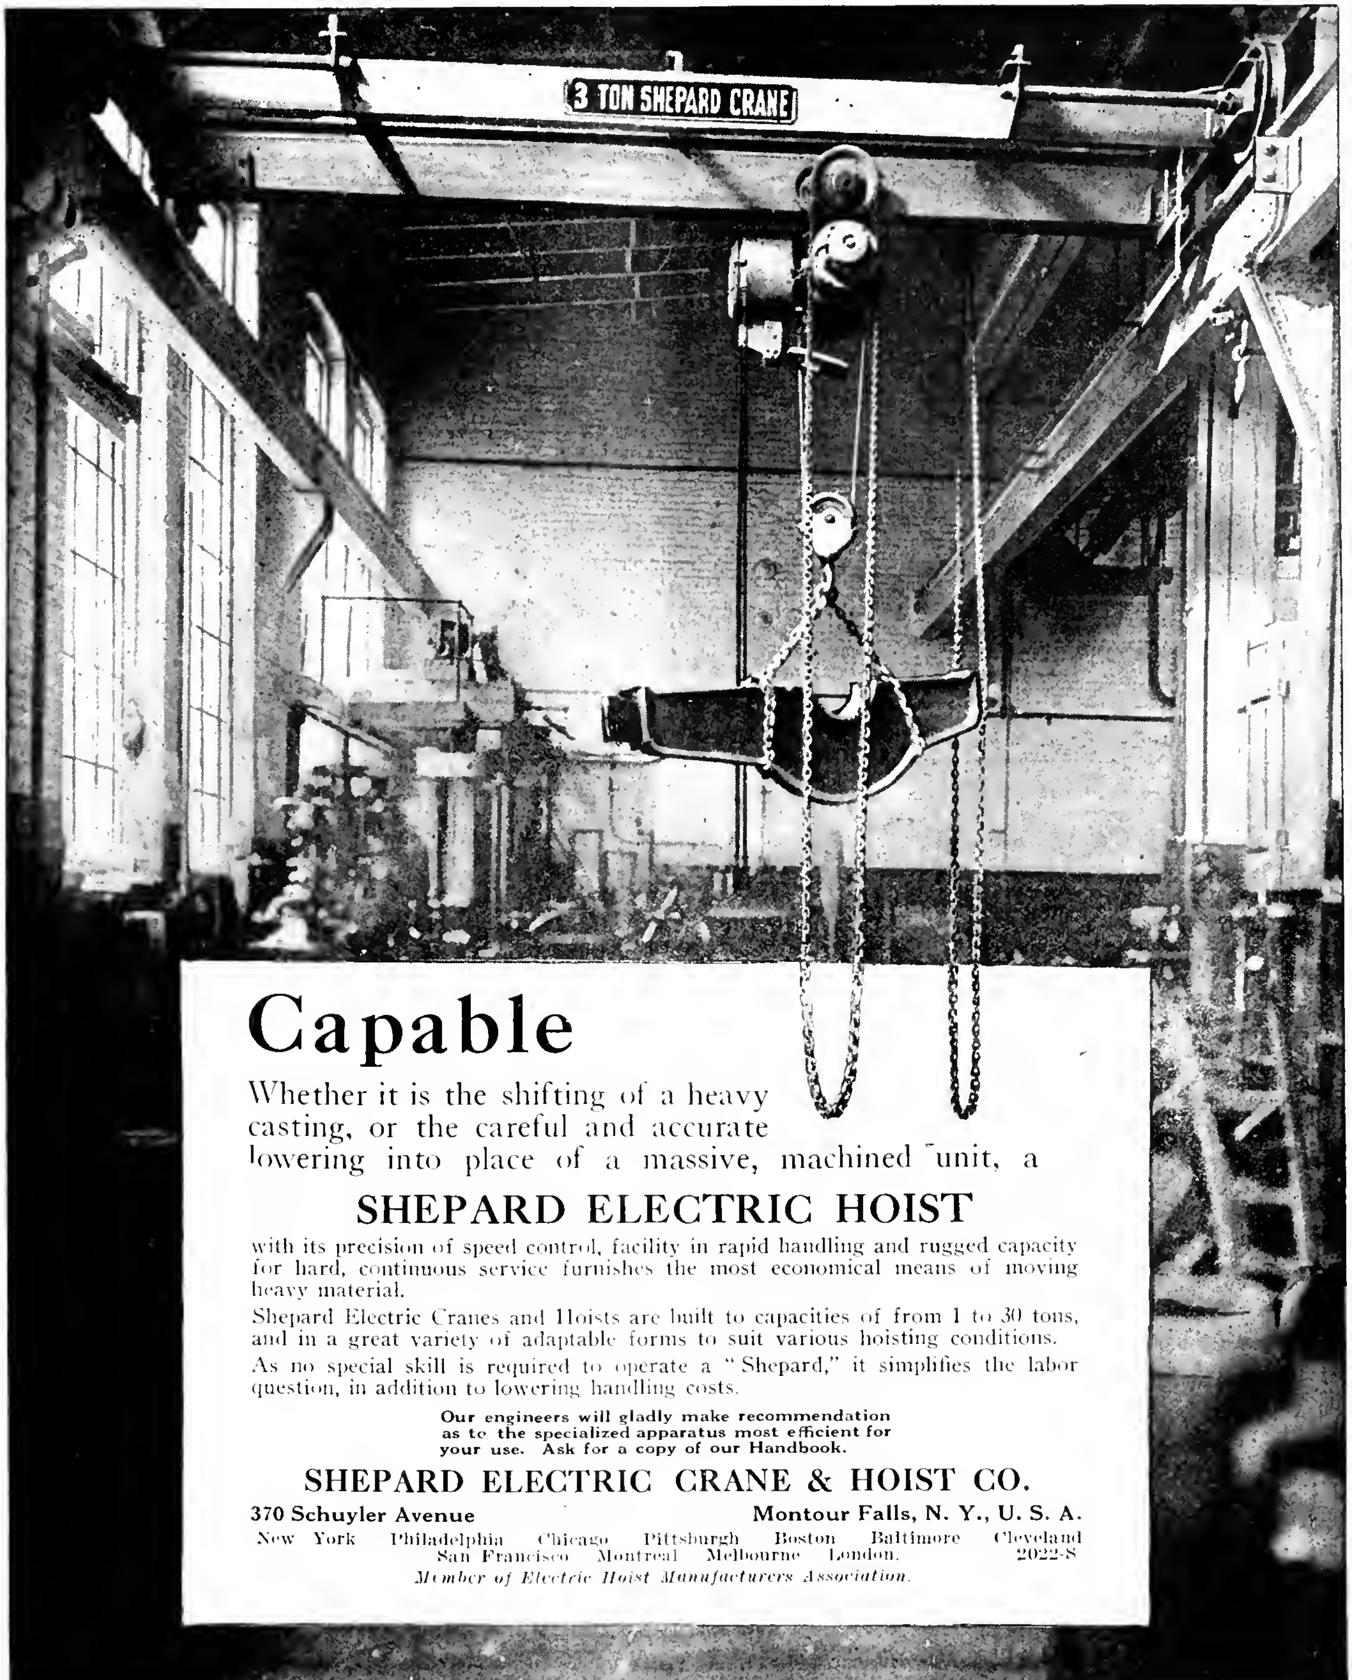
Flying Boats

The Construction of the Navy-Curtiss Flying Boats. Jl. Soc. Automotive Engrs., vol. 4, no. 6, June 1919, pp. 439-442, 4 figs. Radical alterations from past designs quoted as distinctive features of N-C boats are shortened hull and mounting of tail surfaces on outriggers.

Design and Construction of Flying Boats, David Nicolson. Engineering, vol. 107, no. 2786, May 23, 1919, pp. 684-686, 16 figs. Deals particularly with larger types known officially as F-2a, F-3, F-5, P-5 and N-4.

Large Aeroplanes

Some Considerations of the Design of Large Aeroplanes, Leslie V. Spencer. Aerial Age, vol.



Capable

Whether it is the shifting of a heavy casting, or the careful and accurate lowering into place of a massive, machined unit, a

SHEPARD ELECTRIC HOIST

with its precision of speed control, facility in rapid handling and rugged capacity for hard, continuous service furnishes the most economical means of moving heavy material.

Shepard Electric Cranes and Hoists are built to capacities of from 1 to 30 tons, and in a great variety of adaptable forms to suit various hoisting conditions.

As no special skill is required to operate a "Shepard," it simplifies the labor question, in addition to lowering handling costs.

Our engineers will gladly make recommendation as to the specialized apparatus most efficient for your use. Ask for a copy of our Handbook.

SHEPARD ELECTRIC CRANE & HOIST CO.

370 Schuyler Avenue **Montour Falls, N. Y., U. S. A.**

New York Philadelphia Chicago Pittsburgh Boston Baltimore Cleveland San Francisco Montreal Melbourne London. 2022-S

Member of Electric Hoist Manufacturers Association.

REG. U.S. PAT.OFF.

SHEPARD

ELECTRIC CRANES & HOISTS

9, no. 16, June 30, 1919, pp. 774-776, 7 figs. Urges that aeronautical engineers prepare their designs along new and original lines, as writer sees that large aerial liner is far from having reached a standard or final stage.

Lift-Angle of Incidence

The Economics of Flight. H. B. Irving. Automotive Industries, vol. 40, no. 24, June 12, 1919, pp. 1306-1308, 2 figs. Showing variation of lift-drag ratio with angle of incidence and chart for determining most economical speed of flight.

Lift Charts

Chart for Performance Computations. Richard I. Elliot. Aviation, vol. 6, no. 7, June 1, 1919, p. 488, 1 fig. Prepared for solving graphical equations involving lift data.

Loads

The Loads and Stresses on Aeroplanes. John Case. Aeronautics, vol. 16, no. 289 and 291, May 1 & 15, 1919, pp. 445-448 and 502-506, 20 figs. Formula for computing loads that come upon machine as a whole under various conditions of flight. Estimation of movement of air forces on wings about center of gravity or other given point. (Continuation of serial.)

Metal Construction

Metal Construction of Aircraft. A. P. Thurston. Flight, vol. 11, nos. 21 & 22, May 22 & 29, 1919, pp. 680-684, and 710-714, 29 figs., also Aeronautics, vol. 16, no. 292, May 22, 1919, pp. 534-537. Requirements of metal used for aircraft construction and methods of attaching fittings. Boulton and Paul spars; Humber spars; types of struts; methods of design and calculation of girder spars. Preparation and possibilities of steel and duralumin. (Continuation of serial.)

Struts

Some Useful Fuselage Strut Curves. A. J. Sutton Pippard. Aeronautics, vol. 16, no. 288, Apr. 24, 1919, pp. 426-427, 5 figs. To determine weight of members from a knowledge of their length and the loads in them without determining actual sizes required.

The Effect of a Side-Wind on Interplane Struts. A. J. Sutton Pippard. Engineering, vol. 107, no. 2788, June 6, 1919, p. 727, 1 fig. Formulæ and curves based on Euler's formula.

ENGINES

Basse-Selve

The Bassé-Selve 270-300 Horsepower German Airplane Engine. Automotive Engrs., vol. 4, no. 5, May 1919, pp. 222-227, 12 figs., also Automobile Engr., vol. 9, no. 127, June 1919, pp. 178-184, 18 figs. Similar in most of leading details of construction to 260-hp. Mercédes and 230-hp. Benz, on which design is believed to have been based.

Crankshafts

Airplane Engine Crankshaft Design. Glenn D. Angle. Aviation, vol. 6, no. 10, June 15, 1919, pp. 525-528, 2 figs. In its relation to engine design in general.

Curtiss

The Curtiss Model K-12 Aero Motor. Aeronautics, vol 16, no. 288, Apr. 24, 1919, pp. 428-430, 3 figs. Also Automobile Eng., vol. 4, no. 5, May 1919, pp. 217-220, 7 figs. Form of construction adapted said to give minimum center distance between cylinders. Pistons are of aluminum alloy flat head type. Motor said to develop 400 hp. on fuel consumption of 0.55 lb. per b.hp. hr.

Hispano-Suiza

Aviation Motors (Les moteurs d'aviation). Aérophile, vol. 27, nos. 7-8, Apr. 1 & 15, 1919, pp. 112-114, 6 figs. Carburation, cooling water circulation and lubrication of Hispano-Suiza (150 hp.) motor. (Continued.)

Jupiter

See Radial Types.

Liberty

The Liberty Aircraft Engine. J. G. Vincent. Jl. Soc. Automotive Engrs., vol. 4, no. 5, May 1919, pp. 383-401, 14 figs. Historical and descriptive account.

Maybach

Details of the Maybach 300-Horsepower Airplane Engine—II. Automotive Eng., vol. 4, no. 5, May 1919, pp. 228-233, 13 figs. Connecting rod and valve systems, lubrication, carburation and cooling. (To be continued.)

Mercedes

Mercedes 180 HP. (Le moteur Mercedes 180 hp.). Aérophile, vol. 27, nos. 7-8, Apr. 1 & 15, 1919, pp. 114-117, 5 figs. Comparison of horsepower and consumption of the 160-hp. and the 180-hp. at different velocity.

Mercury

See Radial Types.

Napier "Lion"

The Napier "Lion" 450 HP. Aero Engine. Aerial Age, vol. 9, no. 15, June 23, 1919, pp. 730-733, 10 figs. Engine has three groups of four cylinders each, mounted "broad-arrow."

Naval Aircraft

Characteristics of Leading Aero Engines Used in Allied Naval Aircraft. Aerial Age, vol. 9, no. 11, May 26, 1919, pp. 542-543. Supplements tables of characteristics published in issue of Mar. 3, 1919. Forty-five engines are recorded in present set.

Pistons

Elements of Piston Design and Their Particular Application to Airplane Engines. Richard Vosbrink. Pac. Mar. Rev., vol. 16, no. 6, June 1919, pp. 115-119, 10 figs. Particularly in reference to piston design. In this connection investigation and analysis undertaken as preliminary to designing standard piston used by Hall-Scott Motor Co. are referred to.

Radial Types

Some Fixed-Radial Aero-engines. Engineer, vol. 127, no. 3309, May 30, 1919, pp. 530-532, 6 figs. Jupiter and Mercury types.

Renault

Industrial Uses of Renault Motors (Groupes industriels actionnés par moteurs à explosion, système Renault). Génie Civil, vol. 74, no. 20, May 17, 1919, pp. 393-396, 7 figs. Installation of 190-hp. 8-cyl. aviation-type motor given as example.

Sturtevant

The Sturtevant Aeroplane Engines. Aerial Age, vol. 9, no. 11, May 26, 1919, pp. 536-538 & 556, 7 figs. Eight-cylinder "V"-type water-cooled. Made in two models.

Volumetric Efficiency

Increasing the Engine's Volumetric Efficiency—VI. Emil Schimanek. Automotive Eng., vol. 4, no. 5, May 1919, pp. 235-237, 7 figs. Writer expresses reasons why he believes more and less strokes than usual four increase or decrease power development. From Zeitschrift des Vereines Deutscher Ingenieure. (To be concluded.)

MATERIALS OF CONSTRUCTION

Balsa Wood

The Properties of Balsa Wood. R. C. Carpenter. Aerial Age, vol. 9, no. 13, June 9, 1919, pp. 640-641, 5 figs. Tabulated results of tranverse tests.

Coatings

Tests of Moisture and Water Resistant Coatings. Henry A. Gardner. Aviation, vol. 6, no. 10, June 15, 1919, pp. 539-540. Collodion dopes proved inferior to spar varnish as water excluders.

Metal Construction

See Design.

Plywood

The General Properties and Uses of Plywood. B. C. Boulton. Aerial Age, vol. 9, no. 15, June 23, 1919, pp. 724-727, 6 figs. Examples of distortion caused by improper construction.

Waterproof Plywood for Airplanes. Automotive Industries, vol. 40, no. 24, June 12, 1919, pp. 1331-1333 and 1359, 5 figs. Strength tests for ascertaining resistance of glue.

Standards, British

British Standards for Aircraft Materials. India-Rubber Jl., vol. 57, no. 16, Apr. 19, 1919, pp. 1-2 and 5-6, 4 figs. Specifications prepared by British Eng. Standard's Assn. for rubber tubing for use with gasoline, paraffin, lubricating oil or hot water, and for rubber shock-absorber cord for aircraft.

Veneer Construction

Veneer Body Construction. Aviation, vol. 6, no. 7, June 1, 1919, pp. 485-486, 4 figs. Test of USXB-1 bodies. (Concluded.)

METEOROLOGY

Barometric Variation Forecast

Forecasting Barometric Variations (Sur la prévision des variations barométriques). Gabriel Guilbert. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 18, May 5, 1919, pp. 899-902. Additional observations to note presented in Comptes rendus, vol. 168, 1919, p. 356.

Physics of Upper Air

Air Navigation. H. A. Wimperis. Aeronautics, vol. 16, no. 290, May 8, 1919, pp. 482-487, 10 figs. Advises supporting in every possible way development in scientific work in meteorology in every part of the world, and especially for the study of physics of upper air.

Tides

See Winds and Tides.

Weather Forecast

Meteorology and Transatlantic Fight. A. Zaiman. Flight, vol. 11, no. 20, May 15, 1919, pp. 641-642, 3 figs. Necessity of coöperation between various meteorological stations in forecasting weather conditions emphasized.

Winds and Tides

Practical Study of Winds and Tides (Estudio práctico de vientos y mareas), Jose Debenedetti. Ingenieria, vol. 23, no. 8, Apr. 16, 1919, pp. 496-515. Comparison of values of harmonic constants obtained by process outlined in Indian Survey with those obtained by Prof. G. H. Darwin, based on period of thirty days.

The Lunar Tide in the Atmosphere. S. Chapman. Nature, vol. 103, no. 2584, May 8, 1919, pp. 185-187. Diagram showing lunar semidiurnal tide in atmosphere at Greenwich, as determined from Greenwich Records of barometric pressure, 1854-1917.

MILITARY AIRCRAFT

Air Ministry of Great Britain

Great Britain's War Work in the Air. Aeronautics, vol. 16, no. 289, May 1, 1919, pp. 456-462. Particularly in regard to coöperation of Air Ministry with army and navy.

Naval Aircraft

Operations of Naval Aircraft. J. H. Towers. Jl. Soc. Automotive Engrs., vol. 4, no. 5, May 1919, pp. 368-371, 7 figs. Statistics quoted as examples of work done.

Tactics, Aerial

Aerial Tactics and Defence Against Airships (La tactique aérienne et la défense contre avions). J. A. Lefranc. Aérophile, vol. 27, nos. 7-8, Apr. 1 & 15, 1919, pp. 102-107, 5 figs. Organization of airplane pursuit; bombarding enemy airdromes; anti-aircraft guns. Experiences during the war are quoted and scientific aspect of these tactics is discussed. Second article.

MODELS

Fuselage

Model Aeroplanes—XXVI. F. J. Gamm. Aeronautics, vol. 16, no. 292, May 22, 1919, pp. 532-533, 20 figs. T-frame of fuselage as it is being used for twin screw canard models. (Continuation of serial.)

Lauder Racing Model

Elementary Aeranutics. John F. McMahon. Aerial Age, vol. 9, no. 14, June 16, 1919, p. 697, 2 figs. Dimensions of Lander racing models.

Loening Monoplane

Elementary Aeronautics and Model Notes. John F. McMahon. Aerial Age, vol. 9, no. 13, June 9, 1919, p. 647, 3 figs. Scale model of Loening monoplane.

Model Results and Full Scale Achievement

Model Experiments in Aeronautics. Engineering, vol. 107, no. 2786, May 23, 1919, pp. 657-658, 5 figs. Mathematical analysis of conditions which must be satisfied to obtain exact correspondence between model results and full-size achievements in regard to forces brought into play by motion of a body in a fluid medium.

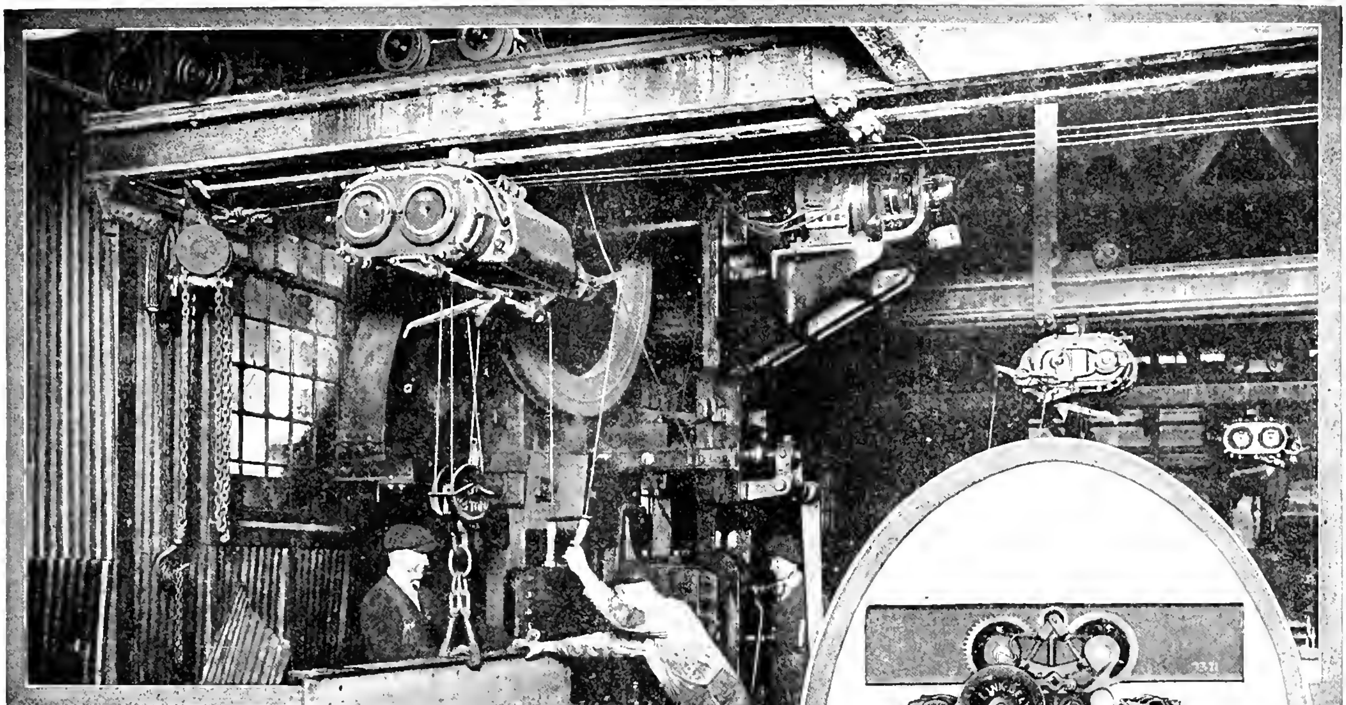
PLANES

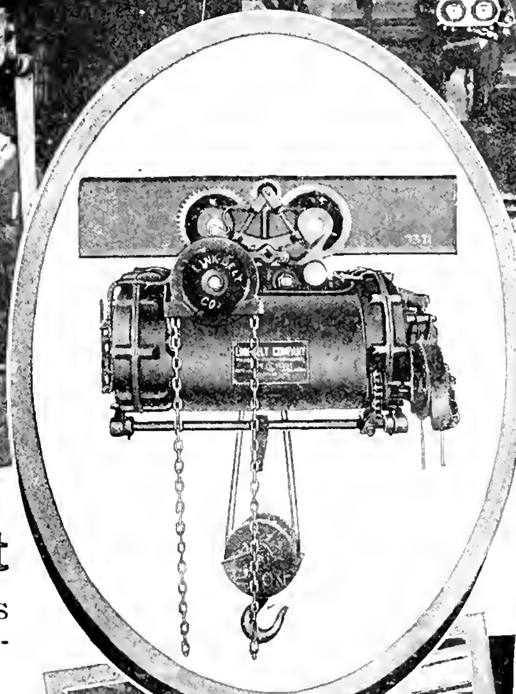
Bantam

The B. A. T. Bantam. Fight, vol. 11, no. 21, May 22, 1919, pp. 662-667, 12 figs. Fuselage construction consists essentially of light framework, comprising six longitudinal members and a number of transverse formers built up of three-ply wood, the whole covered by a three-ply skin put on in bands some 3 ft. wide, lap-jointed where they meet.

Curtiss Biplane

The Curtiss Model 18-B Biplane. Aerial Age, vol. 9, no. 14, June 16, 1919, pp. 676-677 and 701, 4 figs. Peculiarity of machine is employment of ailerons on lower plane only, which are operated by steel tubes running through





Save Time Hoist It—

With a Link-Belt Electric Hoist

A LINK-BELT Electric Hoist is not an expense—it's an investment—one of the most profitable investments you can possibly make.

The hours of time it saves every day in any shop soon pays for the hoist. After that its daily savings are pure velvet for you.

Remember, it's not only the saving of human time and energy that counts—it's the reduction of idle time of expensive and important machinery while waiting for work and its proper placement on the machine bed.

Write us. Let us send you our 44 page Electric Hoist Book No. 246. Shows many types of hoists one of which will no douht meet your requirements exactly. Let our engineers help you solve your handling problems. No charge.

LINK-BELT COMPANY

LINK-BELT

ELECTRIC HOISTS

lower plane and directly connected to pilot's control stick.

Curtiss Triplane

The Curtiss Model 18-T Triplane. Flight, vol. 11, no. 22, May 29, 1919, pp. 698-700, 5 figs. Some of dimensions are: Wing span (all planes) 31 ft. 11 in.; overall length, 23 ft. 3 3/16 in.; overall height, 9 ft. 10⅝ in.

Graham-White

The Graham-White Sporting Aeroplane. Aerial Age, vol. 9, no. 15, June 23, 1919, pp. 728-729 & 733, 7 figs. Span, upper plane, 20 ft.; lower plane, 18 ft. 4 in.; overall length, 16 ft. 6 in.

Navy, U. S.

The U. S. Navy Flying Boat, NC-1. Flight, vol. 11, no. 20, May 15, 1919, pp. 637-639, 8 figs. Flying boat of short-hull type with tail planes carried from hull and top main planes by means of outriggers. Hull is 44 ft. 8¾ in. overall length with maximum beam across side fins of about 10 ft.

Development of the NC Seaplanes. Aviation, vol. 6, no. 7, June 1, 1919, pp. 468-471, 5 figs. Historical account, with particular reference to technical engineering research leading up to adoption of constructional features as ultimately developed.

Radiators

Aircraft Radiators, Archibald Black. Jl. Soc. Automotive Engrs., vol. 4, no. 6, June 1919, pp. 445-461, 24 figs. Brief description of various types.

Tarrant

The Tarrant Giant Triplane, the "Tabor." Flight, vol. 11, no. 20, May 15, 1919, pp. 626-632, 11 figs. Also Aeronautics, vol. 16, no. 291, May 15, 1919, pp. 507-514, 22 figs. Aerodynamically striking features of machine, apart from its great size, are overhanging middle plane, with top and bottom plane of shorter span (span is 131 ft. 3 in., height 37 ft. 3 in.) and disposition of various thrust lines in relation to center of resistance. History of Development with notes on principal features of design and construction.

The Tarrant Triplane. Flight, vol. 11, no. 22, May 29, 1919, pp. 702-703, 2 figs. Accident attributed to sudden starting of two top engines after machine had traveled along ground at high speed with four lower engines running.

Vickers-Vimy

The Vickers-Vimy Passenger-Carrying Aeroplane. Engineering, vol. 107, no. 2788, June 6, 1919, pp. 736-738, 8 figs.; also in Engineer, vol. 127, no. 3310, June 6, 1919, pp. 555-530, 7 figs. Machine as built for traffic service differs from design as originally adopted for bomber purposes, principally in greater depth of fuselage, which, in the passenger class, is of elliptical section and stream-line form.

Whittemore-Hamm

The Whittemore-Hamm Model-L Bibplanes. Aerial Age, vol. 9, no. 16, June 30, 1919, p. 770, 2 figs. Tractor biplanes using Curtiss, Hall-Scott and Hispano-Suiza engines.

PROPELLERS

Bothezat Theory

General Summary of the de Bothezat Blade-Screw Theory, George de Bothezat. Aviation, vol. 6, no. 10, June 15, 1919, pp. 520-524, 6 figs. Expressions for slip and race velocities in slip stream solely in function of dimensions of screw blades, coefficient of fluid resistance of different blade sections and working conditions. From memoir published by Nat. Advisory Committee for Aeronautics.

TESTING

Balloons Fabrics

Use of Ultra Violet Light for Testing Ballon Fabrics, Junius David Edwards and Irwin L. Moore. Aerial Age, vol. 9, no. 15, June 23, 1919, pp. 734-735. Tests made at Bur. of Standards reported to have shown that relative deterioration of fabrics under ultra-violet light is not strictly comparable with deterioration experienced in outdoor exposure.

Metal Parts

Metal Construction of Aircraft, A. P. Thurston. Flight, vol. 11, no. 23, June 5, 1919, pp. 741-745, 12 figs. Testing specimens. Appendix on metal airplane construction. (Concluded.)

Wind Tunnel

The New Curtiss Wind Tunnel. Aerial Age, vol. 9, no. 16, June 30, 1919, pp. 768-769, 3 figs. Employed by Curtiss organization as a means of verifying aeronautical design.

TRANSATLANTIC FLIGHT

Airship vs. Airplane

Airship vs. Airplane for Transatlantic Service (Discorso intorno al dirigibile, all'aeroplane ed alla traversata aerea dell'altlantico), Silvio Bassi. Industria, vol. 33, no. 9, May 15, 1919, pp. 263-267, 6 figs. Technical considerations of limitations of each of these types as at present developed.

The Atlantic Flight, G. Greenhill. Engineering, vol. 107, no. 2787, May 30, 1919, pp. 689-691. Airship versus airplane. Technical.

VARIA

Air-Navigation Rules

The New Air Navigation Regulations. Aeronautics, vol. 16, nos. 290, 291 and 292, May 8, 15 & 22, 1919, pp. 488-491, 516-517 and 538-541. Rules as to lights and signals. Text of order issued by Secretary of State for Air. It deals with general conditions of flying, safety provisions, licensing of personnel, log books, and aerodromes in reference to civil aviation. Rules as to air craft arriving in or departing from United Kingdom. (Continuation.)

Astronomical Determination of Direction

Astronomic Determination of Direction, Edward M. Burd. Jl. U. S. Artillery, vol. 50, no. 4, June 1919, pp. 390-416. Results of comparative observations for determining y-azimuth of a line (Concluded.)

Nomenclature

Nomenclature for Aeronautics, Aviation, vol. 6, no. 10, June 15, 1919, pp. 529-532. From reports issued by Nat. Advisory Committee for Aeronautics.

Physiology of Flying

The Physiology of Flying, W. Guy Ruggles. Aerial Age, vol. 9, no. 16, June 30, 1919, pp. 772-773 and 787-788, 6 figs. On the origin of orientation and equilibration with reference to various types of Ruggles orientators.

Marine Engineering

AUXILIARY MACHINERY

Electrical Auxiliaries

The Electrical Division Aboard Ship, Alex M. Charlton. U. S. Naval Inst. Proc., vol. 45, no. 196, June 1919, pp. 987-1008, 2 figs. Organization, routine and tests developed on U. S. S. "Texas."

Electrically Driven Ships' Auxiliaries. Engineer, vol. 127, no. 3307, May 16, 1919, pp. 478-480, 16 figs. Scott-Bentley load-discriminating device for application to deck winch.

Rudders

The Kitchen Reversing Rudder. Engineering, vol. 107, no. 2785, May 16, 1919, pp. 631-634, 22 figs. Consists of two curved deflectors forming parts of a circular cylinder and partly enclosing the propeller.

SHIPS

American Shipping

The Future of American Shipping, Edwin N. Hurley. Universal Engr., vol. 29, no. 4, Apr. 1919, pp. 21-32, 10 figs. Advises not to concentrate too much upon strength of competition with other nations.

Cargo Vessels

See Freighters.

Concrete Ships

Design and Construction of Navy Concrete Oil Barges, R. M. Burkhalter. Eng. News-Rec., vol. 82, no. 22, May 29, 1919, pp. 1056-1058, 5 figs. Boats have oil holds protected by air compartments and also may carry deck loads. Concrete poured from trestle at rear of boats.

First British-Built Ferro-Concrete Steamship S.S. "Armistice." Steamship, vol. 30, no. 360, June 1919, pp. 275-277, 4 figs. Dead weight capacity 1150 tons. Built on Mouchel-Hennebique system under survey of Lloyd's Registry.

German Views on the Economics of Ferro-Concrete Ships, Carl Commentz. Shipbuilding and Shipping Rec., vol. 13, no. 20, May 15, 1919, pp. 635-636. Table comparing several sizes of steel and reinforced-concrete vessels for both short and long voyages taking prewar prices throughout as basis of comparison. From Hansa.

Form Work and Timbering Details in Concrete Barge Construction. Concrete, vol. 14, no. 6, June 1919, pp. 222-225, 10 figs. Boats have overall length of 112 ft., 36 ft. beam and draft of 9 ft.

Electric Propulsion

See New Mexico.

Freighters

Speed, Dimensions and Form of Cargo Vessels. Shipbuilding & Shipping Rec., vol. 13, no. 21, May 22, 1919, pp. 665-668, 2 figs. Theoretical discussion of best speed, which is defined as the one that will give the largest profit per pound of capital invested, per day invested.

Economical Form and Speed. Shipbuilding & Shipping Rec., vol. 13, no. 23, June 5, 1919, pp. 725-727. Comparison of cost of operating five typical merchant ships.

Cargo Steamers with Rateau Geared Turbines. Shipbuilder, vol. 20, no. 106, June 1919, pp. 327-350, 31 figs. Turbines develop 2500 shaft hp. under ordinary service conditions at 3000 r.p.m. Propeller speed, 70 r.p.m.; total ratio of reduction in speed, 43 to 1.

Leparmentier Unsinkable Ships

Leparmentier System of Building Ships Which Cannot Sink or Capsize (Les Navires inchavirables et insubmersibles Leparmentier), Raymond Lestonnat. Génie Civil, vol. 74, no. 23, June 7, 1919, pp. 453-456, 5 figs. Outlines procedure followed at New Orleans.

Models

Some Experiments on Full Cargo Ship Models, James Semple. Engineering, vol. 107, no. 2788, June 6, 1919, pp. 751-754, 9 figs. To determine effect on performances (1) of fullness, and (2) of longitudinal distribution of displacement. Wake and thrust deduction investigations were also carried out on a number of models, and in addition some comparisons are drawn between results obtained at various establishments.

Motor Ships

The Motor Ship "Santa Margherita." Engineering, vol. 107, no. 2787, May 30, 1919, pp. 691-693 and 706, 8 figs. partly on supp. plates. Equipped with Diesel engiens. Dimensions selected by builders to meet stipulated requirements of British Admiralty in regard to stability, draft and trim, are: length, 440 ft.; breadth, molded, 54 ft.; depth molded (upper deck), 36 ft. 6 in.

Present Position of the Diesel Engine as Applied to Marine Service, Thomas Orchard Lisle. Jl. Soc. Automotive Engrs., vol. 4, no. 6, June 1919, pp. 477-481, 10 figs. Holding that less than 150 hp. per 1000 ton is not of much use as a propelling means, American type of wooden vessel developed during the war is said to have proven unsuccessful because, in addition to other circumstances which are also considered as drawbacks, auxiliary power was insufficient to drive them at a profitable speed without the sails and a favorable breeze and sometimes even with all these.

Motor-Driven Oil-Tank Vessel "Santa Margherita." Shipbuilding & Shipping Rec., vol. 13, no. 23 & 24, June 5 & 12, 1919, pp. 719-721 & 748-750-753, 19 figs. partly on supplement plate. Principal dimensions are: length, 440 ft.; breadth, 54 ft.; depth, 36 ft. 6 in.; draft, normal, 25 ft. 9 in., and maximum, 28 ft. ½ in.; deadweight capacity, 9916 tons. Power supplied by two heavy-oil engines, each of 1250 b.h.p. at 130 r.p.m.

New Mexico

General Characteristics of Electric Ship Propulsion Equipments, E. F. W. Alexanderson. Gen. Elec. Rev., vol. 22, no. 4, Apr. 1919, pp. 224-232, 8 figs. It is said that simplicity and reliability were aimed at for U. S. S. "New Mexico" by elimination of liquid rheostats, and development of new type of squirrel-cage induction motor.

Electric Propulsion for the U. S. S. New Mexico—I, C. S. Raymond. Sci. Am. Supp., vol. 87, no. 2266, June 7, 1919, pp. 356-358, 5 figs. One feature that differs from land practice is omission of turbine and generator base castings. Turbine casing, generator stator frame and bearing standards are bolted directly to stiff structural-steel foundation which is securely tied in with ship's structure. (To be concluded.)

The Turbines of the U. S. S. New Mexico, E. O. Hunt. Gen. Elec. Rev., vol. 22, no. 4, Apr. 1919, pp. 233-243, 10 figs While resembling in many particulars General Electric Co. types built for lamp operation, they possess, it is said, ability to operate over wide range of speed under control of special design governing arrangement.

The New Mexico's Generators, C. S. Raymond. Gen. Elec. Rev., vol. 22, no. 4, Apr. 1919, pp. 244-254, 23 figs. Special feature is said to be arrangement of stator winding in two coils per phase, connected in parallel for low voltage and in "square" for high voltage operation.

Our booklet "Tools and Dividends" suggests ten questions every executive, plant superintendent or purchasing agent ought to ask. Your copy is ready for mailing.

How GTD Helped to Build a Better Marine Engine

THE cooperation of a G T D engineer helped a marine engine manufacturer build a better, more compact, more efficient engine.

American shipping needs demanded an improved American-built product. Foreign engines, especially those of the Diesel type, had been thought superior to ours.

As his first problem this manufacturer saw that the best engine he could build might become useless, if vital bolts or nuts should jar loose under pressure and strain. He knew that upon the precise fit of the thousand threaded parts in his product depended its success.

He sent for a G T D engineer—who recommended tools which would cut threads, if need be, to the limits of a ten thousandth of an inch.

These tools reduced the manufacturer's assembly costs. They made the work easier for his workmen, at the same time helping him to produce a better and stronger engine.

They made it possible for him to use smaller bolts, nuts and screws, thus reducing the amount of metal in the engine, while each thread had been made to fit the other so accurately that the possibility of their jarring loose was reduced to a minimum.

Whether you manufacture engines, machines, implements or appliances, the fit of the threaded parts in your product is of supreme importance to you.

It will pay you to let a G T D engineer look over your blue prints, as was done by this marine-engine builder.

The time and service of our men, based on forty years of experience, is freely offered—and their suggestions may save you thousands of dollars in producing a better and more efficient product.

GTD

GREENFIELD TAP & DIE CORPORATION

Greenfield, Massachusetts, U.S.A.

World s Largest Manufacturers of Screw Cutting Tools

U. S. S. New Mexico. Description and Official Trials. S. M. Robinson and Henderson B. Gregory. Jl. Am. Soc. Naval Engrs., vol. 31, no. 2, May 1919, pp. 345-404, 28 figs., partly on supp. plates. Trials referred to were conducted after ship had been out of dry dock about seven weeks, which is said to have increased by 4000 the shaft hp. necessary to make guaranteed speed of 21 knots.

The Main Control Equipment of the New Mexico, C. T. Hentchel. Gen. Elec. Rev., vol. 22, no. 4, Apr. 1919, pp. 261-271, 16 figs. Construction and interrelationship of units of control apparatus.

Controlling the Propulsion of the New Mexico, H. Franklin Harvey. Gen. Elec. Rev., vol. 22, no. 4, Apr. 1919, pp. 272-292, 10 figs. Refers specially to features permitting interconnection for obtaining direct-current supply at switchboard for turbine-generator excitation, this interconnection providing for contingencies in case of damage to equipment.

A Review of the Propelling Equipment and Operation of the New Mexico, Eskil Berg. Gen. Elec., Rev., vol. 22, no. 4, Apr. 1919, pp. 293-298, 2 figs. Circulating air, hot-well, and lubricating pumps, ventilating fans and other auxiliaries.

Ore Carriers

Geared-Turbine-Engined Ore and Coal Carrier "Conde de Zubiria." Shipbuilding & Shipping Rec., vol. 13, no. 21, May 22, 1919, pp. 659-660, 5 figs. on supp. plate. Principal dimensions are: Length, 314.1 ft.; breadth, 47.9 ft.; depth, 24.3 ft.; gross tonnage, 3278 tons and net tonnage, 2083 tons.

Patrol Boats

The "P" Boats. Engineer, vol. 127, no. 3308, May 23, 1919, pp. 512-513, 2 figs. Patrol boats fitted with 4000-hp. Parsons geared turbines.

Removable Propelling Machinery

Removable Propelling Machinery for Ships (Mécanismes amovibles pour la propulsion des navires), M. Tayon. Génie Civil, vol. 74, no. 16, Apr. 19, 1919, pp. 308-312, 9 figs. Points out that the propelling machinery of a ship is effective only during actual navigation. More economical navigation is, therefore, obtained, it is concluded, by a system which will permit adaptation of machinery set to various hulls.

Tonnage

The Tonnage of Modern Steamships, A. T. Wall. Steamship, vol. 30, no. 360, June 1919, pp. 278-280. Effect of recent legislation and modern machinery on tonnage measurement. Paper read before Instn. Naval Architects.

TERMINALS

Port Management

Some Problems of Port Management, Hamilton Higday. Freight Handling & Terminal Eng., vol. 5, no. 5, May 1919, pp. 186-191. Deals particularly with labor problem, development of industrial areas, and levying of port charges.

Peru

The Ports of Peru, Grosvenor M. Jones. Freight Handling & Terminal Eng., vol. 5, no. 5, May 1919, pp. 170-174. Lobitos, Talara, Callao, Paita, Eten, Salaverry and Chimbote. Description is confined to extent of foreign trade at each.

YARDS

American Shipbuilding

Shipbuilding Development in the United States and Canada, W. R. Gray and Edward F. Clarke. Trans. Northeast Coast Instn. of Engrs. & Shipbuilders, vol. 35, no. 4, June 1919, pp. 151-162 and (discussion) pp. 162-178. Notes gathered on writer's visit to U. S. A.

American Shipbuilding Costs. Shipbuilding & Shipping Rec., vol. 13, no. 20, May 15, 1919, pp. 630-631 & 335-634, 6 figs. Swedish ship of 440 ft. in length with d.w. tonnage of 9500. Engines are 6-cyl., 4-stroke single-action Diesel motors.

Concrete Ships

Concrete Shipbuilding at Barrow-in-Furness, W. Noble Twelvetrees. Engineering, vol. 107, no. 7285, May 16, 1919, pp. 624-627, 14 figs., partly on four separate plates. Site is adapted for building vessels up to 250 ft. in length.

Ford Methods

Ford Methods in Ship Manufacture VI. Fred E. Rogers. Indus. Management, vol. 57, no. 6, June 1919, pp. 456-464, 14 figs. Details of launching scheme and of achievement claimed to have been made in erecting Eagle No. 59 in ten days.

Redesigning

Commerce Absorbs Transport Ships. Mar. Rev., vol. 49, no. 7, July 1919, pp. 326-329, 9 figs. Redesigning of thirteen vessels planned for war emergency to carry freight and passengers.

Standardization of Ship Material

Standardizes Steel Ship Materials, Fred T. Llewellyn. Iron Trade Rev., vol. 64, no. 24, June 12, 1919, pp. 1549-1551. Remarks on standards adopted by Emergency Fleet Corporation which were modeled after British standards. Paper read before Am. Iron & Steel Inst.

Wisconsin Yards

Wisconsin Shipbuilding, Richard S. McCaffery. Wisconsin Engr., vol. 23, no. 8, May 1919, pp. 275-280, 3 figs. Importance of ocean tonnage delivered from Wisconsin shipyards emphasized by remark that if vessels built at these shipyards during last year were placed in line, the line would be two miles long.

SALVAGE

How the "Lake Weston" was Salved. Shipbuilding & Shipping Rec., vol. 13, no. 24, June 12, 1919, pp. 747-749. Vessel ran ashore in Bristol Channel.

Industrial Technology

Ammonia, Oxidation of

See Nitric Acid.

Celluloid

Celluloid in the Industrial Field, John H. Stevens. Raw Material, vol. 1, no 4, June 1919, pp. 227-232, 7 figs. Showing widely differing characteristics celluloid is capable of possessing.

Chemical Engineering

Chemical Engineering, J. A. Wilkinson. Jl. Chem., Metallurgical and Min. Soc. of South Africa, vol. 19, no. 9, Mar. 1919, pp. 159-165, and (discussion) pp. 165-168. Points out that days of haphazard production, unaided by scientific investigation are past.

Physical Chemistry and Its Bearing on the Chemical and Allied Industries, James C. Philip. Chem. News, vol. 118, nos. 3079 & 3082, Apr. 17 & May 9, 1919, pp. 181-183 & 215-222, 2 figs. Apr 17: Influence of temperature and pressure on ammonia equilibrium. May 9: Review of prominent cases of industrial catalysis. (Concluded.)

Fertilizers

The Setting of Mixtures of Superphosphate and Ammonium Sulphate, F. Scott Fowweather. Chem. Industry, vol. 38, no. 9, May 15, 1919, pp. 110T-112T. Experimental. Concluded that rate of setting of such mixtures is increased by reduction of free acid in them.

Gas

Manufacture of Gas from Wood, Adolphe Molin. Gas Jl., vol. 146, no. 2921, May 6, 1919, pp 301-302, 3 figs. Experiences at Stockholm Gas Works in distillation of wood. From Journal des Usines à Gaz.

Glass

The Attack of Pots for Glass Melting. Engineering, vol. 107, no. 2788, June 6, 1919, pp. 725-727, 10 figs. Results of experiments conducted at Nat. Physical Laboratory.

Divitrification of Glass, N. L. Bowen. Jl. Am. Ceramic Soc., vol. 2, no. 4, Apr. 1919, pp. 261-278 and (discussion) pp. 278-281, 3 figs. Experiments interpreted as indicating that divitrification of glass is result of its tendency to reach stable crystalline conditions and that it takes place whenever glass is held for sufficient length of time within temperature where its crystallizing power is great.

Development of Improved Gold Ruby Glass, H. T. Bellamy. Jl. Am. Ceramic Soc., vol 2, no. 4, Apr. 1919, pp. 313-319 and (discussion) pp. 319-322. No conclusive deductions are made from research undertaken, but it is considered that a stable, reliable gold ruby glass can be econmically produced and that the presence of other colors is not a natural phenomenon of gold ruby glass.

Graphite

Refining Alabama Flake Graphite for Crucible Use, Fred G. Moses. Dept. of Interior, Bur. Mines, War Minerals Investigation Ser., no. 8, Dec. 1918, 35 pp., 5 figs. Results obtained in finishing crude graphite concentrate are said to be dependent largely on character of crude flake contained in ores.

Kingsport, Tenn.

Kingsport, Tennessee, and Its Chemical Industries—I & II. Chem. & Metallurgical Eng., vol. 20, nos. 11 and 12, June 1 and 15, 1919, pp. 565-570 and 639-644, 10 figs. Technical description of ceramic and cement plants; also historical survey of growth of city. Coal-tar dyestuffs and intermediates; tannery and tanning extract plant.

Nitric Acid

Commercial Oxidation of Ammonia to Nitric Acid, Charles L. Parsons. Jl. of Indus. & Eng. Chemistry, vol. 11, no. 6, June 1919, pp. 541-552, 13 figs. Methods and apparatus which have been used or are being used for oxidation of ammonia to nitric oxide which, absorbed in water, yields nitric acid.

The Evolution of the Oxidation of Ammonia, W. S. Landis. Chem. Engr., vol. 27, no. 5, May 1919, pp 113-117, 5 figs. Contributions made to process by American chemical engineers in last year of war. (Concluded.)

Nitrogen Fixation

How the Nitrogen Problem Has Been Solved, Henry Jermain Maude Creighton. Jl. Franklin Inst., vol. 187, no. 6, June 1919, pp. 705-735, 4 figs. Outline of principles underlying oxidation of ammonia by air in the presence of catalyst. A bibliography of literature on and relating to nitrogen fixation and oxidation of ammonia. Sixth article.

Nitroglycerin

The Behavior of Nitroglycerin When Heated, Walter O. Snelling and C. G. Storm. Dept. of Interior, Bur. of Mines, technical paper 12, 1912, 14 pp., 3 figs. Experiments interpreted as establishing that nitroglycerin begins to decompose at temperatures of 50 or 60 deg. cent., decomposition being accompanied by evolution of heat.

Nitrous Acid

The Decomposition of Nitrous Acid, Joseph Knox and Douglas M. Reid. Chem. Industry, vol. 38, no. 9, May 15, 1919, pp. 105T-108T, 4 figs. Investigation undertaken to determine influence of surface, shaking, excess of air, temperature and other factors on decomposition.

Peat

Distillation of Peat (La distillation de la tourbe). Journal des Usines à Gaz, vol. 43, no. 11, June 5, 1919, pp. 172-173. Description of installation.

Platinum Substitutes

Comparative Tests of Palau and Rhotanium Ware as Substitutes for Platinum Laboratory Utensils, L. J. Gurevich and E. Wichers. Jl. of Indus. & Eng. Chemistry, vol. 11, no. 6, June 1919, pp. 570-573. It is concluded that rhotanium A ware is superior to platinum ware, both of high (2.4 per cent) and low (0.6 per cent) iridium content in respect to its resistance to loss on heating.

Potash

The Potash Situation, A. W. Stockett. Dept. of Interior, Bur. Mines, War Minerals Investigation Ser., no. 2, Oct. 1918, 13 pp. Summarizes conditions as follows: Normal requirements of country 250,000 tons or K_2O per year; total production of 1917—32,573 tons. Promising sources of permanent supply sufficient for future requirements, brines of Searles Lake and dust from blast furnaces and cement kilns.

Rubber

Effect of Certain Accelerators Upon the Properties of Vulcanized Rubber, G. D. Kratz and A. H. Flower. India-Rubber Jl., vol. 57, nos. 19 & 20, May 10 & 17, 1919, pp. 1-2 and 1-5, 5 figs. Experimental data on activity of certain organic and inorganic accelerators. It is found that magnesia in small amount is less active than certain organic accelerators and does not impart to mixtures the physical improvement characteristic of the latter. (Concluded.)

The Manufacture of Synthetic Rubber, H. Duisberg. Chem. Eng., vol. 27, no. 5, May 1919, pp. 111-112. Compound used at Leverkusen works is said to have been dimethylbutadiene. Paper read before German Bunsen Soc.

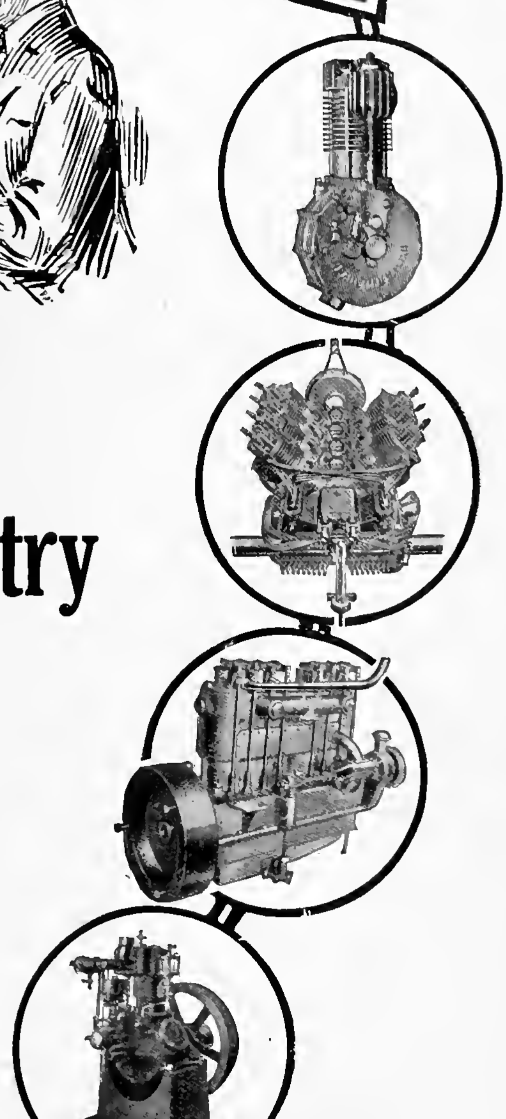
Sugar

The Loss of Moisture from Sugar Samples Under Different Methods of Preservation, C. A. Browne and G. H. Hardin. Sugar, vol. 21, no. 6, June 1919, pp. 294-295. Manner of testing and results obtained at N. Y. Sugar Trade Laboratory. Paper read before Division of Agriculture and Food Chemistry, Am. Chem. Soc.

The Problems of The Automotive Industry

are like the problems of every industry in the Nation's great fields of achievement. Many of the problems of the automotive industry have been taken to Taft-Peirce. The Taft-Peirce organization has developed or co-operated in the development of countless machines and tools (from the typewriter to heavy machinery) involving exceptional ingenuity and requiring great engineering experience and ability.

If you have a designing or manufacturing problem, let the cumulative experience of the Taft-Peirce organization help you solve it. Ask for Bulletin 108-N.



Taft-Peirce Engineering Experts are at Your Service

TAFT-PEIRCE

Woonsocket, R.I., U.S.A.

2076

New York: Woolworth Bldg. Cleveland: 10708 Hampden Ave. Chicago: 1211 E. Marquette Rd. Detroit: Majestic Bldg.

Sulphuric Acid

The Effects of Cooling Burner Gases on the Catalytic Action of Platinum in Sulphuric Acid Contact Plants, S. T. T. Geary. Jl. Soc. Chem. Indus., vol. 38, no. 10, May 31, 1919, pp. 133T-136T, 1 fig. Claims that an average conversion of 98 per cent is obtained when reaction in platinum chamber is allowed to run its course with no attempt at cooling.

Tar Distillation

The Sulzer Process of Tar Distillation. Gas Jl., vol. 146, no. 2923, May 20, 1919, pp. 433-434, 6 figs. Tar passes constantly through apparatus in successive portions, various constituents of which are removed until final residue of pitch is obtained. From Journal des Usines à Gaz.

Tellurium

A Contribution to the Chemistry of Tellurium Sulphide. Aaron M. Hagemin. Chem. News, vol. 118, no. 3082, May 9, 1919, pp. 217-219, 1 fig. Concludes from investigation that introduction of hydrogen sulphide into an aqueous tetravelent tellurium solution at room temperatures or below causes immediate production of a red-brown precipitate represented by formula TeS^2. (Concluded.)

Zinc Oxide

The Manufacture of Zinc Oxide. Chem Eng. & Min. Rev., vol. 11, no. 127, Apr. 5, 1919, pp. 190-191, 1 fig. Plant installed by Broken Hill Associated Smelters Pty. Ltd., Port Pirie

Railroad Engineering

Developments

Railway Developments in Foreign Countries. Ry. Age, vol. 66, no. 23, June 6, 1919, pp. 1371-1375. Materials required for Mexican and Siberian railways; transportation in Italy.

Great Britain

Railway Transport in the United Kingdom. H. Kelway-Bamber. Jl. Roy. Soc. Arts, vol. 67, no. 3470, May 23, 1919, pp. 426-438 (discussion) pp. 438-442, 7 figs., also Iron & Coal Trades Rev., vol. 98, no. 2673, May 23, 1919, pp. 696-697. Considering that welfare of a country largely depends upon provision of cheap and efficient system of transportation, writer endeavors to show how, in his opinion, this could best be effected. Statistical data of track mileage, costs and traffic.

Speeds, Train

European Train Speeds. Ry. Gaz., vol. 30, no. 20, May 16, 1919, pp. 836-838, 3 figs. Survey of highest, longest and fastest non-stop runs, speed of trains between two places and geographical distribution of important services German railways. (Continuation of serial.)

CONSTRUCTION

Track

Using Modern Appliances in Track Construction. W. L. Whitlock. Elec. Ry. Jl., vol. 53, no. 21, May 24, 1919, pp. 995-998, 10 figs. Illustrating how equipment served in Denver construction to increase speed and economy.

ELECTRIC RAILROADS

Locomotives

Brown Boveri Locomotives for the Swiss Federal Railways. J. Buchi. Engineering, vol. 107, no. 2784, May 9, 1919, pp. 589-592, 8 figs. Electric locomotive with single-axle drive, Tschanz system. (Concluded.)

Oerlikon Locomotives for the Swiss Federal Railways. Engineering, vol. 107, no. 2788, June 6, 1919, pp. 727-729 and 740, 7 figs. partly on supplement plates. Two types, 2-6-2 and 2-4-4-2, both single-phase. Some of the dimensions are: voltage, 15,000; maximum drawbar pull, 30,000 lb. and 40,000 lb., respectively; maximum speed, 47 m.p.h.; total weight, 91 and 113 tons, respectively.

Electric Locomotives of Moderate Weight and Power. A. B. Cole. Elec. Ry. Jl., vol. 53, no. 24, June 14, 1919, pp. 1152-1154, 4 figs. With reference to freight-handling requirements on electrified steam-road branch lines and interburban electric railway lines.

New York Central's Latest Motor Cars. Elec. Ry. Jl., vol. 53, no. 24, June 14, 1919, pp. 1134-1138, 10 figs. Design follows steam railroad standards in so far as electrical equipment permits.

Regenerative Braking

Regenerative Direct-Current Electric Railways, E. Austin. Electrical Review, vol. 84, no. 2168, June 13, 1919, pp. 705-707, 3 figs. Principle involved and schematic diagram for connections used in systems installed in locomotives of Chicago, Milwaukee & St. Paul R.R. and on those of the Metropolitan underground, Paris.

Regenerating Braking as Applied to Electric Locomotives. What it Realy Is, H. Ry & Locomotive Eng., vol. 32, no. 6, June 1919, pp. 186-187, 1 fig. Schematic diagram showing single-phase regulation connections.

Third Rail

Types of Third-Rail Used in Railway Electrification. Elec. Ry. Jl., vol. 53, no. 24, June 14, 1919, pp. 1143-1148, 19 figs. Considerations involved in selecting rail section, location and protective covering. Leading types are described and their relative advantages and disadvantages are discussed.

Methods Used in Third-Rail Bonding, G. H. McKelway. Elec. Ry. Jl., vol. 53, no. 24, June 14, 1919, pp. 1154-1156, 8 figs. It is observed that high conductivity is first essential, and ease of installation and maintenance are important considerations.

Track Circuit

Some Things Learned About the Track Circuit, A. R. Fugina and J. B. Weigel. Ry. Signal Engr., vol. 12, no. 6, June 1919, pp. 195-199, 1 fig. Ballast leakage, rail bonding and minimum working voltage of battery are some of the factors that require further study.

ELECTRIFICATION

Contact Shoes

Electrification Facts and Factors, A. J. Manson. Elec. Ry. Engr., vol. 10, no. 6, June 1919, pp. 189-191, 3 figs. Construction details of contact shoes used on over-running and under-running third rails.

France

Partial Electrification of French Railways; Experience Acquired in France and in Other Nations in Regard to Electrification of Extensive Systems (Programme d'électrification partielle des chemins de fer français; expérience actuellement acquise en France et à l'étranger dans l'électrification des grandes lignes—III & IV), M. A. Maudit. Bul. de la Société Française des Électriciens, vol. 9, nos. 79 & 80, Apr. & May 1919, pp. 273-303, 333-360 16 figs. Single-phase, three-phase and mono-phase-three-phase and direct current systems Oerlikon and Brown-Boveri regenerative braking systems. (Concluded.)

Fuel Saving

Methods for More Efficiently Utilizing Our Fuel Resources—XXVI & XXVII, W. J. Davis, Jr., and F. Parkman Coffin. Gen. Elec. Rev., vol. 22, no. 3, Mar. 1919, pp. 196-199, and 212, 4 figs. Possible saving of fuel by railway electrification. Estimates and comparisons. Problems involved in connection with preparation, handling, and burning of powdered fuels on shipboard.

Great Britain

British Railway Electrification. Philip Dawson. Times Eng. Supp., vol. 15, no. 535, May 1919, pp. 153-154. Governing conditions of future extension.

Switzerland

The Electrification of the Swiss State Railways (Die Elektrifizierung der Schweiz Bundesbahnen), E. Huber-Stockar. Schweizerische Bauzeitung, vol. 73, no. 16, Apr. 19, 1919, pp. 181-184, 5 figs. Writer believes that electrification will hardly reduce fares, since it has become very expensive to electrify roads.

EQUIPMENT

Axle Generators

A Discussion of Axle Generators and Pulleys. Ry. Elec. Engr., vol. 10, no. 6, June 1919, pp. 175-178, 5 figs. New York Car Lighting Club debates on truck-hung vs. body-hung machines and solid vs. perforated pulleys.

Headlights

Care of Locomotive Electric Headlights. Elec. Ry. Engr., vol. 10, no. 6, June 1919, pp. 186-188, 3 figs. Rules, regulations and system of records adopted for maintenance of Big Four Railroad's equipment.

Train Lighting

Report on Train Lighting and Equipment Ry. Age, Daily Edition, June 23, 1919, pp. 1667-1670 and (discussion) pp. 1671-1673, 9 figs. Tests conducted by Committee of Am. R.R. Assn. to determine (1) rating of axle generators, (2) method of testing to determine this rating, and (3) relation between capacity as found on the stand test as compared to capacity in actual service.

LABOR

Suitability Tests

Suitability Tests for Railway Men, A. Schreiber. Eng. & Indus. Management, vol 1, no. 16, May 29, 1919, pp. 491-493, 4 figs. Tests applied at Dresden aim to determine how far individual is endowed with four characteristics—intelligence, decision, tranquility and endurance. From Umschau.

LOCOMOTIVES

British

New 2-8-0 Type Locomotive for Mixed Traffic, Great Western Railway. Railway Gazette, vol. 30, no. 23, June 6, 1919, pp. 934-935, 4 figs. Coupled wheels have a size of 5 ft. 8 in.

Carbonization in Valve Chambers

Carbonization in Valve Chambers and Cylinders of Superheated Steam Locomotives, F. P. Roesch. Ry. Age, daily edition, vol. 66, no. 25e, June 25, 1919, pp. 1762-1765, 4 figs. Review of practices of various railways to remedy effects on lubrication and maintenance.

Maintenance

New Locomotive Maintenance Program Pennsylvania Lines West. Ry. Rev., vol. 64, no. 25, June 21, 1919, pp. 913-922, 24 figs. Work involves many new shop structures and much new equipment.

Mallet

Simple Mallet Locomotive with Short Maximum Cut-Off. Ry Age, Daily Edition, June 23, 1919, pp. 1675-1681, 11 figs. Boiler in three parts: Conical course with minimum outside diameter at front end of 96 in., straight combustion chamber 110 in. in outside diameter, and firebox. Two sets of simple cylinders. Longest port opening 50 per cent of stroke. Tractive effort estimated at 135,000 lb.

Meter Gage

New Meter Gauge Locomotives; Bombay, Baroda & Central India Railway. Ry. Gaz., vol. 30, no. 21, May 23, 1919, pp. 868-869, 3 figs. Engines are of 4-6-4 and 4-4-4 types and are equipped with superheating apparatus and piston valves, the latter actuated by Walschaerts valve gearing.

Pacific

Pacific Type Locomotive, Lehigh Valley R.R. Ry. Rev., vol. 64, no. 22, May 31, 1919, pp. 785-786, 1 fig. Designed to utilize mixed anthracite and bituminous fuel.

Three-Cylinder

Three-Cylinder Locomotives, H. Holcroft. Engineer, vol. 127, no. 3307, May 16, 1919, pp. 485-489, 19 figs. General survey of development of locomotives with reference to characteristics in Great Britain, France and America, together with presentation of valve gears for three-cylinder locomotives.

Valve Motion and Fuel Consumption

Fuel Conservation Section of the United States Railroad Administration Tests of Locomotives for Fuel Losses. Ry. & Locomotive Eng., vol. 32, no. 6, June 1919, pp. 169-172, 2 figs. Concluded that condition of valve motion vitally affects fuel consumption, and irregular steam distribution makes proper adjustment of draft apparatus impossible.

MAINTENANCE

Derails

Wide Variety of Practices Shown in Use of Derails. Ry. Maintenance Engr., vol. 15, no. 6, June 1919, pp. 199-203. Tabulation of practice in use on various American railroads.

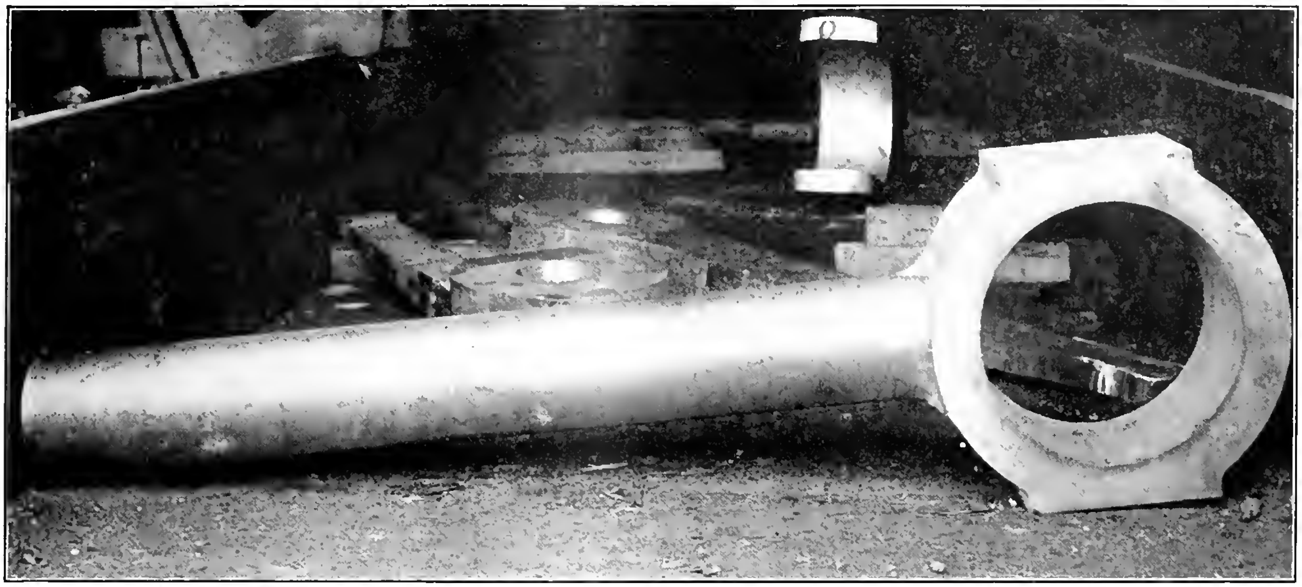
Derails and Where They Should Be Used. Ry. Age, vol. 66, no. 23, June 6, 1919, pp. 1361-1367, 2 figs. Tabulated data covering practices on 48 representative railroads in United States and Canada in regard to conditions governing installation of derails at other than interlocking plants.

Use of Derails Varies Greatly on Railroads. Ry. Signal Engr., vol. 12, no. 6, June 1919, pp. 203-209, 3 figs. Table showing general practice on various American railroads.

Freight-Car Equipment

Maintenance of Freight Car Equipment, H. E. Shipman. Ry. Rev., vol. 64, no. 24, June 14, 1919, pp. 894-896. Recommends more uniformity between roads in freight-car repairs and proposes their classification. Paper read before Western Ry. Club.

CAMDEN



LOST OPPORTUNITIES

Of having your forging orders placed in our shops are regrettable to us, as it is evidence of our not having sufficiently impressed you with the significance of the term

CAMDEN FORGINGS

Our steam hammer and hydraulic press shops, our heat treatment plant and extensive machine shop, our laboratories and Sales Departments are all interested in knowing of your forging requirements and are always ready to answer your inquiries with the purpose of making it possible for you to become our permanent and satisfied customer.

BUYERS' MEMO

High and Low Carbon Bars
Press Columns and Rams
Pull Back Cylinders
Water Cylinders
Valve Bodies
Plungers
Weldless Steel Rings
Lathe Spindles, solid and hollow bored
Long Feed Screws
Power Press Crank Shafts
Rudder Arms

Rudder Stocks
Cam Shafts
Eccentric Shafts
Crusher Shafts
Gear and Pinion Blanks
Locomotives: Side and Main Rods; Crank Pins; Axles; Rod Straps; Guides; Parts of frame both in iron and steel

Hammered Iron Bars for locomotive repairs
Marine Shafts
Marine Connecting and Eccentric Rods
Rolls: Bending; Feed; Straightening; *Embossing*
Large Wrenches
Saw Arbors

Steam Engine Forgings
Pump Crank Shafts
Pump Connecting Rods
Large Nuts
Turbine Shafts
Mill Shafting
Trolley Car Axles
Electric Motor Axles
Any forging to your print, and specifications, in either iron or steel

CAMDEN FORGE CO.
CAMDEN, N.J., U.S.A.

Lighting

Some Notes on Railway Lighting and Maintenance. A. Cunnington. Illum. Engr., vol. 12, no. 3, Mar. 1919, pp. 59-76 and (discussion) pp. 76-86, 11 figs. Advocates adopting standard minimum of illumination in each class of lighting which shall insure comfort for the passenger, efficient working conditions for the railway man and safety for both.

NEW CONSTRUCTION

Big Four

Big Four Increases Capacity at Congested Points. Ry. Age, vol. 66, no. 25, June 20, 1919, pp. 1545-1548, 8 figs. Concerning construction of 87 miles of second track and reduction of grades.

OPERATION AND MANAGEMENT

Bridge Reconstruction and Traffic Maintenance

Maintaining Traffic During Erection of Louisville Bridge. Eng. News-Rec., vol. 82, no. 22, May 29, 1919, pp. 1061-1064, 7 figs. By bunching trains to pass over bridge at noon hour or about 4 p. m. and diverting some trains to other bridges at critical stages in work, operation was maintained throughout two years, during which time about one mile of steel superstructure was erected.

Connectors, Automatic

Train Line Connectors on the Copper Range R.R. Ry. Rev., vol. 64, no. 25, June 21, 1919, pp. 941-943, 4 figs. Report of tests with automatic connectors.

Drawbar Pull-Cut-Off Calibration

Drawbar Pull-Speed-Cut-Off Calibration as an Adjunct to Efficient Locomotive and Train Operation. B. B. Milner. Ry. Age, daily edition, vol. 66, no. 25e, June 25, 1919, pp. 1766-1768, 3 figs. Tests conducted to determine precise cut-off which must be used at various speeds in order to develop maximum drawbar pull.

Fuel Economics

Locomotive Fuel Losses at Terminals. J. M. Nicholson. Ry. Rev., vol. 64, no. 21, May 24, 1919, pp. 752-754, also Railroad Herald, vol. 23, no. 7, June 1919, pp. 36-37. Suggests when locomotive is brought to terminal that fire be turned down to such a point that it will not be necessary to rebuild it in order to get water level in boiler to proper heat before knocking fire. Points out practices which are said to result in useless waste. Paper read before Int. Ry. Fuel Assn.

Reducing Fuel Combustion, Northern Pacific R.R., M. A. Daly. Ry. Rev., vol. 64, no. 24, June 14, 1919, pp. 868-869. Practice of road in schooling enginemen and others in elementary technology of combustion.

Transportation Department and Fuel Economy. H. C. Woodbridge. Ry. Rev., vol. 64, no. 24, June 14, 1919, pp. 865-868, 8 figs. Recommendations to transportation department officials.

Locomotive Operators, Instruction of

Locomotive Operation—Uniform Instructions. J. R. Alexander. Ry. Club of Pittsburgh, vol. 18, no. 4, Mar. 27, 1919, pp. 86-128. Suggestions intended to bring about concerted action in eliminating waste.

Lubrication

Lubrication and Care of Journal Boxes Under Passenger and Freight Equipment. M. J. O'Connor. Off. Proc. Car Foremen's Assn. of Chicago, vol. 14, no. 7, Apr. 1919, pp. 22-32. Suggests establishing standard instructions and practices on all points on any one railroad; for the observance of these writer proposes assignation of experienced men to follow up the work exclusively.

Office Management

Mechanical Appliances in Railway Offices. Railway Gazette, vol. 30, no. 22, May 30, 1919, pp. 900-906, 9 figs. Great Western Railway's method for preparing accounts for goods train traffic.

Power Plants

Management of Railway Power Plants. William Olsen. Ry. Rev., vol. 64, no. 24, June 14, 1919, pp. 858-859. Suggestions in regard to securing fuel economy.

Statistical Department

Checking Percentages by Chart. William Wyer. Ry. Age, vol. 66, no. 26, June 27, 1919, pp. 1826-1828, 1 fig. Practice of operating statistical section of Railroad Administration.

Compilation of Operating Statistics Report. Ry. Age, vol. 66, no. 23, June 6, 1919, pp. 1353-1360, 17 figs. Standard forms for all roads and methods used by various roads in gathering figures.

Viaducts, Smoke Under

Tests to Free Under Side of Railroad Viaducts from Smoke. Robt. H. Moulton. Eng. News-Rec., vol. 82, no. 24, pp. 1162-1164, June 12, 1919, 2 figs. Special arrangement of ducts, air chambers and fans are believed to promise solution of problem of low headroom.

War Operation

The Operation of Federalized Railways Under War Conditions. Carl R. Gray. Off. Proc. St. Louis Ry. Club, 24, no. 1, May 9, 1919, pp. 14-29. Difficulties which, writer believes, caused congestion of railways. Chaotic conditions are said to have resulted from "Lane Commission" taking mens' earnings instead of their ratings as basis for equitable arrangements and relationships between wages.

Wind Resistance

The Wind Resistance on a Train. C. F. Dendy Marshall. Engineer, vol. 127, no. 3307, May 16, 1919, pp. 473-474, 4 figs. Graphs showing ratio of train speed to wind speed, also horsepower requirements for every square foot of transverse surface for various speeds.

PERMANENT WAY AND BUILDINGS

Ties

Reinforced-Concrete Railway Ties (Un nuvvo esperimento di traverse in cemento armato). Rivista Tecnica della Ferrovie Italiana, vol. 15, no. 4, Apr. 15, 1919, pp. 134-143, 19 figs. partly on two supplement plates. Enclosed wire frame forming two circular ends connected by series of straight bars constitutes reinforcement. Blocks of wood to which rails are fastened are embedded in circular ends. Patented.

Track

The Best Methods of Raising Railway Track. Can. Ry. & Mar. World, no. 256, June 1919, pp. 294-295, 5 figs. Report of committee of Road Masters and Maintenance of Way Assn.

Turntable

A Turntable of Unique Design. Ry. Mech. Engr., vol. 93, no. 6, June 1919, pp. 329-332, 6 figs., also Elec. Ry. Engr., vol. 10, no. 6, June 1919, pp. 193-197, 5 figs., and Ry. Age, vol. 56, no. 24, June 13, 1919, pp. 1415-1418, 6 figs. Pennsylvania 110-ft. turntable designed for three-point support and adjustable center.

PUBLIC REGULATION

A Suggested Plan for Control and Operation. Railroad Herald, vol. 23, no. 7, June 1919, pp. 14-16. Suggestion contemplating private ownership and operation under government control.

RAILS

Bonding

The Importance of Rail Bonding. E. Steck. Coal Age, vol. 15, no. 26, June 26, 1919, pp. 1167-1168. Poor track bonding considered as chief difficulty in coal operation, because it cuts down voltage delivered to mine motors.

ROLLING STOCK

Draft Gears

Draft Gear Tests by the United States Railroad Administration. Ry. Rev., vol. 64, no. 18, May 3, 1919, pp. 641-644, 6 figs. Testing arrangement consists of piece of straight track on which are operated two 50-ton gondola cars, equipped with draft gears to be tested.

When Freight Cars Bump. Prof. J. Hammond Smith. Sci. Am., vol. 120, no. 23, June 7, 1919, pp. 602 & 615. Recent tests of draft gears, and the resulting developments.

Dumpers

Car Dumpers. Jas. A. Jackson. Gen. Elec. Rev., vol. 22, no. 5, May 1919, pp. 366-372, 12 figs. Explains operation of two principal types: Turn-over, and lift and turn-over, both of which dump sidewise.

Hopper and Gondola Cars

P. R.R. Maximum Tonnage Hopper and Gondola Cars. Ry. Age (Daily Ed.) vol. 66, no. 24a, June 18, 1919, pp. 1461-1466, 12 figs. Designed for maximum loading of six 6-in. by 11-in. M.C.B. axles. Said to be able to carry 120 tons.

SAFETY AND SIGNALING SYSTEMS

Flagging

Flagging and Its Relation to Railroad Accidents. C. C. McChord. Ry. Age, vol. 66, no. 25, June 20, 1919, pp. 1528-1530. Urges making position of flagman a preferred job investing it with more importance and dignity than is at present the case. Review of American experiences with flagging rule represented as evidencing that most accidents are due to inefficiency and carelessness of flagmen.

Great Britain

Signalling at Southport, Lancashire & Yorkshire Railway. Ry. Gaz., vol. 30, no. 21, May 23, 1919, pp. 871-881, 14 figs. Power-operated signal boxes containing 160 levers.

Block Signalling Practice on a British Railway. F. B. Holt and A. B. Wallis. Ry. Signal Engr., vol. 12, no. 6, June 1919, pp. 188-191, 3 figs. Use of track circuits, signal repeaters and lamp indications. Position of arm shown while pyrometer indicates if lamp is lighted. Second of three articles.

Soda Cells

Testing Soda Cells for Railway Signaling. R. W. Erwin. Ry. Signal Engr., vol. 12, no. 6, June 1919, pp. 201-202, 1 fig. Test consists of discharging a soda cell at one ampere continuously, except during short period each day when a set of intermittent readings are taken.

Transmission Mains

Supply and Transmission for Modern Railway Signalling—II. A. E. Tattersall. Railway Engineer, vol. 40, no. 473, June 1919, pp. 127-130, 4 figs. Formulæ to calculate sags and stresses on transmission mains.

SHOPS

Automatic Machinery

Automatics in Railroad Shops. M. H. Williams. Ry. Mech. Engr., vol. 93, no. 6, June 1919, pp. 303-310, 21 figs. Description of typical machines of the three primary types; set-ups for a variety of jobs.

Cost—Output Formula

Locomotive Repair Shop Output. Henry Gardner. Ry. Mech. Engr., vol. 93, no. 6, June 1919, pp. 335-337, 6 figs. Proposed formula for measuring and comparing cost of repairs in relation to output.

Enginehouse Design

Modern Tendencies in Enginehouse Design. Edwin M. Haas. Ry. Rev., vol. 64, no. 22, May 31, 1919, pp. 787-791, 8 figs. General considerations governing selection of types with illustrations of structures in use by principal railroads. Paper read before Western Society of Engineers.

Rectangular Engine House, Long Island R.R., L. V. Morris. Ry. Rev., vol. 64, no. 22, May 31, 1919, pp. 796-797, 4 figs. Built for rapid handling of equipment. Structure is of reinforced concrete.

Erie Avenue Shop, P. & R.

Erie Avenue Engine Terminal, Philadelphia & Reading Ry. Ry. Rev., vol. 64, no. 24, June 14, 1919, pp. 859-865, 13 figs. In conjunction with plant concrete coaling station has been erected, and a system of electric precipitation wherewith to clarify smoke issued from locomotives is to be installed.

Glenwood Shops, B. & O.

Glenwood Shop Improvements, Baltimore & Ohio R.R. Ry. Rev., vol. 64, no. 21, May 24, 1919, pp. 747-752, 8 figs., also Ry. Mech. Engr., vol. 93, no. 6, June 1919, pp. 288-296, 13 figs., and Ry. Age, vol. 56, no. 24, June 13, 1919, pp. 1401-1404, 6 figs. Site selected for new plant is occupied by old shop building and it was required that shop services should be continued in these buildings during erection of new shops. Shop is of longitudinal type with 21 pits and space is provided for storehouse for mechanical stores.

Steel Car Shops, N. Y. C.

New York Central Steel Car Shop. Ry. Mech. Engr., vol. 93, no. 6, June 1919, pp. 315-319, 10 figs. Brick building, 431 ft. 3 in. long and 243 ft. 6 in. wide.

Tools for Locomotive Valve Parts

Tools for Locomotive Valve Parts, Frank A. Stanley. Am. Mach., vol. 50, no. 24, June 12, 1919, pp. 119-122, 11 figs. Equipment is made up of box tools, boring tools, valve-seating reamers, taps, dies, etc.

Perfected
Die-Casting
Every Stewart die-casting has a smooth, clean surface. Teeth in small gears and pinions made by the Stewart process, are correct in shape and perfect in finish. Holes are true, of exact size and are clean inside. Stewart die-castings are absolutely uniform, not only in size and shape but in composition of metal.
Look over these illustrations of Stewart craftsmanship. Possibly you have been told that parts of your product cannot be die-cast. If so, just send us a sample or blue-print of any part that can be made up in quantities of five thousand or more. The report that the Stewart engineers will make to you may save you time, money and trouble and there is no charge for that service—take advantage of it.
Stewart Manufacturing Corporation
45th Street and Fullerton Ave.
Chicago
Stewart

Water-Gage Fittings

Making Water-Gage Fittings in a Railroad Shop, Frank A. Stanley. Am. Mach., vol. 50, no. 25, June 19, 1919, pp. 1171-1173, 5 figs. Set of tools for turning, boring, facing, threading and otherwise machining various parts entering into construction of gage cocks and fittings, used at California shops of Southern Pacific R. R.

Munitions and Military Engineering

Army Base Service

Military Stores at Port of New York (Entrepots Militaires du Port de New York), P. Calfas. Génie Civil, vol. 74, no. 20, May 17, 1919, pp. 385-391, 13 figs. Description of Brooklyn Army Base.

Ballistics

A Method for Computing Differential Corrections for a Trajectory, Gilbert Ames Bliss. Jl. U. S. Artillery, vol. 50, no. 4, June 1919, pp. 455-460, 1 fig. To account for disturbances in flight of projectiles of magnitude of those caused, for example, by wind.

High Burst Ranging, C. H. Birdseye. Jl. U. S. Artillery, vol. 50, no. 4, June 1919, pp. 417-453, 8 figs. Explanation of methods now in use and suggestions in regard to changes which writer deems desirable.

Camps

The Operation and Maintenance of Utilities at Army Camps and Cantonments, George A. Johnson. Boston Soc. Civil Engrs., vol. 6, no. 5, May 1919, pp. 181-224 and (discussion) pp. 224-233. Special reference is made to conditions brought about by shortage of labor and materials and congestion of transportation facilities.

Guns

The British Eight-Inch Howitzer—I. William Chubb. Am. Mach., vol. 50, no. 25, June 19, 1919, pp. 1189-1194, 11 figs. Consists of A-tube, wire-wound over chamber and portion of bore, inner A-tube of practically same length, and jackets shrunk over wire and a portion of A-tube.

Motor-Transport Service

Keeping 40,000 Army Motor Trucks in Operation, G. E. Rundles. Jl. Soc. Automotive Engrs., vol. 4, no. 6, June 1919, pp. 497-499, 1 fig. Floor plan and layout of mechanical repair shop for Motor Transport Corps.

Navy

The New Navy, VI, Mar. Engr. & Naval Architect, vol. 4, no. 505, June 1919, pp. 265-268, 4 figs. General features of battle cruisers "Renown" and "Repulse."

Railway Artillery

New American Railway Artillery, E. D. Campbell. Ry Rev., vol. 64, no. 294, June 14, 1919, pp. 869-874, 9 figs. Sixteen-inch howitzer railway mount; sliding railway mount for 12-in. and 14-in. guns; 12-in. seacoast mortar on railway mount.

Railway Engineers

Work of a Regiment of Railway Engineers in France, R. F. Fowler. Nat. Service, vol. 6, no. 1, July 1919, pp. 16-20, 3 figs. 100,000 cu. yards of rock were removed from one cut.

Sanitation

Sewage and Wastes Disposal for the United States Army, Leonard S. Doten. Proc. Am. Soc. Civil Engrs., vol. 45, no. 5, May 1919, pp. 233-248, 9 figs. Review of work undertaken by Sanitation Section of Construction Division, U. S. Army.

Shells

Manufacturing the 9.2-In Howitzer Shell—III, S. A. Hand. Am. Mach., vol. 50, no. 23, June 5, 1919, pp. 1089-1093, 10 figs. Washing, fitting and riveting base plug, varnishing, baking and final inspection both by shop and government inspectors. Last article.

Shop Trains

Engineer Portable Shop Train, Philip C. Nash. Power Plant Eng., vol. 23, no. 11, June 1, 1919, pp. 511-513, 3 figs. Equipment furnished U. S. Engineering troops in France.

Target Practice Rod

Making the Hollifield Target Practice Rod, Donald A. Hampson. Can. Machy., vol. 21, no. 26, June 26, 1919, pp. 651-658, 8 figs. Device said to give army recruit all of actual rifle practice without either recoil or noise.

Tunneling

Tunneling at the Front, R. W. Coulthard. Can. Min. Inst. Bul., no. 86, June 1919, pp. 606-620. Best arrangement said to have been found was to divide tunnelers into five sections. Every two days a relief was sent into trenches, where it remained for six days, then returned to rest billets for four days.

General Science

CHEMISTRY

Analysis, Air

The Estimation of Small Quantities of Acetone, Alcohol, and Benzene in Air, Major Elliot and J. Dalton. Analyst, vol. 44, no. 517, Apr. 1919, pp. 132-136, 1 fig. Apparatus consists of four narrow measuring cylinders fitted with Folin tubes. Experiments said to have shown that when air was drawn through at rate of about 10 liters an hour, only one cylinder was necessary for complete absorption in each case.

Analysis, Alcohol

Determination of Small Amounts of Benzene in Ethyl Alcohol, F. W. Babington and Alfred Tingle. Jl. of Indus. & Eng. Chemistry, vol. 11, no. 6, June 1919, pp. 555-556. Standard method adopted by Canadian Revenue Dept.

Analysis, Brass

The Analysis of Brass Ingots from Swarf, R. H. Deakin. Chem. News, vol. 118, no. 3080, Apr. 25, 1919, pp. 193-194. Process for estimating Cu, Zn, Pb, Sn, Fe, Al, Ni.

Analysis, Gas

The Accurate Determination of Carbon Monoxide in Gas Mixtures, J. Ivon Graham. Colliery Guardian, vol. 117, no. 3043, Apr. 25, 1919, pp. 955-956, 1 fig. Writer suggests improving his apparatus (see Trans. Chem. Soc. 1914, 105, 1996), by replacing beaker of water, used for heating purposes, by small steam bath.

Analysis, Steel

Determination of Uranium, Zirconium, Chromium, Vanadium and Aluminium in Steel—II, Charles Morris Johnson. Chem. & Metallurgical Eng., vol. 20, no. 11, June 1, 1919, pp. 588-589. Suggested laboratory methods.

Analysis, Wood

The Proximate Analysis of Wood, W. H. Dore. Jl. of Indus. & Eng. Chemistry, vol. 11, no. 6, June 1919, pp. 556-563. Methods of analysis of woods are described and analysis of five Californian wood samples by these given. It is said that sawdust was found most satisfactory for analysis.

Emulsions

The Modern Conception of Emulsions, W. Clayton. Jl. Soc. Chem. Indus., vol. 38, no. 10, May 31, 1919, pp. 113T-118T. Emulsion of oil in water is produced according to writer, if emulsifying agent is a colloid soluble in water, or more easily wetted by water than oil.

MATHEMATICS

Errors, Law of

Bravais' Law of Errors (Sur la loi des erreurs de Bravais), A. Guldberg. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 16, Apr. 22, 1919, pp. 815-817. Its derivation in space of P dimensions by method of continuous probabilities.

Green's Theorem

A General Form of Green's Theorem, P. J. Daniell. Bul. Am. Math. Soc., vol. 25, no. 8, May 1919, pp. 353-357. Form relates to potential functions which satisfy general integral form of Poisson's equation.

Integrals

True Value of Definite Integrals (Sur la vraie valeur des intégrales définies), Arnaud Denjoy. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 17, Apr. 28, 1919, pp. 848-851. Gives theorem assigning Cauchy's value to function which is measurable and limited to function satisfying various conditions.

Summability, Theory of, Applications

Application of the Theory of Summability to Development in Orthogonal Functions, Charles N. Moore. Bul. Am. Mathematical Soc., vol. 25, no. 6, Mar. 1919, pp. 258-276. Summary of theory and examples of its application to flow of heat and electricity.

PHYSICS

Ether of Space

On a Possible Means of Determining the Two Characteristic Constants of the Ether of Space, Oliver Lodge. Lond., Edinburgh, and Dublin Phil. Mag., vol. 37, no. 221, May 1919, pp. 465-471. Suggests splitting beam of light and sending each half in opposite directions around closed optical circuit in such a way that when they meet, they shall form interference bands.

Kinetics of Heterogeneous Equilibrium

An Electromagnetic Hypothesis of the Kinetics of Heterogeneous Equilibrium, and of the Structure of Liquids, Wm. D. Harkins. Proc. Nat. Acad. Sciences, vol. 5, no. 5, May 15, 1919, pp. 152-159, 1 fig. Indicating general nature of distribution of a component between a set of phases from a knowledge of the properties of only the pure component and of those of the phases before any of this component has been added to them.

Photoelectrons

The Passage of Photoelectrons Through Metals, K. T. Compton and L. W. Moss. Physical Rev., vol. 13, no. 5, May 1919, pp. 374-391, 11 figs. Experiments mentioned as indicating that photoelectrons, excited with a metal, lose the initial kinetic energy as results of single and definite collisions rather than by a gradual process or succession of small energy losses.

Radiation Measurements

Radiation Detection in X-Ray Work, R. E. Slade. Chem. Engr., vol. 27, no. 6, June 1919, pp. 131-134, 3 figs. Research of relation between photographic action and wave length of radiation. Paper based on work done in laboratory of British Photographic Research Assn., and read before Faraday Soc.

Modification of Fluorometric Method of Measuring X-Rays and Its Application to Measuring Radiation of Coolidge Tubes (Sur une modification à la méthode fluorométrique de mesure des rayons X, et son application à la mesure du rayonnement des ampoules Coolige), R. Biquard. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 17, Apr. 28, 1919, pp. 851-854. Substituting 6-mm. screen for series of screens of 0.2 mm. in thickness each.

Sound Measurements

A Complete Apparatus for Absolute Accoustical Measurements, Arthur Gordon Webster. Proc. Nat. Acad. Sciences, vol. 5, no. 5, May 15, 1919, pp. 173-179, 5 figs. Requisites are: source of sound producing a simple tone of known intensity, instrument for measuring in absolute units a constantly maintained simple tone, and series of experiments on propagation of sound from one to other in order to check theory of two instruments. Combinations embodying forms said to have been found suitable after research work are given.

Sound, Propagation of

On the Propagation of Sound in the Free Atmosphere and the Acoustic Efficiency of Fog-Signal Machinery: An Account of Experiments Carried Out at Father Point, Quebec, September, 1913, Louis Vessot King. Phil. Tran. Roy. Soc., Lond., Series A, vol. 218, 1919, pp. 211-293, 26 figs. Tests described as having demonstrated successful use of Webster phonometer for measuring characteristics of pure-toned sound waves of ordinary intensity.

Tuning Forks

On the Characteristics of Electrically Operated Tuning Forks, H. M. Dadourian. Physical Rev., vol. 13, no. 5, May 1919, pp. 337-359, 12 figs. Experimental determination of changes in period produced by massiveness of base, variation of constants in electrical circuits containing electromagnet increase in length of gaps between contact springs and contact points and temperature changes.

Vibration

On the Resultant of a Number of Unit Vibrations, Whose Phases Are at Random over a Range Not Limited to an Integral Number of Periods, Lord Rayleigh. Lond., Edinburgh, and Dublin Phil. Mag., vol. 37, no. 221, May 1919, pp. 498-515, 7 figs. A number of points is distributed at random in a straight line of finite length. Probability that deviation of center of gravity of points, when their number is very great, lies between x and $x+dx$, is found mathematically.

Water

Temperature Coefficient of Tensile Strength of Water, S. Skinner and R. W. Burfitt. Proc. Phys. Soc. Lond., vol. 31, part III, Apr. 15, 1919, pp. 131-136, 1 fig. Liquid was forced under pressure through a capillary constriction between two limbs of a U-tube.

The Horsepower of Resistance in Aeroplane Design

By N. L. Lieberman,[1] Garden City, L. I., N. Y.

The problem of the resistance of an aeroplane has received, directly and indirectly, the analytical attention of many of the celebrated mathematicians and physicists of the last and present centuries. The researches of Newton and Bernoulli have given the general laws of motion and pressure; Euler presented the laws of fluid motion from an investigation of all the points occupied by the fluid, at all instants; while Lagrange explored the same field by investigating the motion of an individual particle. To Lord Kelvin we are indebted for his general dynamical principle. Helmholtz first solved the flow of fluids bounded partly by fixed walls and partly by surfaces of constant pressure and developed the formulæ of vortex flow; then independently and almost simultaneously Helmholtz and Kirchoff established the theory of discontinuity flow. In 1902 Kutta brought forward his vortex sustentation principle, for arched surfaces. A partial explanation of turbulent or eddy motion was presented by Prandtl. The elaborate mathematical analyses of Laplace, Raleigh, Schwartz, Christoffel, Rankine, Stokes, Lanchester and Lamb; and the experiments of Langley, Lanchester, Föppl, Prandtl, Reynolds and Zahm, have all contributed to a directive understanding of the phenomena of fluid motion. No attempt is herewith made to expand any of the above-mentioned theories. Complete discussions, showing the derivations and limitations, are given in Lamb's Hydrodynamics. An excellent résumé showing the salient features of each theory and the mathematical concepts was presented in 1915 by J. C. Hunsaker in his paper, A Review of Hydrodynamical Theory as Applied to Experimental Aerodynamics.[2] It is of interest, however, both academically and for guidance in experimental work, to know the results obtained by these various investigators.

Fig. 1 Four Different Types of Aeroplanes

Model Study and Dynamical Similitudes

The general condition of translational motion in one direction of a solid has been expressed by D'Alembert in the equation

$$M\frac{d^2s}{dt^2} = F \ldots\ldots\ldots\ldots\ldots\ldots\ldots [1]$$

where M = total mass of body

$\frac{d^2s}{dt^2}$ = change of rate of motion of mass M

F = impressed forces

$M\frac{d^2s}{dt^2}$ = effective forces.

Since this equation is independent of any assumption as to the character of the mutual actions and reactions between the particles, it is applicable to fluids as well as to solids. The problem, briefly stated, is the determination of the relations between the impressed forces on a full-scale body, of three dimensions, and its geometrical model.

A detailed examination of the characteristics involved in the complete definition of the body, fluid and motion, shows that only eight are ultimately needed to completely identify the motion for model study. These eight characteristics are—

$M\frac{d^2s}{dt^2} = F$ = force developed

L = span of aerofoil

ε = elasticity of aerofoil

ρ_1 = density of aerofoil

ρ_2 = density of fluid

Abridgment of a paper presented at a meeting of the Buffalo Section of The American Society of Mechanical Engineers, January 29, 1919.

[1] Asst. Mgr., Dept. of Education and Sales Promotion, Curtiss Aeroplane & Motor Corpn.

[2] Presented before the International Engineering Congress, September, 1915.

φ = kinematic viscosity of fluid
C = compressibility of fluid (velocity of sound in fluid)
V = velocity of advance of body (or fluid).

These terms are then treated in accordance with the theory of dimensional homogeneity. The basic principle of this theory is that all terms of an equation must be expressed in the same system of units. The M. L. T. notation is here used.

The physical equation

$$f\left(M\frac{d^2s}{dt^2}, L, \varepsilon, \rho_1, \rho_2, \varphi, C, V\right) = 0$$

yields the final general expression

$$M\frac{d^2s}{dt^2} = F = \rho_2 L V^2 \psi\left[\frac{LV}{\varphi}, \frac{V^2\rho_2}{\varepsilon}, \frac{\rho_2}{\rho_1}, \frac{V}{C}\right] \quad \ldots\ldots\ldots [2]$$

If the velocities of test do not approach the velocity of sound in the medium of test, and further, if the medium of test is the same as the medium of flight, the ψ function reduces itself to a consideration of the L and V factors. Since for any given model

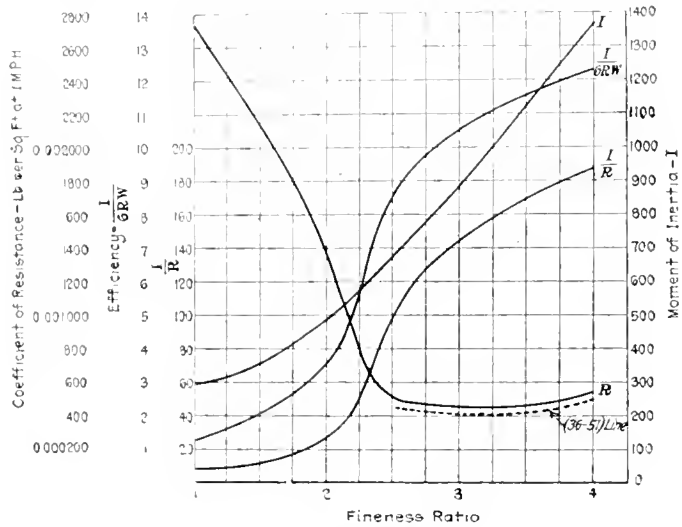

FIG. 2a COEFFICIENTS OF RESISTANCE OF STRUTS

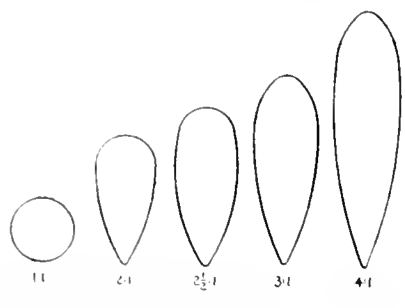

FIG. 2b CROSS-SECTIONS OF STRUTS USED IN PLOTTING CURVES OF FIG. 2a

L is constant, and for critical speed conditions we are governed by the relation $\frac{V}{V_m} = \frac{L_m}{L}$ (where L_m and V_m refer to the line or dimension and velocity of the model), the ψ function becomes a constant. The statement for resistance is then given by the equation—

$$F = K\rho_2 L V^2$$

wherein K combines the effects of cross-section of the body, covering, attitude to flow of medium, etc. It is thus called the "form coefficient." For bodies other than of aerofoil type, interest lies mainly with the coefficient of resistance.

COEFFICIENTS OF RESISTANCE

Struts. In 1912 the N. P. L.[1] tested a series of proposed strut sections submitted by Mr. Ogilvie and obtained interesting results. In Fig. 2a the writer has assumed that a condition of continuity exists between struts of the same form-class, but of different actual length dimensions. In all cases the data plotted are always referred to the fineness ratio (length of cross-section divided by maximum width of cross-section). Fig. 2b shows the sections, dimensioned as to fineness ratio, that were used in plotting the curves of Fig. 2a.

Stream-Line Wires. When members are subject to vibration and movement so that they do not at all times present a head-on view to the wind, the effect on the resistance is similar to that experienced in a turn. Interplane wires are particular offenders in this respect.[1] Hence when stream-line wires were adopted, it was not sufficient merely to decide on a shape that offered the least head-on resistance.

Experiments with struts showed that for different angles of yaw the resistance of the best shape for head-on wind went up very rapidly with the change in angle. As a result of experiments on different shapes, for differing angles, the present generally elliptic shape was adopted. Fig. 3 shows the correction factor for different degrees of yaw.

Fuselage. The general design of the fuselage is frequently fixed by considerations other than those purely aerodynamic. The early forms with open framework are all now replaced with a continuously surfaced structure. Apertures are kept down to the minimum, since theory indicates and experiments show that these add to the total resistance by disturbing the stream-line flow. The main distinction in fuselages centers about the differences between the "short type plus tail booms," and the "long continuous type." The Farman and Voisin construction in French planes, the Vickers Gun-Bus and all the "FE" derivatives, are of the first class. Most of the fuselage construction, however, is of the long continuous type—even when the extended construction merely serves as a boom to the tail (cf. Caproni). The resistance coefficients now available on these various types are meager and disconnected. That is, knowing the coefficient for one form of fuselage does not materially help in determining the resistance of another form. The forms and coefficients given in Table 1 are

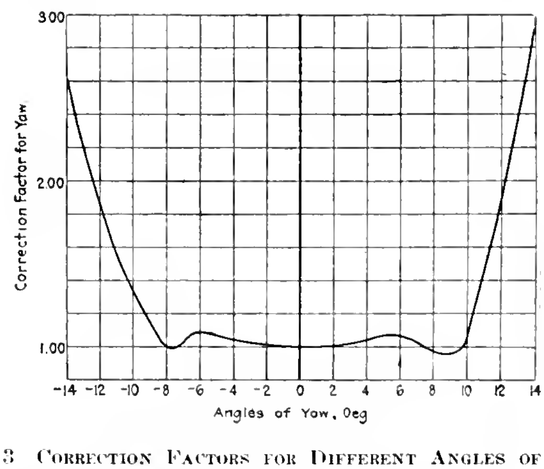

FIG. 3 CORRECTION FACTORS FOR DIFFERENT ANGLES OF YAW

the results of early and recent tests. The coefficients in the table are all for 1 sq. ft. of cross-section at a velocity of 100 m.p.h. (miles per hour), the fuselage inclined 6 deg. to the direction of the wind. The fineness ratio (maximum length divided by maximum depth) is also noted.

PANELS

Extensive experimenting with models and full-scale machines has shown that the factors which for a monoplane form affect a saving are—

1 Wing curve
2 Aspect ratio
3 Plan form.

[1] National Physical Laboratory, Teddington, England.

[1] The vibration of round wires has no effect on the air-resistance—see Comparison of the Air Resistance of Vibrating Wires, by T. E. Stanton, in *Aerial Age*, October 18, 1915.

For multiplane arrangements the saving is a partial function of the monoplane, with increments due to

4 Stagger

5 Gap-chord ratio.

Wing Curve. The lift, drift, movement of the center of pressure and L/D cross-section of two well-known wing curves are shown in Figs. 4 and 5. For comparative study the L/D factors for these and other sections have been plotted in Fig. 6. The choice of a section depends completely on the service. Thus if a high carrying capacity at medium speed is wanted, the curve selected should have an L/D fairly constant over some appreciable range in angle of incidence. If a quick rise is desired at low speed, the lift coefficient at the larger angle of incidence should be high. On the contrary, if a high-speed machine is wanted, but also with a quick get-away (hence fairly low landing and taking-off speed), the L/D factor should be high at both the low and high angles of incidence. Since the weight of the machine is constant, the drift, which is one of the main factors affecting speed, will equal the weight divided by L/D. Hence the larger the L/D ratio, the smaller is the drift, and consequently less horsepower is required to attain, or maintain, a certain high speed.

Aspect Ratio. The more area that can be brought within the province of two-dimensional flow (parallel to the fore-and-aft vertical plane of symmetry), the greater will be the total value of L/D for the entire machine. This is obvious since the end flow of the air at the ends of the panels destroys the lift locally; and by creating probable surfaces of discontinuity within the panel region, still further increases the drift. Tests have shown that the L/D factor increases with the aspect ratio. However, there are both structural and dynamical considerations which limit the aspect ratio. The average practice of today indicates for ordinary

two-place single-motor machines of velocity 75-90 m.p.h., an aspect ratio of about 7.0 to 7.5; for two-place single-motor machines of velocity about 125 m.p.h., an aspect ratio of about 6.0 to 7.0; for single-place machines, 100 m.p.h., an aspect ratio of about 6.0 to 6.5; and for single-place machines, 125 m.p.h., an aspect ratio of 5.0 to 5.5.

It is customary to run wind-tunnel tests on panels having an aspect ratio of 6. The Report of the British National Advisory Committee for Aeronautics for 1911-1912 published correction factors for different aspect ratios, for individual angles of incidence. Within reasonable percentages these relative factors of correction for each angle of incidence have been found to be constant.

Plan Form. While early aeroplane builders attempted to fol-

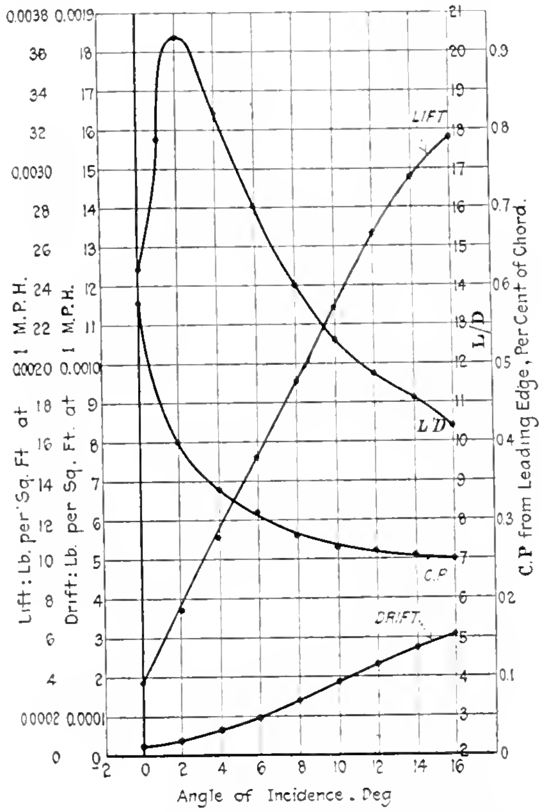

FIG. 4 VARIATION OF LIFT, DRIFT, C.P. AND L/D WITH ANGLE OF INCIDENCE, R.A.F. NO. 15

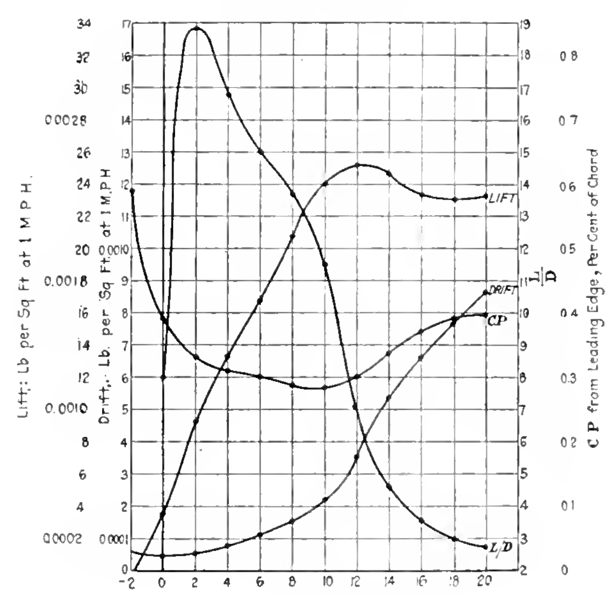

FIG. 5 VARIATION OF LIFT, DRIFT, C.P. AND L/D WITH ANGLE OF INCIDENCE, U.S.A. NO. 16

low the outlines of bird wings, and this still persisted in the early German Taube design, wind-tunnel tests have shown that both stability and good lifting capacity do not always go together for all types of cross-sections tested. Direct comparative tests on all types of plan forms show that the loading on the complete wing is independent of the form of the tip. While it would appear that

for different forms the region of disturbance should vary and hence affect the total loading, undoubtedly the three-dimensional flow masks small regional effects. Tests on a variety of round-ended panels show that a plan form, the end of which is a semi-ellipse, with the major axis normal to the chord and equal to 1.5 times the chord, gives the best results.

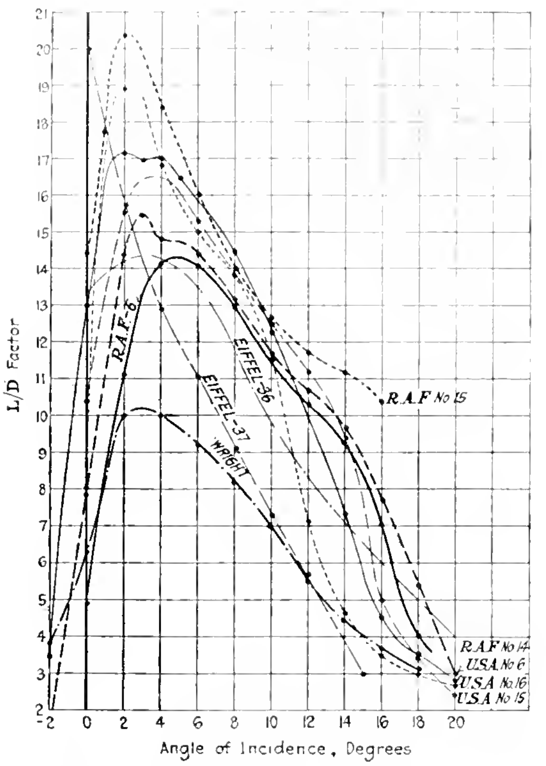

Fig. 6 Variation of L/D Factors of Various Sections with Angle of Incidence

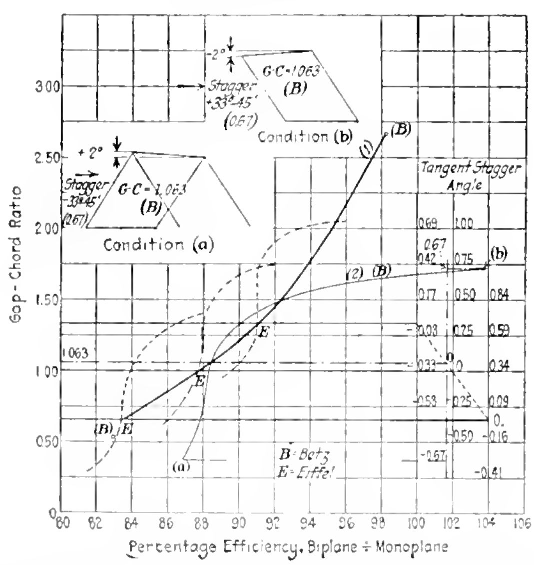

Fig. 7 Efficiency of a Biplane in Terms of an Equivalent Monoplane for Different Values of Gap and Stagger

Stagger and Gap. Many experiments with models and tests on full-scale members have been made in an attempt to reach reliable data showing the effect of the interrelated quantities chord, gap and stagger. M. Eiffel, the N. P. L. and Göttingen have collected considerable data on models in which these quantities were varied singly and readings taken for different angles of incidence.

The writer has taken Eiffel's and Betz' (Göttingen) results and from them constructed a series of curves, Fig. 7, which give the efficiency of a biplane in terms of an equivalent monoplane—permitting variation in both gap and stagger. The abscissæ are always percentage efficiency. The coördinates at the left give the gap-chord ratio. At any specific ratio a horizontal line was drawn, upon which was plotted the specific value of the percentage efficiency found by Eiffel or Betz for condition of "no stagger." The solid curved line (1) thus drawn through these points plotted on the various gap-chord ratio base lines represents the variation in percentage efficiency with changes in gap-chord ratio when the stagger is not considered (i.e., when the stagger is zero). If an auxiliary coördinate line be erected at the right-hand end of any gap-chord ratio base line previously drawn, and the tangents of the stagger angles be marked off as coördinates (positive and negative with respect to the base line), a new set of reference lines are thus established, based on the main set. The point for zero stagger has been set previously and occurs when line (1) intersects the gap-chord ratio base line. This point is now made the origin for another curve showing the variation in efficiency, as the stagger changes—while the gap-chord ratio is held constant. In this manner a series of curves are drawn through curve (1), each showing the variation of efficiency with stagger, for a specific gap-chord ratio. The three values plotted correspond to 1.33, 1.00 and 0.66 gap-chord ratios. Curve (2) shows the variations found by Betz for a gap-chord ratio of 1.063 when the stagger and angle of incidence were changed from condition (a) to condition (b).

In general, the values given by these curves are slightly higher than some of the other tests published; but within the range of ordinary usage the variation will generally be found less than one per cent. One point to be noticed is that for a gap-chord ratio of 1.0 (no stagger) the efficiency is quoted at 87.7 per cent, whereas recent tests have given the efficiency for these conditions at 84 per cent. Figures on the various properties of triplanes were published by J. C. Hunsaker, of the Massachusetts Institute of Technology.

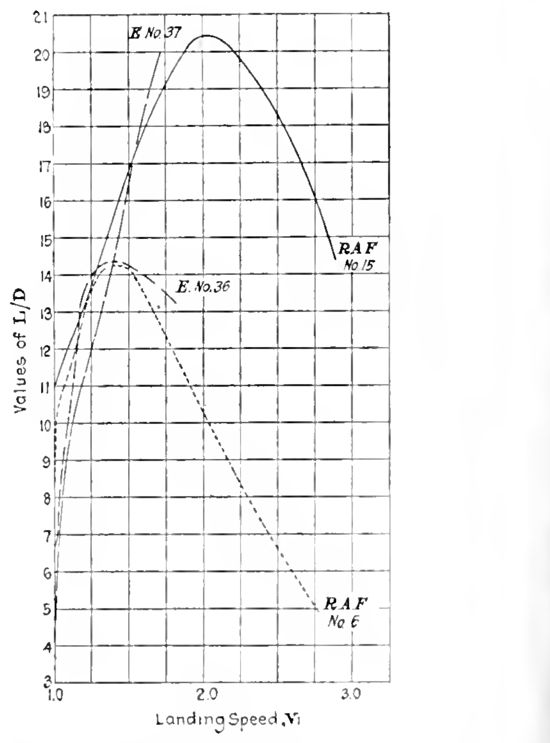

Fig. 8 Curves Showing Relation Between Effectiveness and Landing Speed

Panel Area and Resistance

The total panel area required in any aeroplane is a function of (1) the aerofoil, (2) the weight, and (3) the minimum velocity. The maximum speed, however, is a function of the resistance. Therefore every augmentation in lifting capacity for a given area is a conservation of horsepower and increases the efficiency of the machine (since the "resistance area" will be kept constant).

If the landing speed be called V_1, we have the relation

$$A = \frac{W}{k_1 V_1^2}$$

giving the area that must be furnished in the panels to sustain flight at the given minimum speed. If the minimum velocity be known, the minimum area will be required at the angle of incidence of greatest value of k_1 (k being the lift coefficient of the aerofoil). The maximum speed cannot be predicted until the details of the component parts of the machine are known and the resistance summated. However, assuming that any disturbing moment that would tend to vary the angle of incidence were controlled by the elevators or other means, so that the movement of the aeroplane were horizontal, the velocity at any angle α can be determined by substituting the corresponding value of k_a in the general equation.

$$W = k_a A V_a^2$$

in which W and A are already known, and k_a is selected from the "aerodynamic property" of the aerofoil with which the machine is equipped. Therefore any required velocity for sustentation at any angle other than the landing angle (provided sufficient power is available to overcome the resistance) may be expressed as

$$V_a = \sqrt{\frac{W}{k_a A}}$$

Substituting the value of A as previously found,

$$V_a = V_1 \sqrt{\frac{k_1}{k_a}}$$

Thus the maximum attainable velocity depends on the sum total resistance of the machine and the available power delivered through the propeller. That aerofoil which will sustain the total weight at the given minimum velocity and which will offer the least resistance at the maximum velocity, is therefore the economical one.

From the preceding equation and the aerodynamic coefficients of lift and drift of aerofoils, the effectiveness (L/D) of aerofoils at various speeds for any machine of known weight can be compared.

The resistance of the panels at any speed is equal to the total weight of the machine divided by the L/D factor for the angle of incidence that yields the given speed; or

$$R_a = \frac{\text{Weight}}{\left(\frac{L}{D}\right)_a}$$

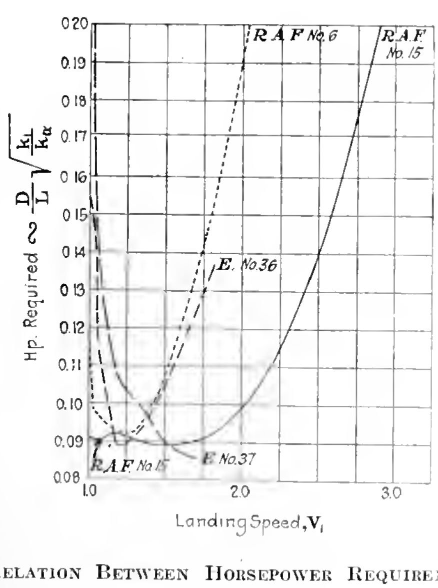

FIG. 9 RELATION BETWEEN HORSEPOWER REQUIREMENTS AND LANDING SPEED

Since the required horsepower $= RV/375$, where R is stated in pounds and V in miles per hour,

$$\text{HP}_a = \frac{\left[\frac{W}{\left(\frac{L}{D}\right)_a} \times V_1\sqrt{\frac{k_1}{k_a}}\right]}{375}$$

which may be written

$$\text{HP}_a \sim \left(\frac{D}{L}\right)_a \sqrt{\frac{k_1}{k_a}}$$

The horsepower required for any type of wing curve can thus be plotted for various speeds (in terms of the landing speed). Fig. 8 shows the relation between the effectiveness (L/D) and

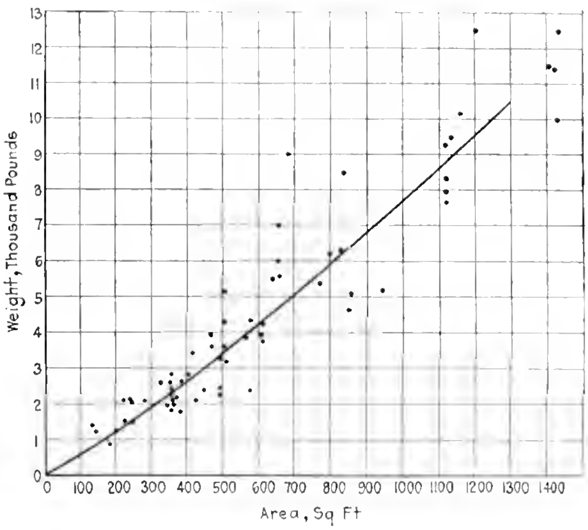

FIG. 10 VARIATION OF AEROPLANE SIZE WITH WEIGHT

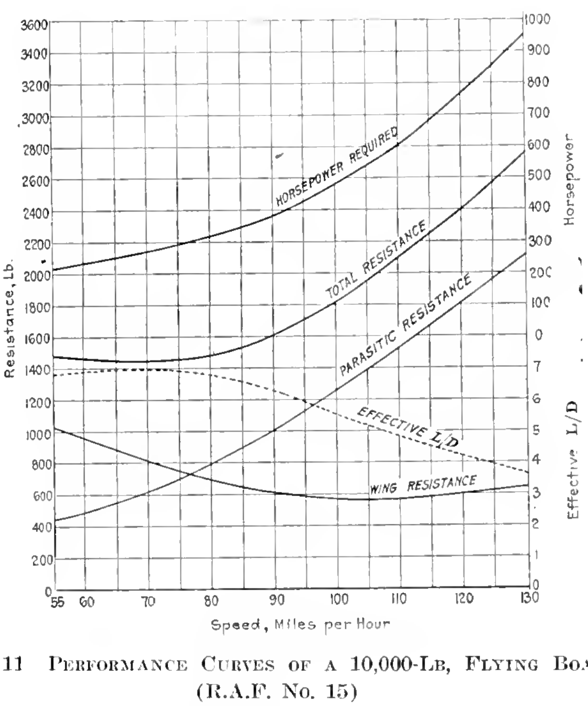

FIG. 11 PERFORMANCE CURVES OF A 10,000-LB. FLYING BOAT (R.A.F. No. 15)

various speeds for different types of curves; Fig. 9 shows the relation between the horsepower requirements and various speeds for the same types of wing curves.

A graphic method is thus presented which permits a direct comparison of the performance of several wing curves, both as to lifting capacity and horsepower consumption at various speeds. Fig. 8 shows that for high speeds the R. A. F. No. 15 wing curve has the greatest L/D; hence for any given machine weight, at high speeds, it will offer the least resistance. Fig. 9 shows that for practically all speeds the horsepower consumption of the R. A. F. No. 15 is least. Hence this wing curve is the most

economical of the four presented at high speeds. The same superiority is evident at low speeds, hence this wing curve is the best all-around curve.

Fig. 8 shows that for low speeds the L/D values of the R. A. F. No. 6 are greater than for the E. No. 36; whereas at the higher speeds the E. Nos. 36 and 37 are superior (the R. A. F. No. 15 excepted).

The curves of Fig. 9 show that for the lower speeds the R. A. F. No. 6 consumes less horsepower than either the E. No. 36 or No. 37. The reverse condition obtains at the higher speeds. Hence for heavy machines the high speed of which will not exceed 1.5 V (V = low or landing speed), the R. A. F. No. 6 curve is preferable to that of either the E. No. 36 or No. 37. Of these last two the E. No. 36 is better at lower speeds but inferior at higher speeds. Unless considerable excess horsepower be available with the E. No. 37 at getting-off speed, this curve is uneconomical.

Distribution of Horsepower Consumption

There is no fixed ratio in accordance with which the total horsepower requirements can be resolved for the component parts of an aeroplane. The following, however, appears to be true for four types studied (see Fig. 1):

1 The percentage of total horsepower consumed by each component group is dependent on the type of group and machine
2 The percentage of total horsepower consumed by each component group is generally independent of the weight of the machine
3 The panels show a decrease in requirement with increasing speeds
4 The remaining component groups show increasing requirements with increasing speed
5 The panel percentage requirement increases in any given type for increases in weight, whereas the percentages of the remaining groups decrease
6 The range of percentages of total horsepower requirements for the different groups, at increasing speeds, is of the following order:

		Per Cent
a	Panels	80 to 25
b	Panel accessories	5 to 25
c	Landing gear	3 to 17
d	Tail units	2 to 15
e	Fuselage	10 to 45

A general statement of "parts resistance," or horsepower requirements, cannot logically be made without considering both type and velocity.

Burden Distribution

The preceding figures have given the actual percentages of total horsepower per group without regard to the weight of the group with respect to the machine. In Table 2 it will be noticed that the percentage weight (of total machine weight) varies for each group, both for machines of the same type and for machines of different types. This variation may be due (*a*) to construction, (*b*) to loading of machine, or (*c*) to both. A curve which will show the relative horsepower expense of each group for its weight the writer has called a "burden curve." Thus a part or group which constitutes a very small percentage by weight may be very expensive in horsepower consumption in proportion to its weight. This curve is obtained by plotting as ordinates the values obtained in dividing the "percentage horsepower consumption," of each group, at various speeds, by the percentage weight of the part or group; and as abscissæ, the speed in m.p.h. Such curves show that:

1 The burden of the panels decreases with increasing speeds
2 The burdens of the other groups increase with increasing speeds
3 The panel accessories have generally the largest burden-figure of all groups

4 The burden of the fuselage is practically constant for different speeds
5 In any one type an increase in weight increases the burden of the panels and decreases the burden of the remaining groups.

In interpreting "burden curves" the precaution should be borne in mind that these curves are functions of the percentage weight of a part besides the resistance. Thus, while the form of a group may be unchanged (hence the aerodynamic property unaltered, and the horsepower requirement kept constant), the internal construction may be altered to reduce its weight. The weight percentage of the group thus decreases and the burden figure increases (burden = per cent hp. ÷ per cent weight). A high burden figure may thus be due to either (*a*) a high resistance or (*b*) a low weight. In either event it serves as an index to the relative horsepower expense of the groups and shows where improvement may be centered.

Flight at High Altitude

The general formula [2] obtained in the discussion on dynamic similitudes showed that the density of the medium affected the dynamic reaction:

$$F = \rho_2 L V^2 \psi [\ldots.]$$

The density of the atmosphere decreases as the altitude increases. The weight of the machine remains practically constant with increases in altitude within the field of operation, hence if ρ_0 = density at sea level and ρ_h = density at altitude h,

$$W = \rho_h k A V^2_0 = \rho_h k A V^2_h$$

from which

$$V_h = V_0 \sqrt{\frac{\rho_0}{\rho_h}}$$

that is, the velocity at altitude h increases in the proportion $\sqrt{(\rho_0/\rho_h)}$ over the velocity at sea level. Also

$$D_h = \rho_h k A V^2_h = \rho_h k A \left(\frac{\rho_0}{\rho_h}\right) V^2_0 = \rho_0 k A V^2_0 = D_0$$

that is, the drifts (hence thrusts) remain constant at the respective velocities for any given altitude of the machine. Again,

$$\mathrm{HP}_h = \mathrm{HP}_0 \sqrt{\frac{\rho_0}{\rho_h}}$$

or the horsepower requirements at altitude h increase in the proportion $\sqrt{(\rho_0/\rho_h)}$ over the horsepower requirements at sea level.

Recent motor tests conducted under reduced pressure to obtain the equivalent condition to altitude, showed a decrease in power in the motor proportional to $(\rho_h/\rho_0)^{1.2}$. The efficiencies of propellers at different altitudes by tests were found to be

$$\eta_h = \tfrac{1}{2}\left[1 + \sqrt{\frac{\rho_0}{\rho_h}}\right]\eta_0$$

The motor output or available thrust at altitude h is $P_h \times \eta_h$,

therefore

$$P_h = \tfrac{1}{2}\left(\frac{\rho_h}{\rho_0}\right)^{1.1}\left[1+\sqrt{\frac{\rho_0}{\rho_h}}\right]\eta_0 P_0$$

$$= \tfrac{1}{2}\left[\left(\frac{\rho_h}{\rho_0}\right)^{1.1}+\left(\frac{\rho_h}{\rho_0}\right)^{0.6}\right]\eta_0 P_0$$

The quantities P_0 and P_h represent the motor horsepower, as indicated in power curves; HP_0 and HP_h represent the horsepower requirements for motion. Hence such value of ρ_h as makes $HP_h = P_h$, indicates the limit of climb, or ceiling of the machine. Combining the foregoing "available horsepower" statement with $HP_h = HP_0\sqrt{(\rho_0/\rho_h)}$,

$$HP_0 = 0.5\left[\left(\frac{\rho_h}{\rho_0}\right)^{1.6}+\left(\frac{\rho_h}{\rho_0}\right)^{1.1}\right]\eta_0 P_0$$

which is an expression for the ceiling of a machine when the available power and required power at sea level are known.

Transatlantic Flights

Recently aeronautical activities have been centered on large flying boats as a means for crossing the Atlantic. What follows, therefore, constitutes a study on the probable size of craft, fuel load and power equipment necessary to accomplish this trip, based on the data and performances of similar craft.

If η = efficiency of the propeller system
P_0 = motor output in horsepower
n = number of motors

the available power $= \eta n P_0$, which in flight equals the power required, or $VD/375$. Since $D = W/(L/D)_e$, where the subscript e denotes "effective,"

$$\text{Available power} = \eta n P_0 = \frac{VW}{375}\left(\frac{D}{L}\right)_e$$

By definition, the total weight is

$$W = nM + L_a + 160p + 6.15\lambda$$

where nM = weight of n motors
L_a = weight of aeroplane
$160p$ = weight of crew numbering p
6.15λ = weight of λ gal. of fuel.

If the motor consumption in gasoline and oil be γ lb. per b.hp., for n motors of P_0 hp. each the consumption per hour will be $\gamma P_0 n$ and the fuel will then last $(6.15\lambda/\gamma P_0 n)$ hours at full throttle and maximum speed. The range of flight, with all n motors going, is in general terms $6.15\lambda V/\gamma P_0 n$. If in this expression the values of $P_0 n$ and W be substituted,

$$\text{Range (in miles)} = \frac{6.15\lambda V}{\gamma\dfrac{WV}{375\eta}\left(\dfrac{D}{L}\right)_e} = \left(\frac{L}{D}\right)_e\frac{6.15\lambda V\times 375\eta}{\gamma WV}$$

$$= \left(\frac{L}{D}\right)_e\frac{2306.25\lambda\eta}{\gamma(nM+L_a+160p+6.15\lambda)}$$

From Fig. 10, if the equivalent linear dimension be designated by $A^{0.5}$, where A = area, the weight will be proportional to $A^{2.6/2.0}$. The weight of the aeroplane can then be expressed as $L_a = \mu W^{2.6/2.0} = \mu W^{1.3}$. The motor weight, when expressed in terms of the available power, is $nM = vP_0 n$, where v is the unit weight per b.hp. Therefore,

$$W = v\left(\frac{D}{L}\right)_e\left(\frac{WV}{375\eta}\right) + \mu W^{1.3} + 160p + 6.15\lambda$$

If now cW be substituted for $(160p + 6.15\lambda)$, the following complete expression in W will result:

$$W = \frac{v}{\eta}\left(\frac{D}{L}\right)_e\left(\frac{WV}{375}\right) + \mu W^{1.3} + cW$$

Dividing this equation by W,

$$1 = \frac{v}{\eta}\left(\frac{D}{L}\right)_e\left(\frac{V}{375}\right) + \mu W^{0.3} + c$$

hence $c = 1 - \dfrac{v}{\eta}\left(\dfrac{D}{L}\right)_e\left(\dfrac{V}{375}\right) - \mu W^{0.3}$

In flying-boat construction the dead load of the hull, panels, etc., will constitute at a minimum about 35 per cent of the total load, or $L_a = 0.35W$. But as L_a has been shown to be equal to $\mu W^{1.3}$, $0.35W = \mu W^{1.3}$, from which

$$\mu = \frac{0.35}{W^{0.3}}$$

Assuming for W the approximate value of 25,000 lb.,

$$\mu = 0.0015$$

The propeller efficiency may be taken at about 80 per cent and a current value of 2 lb. per b.hp. for v. For the complete machine the L/D value will be of the order of 6.9 for the maximum values.

If a velocity of about 115 m.p.h. be approximated and the foregoing values substituted in the expression for c,

$$c = 1 - \frac{2.00}{0.80}(.145)\left(\frac{115}{375}\right) - 0.35$$

$$= 0.54 \text{ maximum to } 0.50 \text{ average}$$

If a crew of four men be included $= 640$ lb. $= 0.026W$, the fuel may be regarded as $0.475W$ to $0.50W = 6.15\lambda$.

Range of operation (miles)

$$= \left(\frac{L}{D}\right)_e\frac{375\eta\times cW}{\left[v\left(\dfrac{D}{L}\right)_e\left(\dfrac{WV}{375\eta}\right)+\mu W^{1.3}+0.026W+cW\right]\gamma}$$

$$= \left(\frac{L}{D}\right)_e\frac{375\eta c}{\left[\dfrac{v}{\eta}\left(\dfrac{D}{L}\right)_e\left(\dfrac{V}{375}\right)+\mu W^{0.3}+0.026+c\right]\gamma}$$

$$= \left(\frac{L}{D}\right)_e\frac{375\eta c}{\gamma}$$

The highest (present design) theoretical value of the effective L/D is of the order of 9.0. For flying boats the value of this factor is considerably lower—more generally of the order 6.8 to 7.0. If an average value of 6.9 be assumed, with $\eta = 0.80$, $c = 0.50$, and $\gamma = 0.525$, the range of operation becomes

$$6.9\,\frac{375\times0.80\times0.50}{0.525} = 1975 \text{ miles}$$

The distance between Newfoundland and Ireland is in round figures 2000 miles, and preceding computations show that a machine of the given characteristics would just be able to cover the flying distance.

If an increase in size be contemplated so that c may attain a value of about 0.52 and the efficiency of large-diameter propellers be reckoned at 0.82 (this value has been consistently obtained in recent designs by the writer),

$$\text{Radius} = 6.90\,\frac{375\times0.82\times0.52}{0.525} = 2100 \text{ miles}$$

If all quantities be taken at their extreme values, a maximum range of 2300 miles is obtainable, giving an excess for deviation in flight of 15 per cent.

The results obtained in the foregoing calculations will now be compared with the performance curves of a 10,000-lb. flying boat, Fig. 11, and deductions as to size, capacity and flying speeds will be made. The model in question carries 330 U. S. gallons of gasoline. Equipped with two Liberty motors it would have a maximum speed of about 110 m.p.h. This gives a straight-ahead flying range of 550 miles, both motors working. It is thus obvious that at least 4.5 to 5.0 times as much fuel must be carried in a craft of this type to make the trip possible. Hence the fuel load must be $330\times5.0 = 1650$ U. S. gallons of gasoline on a two-motor assumption. This corresponds to a load of 10,150 lb. (on the assumption of two motors). Hence if the machine be equipped with n motors the total gasoline load will be 10,150 $(n/2)$ lb.

From the above considerations the indications are that the new machine will be roughly 2.5 times the weight of the first, and about 1.75 times as large. Hence the horsepower requirements may be estimated at $\dfrac{m\sqrt{m}}{N}\,HP_b = 2.25$, say, 2.0, where m = ratio of weights, and $HP_a = 2.0HP_b = 2\times2$ motors. We can thus

(*Continued on page 792*)

ELEMENTS OF A GENERAL THEORY OF AIRPLANE-WING DESIGN

By WALTER C. DURFEE,[1] BOSTON, MASS.

This paper presents in brief outline form ten subjects which have reference to the theory of fluid motion around the wings of airplanes. These are: the vortex theory of lift; the theory of initial motion around wings; vortex theory of shape; hydrodynamic-electromagnetic analogy; action of vortices with reference to each other; action on vortices with reference to their images; influence of the local wind; laws of energy content in trailing vortex; friction and head resistance; and explosion of eddies. These various subjects are not discussed but are merely brought forward for the purpose of providing a starting point for discussion.

THERE are several subjects which seem so interesting in connection with a study of the action of wings upon the air that the writer has thought it valuable to the Society to place them on record, in brief outline and in such a way as to provide a starting point for discussion and the addition of any data which members of the Society may wish to contribute. These subjects which have reference to the theory of fluid motions around the wings of airplanes are as follows:

a The vortex theory of lift, which states that the air which passes the wing of an airplane, or the blade of a propeller, contains a component of circulation around that wing or blade, in such a direction that there is a comparatively high velocity and low pressure on the upper surface of a wing, and a comparatively low velocity and high pressure on the under surface.

b A theory which states that an imperfect fluid will act like a perfect one momentarily; from which it may be inferred that the circulation around a wing cannot exist at the first moment or beginning of its motion of advance but must develop at some time after the first beginning of the motion, since there is no circulation in the beginning.

c The vortex theory of shape, which treats of a solid body in motion as being somewhat similar to the core or kernel of a group of vortices.

d The hydrodynamic-electromagnetic analogy, which states that distributions of fluid motion are very similar to distributions of magnetic flux; so that one may calculate the fluid motion around a supposed vortex or group of vortices mechanically, by arranging electric currents or groups of currents in a manner analogous to the supposed vortices, and measuring the magnetic forces which result.

e The laws of vortex motion with reference to the action of vortices on each other, by which it seems possible to estimate the circulation or strength of the trailing vortex loop which is generated by a wing in flight.

f The laws of the actions of vortices with reference to their images in solid surfaces combined with the laws, so far as known, concerning the generation of eddies and vortices by friction, especially near sharp edges.

g The concept of a local direction of the wind as due to the effects of all vortices existing in the neighborhood of a wing —such as its own trailing vortices and the influence of neighboring circulations.

h Laws concerning the energy contained in various distributions of vortex motion by which one may estimate favorable arrangements of the trailing vortex systems in terms of the load carried by various parts of the wing span, and from which the drag might be estimated.

i Coefficient of friction and head resistance representing losses of energy which can be added to the losses attributed to the energy of the trailing vortices.

j Experience concerning the explosion of eddies and vortices and the causes and effects of such disturbances.

Presented at the Spring Meeting, Detroit, Mich., June 16 to 19, 1919, of THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS. All papers are subject to revision.

[1] Consulting and Manufacturing Chemist. Mem.Am.Soc.M.E.

It is the writer's belief that there are engineers, mathematicians and experimenters in the Society who can give illuminating and interesting statements concerning the subjects mentioned; and that a group of such statements assembled in the form of a discussion would constitute almost a complete and classical theory of the action of wings in steady flight. This paper therefore outlines in a preliminary way the bearing of these various theories and indicates their approximate exactitude.

a The Vortex Theory of Lift. It is not difficult to believe that a component of circulation exists around a wing in flight. If it is granted that the wing carries any load at all, as wings evidently do, there is certainly a difference of air pressure between the lower and the upper surface. Consequently there are accelerations in the neighboring fluid from the under surface around in various circuits to the top surface; corresponding to the fall in pressure from one surface to the other. The quiet or still air into which a wing advances, experiencing these accelerations, must accumulate an upward velocity in front of the wing, and disturbances of a similar nature evidently must occur not only in front of the wing but also to the right hand and to the left hand. Since an upward motion in one region involves a downward motion in another, there must be a downward motion in the rear of the wing. This is a sort of circulation up in front and down behind; and consequently to the rear above and in a forward direction below.

In practice such motions can sometimes be seen in the form of little jerks or jumps of a fluid in the neighborhood of a model wing passing through it. It is not difficult to believe that this disturbance around a wing is rather similar in arrangement to the distribution of velocity around a vortex or group of vortices —their axes parallel to the span of the wing, and perpendicular to the direction of advance. The intensity of motion is very likely greatest near the seat of the disturbance.

According to mathematical theory the lifting force would be in proportion to the strength of the vortex and to its rate of advance, just as the lifting force on a wire in the armature of an electric motor is in proportion to the strength of the current and to the intensity of the magnetic flux from the pole pieces. A formula is given in the Encyclopedia Britannica for the theoretical action of a vortex which surrounds a circular rod which is projected sideways. A force develops perpendicular to the axis of the rod and vortex and at right angles to the motion of advance. This is very similar to the lift of a wing in flight.

Practical examples, however, suitable for mathematical analysis seem to be very rare, nevertheless the writer found one case which seemed to be reasonably free from objectionable complications. This was a wing tested by Eiffel (Eiffel No. 8, at 9 deg. center section). From the measured pressures in this case the probable approximate velocities of the air near the wing surface were estimated, using Bernoulli's theorem. From these velocities a calculation was made of the circulation around the wing, which is the line integral of the tangential component of the velocity vector in a circuit around the wing. The result agrees with the theoretical formula for lift, or $L = \rho Vml$, in which L = force perpendicular to advance; ρ = density of air; V = velocity of advance; m = circulation of the vortex; and l = length taken along vortex axis. It would be interesting to have more measurements of the circulation around wings.

b Theory of Initial Motion Around Wings. It is very evident that no circulation exists around a wing when it is standing still in quiet air on the ground. Mathematical theory further declares that circulation cannot be expected to develop immediately at the beginning of the advance. In the first instant of motion conditions are supposed to be very much as they would be in a perfect fluid. The amount of circulation if zero at the start would be zero immediately afterward. For example, imagine, for simplicity's sake, an inclined plane moving from the position AA' to BB' in Fig. 1, starting suddenly from rest. The

volume equivalent to the space AA'-BB' can be expected to be displaced and to go around the edges in such a manner that there is no net circulation around the section. Very soon after this beginning of motion, however, in the case of a real wing suddenly started in a real fluid, a very violent eddy or vortex is left behind at $A'B'$. When the wing has advanced to a further position CC' the conditions are as sketched in perspective in Fig. 2. There is a vortex loop stretching rearward from near the wing tips and joined together by the eddy generated at the starting point.

c Vortex Theory of Shape. Suppose that the axes of a number of equal-sized vortices are arranged as the black circles in Fig. 3. Then the direction of motion in the fluid due to their combined action in almost exactly[1] in the direction indicated by the full-line arrows. Suppose that a certain motion of translation is added to this particular arrangement of vortex motion. Then the resultant velocity of total result may be in the directions indicated by the dotted arrows. This particular kind of fluid motion corresponds to a certain velocity of motion added to a certain arrangement of vortices.

Now it is a fact that the shape of the curved line of circles shown in the diagram is, as nearly as may be judged, the effective shape of a cross-section of a certain real wing (Eiffel No. 8 at 9 deg.), deducting an allowance for the thickness of the section. Also it is a fact that the spacing of the circles indicates the actual distribution of lifting force experienced by that wing between the front and the rear of the wing section. Also the component of horizontal velocity added to produce the dotted arrows is the velocity used in the published tests of this real wing, and the vortex strength used in preparing the diagram agrees with the vortex theory of lift and the estimated circulation around the

FIG. 1 DIAGRAM ILLUSTRATING THEORY OF INITIAL MOTION AROUND WINGS

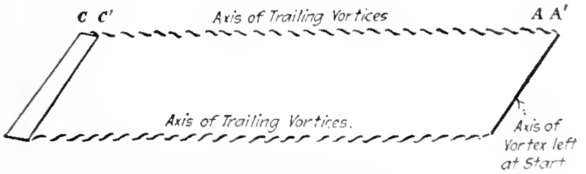

FIG. 2 DIAGRAM FURTHER ILLUSTRATING THEORY OF INITIAL MOTION AROUND WINGS

wing mentioned. Altogether, it is evident from these figures that there is a close connection between the factors of lift, distribution of lift, strength of circulation and distribution of fluid motion and shape.

d Hydrodynamic-Electromagnetic Analogy. Diagrams like Fig. 3 are easily obtained, not by mathematical calculation but by arrangements of electric currents and magnetic fields representing vortices and velocities, choosing any desired amount of flux to represent a standard velocity.

e Action of Vortices With Reference to Each Other. The Encyclopedia Britannica gives formulæ for the action of groups of parallel columnar vortices upon each other, in terms of the strength of these vortices and their distance apart. It is interesting to estimate the strength of the trailing vortices from a biplane by observing their actions on each other. The pairs from the right-hand wing tips are of one kind or direction and revolve around each other in approximate circles. Those from the left-hand tips also revolve around each other, but in the reverse direction from the first-mentioned pair. Very careful experiment would be required to detect any error in the vortex theory of flight in terms of the action of these pairs of trailing vortices.

f Action on Vortices With Reference to Their Images. Many peculiarities of fluid motion are roughly explainable in terms of the action of eddies as if under the influence of their images in solid surfaces. For example, there is a remarkable difference in the circumstances surrounding the eddies formed at B and B' in Fig 1 on the upper surface of the plane. One at the rear B' should tend to roll off if considered as under the influence of its image. Conversely, the one at A should tend to remain with the plane.

g Influence of the Local Wind. Vortices, although regarded as having their axes in some particular location, are usually con-

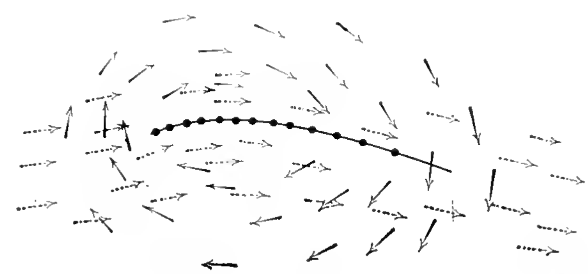

FIG. 3 DIAGRAM ILLUSTRATING HYDRODYNAMIC-ELECTROMAGNETIC THEORY

sidered as having an influence through the fluid in which they exist, just as the magnetic effect of a direct current is considered as having an effect at remote distances. It is interesting to calculate the effect of this influence on a wing of short span. Such a wing in horizontal flight does not act as if encountering a horizontal onrush of the atmosphere. It acts as if there were a downward component of motion in the air around the wing, of very much the same amount that might be calculated from the strength of its own trailing vortices. This is manifest in a relatively poor lift, as if something were reducing the angle of attack, and in a greater resistance as if climbing up through a descending wind.

h Laws of Energy Content in Trailing Vortex. Mathematically it would appear to be as easy to calculate the energy of vortex-motion lift in the wake of an airplane as it is to calculate electrical self-inductance. The arrangement of trailing vortices behind an airplane evidently depends considerably on the distribution of the loading along the wing span, because a wing can terminate in effect considerably short of the actual tip by an easing up of the lift. Calculations concerning the best arrangements would be interesting. The writer has made some approximate computations by assuming the trailing vortices to be a group of parallel columnar vortices: a sort of vortex sheet constituting the wake of the wing. This method of calculation applied to a monoplane gives the usual values of the lift-drag ratio when friction is taken into account.

i Friction and Head Resistance. In a practical way friction is a very large item and it would be very interesting to have separate tests for the friction losses of wings. For example, tests might be made of the resistance of a hoop or endless ring having the cross-section of a good wing.

j Explosion of Eddies. Frequently the low pressure at the center of a vortex or eddy in real air appears to be penetrated by a rush of air along the axis. Knowledge about this, especially with reference to the effect, cause and control of such disturbances in the wake of wings, would be interesting.

DISCUSSION

JOHN R. FREEMAN[1] (written). The writer is hardly competent to discuss Mr. Durfee's paper in the language and symbols of mathematics, but a possible line of investigation of these phenomena occurs to him which may perhaps be useful.

[1] "Almost exactly," because the diagram contains an almost imperceptible allowance for the termination of the sustaining vortices within the lengths of the wing span and for the influence of their rearward extensions as trailing vortices.

[1] President, Manufacturers Mutual Fire Insurance Co., Providence, R. I. Past-Pres. Am.Soc.M.E.

About ten years ago when members of our Society were guests at a meeting in England of the Institute of Mechanical Engineers, the eminent mathematician, Dr. Hele-Shaw, presented an illustrated discussion on stream-line problems in air currents relating to airplanes, in which he showed the disturbing effect upon the streamline of models designed to represent various forms of wings. The fluid in that case was a liquid and the stream lines were represented by ingeniously colored liquid filaments. The investigation was along lines of previous investigations of the distribution of velocities in flowing liquids containing colored liquid threads which showed the eddy currents caused by such obstructions as bridge piers.

At that time it seemed to the writer that the difference in compressibility of air and water, and also the difference in inertia effect, impaired the analogy, and on further thought he laid out a line of experiments for tracing the motion of liquids around obstructions in channels by a combination of methods borrowed from the ultra-microscope and the moving-picture machine, although he has never found time to carry out the experiments. This method seems admirably adapted to experiments on air currents in connection with airplanes.

The method in brief is to make an optical cross-section in any desired plane by means of a thin, broad beam of intense light put into appropriate shape and parallel rays by proper condensing lenses and an optical slit, analogous to that used with the ultra-microscope. By means of dust particles of proper density introduced in the air current, one can render visible the direction and velocity of the currents set up somewhat as he sees the air currents in his living rooms made evident by a sunbeam acting upon the suspended dust particles.

The narrow slit of light reveals only the motions in one plane and simplifies the observation by rendering the particles visible only while traveling in this optical plane.

In the case of the airplane, these motions would mostly be too rapid for the eye to follow, but within limits it is possible to observe them and to record them by a motion-picture apparatus which can be so constructed as to make 30 or 50 exposures per second instead of the customary 16. It is indeed possible to obtain exposures of much shorter frequency by means analogous to the shutter-testing device developed in Dr. Mees' Research Laboratory at Kodak Park, in which a rapidly revolving polygon of mirrors serves to catch and record the fleeting image. Also there have been devised and patented means of revolving polygonal prisms of glass, so adjusted that their reaction holds the image approximately stationary on the screen or film for the fraction of a second.

Such a series of photographs recorded in a short reel of film can be rotated for purposes of study at a much slower speed than that at which they were taken.

By these means the writer believes the actual pathway of the particles of air as they pass either wing plane or propeller can be made evident and precisely recorded at velocities far higher than can be observed in any other known way, and a series of optical sections, analogous to those of the ultra-microscope or the sunbeam, will simplify the hopeless complexity of a dense mass of particles traveling in various directions.

EDWARD P. WARNER[1] (written). It is manifest that any considerable development of the theory of wing action beyond the point already reached must be conditional on the use of new and more powerful and logical methods of attack. In most of the work so far done, whether by the simple assumption of plane impact and reflection or by such more elaborate methods as that of Kirchhoff and Helmholtz, the continuity of the air has been ignored, and the results have consequently been far from the truth.

The work of Lanchester, Kutta, and others on a vortex theory of sustentation seems to offer the most promising path to an analysis of wing action which shall be of real practical use. It leads to the only method which takes due account of the fact that there can be no actual acquisition of downward momentum by the air as a whole, since the center of gravity of the atmosphere cannot shift, and any downward motion imparted to the air in the neighborhood of the wing must be counterbalanced by an equal upward motion imparted to an equal mass at some other point.

Promising as the vortex theory is, however, it should not be overrated. There are many factors in the action of wings for which it does not appear to account, and the mathematical weapons are not at hand for applying it, except in the simplest cases. The electromagnetic analogy proposed by Mr. Durfee is very interesting, but it must be handled with care, particularly in connection with thick wings, where the air flow changes from stream-line to turbulent types and back again with the greatest suddenness and in response to the minutest alterations of wing form or conditions of operation. It is doubtful if this analogy could be extended to any cases beyond those of the flat plate and the simplest forms of thin, cambered sections.

[1] Chief Physicist, National Advisory Committee for Aeronautics Research Laboratory, Langley Field, Hampton, Va. Jun. Am.Soc.M.E.

GEORGE DE BOTHEZAT[1] (written). The statement "*a*" of Mr. Durfee's paper constitutes in reality the well-known "Kutta theorem," discussed by Kutta himself (*Illustrirte Aeronautische Mitteilungen*, 1902; Sitzungsberichte der Königlichen Bayerischen Akademie der Wissenschaften, 1910 and 1911), by Joukowski (*Aérodynamique*, Paris, 1916) and by Dr. de Bothezat (Report No. 28, Note I, from Fourth Annual Report, National Advisory Committee for Aeronautics).

The statement "*c*" was first made by Lord Kelvin with reference to an example actually classical (the so-called atmosphere around a system of two rectilinear and parallel vortices rotating in inverse sense).

The statement "*d*" of the hydrodynamic-electromagnetic analogy is well known. But the suggestion to study the flow around an airfoil by this method is of interest, and such experiments conducted in a suitable manner could bring out valuable results.

A solution of the question proposed in statement "*e*" is directly obtained by the successive application of the Kutta theorem, Lord Kelvin theorem on the constancy of circulation, and the Stokes theorem connecting circulation with vortex intensity. (See Report No. 28 of the Fourth Annual.)

The statement "*g*" is not quite clear; if local wind means only the instantaneous value of the fluid velocity at a given point around the airfoil, it is only a regular conception.

The statements "*h*" and "*i*" demand very careful consideration, because it seems that in the case of hydrodynamic phenomena some special conditions may occur which we do not meet in electromagnetic phenomena.

F. W. CALDWELL[2] (written). This paper is very timely, particularly in view of the growing tendency among aeronautical engineers to regard the classical coefficients K_x and K_y as inadequate.

It has been almost universally the practice to write $L = \frac{\rho}{g} \times K_y S V^2$ and $D = \frac{\rho}{g} K_x S V^2$, where L is the lift, D the drag, S the area of the supporting surface, V the velocity of advance, ρ the density of the air in weight units, and g the acceleration due to gravity, hence $\frac{\rho}{g} =$ density of the air in slugs.

It is well known as the result of experience that the values of K_y and K_x vary somewhat with velocity and also with the size of the surface under consideration. If l represents one of the linear dimensions of the surface it is assumed that the values of K_y and K_x are functions of the product Vl. This is known as the scaling effect.

Information on the scaling effect is very meager. In the case of propeller sections we have been forced to make use of characteristics obtained at a speed of 30 miles per hour and apply them to conditions where the speed obtained is as great as

Fatigue Phenomena in Metals

A Report Summarizing the Available Facts and Theories Relating to Fatigue Failure and a Discussion of Some of the Unsolved Problems

METAL parts of machines, such as springs, shafts, crankpins and axles, occasionally fail suddenly while only subjected to conditions of ordinary service. Not only does failure occur suddenly, but the part about to fail shows no ordinary evidence of weakness. The broken parts when examined are seen to be broken off short, and without general distortion, even though the material may show high ductility in ordinary tests. Such failures are found only in parts subjected to stress repeated many times—to "vibration," as it is sometimes stated—and the phenomena which are involved in the final failure of metal through oft-repeated loading are known as "fatigue" phenomena of metals.

The phenomena of fatigue failure have recently given rise to some perplexing problems in connection with the design and service of airplane-engine crankshafts, the hulls of steel ships, axles and shafts in railway cars, motor cars and trucks, and other machine parts. The question whether structural parts subjected to repeated stress are in danger of fatigue failure has been discussed at considerable length. The danger of fatigue failure seems to be an unimportant factor in determining the safety of structural parts, with the possible exception of parts subjected to reversal of stress. The reason for this is probably found in the relatively small number of loadings which most structures are called upon to withstand, and in the fact that most of the loadings are below the maximum working value. On the other hand, the danger of fatigue failure is a major factor in determining the safety of many machine parts.

The problem of fatigue of metals engaged the attention of engineers seventy years ago, in connection with car axles and members of iron railway bridges. It was early recognized that high stress tends to cause, or at least to hasten, fatigue failure, and about 1860 Wöhler's famous investigations[1] were undertaken to determine the relation between intensity of fiber stress and the ability of materials to resist fatigue under repeated stress. Wöhler's tests occupied some eleven years, and remain to this day the most thorough tests on record. Wöhler investigated metals under direct tension, under bending, and under torsion (shear). For some of his tests the stress varied from zero to a maximum, and for others the stress was reversed. The results of Wöhler's tests may be summarized as follows:

1. A machine part or structural member may be ruptured by the repeated application of a load which produces a computed fiber stress less than the ultimate strength of the material as determined by a static test
2. The greater the range of stress, the lower the limiting fiber stress to insure against rupture after a very large number of repetitions
3. To insure against rupture after a very large number of repetitious of loading causing complete reversal of stress, the limiting fiber stress is but little greater than one-half the limiting fiber stress for a very large number of repetitions of stress varying from zero to a maximum.

Following Wöhler the famous Bauschinger[2] published a series of conclusions on fatigue, and various other investigators, notably Gerber,[3] and Weyrauch and Launhardt,[4] gave early interpretations of the experimental results of Wöhler and Bauschinger.

In these earlier experiments several facts seem noteworthy. The prime object of the investigators was to deduce laws of fatigue for railway bridges and car axles. The problem of fatigue in high-speed machine parts had not then appeared. These investigators carried their tests far enough to cover the number of repetitions required by the structures of their day and assumed that having done so they had established an endurance limit. Reading their conclusions carefully, the statement does not seem to be made that material which passed their tests would stand an *infinite* number of repetitions. The term generally used is "indefinite" or "very large," and the number corresponding is from ten to fifty millions. For the problem which they investigated their tests seem to give safe guides for practice, but today, with the advent of modern high-speed machinery, some parts of which must be as light as possible, and the extension of the fatigue problem to such members as the cranks and the connecting rods of gas engines and the shafts of steam turbines, the number of repetitions of stress which a machine member may be called upon to undergo is very much increased. This fact is illustrated by Table 1, which gives a statement of the approximate service required from various structural and machine members.

Investigations have been made in recent years by Howard,[5] Stanton,[6, 7, 8] Basquin,[9] Smith,[10] Eden, Rose and Cunningham,[11] Kommers,[12] Mason,[13] Moore and Seely,[14] and others. The efforts of these investigators have been directed toward the study of modern materials, refinements in methods of testing, and interpretation of results. The limits of actual tests have not been extended to modern requirements, and the problem still remains of obtaining test data for much longer endurance of fatigue than was contemplated by Wöhler. Under the most favorable conditions conceivable such data will be obtained very slowly, and meanwhile there must be faced the problem of determining safe stresses for very large numbers of repetitions by extrapolation from previous test results.

TABLE 1 APPROXIMATE SERVICE REQUIRED OF VARIOUS MEMBERS OF STRUCTURES AND MACHINES SUBJECTED TO REPEATED STRESS

Part of structure or machine	Approximate number of repetitions of stress in the "lifetime" of the structure or machine
Railroad bridge, chord members	2,000,000
Elevated-railroad structure, floor beams	40,000,000
Railroad rail, locomotive wheel loads	500,000
Railroad rail, car wheel loads	15,000,000
Airplane-engine crankshaft	18,000,000
Car axles	50,000,000
Automobile-engine crankshaft	120,000,000
Lineshafting in shops	360,000,000
Steam engine, piston rods, connecting rods and crankshafts	1,000,000,000
Steam-turbine shafts, bending stresses	15,000,000,000

Machines for Testing Fatigue Strength

Fatigue tests cannot readily be carried out with ordinary "static" testing machines. It is, of course, possible to repeat loadings on a test specimen in such a machine, but the process is very slow. Such a machine equipped with an ingenious auto-

The society contributes toward a portion of the cost of this research and the report is presented to the membership through the Research Committee of the A. S. M. E., Prof. Arthur M. Greene, Jr., *Chairman*. The personnel of the Committee on Fatigue Phenomena is as follows:

H. F. Moore, *Chairman*, Research Professor of Engineering Materials, Engineering Experiment Station, University of Illnois, Urbana, Ill.

O. H. Basquin, Professor of Applied Mechanics, Northwestern University, Evanston, Ill.

Zay Jeffries, Director of Research, Lynite Laboratories, Aluminum Castings Co., Cleveland, Ohio.

T. R. Lawson, Professor of Rational and Technical Mechanics, Rensselaer Polytechnic Institute, Troy, N. Y.

J. H. Nelson, Engineer of Tests, Wyman-Gordon Co., Worcester, Mass.

W. E. Ruder, Research Department, General Electric Co., Schenectady, N. Y.

H. L. Whittemore, Chief, Section of Metal Testing, U. S. Bureau of Standards, Washington, D. C.

[1] For this and following references see page 738.

matic arrangement for applying and releasing load was used by Van Ornum[15] in fatigue tests of concrete in compression, but the time required for even a hundred thousand cycles of stress was very great.

A very simple repeated-stress testing machine acts by the application and removal of a weight to the end of the long arm of a simple or compound lever, the specimen carrying load at the short arm. Such a machine was used by Berry[16] in fatigue tests of concrete in compression. In a machine of this type the load must be applied slowly, else there will be inertia forces set up by the impact of the weight as it is let into place.

A common type of repeated-stress testing machine is one in which a calibrated set of springs resist the tensile, compressive, flexural, or torsional stress set up in the specimen, and the deformation of the calibrated set of springs gives a measure of the force or moment acting on the specimen. Fig. 1 diagrammatically illustrates this type of machine which was used by Wöhler and has since been used by many other experimenters. The Upton-Lewis machine is of this type and extensive use was made of

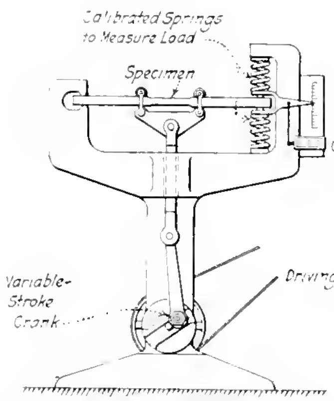

FIG. 1 A TYPE OF REPEATED-STRESS TESTING MACHINE

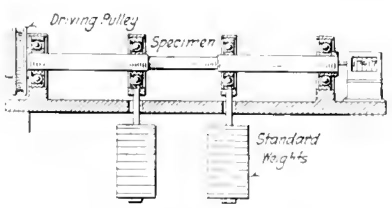

FIG. 2 TYPE OF MACHINE FOR DETERMINING REVERSE BENDING STRESSES

it in torsion tests carried on by McAdam.[17] This type of machine permits a fairly high rate of repetition of cycles of stress, and machines which have been run at 1000 repetitions per minute have given results apparently trustworthy.

The most common type of machine for reversed bending stresses uses a circular specimen acting as a rotating beam. This type was used by Wöhler, and also by many later investigators. Fig. 2 illustrates such a machine. The specimen is in the form of a bar of circular section, to which bending stress is applied by weights. The specimen is rotated by means of a pulley. At any instant the outer fibers are subjected to a stress varying from tension on one side to compression on the other, and the fiber stress at any point passes through a cycle of reversed stress during each revolution. As shown, the specimen is loaded at two symmetrical points of the span, and between these two points the extreme fiber stress is constant for each element along the bar. This type of machine permits high speed of reversal of stress, speeds up to 2000 r.p.m. having been successfully used.

British experimenters have used repeated-stress testing machines in which varying stress was applied to a specimen by means of the inertia of reciprocating parts. Fig. 3 shows such a machine, which can be used at high speeds. However, the speed must be very closely controlled, as the inertia forces vary with the square of the speed. Moreover, friction on the guides causes some slight uncertainty as to the magnitude of stress set up at each stroke of the crank.

A repeated-stress testing machine depending on centrifugal force to produce cycles of stress is shown in Fig. 4. It is evident that as the eccentric weights revolve the specimen will be placed alternately in tension and in compression. This machine has been used by J. H. Smith.[10] Its characteristics are much like those of the inertia type; in fact, it is a special form of inertia machine.

A type of machine used by Arnold and later by other experimenters is shown in Fig. 5. In this machine a specimen is repeatedly given a certain deflection. Usually this deflection is sufficiently large to stress the material well beyond the yield point, and no very definite stress can be computed. This machine is used mainly for short-time tests.

Another short-time-test machine uses the repeated impact of a small hammer. The claim is made that impact loading emphasizes local flaws better than a load which is more gradually applied, and that thus it *indirectly* gives a better index of fatigue strength. Data, however, are lacking to prove or disprove this claim.

Various repeated-stress testing machines have been constructed in which the cycles of stress were set up by the action of an electromagnet energized by alternating current. Usually the stress was measured either by the deflection of a spring or by the deformation of a standard test bar attached to the specimen. The speed of such a machine, however, is usually so high that there seems to be some uncertainty as to whether the successive waves of stress pass through the specimen without interference.

While the microscope can hardly be classified as a testing machine, it has, nevertheless, been of such vital importance in studying fatigue phenomena that it may well be mentioned in

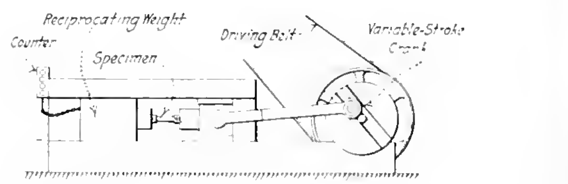

FIG. 3 BRITISH FORM OF REPEATED-STRESS TESTING MACHINE

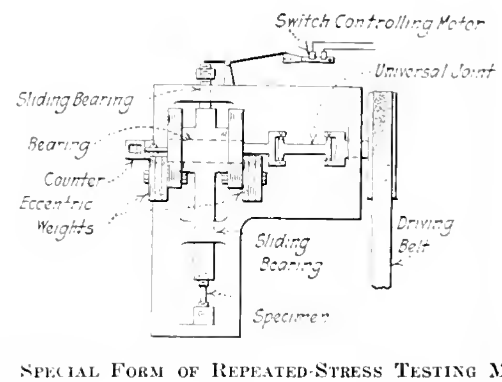

FIG. 4 SPECIAL FORM OF REPEATED-STRESS TESTING MACHINE

this place. Space will not permit of a detailed description of the methods employed in the microscopic examination of metals, but the process involves polishing a small area of the metal, etching the surface with some reagent to bring out the lines of the crystalline structure and examining and photographing the surface through a microscope, the surface of the metal being illuminated by means of a reflected light.

THE PHENOMENA OF FATIGUE FAILURE

A fatigue failure of a metal, whether it occurs in a test speci-

men or in a machine part, is characterized by suddenness, lack of warning, apparent brittleness of material, and, in many cases, a fracture with a crystalline appearance over a part of its surface.

This crystalline appearance led to the old theory that under repeated stress metal "crystallized," changing from a ductile "fibrous" structure to a brittle "crystalline" one. This theory, however, has been quite thoroughly demolished as a result of study of the structure of steel under the microscope. As revealed by the microscope the structure of all metals used for structures and machines is crystalline, any "fibrous" structure being caused by inclusions of non-metallic impurities (for example, slag in wrought iron). Microscopic examination of metals under stress shows no change of the general scheme of internal structure, but under sufficiently heavy stress there appears gradual breakdown of the crystals in the structure.

When a ductile metal is deformed cold, the first deformation occurs in the particular grains which either take the most stress or have the lowest elastic limit. Deformation takes place by the slipping of one portion of the grain with reference to other portions. This slipping is shown by the appearance of lines called "slip bands" or "slip lines" extending across crystals and indicating planes of cleavage, as shown in Fig. 6. As the load is increased deformation proceeds and other slip bands are formed, the law being that the most easily deformable grains first show slip bands. Gradually the most favorable planes of slip are exhausted, and further slippage can take place only with the addition of more load.

The failure in ductile metals subjected to repeated stress takes place with substantially no general deformation There is, however, considerable local deformation over microscopic areas, evidenced by the appearance of many slip bands on a polished surface of the metal after the application of repeated stress. These slip bands appear after a small number of reversals of stress with relatively large loads, and may not appear at all with slight loads. The slip bands may first appear either in the interior of a grain or at the grain boundary. As the number of applications of stress increases more slip bands appear, and those first appearing usually lengthen and widen. Under the microscope and with normal illumination the general surface becomes blacker as the number and width of the slip bands increase. In ductile metals fatigue failure is almost exclusively through the grains themselves rather than at the grain boundaries, and the first slip bands to appear do not necessarily form a part of the final path of rupture. Failure seems to take place by the uniting of slip bands into cracks. When the first grain develops a crack extending across its entire width, added stress promotes the extension of this crack into adjacent grains on both sides, although the orientations of these grains may be and usually are such that the crack must extend itself at an angle to that in the initial grain. The general tendency is for these slip bands to follow the lines of cleavage of the particular grain in which they occur. Often incipient fracture is found in many grains adjacent to the final path of rupture, indicating that had rupture not taken place where it did, it would have soon taken place in some other adjacent part.

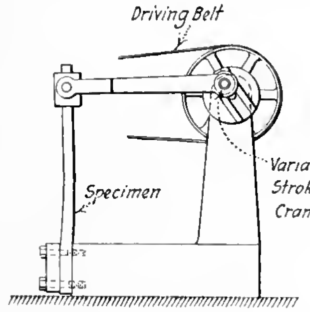

FIG. 5 SHORT-TIME REPEATED-STRESS TESTING MACHINE

Such observations by means of the microscope indicate that *localized deformation* is the primary cause of fatigue failure in ductile metals, but it does not necessarily follow that the formation of one slip band under repeated stress will indicate eventual fracture if the loading is continued; one grain may appear to have a greatly reduced elastic limit because of internal strains or peculiarly unfavorable orientation. It is not certain that there is a limiting load below which fatigue failure will never take place.

Materials classified as brittle have very little permanent deformation under static stress, and under repeated stress the progressive fracture of brittle material might take place, not by slipping within crystals, but by tensile fracture of crystals. There has been practically no study made of the fracture of brittle materials under repeated stress, and it would be instructive to have tests carried out on brittle amorphous materials such as fused silica and on brittle crystalline materials like marble or tungsten. It is gradually being recognized that the breaking load of a specimen is a complex matter, and depends, among other things, on the time of application of the load. Mere duration of static loading, however, does not have an effect at all comparable with repetition of loading in reducing the breaking load. It seems evident that the distribution of stress in some brittle materials is very much less uniform than in ductile materials, and that fractures in brittle materials start on areas of high stress, whereas in ductile materials the high stresses are relieved by local yielding. A more complete understanding of the mechanism of rupture in brittle materials would doubtless be of great value.

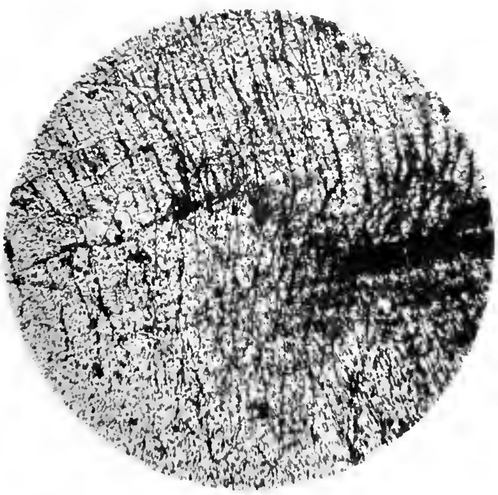

FIG. 6 APPEARANCE OF "SLIP BANDS" INDICATING PLANES OF CLEAVAGE

When the action of metal under repeated stress is considered from the viewpoint of the internal strains and accompanying stresses in the material, a radical difference is seen in the behavior of material under static load and under repeated load. In a general way we may consider any structural or machine part as subjected to static conditions if the load on it is applied gradually and is not repeated more than a few hundred times; the part may be considered as subjected to fatigue if the load on it is applied, say, one hundred thousand times or more; and for intermediate conditions of loading the phenomena characteristic of both kinds of loading would be present.

We must look upon steel as filled with a multitude of minute flaws. These flaws are developed in the solidification of the material. In static testing, steel under stress of about half its ultimate strength passes into a semi-plastic condition, in which there is a gradual flow of the material. Under such conditions the small flaws have almost no effect upon the flow or upon the static strength. When steel is loaded to moderate stresses the yielding is almost entirely elastic, but in general a small portion of it is inelastic, energy being taken up by the steel itself. If the specimen can be loaded a great number of times without heat loss its temperature will increase. If it is set vibrating in a chamber free from air it will stop vibrating in a short time, due to the absorp-

tion of energy. In such cases the stress-strain curve appears to be straight and the curve for the removal of the load may be practically identical with that for the application of load, but still these other effects show loss of energy in the steel itself.

This loss of energy is doubtless due to small displacements at these flaws, which are not reversible. Under alternate loadings these displacements are made back and forth. Energy is continuously being absorbed in the location of these small flaws, and it is perfectly natural that they should increase in size. We must look upon these extensions of the flaws as occurring in a great many parts of the steel. If the stresses are small the increase in size of these flaws is practically negligible, but if the stresses are larger the increase is rapid, and later on in the history of the piece under test, very rapid, and finally the strength of the piece is terminated when a sufficient number of these flaws have connected so as to form an area of very great weakness.

For static loads all the above is of little consequence with a ductile metal; but it is of consequence in the case of a brittle metal like cast iron, which has a remarkably low strength in tension in comparison with its compressive strength. Ductile metals may be considered as having a very high value for cohesion with a rather low coefficient of friction—or whatever corresponds to that—so that these metals begin to slide on diagonal planes without actual fracture under high local stress.

When a ductile material is loaded it may be subjected to stresses whose average values for small areas are not very different for parts that are a tenth of an inch apart; but there is a multitude of tiny spots whose fiber stresses are 2, 3, 4 or 10 times the average value.[23, 24, 25] This holds so long as elastic conditions obtain. As the applied stress increases some of these stresses increase in like ratio, but not in like increments. At moderate applied stresses these special stresses reach inelastic conditions and slipping occurs. If the average stress is now entirely removed, we may assume that the unloading takes place in a similar manner. The small spots unload first in an elastic manner, but at a different rate than the remainder of the material. They will unload approximately at the same rates as they used in taking stress, namely, 2, 3, 4 or 10 times the normal rate. For the unloading they have about twice the range of stress that they had in the loading before inelastic action is set up. Some of them will reach the opposite limit and slip part way back again, while some of them may not be subject to this return slip of inelastic action, but will retain in the unloaded state a stress distribution of the opposite kind. Either of these actions will give rise to hysteresis and to slight change of dimensions, usually, however, too small to be detected.

In all of the foregoing the main parts of the material have not been subjected to stresses which give inelastic action. If the loading is repeated without reversal, the spots that slipped on the first unloading will be subjected to further slipping both on loading and on unloading, but the areas that suffered no slipping on the first unloading should show no further inelastic action unless the loading is reversed. If the loading is reversed, however, all the particles that slipped in the first loading will slip on the reverse loading, so that with repetition a larger number of spots undergo this slipping action than is the case with loading which is not reversed. This explains the shorter life under reversed stress than under repeated stresses in one direction only.

If the fractured surface of a "rotating beam" specimen made of ductile metal and broken by repeated stress is examined, it is usually seen to be made up of two parts: (1) near the extreme fibers there is a dark surface with a dull, lusterless appearance, while (2) the remainder of the surface has a bright crystalline fracture. If these are examined more carefully it is found that their principal difference is in the size of the small flat surfaces that constitute the fracture. The center portion of the area has comparatively large surfaces, giving a crystalline effect, while the dull gray portion has very small surfaces of fracture.

An explanation of this is that the flaws in the outer portion of the surface have connected to form an annulus, whose rugged face is roughly at right angles to the axis of rotation. This has doubtless occurred slowly, and has started from many centers, thus giving the rough face. After this slow growth of flaws into an annular fracture has been accomplished the specimen has become very weak and the stresses have become so large at the fracture that they suddenly tear the metal in two on the natural surfaces of cleavage of the crystal grains.

The center portion of this fractured surface does not differ from the crystalline surface at the bottom of a cup in an ordinary static tension fracture, except that the crystalline surfaces are somewhat larger. This is to be explained by the fact that in an ordinary tensile test the material at the fracture has elongated something like 100 per cent, so that the crystal grains have become of smaller cross-section and will naturally show smaller facets on fracture, whereas, in a fracture of the endurance specimen, the material has had no chance to elongate and the crystalline grains have their normal size, which will be shown in fracture. It is not the crystalline portion of the broken specimen which has failed primarily by repeated stress, but the dull portion. In the crystalline part of the fatigue fracture and in the crystalline part of the static tension fracture the failure seems to be of the same nature, namely, a failure in cohesion.

In considering the phenomena of fatigue failure it may be well to call attention to the fact that there is an intermediate type of failure of ductile material in which both plastic action and the development and spread of microscopic flaws are present. Such failures sometimes occur in staybolts, boiler sheets between rivet holes, and other parts occasionally subjected to very severe local distortion.

Localized Stresses Under Static Loading and Under Impact Loading

When a machine member or structural part is loaded gradually a state of strain and accompanying stress is set up throughout it. In a general way the distribution of stress is similar to that given by the theory of elastic action which serves as a basis of our formulæ for computing stress and strain. There are, however, many deviations from this distribution due to non-homogeneity of the material and to irregularities in outline such as projecting corners, scratches and tool marks. When load is applied the general behavior of the piece as indicated by careful measurements of stretch, compression, twist, or flexure conforms to that required by the common theory of elastic action, but there are doubtless many localized strains which cannot be detected, even by the use of delicate micrometer measurements. It is to be recalled that in measuring strains it is necessary to use a gage line of considerable length, with the result that the observed strain is an average value along a relatively long line. The localized stresses, corresponding to these undetected localized strains, are not of any great importance under static load. When the load is increased to such an extent that a considerable portion of the piece is stressed beyond the elastic limit, the distortion of the piece increases abnormally and the piece may be considered to have reached its yield point. After this limit is passed the distribution of stress is much modified, and for parts made of ductile material the abnormal distortion at the yield point usually gives warning of structural damage before complete failure occurs.

Under impact loading, which is merely loading applied in a very short space of time, the action is somewhat similar to that under static loading, except that ductile material may offer a higher resistance to very rapid fracture than it does to fracture occurring gradually through a period of several minutes. Impact fracture, moreover, may emphasize somewhat the localized stresses set up at places where the structure of the material is non-homogeneous, or at places where there are sharp notches or deep scratches in the surface of the piece. Under slowly applied load there is opportunity for considerable adjustment and equalization of stress after the yield point is passed; under impact load there is probably less equalization on account of the rapidity of the action, and hence the localized stresses are higher and more effective in causing failure. This explanation of the action under impact is given here because repeated stresses also emphasize the effect of high localized stress, though for an entirely different reason.

Tests and Criteria for Fatigue Strength

It was formerly the common opinion that the determination of the elastic limit of a material by means of a static test in a testing machine gave a reliable test for the fatigue-resisting qualities of the material, and that the material could withstand an infinite number of repetitions of stress lower than this elastic limit. Tests at various laboratories, however, have quite thoroughly disproved this idea, and have thrown grave doubts on the reliability of the elastic limit as an index of fatigue strength. The term "elastic limit" has always been rather loosely used, and covers several quite different stresses.[18] The value determined for the elastic limit for any material depends on the sensitiveness of instruments used and the accuracy of plotting results, and the elastic limit as determined by such a test in a testing machine is determined by the average behavior of the material over a considerable length, while the process of fatigue failure may be going on over a section so small that it does not appreciably affect the readings of the measuring instruments used. In several laboratories comparative repeated-stress tests of different materials have shown higher fatigue resistance for the material with the lower elastic limit.[19, 20, 27]

Bauschinger in his classic experiments showed that the elastic limits in tension and compression as determined by ordinary testing-machine tests were variable limits, their value depending on the treatment of the material during fabrication. He called such limits "primitive" elastic limits, and showed that when a specimen is subjected to gradually increasing range of alternating stress there are soon set up two elastic limits in the bar—one in tension and one in compression. He called these limits, which may have values widely different from the "primitive" elastic limit, the "natural" elastic limits, and the range between them the "elastic range." He also showed that a test specimen will stand several million repetitions of this elastic range of stress without failure, and proposed the "natural" elastic limits as indices of the fatigue-resisting strength of the material. J. H. Smith[10] has developed a somewhat simplified process of determining the elastic range. This elastic range seems a more reliable index of fatigue strength than the ordinary "primitive" elastic limit, but the reliability of indices of fatigue strength based on determinations of any elastic limit by testing-machine tests is open to question on account of the possibility that localized fatigue failure may be in progress without affecting the readings of the instruments used in static tests.

Wöhler used as an index of fatigue strength the "endurance limit" of material as determined from a series of fatigue tests with different intensities of stress. He used the method of plotting values of stress (S) against numbers of repetitions required for fracture (N) and determining by eye where this S-N curve became "practically horizontal." Other investigators have plotted values of S against values of $1/N$ or of $(1/N)^n$ and by extending the diagram till it intersected the axis of ordinates have determined an assumed endurance limit for an infinite number of repetitions of stress. Both of these methods involve enormous extrapolation of test data. Moreover, widely different endurance limits can be determined from the same test data by different methods of plotting values.[14] The tendency to irregularity of test results under low stresses makes the decision whether the S-N curve is horizontal or slightly sloping downward one of very considerable uncertainty.

It has been proposed by various experimenters to compare the fatigue-resisting qualities of different metals by short-time tests with stresses well beyond the yield point of the material. Such tests are quickly and easily made. Under such stresses, however, the action of the material is partly a plastic flow. Such tests give good promise of determining fatigue strength and toughness under occasional overload for parts such as staybolts, which in their ordinary service are subjected to rather severe distortion, but it is not at all certain that such tests give a reliable index of resistance of machine parts under ordinary working stresses.[20]

It has been proposed by various laboratories to compare the fatigue strengths of various materials by comparing their life under repetitions or reversals of some standard stress, usually less than the elastic limit of the material as determined by a static test. A somewhat similar standard proposed is to determine the stress which will cause failure under a given number of reversals. Standard stresses proposed for steel are 38,000 lb. per sq. in. (reversal) and 25,000 lb. per sq. in. (reversal). One million reversals has been proposed as a standard "life." These two types of test approach working conditions more closely than do the short-time, high-stress tests described above. However, they determine only one point on a S-N diagram for a material and do not indicate how fatigue endurance changes with change of stress.

A comparative study of fatigue strengths of various materials can be made from a S-N diagram plotted on logarithmic paper. Up to about 1,000,000 repetitions of stress logarithmic S-N diagrams fall quite closely along straight lines, and from the ordinates and slopes of these lines the behavior of materials under various intensities of stress can be studied. Tests may conveniently be made with stresses at about the yield point of the material, at stresses about 20 per cent lower, and at one or two intermediate stresses.

Various other possible tests have been proposed for determining the fatigue-resisting strength of a material, but no test has been proved to be of sufficient reliability to be accepted as a standard. A number of tests, however, seem worthy of experimental study.

The rate of dying out of vibrations in a "tuning fork" specimen of the material has been suggested as a possible index of fatigue strength.[21] It is assumed that the gradual dying out of vibration is due largely to loss of energy spent in inelastic action in the material, and that such inelastic action is a measure of the fatigue weakness of the material. Test data are lacking to determine the value of this test, but it seems worthy of study.

Tests of magnetic permeability have also been proposed to locate internal flaws in the material and thus indicate its relative fatigue strength. The entire subject of the correlation of the magnetic and the mechanical properties of iron and steel is a promising field of investigation.[28]

The rise of temperature under repeated stress has likewise been proposed as a measure of fatigue resistance.[22] Theoretically, if a specimen is subjected to reversed elastic stress no change in temperature should take place, and it has been proposed to determine the endurance limit for metals at that stress which causes the first noticeable rise in temperature after some thousand or more reversals. A practical difficulty in using this test is to secure proper heat insulation for the specimen. This test seems worthy of study, however, especially if employed in an inertia type of testing machine (see Figs. 3 and 4).

The detection of the appearance and growth of "slip lines" in a specimen subjected to repeated stress gives some promise of furnishing a reliable test for fatigue strength. Slip lines appear long before fracture occurs, and if their appearance or the rate of their spread can be shown to be an index of fatigue strength it seems possible that a feasible laboratory test may be devised. The search for slip lines over any considerable area would, however, be very tedious.

Impact tests, usually on notched bars in bending, have been proposed as an index of fatigue strength. The actions under impact failure and under repeated stress are very different, the first giving a sudden break of the entire cross-section of the specimen, and the second a gradually developing fracture. Both failures, however, seem to be affected by localized flaws or irregularities in outline, and though no definite correlation between fatigue strength and strength to resist impact has been established, yet such tests are worthy of study. Repeated-impact tests have also been proposed to determine fatigue strength, but whether such tests have any advantage over short-time tests under non-impact loads is not known.

In all tests to determine fatigue strength it is of the highest importance to secure uniformity of surface finish between the different specimens to be compared. Probably this can best be done by polishing the surface of the specimens where failure is expected.

There is today no short-time test accepted as a standard test

for fatigue strength; but the development of such a test, and the establishment of its reliability, would unquestionably be of very great service to testing engineers.

Localized Stress and Its Influence in Producing Fatigue

The ordinary formulæ and methods of analysis used in computing the fiber stress in a machine part or structural member are based on the assumption that the material is homogeneous throughout, and that the cross-section of the member is either constant or that it changes its dimensions so regularly and gradually that there is no appreciable localized fiber stress at sections of rapid change. For structures and machines of ductile material subjected to not more than a few hundred loadings, such assumptions are reliable, because localized stresses do not appreciably affect the general deformation of a member, nor do they under ordinary working conditions cause trouble before the member has been subjected to some thousand or more repetitions of load. For nearly all parts, however, high localized stresses are present. Internal flaws may cause such localized stresses. This is shown by mathematical analysis of stress in plates with holes in them[23] and by direct experiment on such plates.[24, 25] External irregularities of outline may cause localized stress. Under bending or twisting a member with a sharp reëntrant angle in its outline theoretically develops an infinite stress at the root of the angle,[29] and actually both mathematical analysis and direct experiment show that very high localized stress may be caused by sharp grooves or scratches on the surface of a machine part or structural member.

It has been stated above that for parts subjected to a few loadings localized stresses are not of great significance. The case is quite different, however, for parts subjected to thousands of loadings. High localized stress may cause a crack to start, either directly or by "cold-working" the material where the localized stress exists until the material becomes brittle. This crack forms an extension of the discontinuity of the material which caused it, and under repeated stress tends to spread still more rapidly. This tendency is illustrated by the action of a piece of plate glass in which a crack has started. In most cases under any repetition of load the crack spreads, and will cause final fracture of the glass. A fatigue failure under repeated stress is a progressive failure. This spreading of cracks to cause failure explains why under fatigue even ductile materials snap short off. Failure does not involve plastic flow of considerable masses of metal, but only of microscopic masses near the crack, and final fracture comes suddenly just as if the member were cut half off by means of a saw cut and then bent. The importance of avoiding localized high stress in members subjected to repeated stress can hardly be overemphasized. Homogeneity of internal structure, smoothness of external surface, and avoidance of sudden changes of cross-section may be more important in the construction of machine parts subjected to repeated stress than is high static strength of material.

Shoulders of crankshafts and of axles, keyways in shafts, screw threads, and rivet holes are examples of locations where high localized stress is liable to occur.

Relation Between Microscopic Structure and Fatigue

A very large field of investigation and one in which very little systematic work has been done is the study by means of the microscope of fatigue failures in various characteristic structures of metals, especially steels. The following paragraphs are given as a summary of the theory held by present-day metallographists of the relation of microstructure of metal to its fatigue strength. Many of the details of this theory, however, lack adequate experimental verification.

Annealed steel consisting of ferrite (pure iron) and cementite (iron carbide, Fe_3C) seems to increase in resistance to fatigue with the increase in carbon content, especially when the cementite is present in the form of plates as in lamellar pearlite and as long as the cementite does not surround the grains of pearlite.[27] When the cementite is spheroidized, the elastic limit is greatly decreased and probably the resistance to fatigue is also decreased. As a structural material, therefore, a steel with considerable carbon in the form of spherical globules of iron carbide would have practically no advantages over wrought iron. When, however, the iron carbide is in plates it seems to have a marked effect in raising the elastic limit, and probably increases the resistance to fatigue. We would also expect that complete and large networks of ferrite would lower fatigue resistance.

The same arguments regarding grain size of single constituent metals hold to a certain extent for two component alloys. For example, such experimental evidence as is available indicates that the sorbitic structure in steel is the one which resists fatigue best. This structure is supposed to represent an extreme refinement of grain in which the particles of iron carbide are very small, and hence the particles of ferrite must also be very small. It is true that some of the iron carbide may be in solution in the iron, but it is more probable that the mechanical properties observed can be accounted for by an extreme reduction in the size and by the dispersion of ferrite and cementite particles. When these globules are made larger by heating to a higher temperature than that at which the sorbite was formed, granular pearlite results with reduced fatigue resistance.

When a high-carbon steel is quenched from above the critical range to form martensite, the metal becomes extremely brittle. The normal path of static rupture in brittle martensite is at the old austenite (solid solution of Fe_3C in gamma iron) grain boundaries. The path of rupture in fatigue has, so far as is known, not been ascertained. From certain tests on the resistance to fatigue of chrome-vanadium steel after various heat treatments, Dr. C. M. Olmstead, of the C. M. O. Physical Laboratories, Buffalo, found that the steel in the martensitic state, that is, as quenched, had a very much lower resistance to fatigue than after reheating to about 1100 deg. fahr. The maximum resistance to fatigue occurred by quenching and reheating to 1000-1200 deg. fahr. (538-648 deg. cent.), and there was very little difference between the specimens tempered at 1000 deg. and at 1200 deg. There was a marked difference, however, between these and the samples tempered at lower temperatures or those not tempered at all. This is the heat treatment that is commonly given to automobile parts which must withstand fatigue stresses, and which may be subjected to shock. The tempering of springs is done at a little lower temperature, but it is not certain that the spring structure is the one having the highest resistance to continued repetition of stresses.

It seems from the above that martensite is not a suitable material to withstand fatigue stresses, and that some intermediate structure between martensite and the annealed or normalized structure will have the maximum resistance to fatigue. This structure is called the sorbitic structure and corresponds to that used in automobile springs and other parts of automobiles which must resist fatigue and shock stresses.

Formulæ for Designing Parts Subjected to Repeated Stress

All formulæ which have been proposed for designing parts subjected to repeated stress depend upon extrapolation from test results and should therefore be regarded as tentative. Their use is justified only on the ground of necessity. Parts must be designed to resist repeated stress, and even formulæ derived from a confessedly inadequate experimental basis seem better than mere guesswork. Two types of formula have been used.[30]

In many discussions of data of repeated-stress tests, it is assumed that there exists some definite "endurance limit," that is, some stress, greater than zero, which can be repeated an infinite number of times without causing failure of the material. If such a limit exists it is certainly lower than the elastic limit of the material as determined by static tests, for actual failures of materials have occurred under repeated nominal stresses as low as one-quarter of the elastic limit as determined by a static test. Examination of test data indicates that the endurance limit is an assumption rather than a proved fact. It is usually determined by plotting a diagram with stresses as ordinates and number of

repetitions producing failure as abscissæ and estimating the stress for which the diagram seems to become horizontal. Various other methods have been proposed, but all involve this assumption.[14]

In 1910 a paper [9] presented before the American Society for Testing Materials pointed out that an examination of the results of numerous series of repeated-stress tests indicates that for nearly all the range covered the law of resistance to repeated stress may be expressed by the equation:

$$S = KN^{-m} \dots\dots\dots\dots\dots [1]$$

in which S is the maximum unit stress developed in the test piece, N the number of repetitions of stress necessary to cause failure, and K and m are constants depending on the material and somewhat on the manner of making the test. This is known as the "exponential equation for repeated stress."

Another form of expression for the above equation, and frequently more convenient, is:

$$\log S = \log K - m \log N \dots\dots\dots\dots [2]$$

If the logarithms of S and N are plotted, or if the values of S and N are plotted on logarithmic cross-section paper, Equation [2] is represented by a straight line. Fig. 7 shows the S-N diagram given by a series of repeated-stress tests. In Fig. 7*a* ordinary coördinates are used, but in Fig. 7*b* the coördinates are logarithmic. For large values of N the exponential equation gives in many cases values of S smaller than the observed values; in other words, the exponential formula seems to err on the side of safety.

It will be noted that the use of the exponential formula involves the assumption that any stress if repeated often enough will eventually produce failure of the material. Thus while both the endurance limit and the exponential formula are based on extrapolation from known data, the exponential formula seems to be an assumption on the safe side. The working stresses as developed by the two methods do not differ greatly except for members subject to more than ten million repetitions of stress. Above that number the exponential formula requires lower working stress, but even then the stresses given by the exponential formula are not impracticably low.

While nothing but tentative formulæ can be proposed now,[30] some features which a satisfactory formula for fatigue strength should include may be noted. It is probable that such a formula for any material will not depend on ordinary static qualities of the material such as elastic limit or tensile strength. It may depend on some form of elastic limit determined after the material has been put in a "cyclic" or "normalized" state by a number of reversals of stress. Such a formula will quite probably contain factors dependent on the surface finish of the part and upon the uniformity and regularity of its crystalline structure. It will contain a factor dependent on the range of stress during a cycle. Such a formula may contain a factor dependent on the probable number of repetitions of stress which the part may be expected to withstand during a normal period of service, or the result may be an "endurance limit"—a stress which the part is capable of withstanding so many times that even for modern high-speed machinery the number of repetitions may be regarded as infinite.

Special Subjects Needing Investigation

Long-Time, Low-Stress Fatigue Tests of Metals. It is not known today whether machine or structural parts can withstand an infinite number of repetitions of any stress, however small. It is not known what share of blame for the occasional failures of test specimens or of actual parts in service under low nominal stress should be attributed to weaknesses in the metal structure: to localized damage to the surface with resulting increase of localized stress over nominal stress, or to "harmonies" of high stress due to interference of waves of stress traveling through the part. There should be undertaken an extensive series of long-time, low-stress tests on typical irons, steels, and other metals. It is doubtful whether any series of tests can settle the question of the existence of an endurance limit, but a considerable amount of test data for endurances up to, say, 100,000,000 repetitions will give a better basis for working formulæ than is now available.

Study and Comparison of Different Testing Machines for Fatigue Tests. Different testing machines for determining fatigue-resisting qualities do not always give consistent results. A series of tests of samples of several typical metals run on various testing machines should give some indications of the reliability of various types of testing machines and perhaps enable correlation to be made between tests on different machines. For all series of fatigue tests careful chemical and microscopic tests of the material should be made to insure uniformity both of chemical content and of structure. Careful tension, compression, and torsion tests should also be made so as to insure uniformity of static strength qualities, and to give data for the study of correlation between static strength and fatigue strength. Short-time, high-strain, repeated-stress tests and impact tests should likewise be made to give data for the study of correlation between toughness, impact resistance and fatigue strength. All test specimens should be prepared with great care and surface conditions be kept as uniform as possible. It appears that this uniformity could be best secured by giving the surface a high polish.

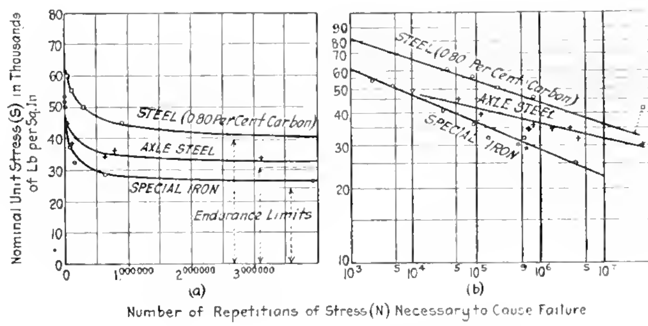

FIG. 7 STRESS-STRAIN DIAGRAMS

Relative Importance of Surface Condition and Structural Characteristics as Shown by the Microscope. It seems practically certain that fatigue fractures may be started either at a surface imperfection or at an internal flaw, such as a "snowflake" or a "transverse fissure." The importance of these two types of defect might well be the object of experimental study. In connection with such a study there should be a study of methods of detecting internal flaws, such as deep etching [31], and a study of methods of indicating the degree of perfection of surface finish.

Effect of Grain Size of Metal on Fatigue Strength. On this subject Rosenhain [26] says:

> The question then arises whether the increased size of crystals produced in a simple metal by prolonged heating is injurious or otherwise, so far as the useful properties, and more especially the mechanical properties, of the metal are concerned. There can be little doubt that within reasonable limits the mechanical properties of a simple metal are better the smaller the constituent crystals of which it is built up. Under the tensile test, coarseness of structure usually results only in a slightly lowered yield point, while the ultimate stress and the elongation are little impaired, although the reduction of area at fracture is sometimes markedly less. On the other hand, under both shock and fatigue tests, a coarse structure, even in a simple metal, gives unsatisfactory results.

Tests and service records quoted by Jeffries and by Ruder tend to confirm this opinion in the case of copper. Fine-grained copper is very much more resistant to repeated stresses than coarse-grained copper. Also if the elastic limit of fine-grained metals is determined by delicate instruments, it is generally found to be greater than that of the same metals in the coarse-grained state. Systematic tests should give us a firmer basis for conclusions in this important phase of fatigue phenomena.

There have been found no records of microscopic analyses dealing with the path of rupture under repeated stress in steels having various structures from martensite to the normalized state. A study of the path of rupture and the manner of rupture in these samples would be most interesting.

Development of Special Tests for Fatigue Strength. At present there is no short-time test for fatigue strength which has been proved to give reliable results. Some tests which give promise of usefulness are:

1 The Rise-of-Temperature Test used by Mr. Stromeyer.[22] In this test the highest reversed stress which a specimen can stand without appreciable rise of temperature is taken as an index of fatigue strength.

2 The Development of "Mechanical Hysteresis." If a fatigue failure is in progress in metal subjected to repeated stress, very small amounts of energy are lost during every cycle of stress. The energy lost during each cycle may be too small to measure, but after some hundreds or thousands of cycles the cumulative effect of the losses may become appreciable. This loss may appear as a "loop" in the stress-strain diagram for a complete cycle of stress, and this indication may be detected at a comparatively early stage of the fatigue failure. Dr. Stanton of the British National Physical Laboratory has made some experimental study of this development of "mechanical hysteresis," as this loss of energy is called.[7] It is possible that mechanical hysteresis may be studied by the dying out of vibrations set up in a test piece, as has been proposed by Boudouard.[21]

3 Magnetic Testing of Steel for Fatigue Strength. The structural damage done while a progressive fatigue failure is occurring may, possibly, be detected and measured by the change in magnetic permeability of the steel. Burrows, Dudley, and Sanford[28] have done some experimental work on this subject, and magnetic analysis seems worthy of study as an index of fatigue strength.

4 Impact Tests and Repeated-Impact Tests. Although the action of metal under impact is very different from its action under repeated stress, yet both impact and repeated stress seem to emphasize local irregularities and imperfections of surface or structure. It may be that a repeated-impact test may be devised which will give a reliable measure of fatigue strength, and which will do so in a comparatively short time. Such tests seem worthy of study, though their value as tests of fatigue strength cannot be said to be established.

It is believed that the foregoing paragraphs outline fundamental investigations, many of which should be undertaken at an early date. Experimental study of typical metals under long-time, low-stress tests; study by means of the microscope of the phenomena of fatigue failure in metals of various crystal structures; and study of reliable test methods of determining fatigue strength constitute, in the opinion of the Committee, the fundamental line of research in fatigue phenomena. Once such fundamental tests have made fair headway, especially the determination of a reliable test for fatigue strength, a large number of problems call for study, among which may be mentioned: the effect of surface finish; the effect of various heat treatments on fatigue strength; the effect of cold-working and of hot-working of metal on fatigue strength; the effect of intervals of rest in restoring fatigue strength; the effect of range of stress; the effect of compound stresses; the effect of speed of repetition of stress; a study of waves of stress in machine members; and fatigue studies of full-sized members, such as railroad rails, riveted joints, wire ropes, car and truck axles, crankshafts, and power-transmission shafting.

Under the sundry civil service bill the Council of National Defense has had its unexpended balance for the fiscal year ended June 30, 1919, reappropriated to it. Plans are now being matured for the return of the Council to its peace-time functions, which, according to the Act of Congress creating it, are "the coördination of industries and resources for the national security and welfare and the creation of relations that will render possible in time of need the immediate concentration and utilization of the resources of the nation." It is the intention of the Council to collect, study and centralize in a scientific way all information bearing upon the national defense, particularly with regard to the mobilization of industries, science and labor in time of war.

The entire expenses of the Council up to May 1, 1919, were only $1,500,000. It is estimated that more than $3,000,000,000 was saved to the Government by the prices which the Council's experts on raw materials, minerals and metals made in the procurement of iron and steel products.

Torpedo-Boat Destroyers in the Making

By COMMANDER JAMES REED,[1] U. S. N., MARE ISLAND, CAL.

The American destroyer and the spectacular part which it played during the war in convoying troops and combating the submarine are subjects of almost universal knowledge and interest. The destroyer has fully justified its existence as a distinct naval type, not only because of its value for scouting, screening, convoy service, and coastal attack, but also on account of its use in major engagements between fleets. The development of the destroyer has been a logical one and Commander Reed first presents in his paper a brief historical review of modern American torpedo craft. This review is followed by a non-technical description of the construction of the so-called "Liberty Destroyer," the Ward, which was launched on June 1, 1918, 64 per cent complete, and only 17½ days after the laying of the keel. This is a record in ship construction and one that has never even been approached. It is a remarkable achievement and when contrasted with the two to four months required to complete some of the earliest torpedo vessels it brings a realization of the great advances that have occurred in the art of shipbuilding.

THE torpedo-boat destroyer, or more briefly, the "destroyer," as the type is generally known, is strictly a logical development of the torpedo boat of Cushing, just as the modern superdreadnaught is a development of the *Monitor* of Ericsson. The destroyer is the answer to the torpedo boat; but as the destroyer proved capable of performing all the functions of her smaller prototype and also possessed more speed, seaworthiness, comfort, radius of action and power of attack and defence, it soon forced out the smaller torpedo boat, which at best was but a small, dirty, uncomfortable and weak unit.

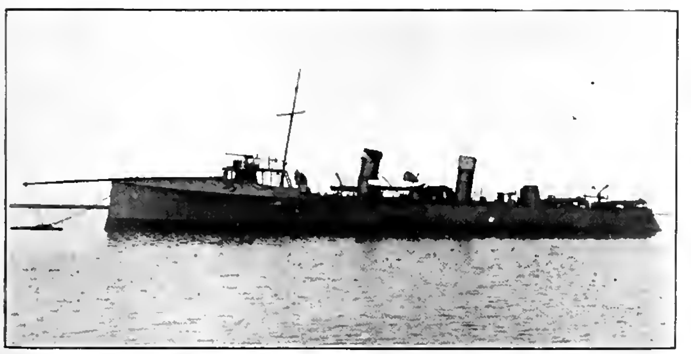

Fig. 1 U. S. Torpedo Boat *Farragut*
This vessel made a mile during its trial run in 1899 at the rate of 31.7 knots

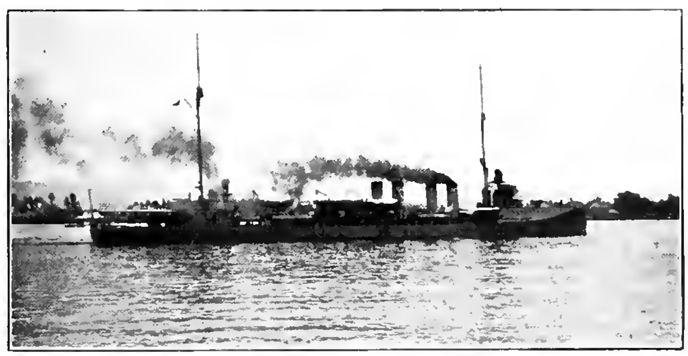

Fig. 2 U. S. S. *Shaw*

The demands for higher and higher speeds—and sustained sea speeds at that—have resulted in great increases in horsepower, structural strength, and freeboard. The latest types of United States destroyers have a speed of 35 knots in cruising trim, which means practically in war condition, and not over a measured mile in stripped condition and with favorable wind and tide, under which circumstances certain marvelous foreign speed records are known to have been made. It is accordingly satisfying to learn that in joint operations during the war our destroyers compared more than favorably with the British and French as regards strength, seaworthiness, speed, armament, and comfort in accommodations for both officers and men.[2]

The designing and building of a successful type of modern destroyer brings into play the highest skill of the naval architect, the marine engineer, and the shipbuilder, due to the sacrifice of all other considerations to those of speed, armament, seaworthiness, strength and cruising radius. The destroyer is really an overgrown racing motorboat, and her lines are therefore radically different from any other type of sea-going vessel. For example, the ratio of beam to length is less than 1:10, and her draft is very shallow for her length, being only 9½ ft. for the latest 315-footers.

Conclusions drawn from the world war have not terminated the long discussion upon that favored topic among all naval authorities—as well as interested laymen—in regard to the relative value of the superdreadnaught type of warship. However, all authorities are agreed that the torpedo-boat destroyer has come into its own and has fully justified its existence as a distinct naval type, not only for submarine hunting but also for efficient use in convoy service, in scouting and screening, in coastal attacks, both alone and in conjunction with ships of heavier type and with aircraft, and even in major engagements between fleets.

Early Types of Destroyers

The early torpedo boats carried the torpedo on a spar extending from the bow of the vessel, and the method of attack consisted in steaming head-on for the enemy vessel and exploding the "spar" torpedo on contact. Of course such a torpedo would be practically harmless to a modern superdreadnaught with its extravagant protection against torpedo attack. These boats were small and not very fast according to present-day standards, but with the inefficiency of gunfire in those days they could have probably been successfully used for night attack at least, if one were reconciled to the probable loss of the attacking boat and crews. War service on board one of these torpedo craft would have proved highly hazardous, especially since this was long before the invention of the wonderful non-sinkable life-preserver suits which have been popular for Atlantic travel during the past three years, and in which it is reputed one can float around until death from starvation occurs.

With the development of a more or less satisfactory self-propelled torpedo by Whitehead about 1880, the spar-torpedo boat—which was really not much more than a picket boat—gave place to a larger, speedier, and more seaworthy type of vessel, with corresponding increases in complement and cruising radius. These boats launched their torpedoes from single tubes on deck, and their power of attack was limited to their torpedo equipment as the remainder of their armament consisted only of machine guns or rapid firers of the smallest caliber.

The first torpedo boat in the United States Navy using self-propelled torpedoes was the *Stiletto*, a little wooden yacht 88 ft. 6 in. long by 11 ft. beam by 3 ft. draft, purchased from Herreshoff for $25,000. She was single-screw, of 350 hp. and

Presented at a meeting of the San Francisco Section of The American Society of Mechanical Engineers, April 16, 1919.

[1] Construction Corps, U. S. Navy Yard. Mem. Am. Soc. M. E.

[2] During the whole period of their operations abroad no American destroyer ever returned to port because of stress of weather.

developed a speed of 18.2 knots. For many years she was employed at the Torpedo Station, Newport, R. I., for practice firing of torpedoes.

The first steel torpedo vessel for our service, very appropriately named the *Cushing*, was authorized August 3, 1886, and built by Herreshoff for $82,750. She was 138 ft. 9 in. long by 14 ft. beam by 4 ft. 10 in. draft and displaced 105 tons. Her engines were twin-screw, vertical, quadruple-expansion, and her speed 22.5 knots. Her armament consisted of three 18-in. Whitehead torpedo tubes and three 1-lb. rapid-fire guns, and her complement was three officers and twenty men, the same complement, it may be noted, as that of the famous little submarine chasers of the present war.

The *Cushing* was followed by the *Ericsson, Foote, Rodgers, Winslow, Du Pont* and *Porter*, all of which saw service in the Spanish-American War, and hard service at that, as any of

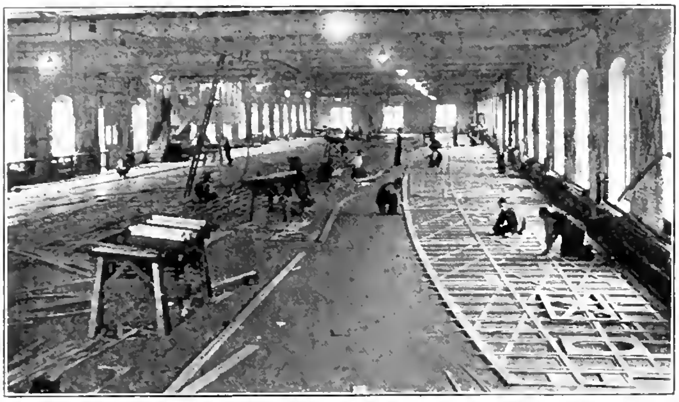

FIG. 3 THE MOLD LOFT
During the laying out of the molds for the main deck of a destroyer.

the officers who were on duty on board them will testify, even though they did not operate in the cold, foggy and boisterous North Sea in pursuit of the elusive "tin fish."

In the group of torpedo boats placed in commission shortly after the Spanish-American War, the *Farragut* (Fig. 1), designed and built at the Union Iron Works, San Francisco (now the Union Plant, Bethlehem Shipbuilding Corpn., Limited), is worthy of mention. This little vessel on one trial attained a speed over a measured mile of 31.7 knots, which was an extremely high speed for any war vessel at that date (1899). It is of interest to note that the *Farragut* still holds the record from Mare Island Navy Yard, Cal., to San Diego, a distance of 500 miles, which she covered in 1910 at an average speed of 27.3 knots, a remarkable performance for a coal-burning vessel of her size. She served throughout the present war and on one occasion in 1918 made over 26 knots in service while heavily loaded.

About 1902 the first of a group of sixteen destroyers for the American Navy were completed and these boats have been in continuous service ever since, all having done good work in the war zone. Their dimensions were practically identical: namely, displacement (actual), about 560 tons; speed (average), 28 knots; armament, two 3-in. guns, five 6-pounders and two single torpedo tubes.

These boats were followed by several classes of destroyers gradually increasing in size and power until the United States entered the present war. At that time the latest destroyers were of about 1000 tons displacement, 30 knots speed, carried four 4-in. rapid-fire guns, and four double torpedo tubes. (The depth-charge armament was installed afterward.) These were "high bow" boats, with a forecastle deck ending at the bridge, as will be seen in Fig. 2. Soon after we entered the war the first of the "flush deck" type of destroyers was produced and this type has now been standardized for our Navy.

THE NAVY'S LATEST TYPE OF DESTROYER

The general characteristics of the latest destroyer, as compared to the little *Stiletto* previously mentioned, will possibly be of interest. The new type has a length of 315 ft., a beam of 30 ft. 10 in., and a draft of 9 ft. 4 in., with a displacement of about 1200 tons. The armament consists of four 5-in. rapid-fire guns, two 3-in. anti-aircraft guns, three machine guns, four triple torpedo tubes, and large numbers of depth charges.

The inboard profile of one of our modern destroyers reveals the fact that an enormous amount of space is given over to machinery. The crew of 130 men sleep in wire-mattressed folding bunks instead of in hammocks as on the larger ships, and each man has a metal locker for his effects. The men mess and sleep in the same compartment. The officers' quarters are roomy and comfortable and equipped with metal furniture throughout.

Forced ventilation is provided in all living spaces by means of electric blowers. Other electric equipment consists of laundry machines, refrigerating unit, and a coffee percolator, toaster and warming oven for the pantry. The galleys have oil-burning ranges, also steam coffee urns and steam cookers. Running water and showers are also provided for both officers and men, but tubs are not installed because of the space required, the larger consumption of fresh water, and the weight involved.

This question of weight is a most serious one in vessels of such high speed and most careful designing is necessary in order to secure the maximum strength with the minimum weight. In

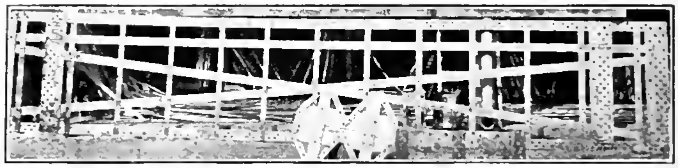

FIG. 4 SHELL MOLDS
Full instructions for the "layer out" are painted on each mold.

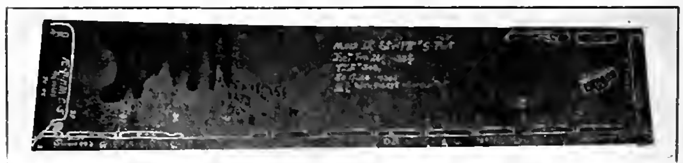

FIG. 5 A PLATE LAID OFF READY FOR FABRICATION

recent years great advances have been made possible through the generous use of high-tensile steel, for by its use radical reductions in scantlings throughout the vessel have been effected. Attention is invited to the extreme lightness of plating and shapes throughout a modern destroyer. The lightest plating on bulkheads is only 5 lb., or 3/20 in., approximately. Deck thicknesses vary from 5 to 20 lb. per sq. ft., and shell plating from 7 to 18 lb. per sq. ft. (7/40 in. in thickness).

In addition to the use of extremely light materials throughout, holes for lightening purposes are punched or burned by oxy-acetylene in all floors, web frames, girders, brackets, etc., and wherever practicable corners are snipped off beams and frames; butt straps are also scalloped between rivet holes, etc., and all this is done to save a few pounds. In connection with the light scantlings of torpedo craft, the annual report of the Chief Constructor of 1897 bears this remarkable recommendation: "The remaining boats will be in reserve and must be kept in good condition ready for service at short notice. To do this most economically and to prolong the life of the boats as far as possible, they should be *kept out of the water and under cover.*"

In spite of all this cutting down in weight throughout the whole structure these vessels have proved wonderfully strong in service, as is demonstrated by several serious casualties experienced in the war zone, notably the one where the stern of the *Manley* was blown off by the explosion of her own depth charges, and the case of the *Shaw* (Fig. 6), where the entire bow from the bridge forward was cut off by a collision with the mammoth Cunarder *Aquitania* while zigzagging at a speed of 24 knots. The *Manley* was towed into port, but the *Shaw*

proceeded under her own steam, and both have since been repaired and placed in service. Due to the intricate watertight subdivision of these boats, they are practically immune from sinking as a result of any ordinary casualty in service.

Another way to reach an appreciation of the exceptional strength of these light craft is to consider the tremendous horsepower installed in them in order to secure the speed demanded. In the latest boats upward of 30,000 shaft hp. has been developed on trial, which power approximates closely to that of many of the latest superdreadnaughts. This power is carried on a displacement only one-twenty-fifth as great as in the battleship, and in a space of less than 4200 sq. ft. for boilers, engines and all auxiliaries. Hence, it will be seen that although to provide sufficient power for these destroyers is comparatively easy, to house it in the hull to be driven, and to design and fit proper foundations and strength members to hold it are serious problems in such a small hull where weight saving is of such vital importance.

Only those who have been on board of one of these destroyers while it was tearing into a head sea at a speed above 36 knots per hour can sense the tremendous power their slender, quivering hulls contain. Their main engines consist of steam turbines connected through reduction gears to two shafts driving twin screws up to 480 r.p.m. Skill in balancing all rotating parts has reached such a high degree that there is practically no vibration due to the engines or propellers even at the highest speeds, and with regard to cruising radius the latest class of destroyers carry sufficient fuel oil to cross the Atlantic at a speed above 20 knots.

Modern Methods of Building Destroyers

After the general characteristics for a proposed class of destroyers are determined by the General Board of the Navy, and approved by the Secretary, tentative plans and estimates are prepared by the Bureaus of Construction and Repair, Steam Engineering, and Ordnance, and these form the basis of the recommendations of the Secretary for the necessary Congressional appropriations. When the appropriations are made the Bureaus concerned get out contract plans which, after approval by the Secretary of the Navy, are forwarded to various shipbuilding firms and navy yards for bids. These plans are general in character, and contain no details. After the acceptance of a bid, which frequently offers a modified design embodying the builder's ideas, the following steps are involved in the building of the destroyer:

1. Ordering of the material
2. Preparing detail plans for both hull and machinery
3. Laying down lines in the mold loft and preparing the molds (construction of machinery is usually started at about this time)
4. Laying off and fabricating structural material
5. Assembly of fabricated material
6. Erection of fabricated material (hanging and bolting up)
7. Riveting and calking
8. Testing
9. Launching
10. Installing of machinery, armament and outfit complete
11. Dock, builders' and acceptance trials of the vessel
12. Commissioning and fitting out.

Ordering of Material. Orders for material are made up from Material Schedule Sheets, which show the type, dimensions, weight, and distinctive marks of each piece entering into the structure, and when required the assembly drawing on which it appears. The main orders to the steel mills do not, of course, go out in such detail as the various weights and sizes are grouped for the mills, wherever practicable, into classes of more or less standard dimensions, and the detailed schedules follow later. Orders for main and auxiliary machinery not supplied by the shipbuilder from his own works are placed as early as possible, since it is machinery, not hull completion, that determines the date of delivery of the finished vessel.

Preparing Detail Plans. There are about 1100 plans required to cover all the work on one of our latest type destroyers and a great saving in both time and expense has been effected by the Navy Department in the use by several contractors of prints from one set of the detail plans, instead of each contractor developing his own plans, as was the former custom.

Laying Down Lines and Preparing Molds. This consists in striking in on the smooth floor of the mold loft the lines of the vessel in full size. The forms of all naval vessels are determined by towing actual models in the Model Tank at the Washington Navy Yard and recording the resistance of each. These lines are the intersections of the hull and decks of the vessel at certain regular stations with three different planes at right angles to each other as follows:

a The vertical longitudinal plane (sheer plan)
b The horizontal longitudinal plane (half breadth)
c The vertical transverse plane (body plan).

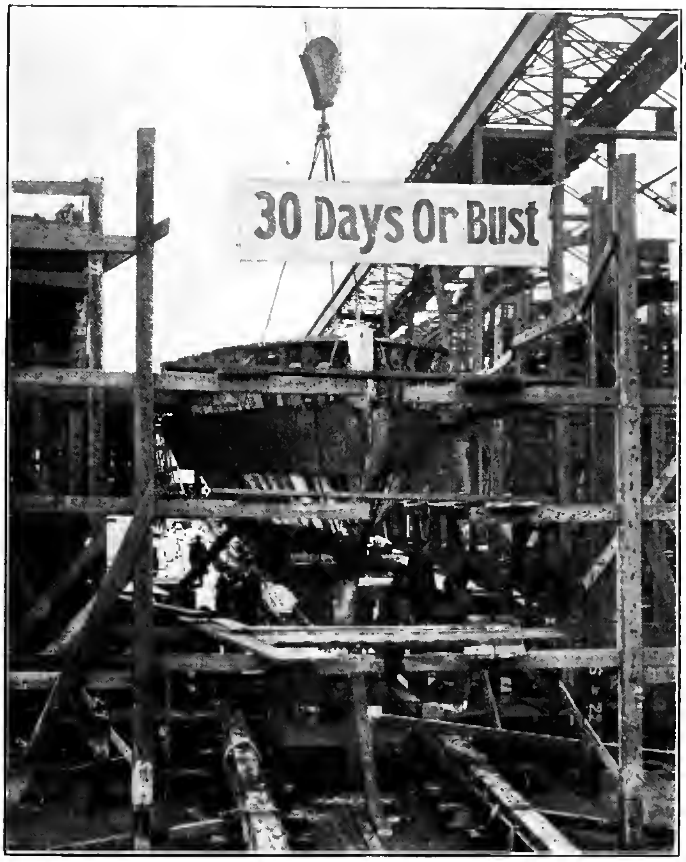

Fig. 6 The *Ward*—First Day
Lowering the "assembled stern" into place.

From these lines, together with certain additional ones that are used in those parts of the ship where extreme curvature occurs, the expanded dimensions as well as the shape of every piece entering into the ship's structure may be obtained, and a wood, paper or metal pattern, as shown in Fig. 3, can be made up showing all the details of the fabrication of the piece.

Every seam, butt, lap, cut and bevel of the plate or shape, as the case may be, is indicated on its proper mold (Fig. 4), which also usually carries the piece number (from the Material Schedule), the location in the ship, the description, and the job order number on which the work is to be performed. Heavy paper is used for some molds, and by certain shipbuilders even to the exclusion of wood. At the Mare Island Navy Yard, in order to keep out moisture and avoid shrinkage, all wooden molds are shellacked by the use of a pneumatic painting machine.

The loftsman is a real practitioner in analytical and descriptive geometry, and upon the accuracy of his work depends much

of the success or failure when the fabricated material comes to the shipfitter for erection. Half-holes, unfairness, etc., result from inaccurate mold-loft work and these errors are very serious in a destroyer where all structural members are thin, and where fairness of holes and of form throughout is essential.

Laying Off and Fabricating Material. The molds go from the mold loft to the shipfitter, who lays off the structural material by clamping the mold in its proper position upon the steel plate or bar and then marks up the piece according to the instructions on the mold, which is really his pattern for cutting the goods. There are 411,252 rivets by actual count in one of these destroyers, and it will be noted that each rivet hole is indicated on a

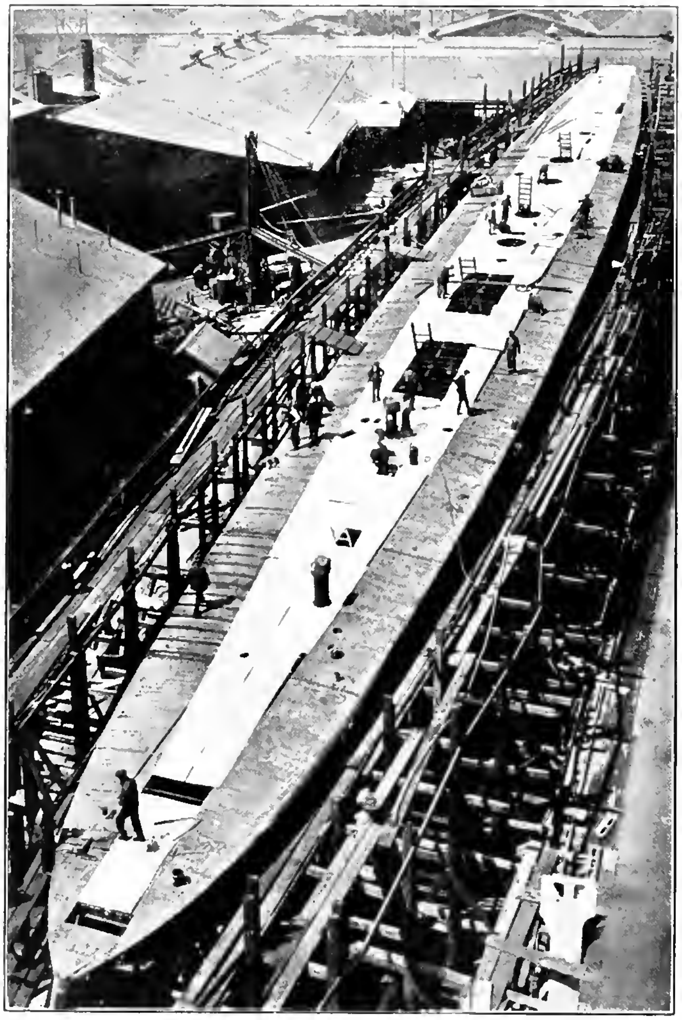

Fig. 7 The *Ward*—Fifth Day

mold where the universal system is used, as at Mare Island, and the location of each hole is punchmarked on to the plate or bar in laying them off as shown in Fig. 5. The material then goes to the shop for fabrication, that is, rolling (if required), shearing to dimensions, punching rivet holes, edge planing, punching or burning out lightening holes by the use of oxy-acetylene torch, and weighing. The weight of every piece entering into the structure of the ship is carefully estimated in advance in order that the displacement of the vessel may not exceed that for which it was designed, and a constant check is kept on this by actually weighing everything prior to placing it on board the vessel. It is not unusual for a destroyer to actually displace on completion a tonnage of water which will vary less than five tons from the displacement which was estimated in connection with her design. This is an accuracy of 0.4 per cent for a 1200-ton vessel.

Assembly of Fabricated Material. Prior to laying the keel practically every piece of structural material is laid off and fabricated, ready for assembly, and in the case of the *Ward* the following preliminary assembly and riveting was performed:

a Keel in sections with clips for floors and frames attached
b All main structural bulkheads complete with bounding angles
c Web and belt frames and beams
d Frames with floors and bulkheads attached
e Deck houses
f Stern of ship including stern post and frames to bulkhead.

Erection of Fabricated Material. Having assembled the material as outlined in preceding paragraph, the keel of the *Ward* was laid at 7.45 a. m. on May 15, 1918. As soon as the keel was in place riveting the various sections together proceeded, and the various frames with floors attached were bolted to the clips on the keel, while the main structural bulkheads were dropped into place complete. The frames were temporarily held in proper register by a longitudinal rib-band shore at the turn of the bilge and another support from the scaffolding at the top of the sheer strake near the deck edge. The bottom plating was then placed in proper position and bolted to the frames, and the stem erected and the fabricated stern of the ship placed in position, as indicated in Fig. 6. Next the plating of the platforms and decks was laid on (Fig. 7), and as the bolting-up throughout the structure proceeded rivet holes were reamed throughout and riveting gangs followed. The deckhouses were placed in position as were all other deck erections (Fig. 8), such as ventilation trunks, foundations, skid beams for carrying boats, davits, etc., as fast as the deck was ready to receive them.

Riveting and Calking. In the assembly of the fabricated material 183,000 rivets were driven prior to laying the keel of the vessel, and 165,000 were driven thereafter before launching. Eighteen riveting gangs were employed, and the average number of rivets of all kinds per day per gang was 587.5. Work on the vessel was not continuous, averaging only eighteen hours out of each twenty-four. Overtime in general was restricted to two hours, but a few trades worked three hours over eight hours during part of the 17-day period. The ordinary rough-fisted riveter, trained in structural-steel riveting, or on merchant work, makes a sorry job of destroyer riveting, where the greatest care and skill are necessary to insure a tight, well-shaped joint without hammering of the light high-tensile plating adjacent to the rivet hole. Careful packing and thorough bolting up are essential to a properly watertight or oiltight job. The calking must also be skilfully performed on these light vessels or the very object of this work will be defeated.

A few of the records of the best Mare Island riveters on the *Ward* may be of interest and Table 1 is accordingly given.

Testing. The strict requirements of the Navy specifications in regard to bulkhead strength, water and oiltightness, are insured by actually testing the various compartments under a head of water, while others are tested under air pressure. Of course the fire rooms must be airtight to meet the demands of forced-draft operation in service, these spaces being under pressure at all times while steaming. Decks, hatches, airports, deckhouses, etc., are tested for tightness by playing a hose on them.

Launching. The operation of launching consists essentially of simply transferring the weight of the hull from the blocking, cribbing and shores, upon which it has been supported during construction, to two parallel launching ways, one running each side of the keel for a portion of the vessel's length. These ways are in two parts, the lower fixed section comprising the ground ways, the upper, which carries the cradle in which the ship rests, the sliding ways. The ways are laid at an inclination to the horizontal, usually about 25/32 in. to the foot and the smooth facing surfaces of the ground and sliding ways respectively are thoroughly greased. Upon releasing a trigger, dropping a "dog shore," or sawing through a timber holding the sliding ways to the fixed ways, the vessel starts on her journey down the ways. Actually, there is a great deal of careful calculation necessary preliminary to this launching operation, which unfortunately does not always pass off smoothly. Sometimes the ship balks, refusing to start, or goes so slowly that she sticks, in which cases recourse is had to jacks, towlines, vibration by running on deck,

[1] L. A. Towers' record was 13,343 shell rivets (1/2 in. to 3/4 in.) driven in ten working days, or a total of 97 hours.

FIG. 8 THE *Ward*—TENTH DAY

etc. If all means fail, it is necessary to jack her up and start over again.

Installation of Machinery. The installation of machinery and miscellaneous fittings is usually begun before launching, and completed after the vessel has been launched, but in the case of the *Ward* this work was performed overboard, her boilers, gears, main turbines and auxiliary machinery all being placed on board at the fitting-out pier. The controlling feature in the completion of a destroyer nowadays is the expedition with which the coppersmith performs his work. The country was scoured for skilled men in this trade, but the demands were never met, either as regarded the Navy or the Shipping Board.

Trials. Dock trials are held as soon as the machinery installa-

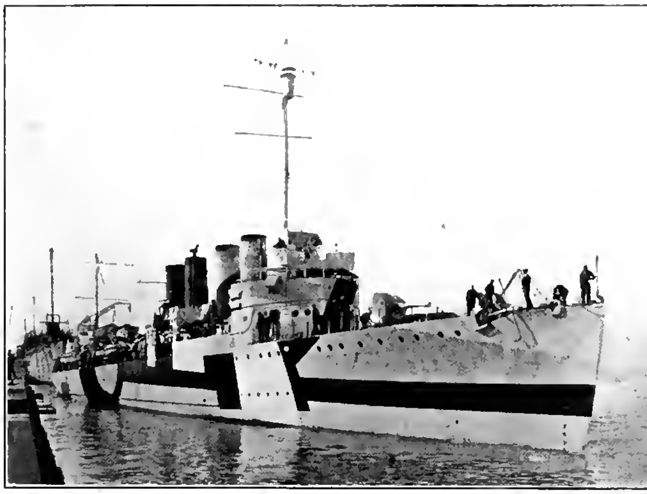

FIG. 9 THE *Ward* COMPLETE AND READY FOR TRIAL TRIP

tion is complete, and if everything functions satisfactorily, the vessel proceeds on a "builder's trial," in order to "run in" her machinery and insure that everything will operate smoothly on the official trials before the Naval Trial Board, composed of officers experienced in naval construction, engineering and ordnance. These trials are very severe and consist of continuous runs, of several hours' duration each, at various speeds up to the maximum. At least one vessel from each class is carefully "standardized," that is, the vessel is run over a measured-mile course both with and against the tide at varying speeds up to the maximum, both the revolutions per minute and the horsepower required being carefully observed during each run. From these results curves are plotted, which give a ready means of ascertaining the horsepower or revolutions required for any given speed.

All of the above trials are held at the vessel's normal displacement, which was specified in the contract. Additional tests carried out during the trials are on the steering gear, anchor gear, and gun firing (to test foundations). A thorough report, embodying the observations of the Board on the design, construction and performance of the vessel, is submitted to the Department and any weaknesses or alterations are corrected in the boat under trial, also in future boats. By this system a continual improvement in design and construction has resulted.

Commissioning. Navy-yard-built destroyers are placed in commission before the trial runs are held, these being conducted by Navy personnel. The *Ward* was placed in commission on July 28, 1918, 74 days after the laying of the keel. Her machinery installation was not complete on this date, but she was commissioned so that stores could be placed on board, the ship's organization perfected, and the vessel in all respects made ready for departure the moment her machinery installation was completed, which was on September 1, 1918, as per schedule.[1]

(*Continued on page 781*)

[1] The fact that serious difficulties developed with certain auxiliaries supplied by private contractors in no way detracts from the merit of the performance represented by the completion of this vessel, ready for sea in 104 working days, especially when the intricacy of her design and the enormous power she carries are considered. Our earliest torpedo vessels, smaller, simpler and of relatively low powers, took from two to four years to complete.

Pulverized Coal as a Fuel for Boilers

A General Study of Its Characteristics and the Operating Conditions Met With in Its Commercial Applications; also a Discussion of the Nature of Flame, Types of Burners and of a Design of a Pulverized-Fuel Furnace for a 500-Hp. Boiler

By EDWARD R. WELLES[1] AND W. H. JACOBI[2], NEW YORK, N. Y.

BEFORE entering into details concerning pulverized coal, it is not out of place to emphasize that in the process of burning fuels certain very definite operations take place which depend strictly on the physical and chemical properties of the fuels. The reactions occurring, the quantity, quality, density and the temperature of the gases that result during combustion, and their effects, as well as the practical rate of burning to secure perfect or nearly perfect combustion, have all been defined and clearly enough so for practical application. Unfortunately, however, because of the cheapness of all fuels, these matters have not received the attention their importance deserves. We are more interested in the calorific value of fuels per unit weight, regardless of whether they are solid, liquid, or gaseous; that is, we consider a pound of fuel as the container of a given number of British thermal units and on that basis are prone to use one form of fuel or another in any service and to expect equal results.

Our conception of the thermal form of energy is still that of an imponderable fluid instead of a condition of matter. The common conception is that radiation does more heating than convection and conduction, whereas in reality the opposite is the case. We speak freely of heat transfer from one body to another instead of its propagation, and almost without regard to the relative value of specific temperatures, conduction, convection and radiation. We overlook the fact that the available heating capacity of a fuel is the surplus left from that developed in its conversion to the ultimate gaseous oxides, and that we can use only a portion thereof, depending not on the temperature that develops during combustion, but on the nature of the work to be done and the temperature at which that work can best be done. The energy consumed by combustible materials in the transition from the gaseous, the liquid and solid forms into the ultimate gases is different for the same quantity of combustible constituents. Each case involves a different time element, which is comparatively short with gases, longer with liquids and longest with solids. The presence of elements other than carbon and hydrogen, and their more or less complex formation, increase the endothermal losses, and affect directly the temperatures that develop. In consequence, not only is the heating value of each kind and form of fuel different from that expected from preliminary analysis, but the effects of the resulting properties are different. In burning lump coal, on account of the slow rate of combustion sufficient time is allowed to compensate for its variable structure and impurities. Liquid and gaseous fuels, on account of their uniform structure, give constant deflagration regardless of the rate of burning, and the effects of the actions that take place in burning are of less consequence.

With pulverized coal, on account of its rapid combustion, the effects due to the structure and amount and nature of the impurities are conspicuously manifested by the varying high temperatures and the unsteadiness of deflagration. The necessity of carefully considering the actions that take place in the combustion of powdered coal to adequately provide for their efficient utilization is thus made apparent. When dealing with the combustion of fuels and with heating we are confronted with problems concerning the molecular structure of materials in all their possible forms, and as such we should treat the matter on a different basis than mere B.t.u. considerations.

Advantages and Disadvantages of Pulverized Coal as a Fuel

The merits of pulverized coal as a fuel, briefly stated, are as follows:

a If ground sufficiently fine the entire combustible content of the coal can be burned, thereby effecting fuel economies hitherto not attainable even with the better grades of coals burned under favorable conditions.

b It permits the use of all grades of coal, including peat and lignite, with an approximately equal degree of thermal efficiency for the same service, and increases very materially the energy that can be derived from the world's supply of coal

c It possesses very largely the facility of control and combustibility of oil and gas fuels, thereby placing coal on a parity with these fuels.

The limitations of pulverized coal are:

a The very high temperatures attending its efficient combustion (see Table 1) and the unsteady mode of its deflagration, necessitating special furnace construction to secure reliable service and to realize the possible economies it affords, preclude its ready application to existing equipment

b The operating cost and attention required to maintain the necessary apparatus for its use may more than offset the fuel economies that can be effected in small independent services

c The presence of ash, which may not always be collected and held under control

d The human element, which will not submit to the peculiarities of its nature.

TABLE 1 APPROXIMATE COMBUSTION TEMPERATURES OF CARBON AND BITUMINOUS COAL AND THE RESULTING PERCENTAGES OF CO_2

Percentage of excess air	0	25	50	75	100	125
Combustion temperature, deg. fahr.:						
Carbon	4000	3450	3000	2625	2350	....
Average bituminous coal	4860	4000	3325	2860	2500	2220
CO_2 per cent	20.8	16.5	13.8	11.8	10.2	....

For flexibility and nicety of operation gaseous fuels rank first, being followed respectively by liquid fuels (oils), powdered coal and solid (lump) fuels. On the basis of cost they assume exactly the reverse order. Economy depends on the nature of the service and local conditions.

Preparation of Pulverized Coal

The valuable feature of pulverized coal is that by reason of its divided state it can be brought en masse into intimate contact with the air necessary for its combustion, and in consequence, when injected into a suitably heated hearth it burns completely, deflagrating almost as readily as atomized oil.

Obviously the first requisite is to render the fuel into as fine particles as is possible, so that when mixed with air the mixture shall assume the form of a homogeneous gas. This analogy is comparative only, for no matter how finely broken and thoroughly mixed with air the coal particles are, they retain their solid structure and are therefore subject to a very arduous process of combustion, which is responsible for the attendant high temperatures that result.

The standard established in cement-mill practice, generally adopted for all purposes, is that 85 per cent of the powder shall

pass through a 200-mesh screen, and 95 per cent through a 100-mesh screen. Coal so ground weighs from 35 to 45 lb. per cu. ft. and 1 lb. of it can be carried in suspension through smooth piping in about 5 lb. of air moving at low velocities. Experience shows that under favorable conditions 100 per cent 60-mesh powder can be burned satisfactorily. This coarse fuel necessarily requires a longer time for its complete combustion and it can only be carried in suspension at high velocities. Its use, therefore, would be permissible only in furnaces which provide a long path for the resulting flame. In short chambers operating at low velocities these large particles fall to the bottom of the chamber before being consumed and coke, the result being a loss of fuel.

Granulated coal ranging in size from 1/4 in. to powder has been used as fuel for boilers aboard ship, it being blown into specially constructed hearths. This method has given good results in forcing the generation of steam, but it is not strictly in the class of burning pulverized coal in suspension and does not possess the same range of possibilities.

Coarsely pulverized coal has the redeeming quality of damping the temperature of the furnace and may be resorted to for the purpose of cooling overheated hearths without chilling; nevertheless, pulverized coal larger than the 80-mesh grade should be avoided in ordinary operation for best results. A uniform mixture averaging 100 per cent 150-mesh or finer should be employed, especially in the case of low-grade coals.

Pulverizing mills ordinarily produce powder of the cement-mill standard, and on the basis of fairly dry coal the average cost of pulverizing runs from 15 to 30 cents per ton ground at the rate of 2½ to 1/4 tons per hour, respectively.

Qualities Desirable in Coals to be Used in Pulverized Form

In burning pulverized coal there is no restriction on the variations in quality found in commercial grades. Low-grade coals perform better than high-grade on account of the large proportion of impurities they contain, resulting in less destructive temperatures and thereby in lower combustion losses. Generally it is necessary to dilute with air the gases resulting from the combustion before they are used, but less dilution is required with low-grade coals and in consequence more economical operation is obtained through their use.

A large proportion of volatile matter has heretofore been regarded as a leading requirement for pulverized fuel on account of its combustibility, but experience does not support this; on the contrary, there are those who consider it expedient and beneficial to drive off a portion of the gaseous content of a coal before burning it.

The temperatures of combustion hearths for pulverized coal range from 2200 to 3000 deg. fahr. depending on the design of furnace, the service, and the fusibility of ash and refractories employed. With these temperatures predominating the deflagration of all commercial coals is assured, and the restriction on any particular kind of coal for powdered fuel on account of combustibility is eliminated.

The suitability of coal for use as powdered fuel is to be gaged by its pulverizing qualities, and the soft grades, which incidentally contain a large proportion of volatiles, are to be preferred. Hard coals and coke are very severe on the mills. For pulverizing, slack coal and all small sizes under 3/4 in. are desirable in that they eliminate the necessity of crushing. Screenings, which usually are fragments of the more combustible portions of coal, are excellent for pulverizing on account of the lesser amount of impurities present.

Uniformity in the quality of pulverized coal is as essential as uniformity in the fineness of the powder, and for continuous reliable service as essential as its calorific value. In preparing the powder it is extremely important to mix and blend the coal so as to uniformly distribute its impurities. The ill effects of the irregular presence of impurities are felt more as the quantity of fuel burned becomes smaller. When burned in large quantities—necessitating larger combustion space—there is a chance for equalizing the variations of the impurities. To obtain a uniform quality of fuel wherever the coal supply is of varying kind the various grades of coal may be blended to advantage by pulverizing, thereby effecting economies which might not otherwise be realized.

Effect of Moisture in Coal

Moisture in coal is objectionable not so much on account of the apparent thermal losses but because it renders pulverization difficult and more costly. For this operation 5 per cent moisture may be regarded as the permissible limit, and air-dried coal is entirely satisfactory for the efficient operation of the mills. However, in cases where the storage of pulverized fuel is necessary, coal should not contain more than 1.5 per cent moisture as a greater amount tends to cake the powder, and in the event of iron pyrites being present, their oxidation by water may be the origin of spontaneous combustion. It has also been considered necessary to dry the coal before grinding and experience has shown that this practice brings about losses of volatile combustible and adds from 8 to 12 cents per ton to the cost of preparation. Furthermore, with reasonably protected storage and handling facilities it is possible to render the raw coal sufficiently dry, thus doing away with the separate drying operation. The present tendency in drying coal is to confine this process to central distribution plants, such as will be required for railroad or large service. For stationary work, self-contained pulverizing units in which grinding, air mixing, and feeding of the combustible mixture directly to the furnaces are progressively accomplished are more desirable, especially so since preheated air—a by-product of the furnace—can be used in their operation, thereby conditioning the mixture for better combustion performance.

In the combustion of pulverized coal a certain amount of moisture is beneficial rather than detrimental in that it tends to maintain the temperature of combustion constant and thereby renders deflagration more steady. The explanation of this effect is that the normal temperature of dissociation of the solid particles of coal is greater than that of water, and in the process of combustion some of the moisture that may be introduced with the charge breaks up, absorbing thermal energy and thereby lowering the combustion temperature.

Powdered coal containing as much as 15 per cent of moisture has been burned satisfactorily.[1] This amount is no doubt excessive, but by introducing preheated air for combustion through the self-contained pulverizing units or otherwise it is possible to absorb large proportions of moisture from coal and use this to advantage in the process of combustion.

Ash—Sulphur—Spontaneous Combustion

The ash resulting from burning solid fuels has been and always will be a problem for each particular case. With pulverized coal the ash from particles consumed in suspension is a light powder. This powder is carried along with the gases and deposited on all surfaces beyond the hearth, making removal more or less difficult. In the case of boilers this kind of ash accumulates on the tubes, lessening the evaporating efficiency and necessitating periodical removal by steam or air sprays. The dissemination of this ash can be somewhat reduced by proportioning the combustion space so that after combustion is completed the gases expand rapidly, decreasing their velocity and density and depositing the ash particles in a suitably located pit. If the powder is too coarse, or the amount of fuel injected into the hearth is greater than can be fully consumed therein, the coal particles while in the distillation stage are impelled against the walls and there coke. The continuous supply of these unconsumed particles builds up and burns slowly, leaving ash of a pumice-stone formation, which, if in the proximity of the zone of deflagration, slags and becomes very difficult of removal. The remedy for this is the continuous production of uniformly fine powdered fuel and the proper design of the combustion space to consume completely all the particles of the fuel charge.

On the whole, compared with lump-coal burning on grates,

[1] Firing Boilers with Pulverized Coal (Henry Phipps Plant), W. S. Worth, *Power*, vol. 33 (1911), pp. 267-269.

experience shows that with reasonable precaution ash from pulverized coal is less troublesome in every way. Slagging of the ash and brickwork occurs only when these are too near the deflagration zone, which naturally is several hundred degrees higher in the temperature than their fusion points. This difficulty is eliminated by designing the combustion hearth so that the side walls and top arch attain a temperature lower than the slagging point and the bottom is no higher than about 2000 deg. fahr., which avoids melting of the low-fusible ash.

The presence of sulphur is to be looked upon with less concern in the case of pulverized coal, since, as mentioned before, the high temperatures attending the combustion of this fuel dissociate water into its elements and hold these in a condition less liable to combine with sulphur. Pulverized coal containing over 5 per cent sulphur has been used in boiler settings without giving evidence of corrosion.

In regard to safety, it may be said that while mine explosions attributed to coal dust indicate its combustibility and the testing station of the U. S. Bureau of Mines in Pittsburgh has painstakingly shown that coal dust in suspension can be made to explode, pulverized coal, nevertheless, is an excellent fire extinguisher. To ignite it in any form, coal must be brought to the temperature of its ignition, 1000 deg. fahr. and above. This is greatly in favor of pulverized coal since it permits its being conditioned for better combustion performance by heated air before using.

Importance of Preheating Combustion Air

Combustion air for pulverized coal has variously been applied under different pressures and usually at ordinary temperatures. No judgment has yet been passed on the condition of the necessary air bearing either on the flame-propagation qualities of powdered coal or on the dimensions of the combustion chamber, and in the absence of definite experimental data one conjecture is as good as another. Although the relatively low deflagrability of the powder suggests it, it is only through costly experience that we have learned the advantage of low air pressures and velocities for combustible mixtures.

The function of air in connection with burning pulverized coal is not only to provide the proper amount of oxygen to hold and convey the powder or supply a dilution element, but also to carry the flame—zone of oxidation—in suspension throughout its path; that is, away from the brick walls. The importance of this requirement is obvious, in that it eliminates destructive temperatures and the accumulation of ash and semi-burnt particles on the brick walls, and secures more perfect burning of the fuel particles "in suspension".

The value of heated air for mixing and dilution purposes cannot be overestimated. It prepares the fuel for quicker deflagration, thereby permitting a larger quantity of fuel being burned in a given space, it maintains the powder in better state of separation, and in general promotes steadier combustion. Furthermore, in conjunction with a suitably designed furnace it is possible to attain a better heat balance by utilizing waste gases and radiation for heating the combustion air required for the treatment of the powder.

For mixing purposes the air temperature should not exceed that of the coking point of the particular coal used, and for dilution the higher the temperature of the air the better.

Comparative tests on a 250-hp. boiler using combustion air at 65 deg. fahr. and 750 deg. fahr. with powdered bituminous coal showed that, other things being equal, with air at 65 deg. the evaporation was 7.7 lb. per lb. of fuel and the temperature of escaping gases 528 deg., while with the 750-deg. air the evaporation was 9.17 lb. per lb fuel and the temperature of the escaping gases 475 deg. On the basis of the normal boiler rating this performance indicated a gain of 15 per cent. with hot air and a loss of 12.2 per cent with air at the ordinary temperature.[1]

At the present time air pressures from 0.5 oz. for small furnaces to 10 oz. and above for cement kilns are being used with success, while pressures of 3 oz. and under for boilers have given good results. As mentioned above, pulverized coal should be burned in suspension and with excess air on account of the high temperatures that develop in its combustion (see Table 1). The pressure and distribution of the air necessary to secure this condition vary with each case and demand careful consideration to obtain best results.

In general, the finer the powder and the warmer the air the lower will be the pressure necessary to inject the combustible mixture into the furnace, and the better will the powder be held in suspension; also, other things being equal, the larger the amount of fuel that can be burned in a given space. This implies lower furnace losses.

Comparison of Stoker and Pulverized-Fuel Plants

Economy in connection with fuels is a term which must be used with caution and depends upon the purpose for which fuels are employed. If pyrometric effects are sought, as in metallurgical furnaces, the conditions and rate of burning fuel are such that thermal efficiency is out of the question and economy can only be expressed directly in dollars, regardless of the kind of fuel used and its performance. If calorific or straight heating effects are desired, as in steam generation, thermal efficiency plays the all-important part, and in this connection two factors are to be considered; one involving the furnace performance and combustion losses, and the other the means provided to absorb the thermal charge in the products of combustion. These two conditions go hand in hand, and maximum economy is therefore a function of the two.

With pulverized coal the furnace and combustion losses can be greatly decreased as compared with those incurred in burning lump coal over grates, by reason of its manner of burning, and it is to that condition alone that very acceptable fuel economies can be effected by its use. Instances are recorded showing that 10,500-B.t.u. coal fired as powder in a given boiler setting has evaporated a larger amount of water than 12,090-B.t.u. coal fired by hand.[1] Invariably records of tests made in steam plants of various capacities using pulverized coal as fuel indicate boiler thermal efficiencies of 75 to 80 per cent and over, which parallel the best efficiencies obtainable with modern stokers in large installations. The consensus of opinion is that with the better methods of firing pulverized coal the high efficiencies observed both in the hearth and in the boiler remain fairly constant throughout a wide range of quantities of fuel burned, whereas with stokers, which permit only a rigid design of combustion hearth, beginning with the higher efficiencies in large boiler installations the efficiencies drop as the installations become smaller. This is self-evident in part, since in stoker practice only the better coals can be used to advantage and a certain amount of fuel loss cannot be prevented, whereas by pulverizing, all grades of commercial coals are admitted to the same service with equal merits and fuel losses may be avoided. And since deflagration, and therefore the combustion space necessary, becomes a measure of the actual amount of combustible present in the coal, the hearth losses remain practically constant for all conditions encountered in actual service.

The conclusion to be derived is that, other things being equal, the competition between the use of pulverized-coal firing and stokers for large boiler plants will be a matter of flexibility of service, convenience in operating, and maintenance cost; while in small plants fuel economy will be the deciding feature along with the other advantages, and pulverized coal will obtain the preference, not only on the basis of combined first and operating costs, but especially so after the greater convenience and flexibility of service resulting from its use have been sufficiently demonstrated.

Conclusive figures on the operating and maintenance costs of pulverizing equipment have not yet been obtained from actual practice, since no specific standards have been established. With

[1] J. H. Travis, *Power*, vol. 24, pp. 168-196 and 271

[1] G. F. Gasbe, *Railroad Gazette*, vol. 34.

self-contained pulverizing units, however, it is thought that, totalizing all the items of expense, the operating costs of an equivalent stoker equipment are approximately the same.

Considered as a gas, pulverized coal when mixed with 100 per cent of combustion air produces a fuel mixture having a calorific value of from 90 to 120 B.t.u. per cu. ft. Fig. 1 gives the relative costs of fuels on the basis of their calorific values.

Where it is desired to determine the maximum price which could be paid for a low-grade coal for pulverizing to place it on a basis comparable with higher-grade fuel for stoker firing, the formula

$$P_1 = \frac{P_2 H_1 E_1}{H_2 E_2}$$

may be used, in which P_1, P_2 = price per ton, delivered, dollars; H_1, H_2 = B.t.u. per lb. of coal; E_1, E_2 = combined boiler efficiency; and the subscripts 1 and 2 refer respectively to low-grade and high-grade fuels. The price P_1, however, does not include the cost of pulverizing.

Burners

Under the name of "burners" the devices that have been used to mix the necessary air and coal powder and feed the mixture to the hearth are numerous. Their merits are relative at best and each has its limitations, their only function being to convey, mix thoroughly and deliver the fuel charge to the hearth in the required quantity. Much ingenuity has been exhibited in the development of these devices, but little attention has been paid to what is more essential, namely, the correct design of the furnace for burning the combustible mixture.

Fig. 2 illustrates diagramatically the schemes generally employed in the devices now used. Scheme 1 shows a device which depends entirely on the induced chimney draft for the air supply. Naturally its capacity is limited by the chimney draft and its regulation is restricted to a small margin. This method would be suitable for service in which steadiness is a minor consideration. Scheme 2 shows a combination of natural and forced draft which permits wider application than Scheme 1; its regulating features are better, but it is still subject to the fluctuations of the natural draft. Scheme 3 shows an arrangement which affords full control of the fuel and the air, and in consequence greater flexibility in its operations, being less affected by external variables. It lends itself admirably to the application of

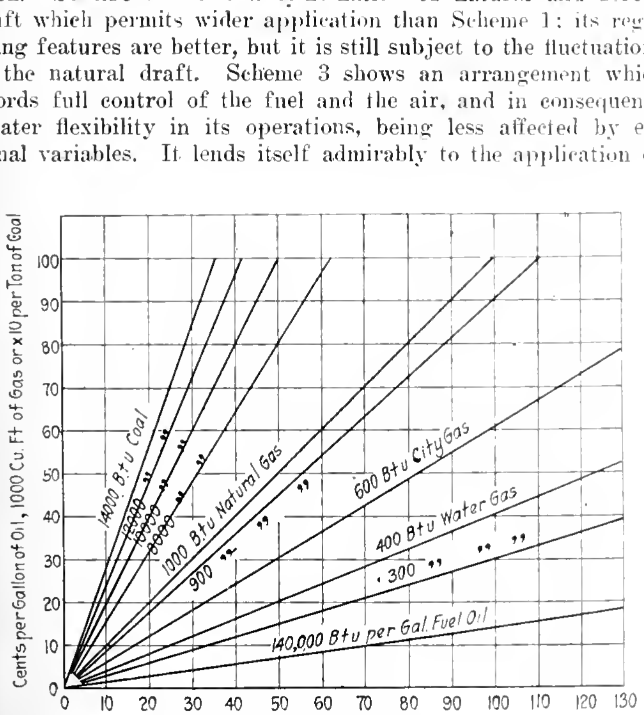

Fig. 1 Relative Cost of Fuels

heated air for combustion through the secondary blower f, a method which should be adopted exclusively for burning pulverized coal. It also makes it possible to automatically control the fire in response to varying load conditions, something particularly desirable in steam generation. Schemes 4 and 5 illustrate arrangements in which self-contained pulverizing units are employed, simultaneously preparing and feeding the fuel to the hearth. These machines are usually provided with a fan for the double purpose of separating the powder in the process of grinding, and mixing and supplying part or all of the combustion air. Schemes 3 and 5 possess the same merits as to flexibility, regulation and usefulness and should be adopted wherever possible.

Equipment for Preparing Pulverized Coal

Two distinct methods are in use to prepare pulverized coal. One of these involves a plant in which the fuel is treated independently of the rate of its consumption and comprises, beginning with the coal bunker and in the order of the operations: crushers, crushed-coal hoppers, driers, magnetic separators, pulverizers, powdered-coal storage hoppers, distributing conveyor feeding individual hoppers at each furnace which are fitted with feeding devices, and a blower or separate blowers operating in conjunction with the feeding devices to mix and feed the fuel to the furnaces. This various equipment is interconnected with suitable elevating or conveying means to conveniently carry out the cycle of operations and permit of multiple arrangements to suit local conditions. The advantages of pulverizing plants are:

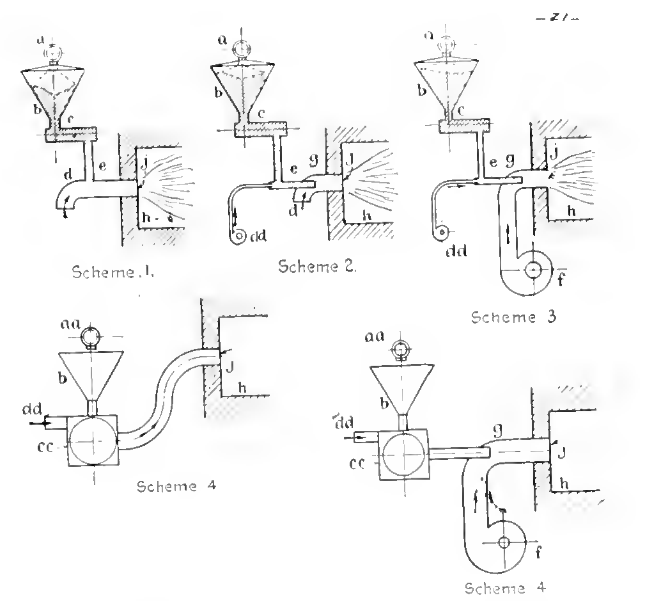

Fig. 2 Pulverized-Coal Feeding Devices

a, Screw conveyor for pulverized coal; *aa*, Screw conveyor for crushed coal; *b*, Hopper; *c*, Feeding device; *cc*, Self-contained pulverizing, mixing and feeding machine; *d*, Induced-draft combustion air; *dd*, Primary mixing air blower; *e*, Primary mixing chamber; *f*, Secondary air blower; *g*, Secondary mixing chamber; *h*, Hearth; *j*, Nozzle. The delivery outlet or outlets are arranged and shaped to suit the hearth, which in turn depends on the nature of the service.

a Uniformity in the quality of the powder
b Ample fuel supply to provide for varying loads and starting without taxing the normal operation of the equipment
c Suitability for large installations where uniform service and a central point of distribution are necessary.

The disadvantages are:

a High first and operating costs
b Large floor space required
c Multiplicity of equipment and parts.

The other method employs self-contained pulverizing units, conveniently located near the point of fuel consumption, which prepare the powder as required. Beginning with the coal bunker, the equipment comprises: crushers, magnetic separators, crushed-coal storage hoppers, distributing conveyor feeding individual hoppers at the pulverizers, pulverizers, blower for combustion air, and feeding devices leading to the furnaces. In the event of a single pulverizer feeding finished fuel to various furnaces the conveyor is eliminated, the distribution being accomplished by air as a part of the feeding devices for the furnace.

The advantages of this arrangement are:

a Simplicity of equipment and therefore low first and operating costs
b Individual control of each furnace
c Adaptability to existing plants
d Good regulation without altering the quality of the powder.

The disadvantages are:

a Necessity of carrying spare units, on account of severe wear and tear when in continuous service
b Absence of storage of powder for starting.

As a general proposition, if conditions permit ample storage and suitable handling facilities to air-dry and mix the raw coal thoroughly, the self-contained equipment offers greater possibilities both in flexibility of service and arrangement and economy.

II FLAMES[1]

The flame resulting from the deflagration of pulverized coal differs from that of other fuels in the larger combustion space required on account of its low combustibility, and the higher temperature due to the rapid breaking up of the solid structure of the coal particles.

In general, the more inflammable the material or the lower the rate of oxidation, the smaller the space required for its combustion and the lower the average temperature that develops.

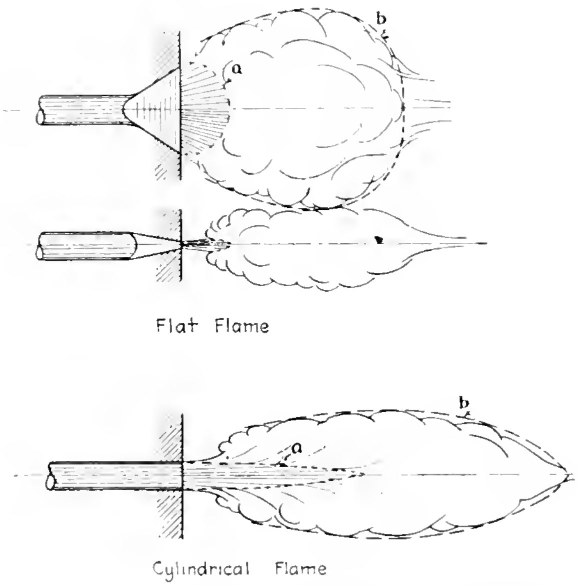

Fig. 3 Approximate Shapes of Flat and Cylindrical Flames of the Same Capacity and Under Similar Conditions

a, Zone of initial oxidation; *b*, Zone of complete oxidation. Note the length of zone *a* in the cylindrical flame. Coking of powder has been observed to take place within this zone through baking.

This condition is shown by the performance of explosives and the slow burning of gas, oxidation of iron, etc. The average temperature of combustion of gases in ordinary air is from 1500 to 2000 deg. fahr., and, for a given amount of fuel consumed, the combustion takes place in a smaller space than that required for atomized oils, which begin to burn steadily at about 2000 deg. Experience shows that the deflagration of pulverized coal requires a still larger space and that the average temperatures developed by its combustion are much higher—2500 deg. and above.

Fuels are rendered more inflammable as they are brought to or carried beyond their ignition temperature and are more thoroughly mixed with the necessary oxygen.

[1] Flame is usually defined as the luminous or visible portion of the zone of deflagration. While this is the ordinary conception, in the present case by "flame" is meant the zone of oxidation, that is, the space within which the oxidation of the combustible elements is completed, which is much larger than the luminous zone, especially in the case of blast flames, such as obtain with oil, gas and pulverized coal.

Temperature a Measure of Relative Molecular Activity

Temperature, like voltage and pressure, is a difference of potential and, with reference to burning fuels and heating, is a measure of the relative molecular activity of the materials involved, which can be expressed quantitatively in terms of MV^2. Reference to this phase of the dynamic theory of the formation of matter is made here merely to indicate the fundamental relationship between temperature, mass and the performance of the component material particles; so that for a given mass the measure (temperature) of thermal energy varies as the square of the molecular activity.

The truth of this is evidenced in part by the fact that the specific heat of a substance increases with the temperature, though not in proportion thereto, and in a manner which confirms the law just stated. A long metal bar heated at one end up to melting point is another example showing similar temperature conditions at equal distances apart toward the cold end.

As yet no definite methods have been found to measure thermal energy in terms of MV^2, and for the time being the practical value of the conception of that law lies in the aid it lends in following the actions that take place during combustion and heating to determine with some precision truer thermal conditions and effects that may result.

Assuming then that temperature is a function of the square of the activity of the particles of matter, it is easily conceivable that the greater the molecular or atomic disturbance caused by the combination of oxygen and the combustible elements, the higher will be the temperature of combustion, and that this temperature, though not directly proportional to, will vary as some function of the square of the rate of combination. If we then assign a constant value to the unit increment designated to measure temperature, as our present degrees, the heating of any given mass will vary as some function of the square root of the applied temperature (the temperature difference between the heating medium and the mass to be heated), and inversely as the mass. That is, the heating is not directly proportional to the temperature applied as is ordinarily understood. This fact is conspicuously verified in metallurgical work where a wide range of temperatures obtains.

The influence of mass, however, is not a constant one, since the nature of its structure varies in all materials and this condition must be looked to for the inconsistent results ordinarily observed in all heating operations. But a practical solution of the difficulty is not out of reach, for it may be stated that within the range of temperatures employed in industrial applications, manifestations akin to resistance, inductance and capacity appear in the process of heating, and that it is consequently possible to develop and introduce a term of the order of "power factor" to designate more precisely the amount of useful thermal energy from any one reaction, thereby eliminating prevalent empirical considerations. This method of dealing with the subject of burning fuels and heating in general, however, in the absence of conventional definitions and sufficient experimental data to quantitatively confirm the law, naturally calls for a more technical treatment. For the purpose in hand, however, it is necessary to adhere to existing methods and units, except that we have at our command a more comprehensive conception of the actions that take place, which is a material aid in arriving at practical results.

Coals Should Be Rendered Equally Deflagrable

Profiting by the foregoing considerations and recognizing that the structure of coal chemically and physically is a variable one, the all-important requisite for pulverized coal is that its nature shall be rendered as uniform as possible with reference to a given standard, so that for any given furnace the temperature and operating conditions at the hearth shall be maintained as constant as possible with the various kinds of commercial coals and afford approximately the same regulating qualities.

Assuming a continuous production of powder of uniform fineness and impurities, the inherent weakness of coal for burning

in powdered form is its deflagrability, which varies as its structure varies. It is possible, however, to alter the structure of all coals pyrometrically so they acquire a sufficiently uniform texture before combustion to practically satisfy the requirements. In general, hard and high-ash coals should be heated to a higher temperature than soft and low-ash coals, the coking point of the particular coal being the limit.

By rendering all grades of coal equally deflagrable the precision of other requirements becomes apparent: (*a*) The velocity of the fuel-mixture feed is limited and fixed by the velocity of the flame propagation, which means constant pressure and supply of air for all grades of coals, measurable by the actual amount of combustible content; (*b*) wider regulation by direct fuel control is possible; (*c*) very steady lower hearth temperatures can be secured. The desirability of these conditions is obvious. In general, for constant results the more inflammable the fuel mixture the higher the velocity of discharge and the lower the temperature of the hearth; and conversely, the less inflammable the fuel mixture the lower the velocity of discharge and the higher the temperature of the combustion hearth necessary to burn the same amount of fuel in a given space. For the realization of these conditions it is assumed that the distribution of combustible charge over the hearth is the same in each case.

Proper Velocity for Fuel Mixture

The proper velocity for the fuel mixture as determined by its inflammability can only be found by trial, and the condition to be fulfilled is that the base of the flame shall approach the outlet as closely as possible. A lower velocity may result in backfiring within the feed tubes, which are of appreciable dimensions, and cause a more or less destructive explosion. A higher velocity carries the mixture too far into the hearth before com-

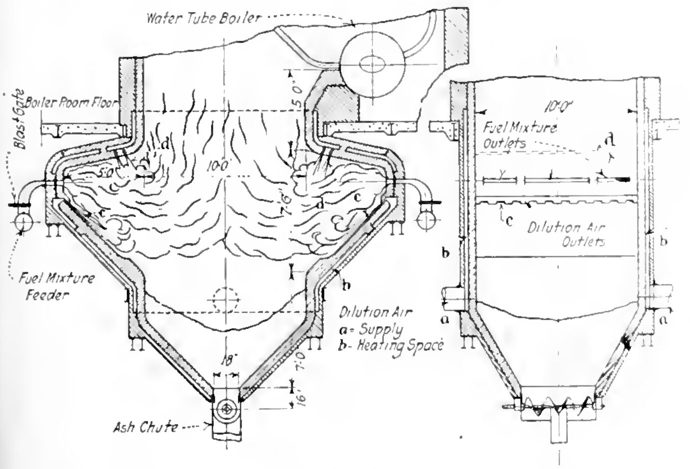

Fig. 4 General Design of Furnace for Burning All Grades of Commercial Coals in Pulverized Form Under a Water-Tube Boiler

bustion begins, and has the effect of coking and consolidating the particles, which drop to the bottom of the hearth in the form of relatively large globules, thereby causing faulty combustion and loss of fuel. Coking of the combustible charge is very perceptible in connection with discharge outlets of large diameter such as are used in cement kilns. The action in this case has been attributed to more rapid combustion on the surface of the combustible jet, which has the effect of baking the core within (see Fig. 3). This difficulty has been overcome by using outlets in the form of a slot of the required cross-section, thereby exposing more surface to the hot gases in the hearth.

Volume of Flame or Zone of Oxidation

The volume of the flame, that is, the zone of oxidation, in general, cannot be predetermined on account of the many uncontrollable variables, and especially because the virtual temperature of combustion cannot be ascertained by present means and the real time element of complete oxidation is not definitely known. Observation and analysis show that, under similar conditions, more inflammable fuels burn with a shorter flame than the less inflammable. In connection with pulverized coal the problem becomes more complex on account of the variable amount of excess air required for its combustion. The values for this excess hitherto suggested vary widely and are so conflicting as to preclude their use. Nevertheless, based on the average temperatures of combustion and the amount and temperature of the gases required, it is possible to arrive at a very satisfactory conclusion regarding the dimensions for the combustion and gas space.

Briefly, though in the combustion of pulverized coal there is a wide margin for regulation by judiciously applying the conditions herein indicated, nevertheless, until more complete ex-

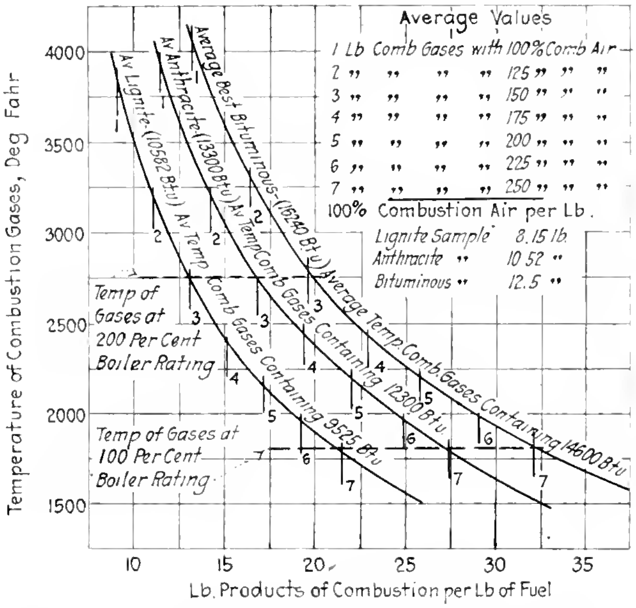

Fig. 5 Gases of Combustion of Typical Coals and Their Average Temperatures

perimental data are available, it is necessary to consider every element entering—from the nature of the coal to the performance of the boiler—and to disregard all precedent existing in the burning of lump coal in order to secure satisfactory results with the powdered fuel.

III FURNACES

Although in general furnaces are more or less special structures and their character is determined by the service they perform, their design and type of construction depend chiefly on the nature of the fuels used in their operation.

The combustion of a fuel results in gases charged with the available useful heat developed during their formation, and ash, in the case of fuels containing solid impurities. The quantity of gases and their temperature depend on the quality of the fuel and the amount of air used for combustion and dilution purposes, which can be varied to suit practical requirements.

In steam-boiler settings the duty of both boiler and furnace is a calorific one, that is, one of straight heating, and is measured by the amount of water evaporated in the boiler by the combustion gases from one pound of fuel.

The amount of water that can be evaporated in any type of boiler by a given quantity of fuel depends on the quality of the steam desired and the ability of the boiler to absorb the heat charge of the gases supplied by the furnace necessary for the generation of the steam required. So that, briefly stated, the boiler is subordinate to the steam requirements and the furnace

Fuel Saving in Industrial Plants

By JOHN F. TINSLEY,[1] WORCESTER, MASS.

Although war-time necessity of saving fuel has happily passed, the conservation of fuel is still as important as ever. During the war the industries of New England benefited in many ways through the suggestions and assistance of Fuel Conservation Committees, and although these are now of the past, their work is still having its effect. Their methods and the recommendations which they made are of value even today and this paper which outlines the campaign of the Worcester Fuel Conservation Committee contains a brief account of the manner in which that committee dealt with the problem.

AFTER the very strenuous winter of 1917, with its distressing "heatless" days and other comfortless evidences significant of a fuel shortage in New England, Massachusetts awakened to a fuller appreciation of the importance of conserving fuel, if her industries were to do the part expected of them in the winning of the war. Under the excellent guidance of the state and local fuel administrations, steps were taken in the early spring of 1918 to point out to the industrial fuel users of Worcester the critical situation that was likely to exist the following winter, and to create an organization that would carry out the work successfully and effectively.

The two things necessary to the accomplishment of any big work—incentive and organization—were quickly apparent, the former through the daily news columns of those dark days when the last great German drive was on, and the latter through the splendid response that has been so characteristic of the people of Worcester in every phase of war activity. At the time of the signing of the armistice, in November, the fuel-saving campaign had been successfully under way for several months with gratifying results and with every indication of an accomplishment in the saving of fuel that would exceed our expectations. But within a short time after that event the committee ceased its official functions, and this paper therefore deals with the work done in a comparatively few months prior to the close of the war.

The work of organizing Worcester's fuel-saving campaign was started in May 1918 with the appointment by the local fuel committee of a Factory Fuel Conservation Committee, consisting of three men selected from the management of three of Worcester's industries. This committee soon realized there were two distinct steps vital to success: First, that the managing heads of the various plants should be aroused to a full appreciation of the critical situation likely to exist in connection with the fuel supply; and second, that the foremen and workmen throughout the factories should be brought to feel that, after all, the real success or failure in meeting the problem rested in large measure with them.

The first part of the committee's program was easily and quickly accomplished. In a series of meetings the plant managers generously pledged their support and coöperation, and by so doing enabled us to vigorously take up the second step with the employees in the various plants. This task, however, was a large one, since it involved not only arousing the interest of upward of 75,000 men in about 260 plants, but also required for effective results that this interest be maintained.

To this end the Factory Fuel Conservation Committee appointed a sub-committee to assist in the work. This sub-committee was composed of practical engineers who could carry the message right to the workmen themselves. It was made up of eleven men chosen from the leading industries of Worcester, and the results accomplished through their fine work proved clearly the wisdom of their selection. Several of these men were technically trained, and all were practical. They were all engaged at the time of their appointment in active engineering work in the various concerns with which they were connected. These men were selected because the fuel problem has been for some time past a greater one with the larger plants than with the smaller ones, and many steps had already been taken by the larger concerns to save fuel. Consequently, through these engineers we wanted to pass along the full advantage of such experience to others.

The next step was to get the various shops organized. The State Fuel Administrator had requested that each factory appoint a Factory Fuel Committee, and the managers of the various industrial plants signed pledge cards agreeing that they would have fuel committees promptly appointed in their plants. Thus we had in a short time fuel committees appointed by factory managements to the number of 258 in Worcester. Some of those committees contained in the case of the smaller plants one man, but in the larger plants several men, who only represented the various lines of work in which fuel economies were possible. More than a thousand men were thus actively organized in Worcester on fuel-saving committees.

This portion of our organization was very effective, and the response on the part of these men whose efforts were exerted among thousands of workmen in Worcester was splendid. The details of factory organization and personnel thereof were left in most cases to factory managements, as we wanted these committees to feel that the responsibility was primarily with them. In this connection it is interesting to note that those plants that accomplished the most specialized in their factory organization to the extent of having specific men for specific jobs.

With an organization thus created that could easily reach the men in the shop, we were ready for business. As the problem was to save fuel, it was necessary at the outset to see that the various factory fuel committees understood the seriousness of the fuel situation, that they were organized to do effective work, and that in every plant the best opportunities for making economies were pointed out and thereafter followed vigorously. To accomplish these objects the various factories, to the number of about 260, were assigned to the Engineers' Committee for inspection, instruction and supervision. Each engineer was given about 25 plants to look after, assignments being made in groups throughout the city to facilitate visiting, though in certain cases all the plants of the same general manufacturing character were grouped together under one engineer.

In a remarkably short time, due to the splendid enthusiasm of these engineers and the generous coöperation of their employers in allowing them the time necessary to do this work, all the factories in the city were visited, the factory committees instructed, and an initial inspection made by the engineers. At the same time those lines offering the best promise were carefully pointed out to each factory committee, and practical suggestions made to meet the needs in each case.

There was one feature of our campaign on which we laid special emphasis. There is likely to be an impression in the average plant that the place to save fuel is where the fuel is used—in the boiler room. In fact, very little organized effort has been made in the past to save fuel anywhere else. There are, of course, many opportunities for saving fuel by efficient firing and by good boiler-room methods, but there is also a large field for fuel economies beyond the boiler room. The boiler room must meet the demands made upon it, and that demand is created outside. It was therefore apparent that if we were to make a favorable showing, the greatest opportunity for so doing was essentially outside of the fire room, and the economies in the fire room would necessarily have to be limited to such matters as could be effected quickly and without radical changes.

The visits and inspections of the engineers gained from every plant the best of coöperation from the start. The instances were few where any pressure had to be exercised to obtain results. In connection with the work certain records and statistics were, of

Abstract of paper presented at a meeting of the Worcester Section of THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS, May 28, 1919.

[1] Chairman, Worcester Fuel Conservation Committee.

course, necessary. We established for every plant monthly reports of fuel used, as compared with corresponding months of previous years, and also sufficient statistics as to operating schedules to permit of comparisons being made.

Inspection reports covering specifically all recommendations were also made. On the second and succeeding visits a report was rendered as to previous recommendations put into force, and additional suggestions offered. These reports were for two purposes: first, to give the State and local fuel committees reliable information (the fuel authorities took the position that in case of a critical shortage of fuel it was probable that the allotment of fuel to any plant would depend on the degree of coöperation that was extended by it); and second, to show the factory fuel committees that they were being rated on actual performances and compared with other plants.

Some idea of the value of these visits may be obtained from the records of recommendations made by the engineers. As a result of a single visit to 117 of the larger plants, 547 recommendations were made, or an average of about five per plant. Of these about 85 per cent were carried out before the second and third inspections, a response speaking most eloquently of the fine spirit of coöperation with which our efforts were met.

A few typical recommendations follow:

1 Many unnecessary lights are kept burning. Get everybody to help the cause by turning off unnecessary lights
2 Your belts are not looked after closely enough. You are losing power and money by having belts both too tight and too loose
3 Your motors are underloaded. The loss in efficiency and power is large if your motors run much underload
4 Your shafting should be lined up. Friction load in the average plant is very high, and power is wasted at a terrific rate if shafting is out of line
5 You have a lot of uncovered high-pressure steam pipes. Your losses are high, due to this cause
6 You have many machines running idle and wasting power. Install belt hooks and slip the belts off on machine shut down for long periods. If for short periods, educate your men to shift to loose pulley
7 Fix your doors and windows to prevent undue loss of heat
8 Wash your windows. You have an opportunity to save at least ½ hour of lighting daily by so doing.
9 Your fire-room practice should be improved. Keep fires bright, fire frequently, avoid holes, clean regularly, keep ashpit cleaned out, clean tubes oftener, get better damper regulation, etc.
10 Indicate your engine. We will help you take the card and interpret it.

There were, of course, many others, but all were of the common-sense variety, and it is evident that if all the industrial plants in any community worked concertedly and continuously along these lines, an economy in fuel must of necessity result. Furthermore, the service on the part of the engineers was not merely advice, for often they supplied from their own companies testing instruments, shaft-lining instruments, engine-indicating apparatus, etc., and assisted in making flue-gas analyses, engine indications, etc.

Aside of the work done in connection with the engineers' visits and inspections, the committee also felt that the educational or propaganda side should be emphasized. Literature that could be understood by the average workman relative to all phases of the fuel-economy problem was obtained and was distributed to the various factory committees. To firemen and engineers were issued short pamphlets covering in the simplest terms the fundamentals of economy as far as the generation and application of power were concerned, while to master mechanics and electricians were directed bulletins on belt troubles, power-transmission losses, etc.

We found the language most effective was that which dealt with dollars or tons of coal. The coöperation of a workman in regard to turning off an electric light was forthcoming much more quickly when he learned that, small as it was, in a year's useless burning it consumed several hundred pounds of fuel, and that 100 ft. of 1-in. uncovered pipe conveying live steam at 100 lb. pressure wasted upward of $100 worth of fuel per year, with coal at $7.50 per ton.

In addition to this service, the Factory Fuel Conservation Committee issued for two months a monthly newspaper or news letter which was much appreciated. In this paper were published the names of all factory-committee chairmen—something which was apparently liked—and a number of short, pithy, readable paragraphs giving suggestions for fuel saving. Efforts were made to cover all phases of the subject and thus interest engineers and firemen, master mechanics and electricians, as well as the rank and file of the workmen themselves. A noteworthy feature of this paper was the publishing under the various firms' names of the several steps taken by them to save fuel. This served an admirable purpose in stimulating a spirit of friendly rivalry, and also served to disseminate generally a knowledge of fuel-saving methods that could profitably be followed by other plants than those under which they happened to be reported. In a word, our educational or propaganda service was intended to give all industrial fuel users a knowledge of "what the other fellow was doing."

And now the results. Table 1 gives a comparison between the average monthly coal consumption of 13 of the leading industries in Worcester as between 1917 and 1918. The months under comparison are those of the late summer and early fall. The plants represented include the wire, grinding-wheel, belting, crankshaft, machine-screw, machine-tool and carpet industries, as well as one large public utility.

TABLE 1 AVERAGE MONTHLY BITUMINOUS COAL SAVING

Plant No.	Number of months included in average	Tons of coal consumed in 1917	Tons of coal consumed in 1918
1	3	16,953	14,778
2	3	7,847	7,044
3	3	1,697	1,438
4	3	1,303	1,388
5	3	866	908
6	3	586	200
7	3	367	340
8	3	333	350
9	3	296	144
10	3	293	189
11	2	278	200
12	2	255	15
13	3	132	110
Total......	....	31,232	27,104

The table indicates a general reduction in coal consumption in 1918 of over 13 per cent when compared with the same months of the previous year. There is another interesting point about this table. If it were divided into two parts of six plants each, representing the larger coal-using plants separate from the smaller ones (eliminating plant No. 12 which shows the largest relative variation), the saving is 11.9 per cent for the group of large coal users, as against 21.6 per cent for the group of smaller users. This is apparently as we should expect. The larger coal users had been studying their fuel consumption previously, while in the smaller plants the matter of fuel naturally had not been so prominent a matter of cost with them.

The question will naturally arise in connection with the comparison as given in the table as to whether it represents in both years similar operating capacities. In other words, was the load of these plants as large in 1918 as in 1917? This is an exceedingly difficult matter to determine, but a fair idea of the operating load of the plants may be obtained from the number of employees represented in these concerns in 1917 and 1918 at the time the comparisons are made. The twenty-six concerns included in the two lists report for 1917 at the time the comparison was made approximately 20,200 employees, and in the corresponding months of 1918 these same companies reported an approximate number of employees of 20,350, that is, an increase of approximately three-quarters of one per cent. The inference, therefore, is fair that the figures as given above as to saving are reliable. Succeeding months would also have probably shown even more gratifying results, since the figures reported herein cover months rather unfavorable for effecting the maximum effort in reducing fuel consumption. The movement was conducted, however, in an organized way long enough to show the splendid results that come from the coöperation of fuel users and from an organized effort to save fuel.

DISCUSSION ON PULVERIZED COAL AT THE SPRING MEETING

At the Fuel Session of the Spring Meeting of the Society two papers were presented on the subject of pulverized fuel: namely, Pulverized Coal as a Fuel, by N. C. Harrison, and Pulverized Coal for Stationary Boilers, by Fred'k A. Scheffler and H. G. Barnhurst. Abstracts of these papers were published in the August issue of MECHANICAL ENGINEERING, together with extensive extracts from the large volume of discussion which they elicited. A portion of Mr. J. E. Muhlfeld's discussion, dealing with the performance of pulverized-fuel equipment in locomotive and marine service, which it was not possible to print last month, is given below, followed by the closures of the authors of the papers.

Pulverized Fuel in Locomotive and Marine Service[1]

By J. E. MUHLFELD[2]

FROM a study made of the coal measures in the southern part of Brazil during 1904-06, it was concluded that the native coal was unsuitable for economic use. Later, during 1915-16, at the direction of Dr. Miguel Arrojado Lisboa, then Director of Government-Operated Railways, an investigation was made of the use of pulverized fuel in the United States, with the result that the Central Railway of Brazil decided to install a 15-ton-per-hour capacity fuel-preparing and coaling plant and a stationary boiler equipment at Barra do Pirahy, an enginehouse and shop terminal about 65 miles north of Rio. Plans and specifications were prepared and installation was made of the "Lopulco" system by the International Pulverized Fuel Corporation of New York. Arrangements were also made for the equipping of 250 existing and new locomotives with the same system and by the same company, and since that time twelve ten-wheel-type and two Consolidation-type locomotives have been newly built and so equipped, by the American Locomotive Company, and put into regular use on the Central Railway of Brazil.

The first official run with Brazilian native coal, pulverized, was made on September 9, 1917, with a special train that transported Dr. Wenceslao Braz, President of the Republic of Brazil, and his staff. Ten-wheel-type locomotive No. 282 handled the President's special train from Barra do Pirahy to Cruzeiro, a distance of about 90 miles, and during the greater part of the trip President Braz remained in the locomotive cab and fired the locomotive, on which the steam pressure was fully maintained throughout, without any smoke.

As the result of this performance, President Braz sent a telegram to the Minister of Public Works, as follows:

> From Barra do Pirahy to Vargem Alegre, I traveled on ten-wheel locomotive No. 282, fitted for the use of pulverized fuel, with excellent results. The trip was made with a velocity of 63 kilometers per hour, having a train of 210 units behind it. I take great pleasure to give you this communication which I am certain will be received by all Brazilians interested as solution of one of your most important national problems. Salutation.
>
> WENCESLAO BRAZ.

Barra Mensa, September 9, 1917.

The Central Railway of Brazil locomotives equipped with pulverized-fuel-burning equipment are operating in fast-passenger, mixed-passenger and freight, and freight service, and all are giving excellent results.

In tests recently conducted with Brazilian native coal and lignite the distance traveled during trials was 118 miles and the boiler pressure remained almost constantly at 175 lb., which is working pressure. The results of these tests may be stated as follows:

PERCENTAGE ANALYSES OF FUELS USED

Name	Kind	Moisture	Volatile	Fixed Carbon	Ash	B.t.u. per lb.
Jacuhy.........	Bituminous	6.10	22.40	45.70	19.80	10,851
Santa Catharina.	Bituminous	12.60	36.00	42.10	9.00	10,259
S. Jeronymo.....	Bituminous	3.00	31.00	39.30	26.70	9,565
Cacapava.......	Lignite	19.00	36.00	19.20	25.80	5,249

PERFORMANCE DATA

Fuel		B.t.u. per lb.	Quantity burned per trip, net tons	Evaporation, lb. water per lb. of fuel	Ash found in firebox and pan, lb.
Name	Kind				
Jacuhy......	Bituminous	10,851	4.19	7.2	176
Santa Catharina..	Bituminous	10,259	3.5	7.1	176
S. Jeronymo......	Bituminous	9,565	5.419	7.1	198
Cacapava........	Lignite	5,249	4.41	7.3	220

The only difficulty met with has been in instructing the enginemen, who were not acquainted with this method of combustion, and for this purpose an illustrated instruction book has been issued to each man.

Only by adopting this pulverized-fuel system has the problem of the utilization of Brazilian fuel, which cannot be burned practically or economically on grates or in retorts, or utilized to good advantage for the production of producer gas, been solved, and the development of the native coal fields of the country is now in process through the establishment of steamship and railway means of transportation from the mines, and in the actual mining developments.

In the United States the development work in connection with the use of pulverized anthracite and bituminous coals and lignite for steam locomotives has been carried out by making application to single locomotives of different types which were distributed on five different railroads of the country in order to determine upon a composite and interchangeable pulverized-fuel feeding, burning and furnace equipment that would be adaptable to any kind or size of steam locomotive, as well as to all possible fuels or combination of fuels locally available, and which at the same time would permit of the quick conversion from pulverized fuel to fuel oil, and vice versa.

When it is taken into consideration how many modifications of firebox, grate, ashpan, brick arch, smokebox draft appliances, exhaust nozzle and stack designs and equipments are required to adapt steam locomotives to the various anthracite and soft bituminous coals and lignites as used for fuel, even on a single railway, it can readily be imagined what the development of a single pulverized-fuel-firing mechanism and furnace arrangement for the entire United States has involved, particularly to make it adaptable to existing as well as new designs of locomotives. For example, the time required for the development and the practical use of fuel oil and of a satisfactory superheater is comparable.

During the past year the financial, labor and material conditions on steam railways, brought about by the war, have prevented any appropriations being made for the equipping of operating terminals and divisions in the United States for the extended use of pulverized fuel, but the result of what has obtained may be summed up in the following data applying to The Delaware and Hudson Company and the Atchison, Topeka & Santa Fe Railway:

On The Delaware and Hudson Company a newly built Consolidation type of freight locomotive, No. 1200, with a tractive power of from 61,400 to 64,000 lb., was equipped for experimental purposes, from March 1916 to August 1917, and operated in road freight service between Carbondale and Plymouth, Pa., and Oneonta, N. Y., on runs of from 37 to 94 miles one way. Pulver-

[1] Supplementing Mr. Muhlfeld's discussion of the Spring Meeting papers on pulverized coal, published in MECHANICAL ENGINEERING for August, p. 658.

[2] Vice-President, Railway and Industrial Engineers, New York. Mem. Am. Soc. M. E.

ized fuel was supplied from The Hudson Coal Company's stationary-boiler experimental pulverizing plant at Olyphant, Pa.

This locomotive was designed for a working steam pressure of 195 lb., but the boiler was designed to carry 215 lb. steam pressure. With 195 lb. working pressure the cylinder horsepower rating is 2368 and the boiler horsepower rating 2540, giving a 107.2 per cent boiler.

Pulverized-fuel tests were made with the following adjustments:

Adjustment	Boiler pressure, lb.	Tractive power, lb.	Factor of adhesion	Results
Original	195	61,400	4.36	O. K.
First change	200	63,000	4.24	O. K.
Second change	205	64,600	4.14	O. K.
Third change	210	66,200	4.03	O. K.

The raw coal which was supplied for these tests analyzed about as follows:

Content	Anthracite slush	Anthracite birdseye	Bituminous slack
Moisture, per cent	14.96	......	7.28
Volatile, dry, per cent	6.95	6.75	22.47
Ash, dry, per cent	23.67	75.23	57.21
Calculated B.t.u. per lb.	11,800	12,600	13,700

This raw coal was mixed in the proportion of 60 per cent anthracite and 40 per cent bituminous, which, after drying and pulverizing, produced a fuel of from 15 to 20 per cent volatile content. This was entirely satisfactory for locomotive purposes and yielded an average of one boiler horsepower for each 1.4 sq. ft. of combined firebox and tube heating surface.

Dynamometer-car tests conducted to determine sustained pulling capacity on heavy grades and at starting gave the following results:

Maximum dynamometer drawbar pull, lb.	Speed, miles per hour	Reverse lever cut-off, per cent	Throttle opening, per cent	Boiler pressure, lb.	Grade on line, per cent
64,000	At start	Full	75	200	1.65
59,000	6	66	Full	205	1.65
58,000	8	66	Full	205	0.72
56,000	10½	66	Full	205	0.72

During these tests a fuel mixture of 60 per cent anthracite birdseye and 40 per cent bituminous slack was used, and the apparent evaporation ranged from 7.3 to 9.3 lb. of water per lb. of coal consumed. The coal fired per 1000 ton-miles averaged 202 lb.

In heavy-tonnage-service runs—over ruling grades of from 0.72 to 1.65 per cent—for a distance of 37 miles the following data show typical performance:

Item	Trip No. 1	Trip No. 2
Miles run	37	37
Speed, average, miles per hour	14.5	13.1
Ton-miles, actual	83.147	85.758
Ton-miles, adjusted	88.553	90.113
Coal consumed per 1000 ton-miles	186	202
Steam pressure, average, lb.	199	200

When in heavy-mine-run service between Carbondale and Olyphant, Pa., for the three months' period, March 13 to June 12, 1917, the performance of the No. 1200 was as follows:

Period From	Period To	Days in road service	Hours in road service
1917	1917		
March 13	April 12	28	301 hr. 3 min.
April 13	May 12	27	301 hr. 30 min.
May 13	June 12	25	273 hr. 10 min.
Total....	....	80	875 hr. 43 min.

After the day's work, upon arrival at the Carbondale engine terminal, the locomotive would be run directly into the house, no fire, track or ashpit delays or work being required.

On the Atchison, Topeka & Santa Fe Railway an existing Mikado type of freight locomotive, No. 3111, with a tractive power of 59,600 lb., was equipped for experimental purposes—from May 1917 to July 1918, and operated in road freight service between Fort Madison, Iowa, and Marceline, Mo., on runs of 112.7 miles one way. Pulverized fuel was supplied from the company's experimental pulverizing plants at these points.

Dynamometer-car tests were run with the following average results, using Frontenac, Kan., run-of-mine bituminous coal, averaging in analysis when pulverized as follows:

Moisture, per cent	1.05
Volatile, per cent	32.67
Fixed carbon, per cent	51.57
Ash, per cent	14.71
Sulphur, per cent	3.95
B.t.u. per lb.	12,022
Per cent through 100-mesh	97.8
Per cent through 200-mesh	82.6

The general performance of the locomotive equipped with the Lopulco pulverized-fuel system was as follows:

Date of runs	Mar. 4 to Mar. 22, 1918
Total trips run (112.7 miles each)	14
Total miles run	1578
Average running time	5 hr. 6 min.
Average speed, miles per hour	22.3
Average train tonnage, net tons	2273
Average gross 1,000 ton-miles	256.5
Average coal per gross 1,000 ton-miles, lb	82.4
Average water per gross 1,000 ton-miles, lb.	566
Average boiler pressure, indicated, lb.	188
Average feedwater temperature, deg. fahr.	48
Average flue-gas temperature, deg. fahr.	553
Average smokebox draft, inches of water	11.3
Average firebox draft, inches of water	1.3
Average quality of steam, per cent dry	96.0
Average superheat in steam, deg. fahr.	233
Average lb. of coal per hour of running time, per equivalent sq. ft. of grate area	71.3
Average lb. of coal per hour of running time, per sq. ft. of boiler heating surface	1.01
FUEL PERFORMANCE	
Equivalent evaporation, lb. of water from and at 212 deg. fahr. per lb. of coal for boiler and superheater	9.22
Per boiler horsepower for boiler and superheater	11.15
Combined efficiency for boiler and superheater, per cent	74.5
Thermal efficiency for locomotive, per cent	4.19

An actual evaporation (not corrected for the quality of steam) showed at the rate of 8.46 lb. per sq. ft. of boiler heating surface.

The combined boiler and superheater efficiency showed a gain of 23.2 per cent for pulverized fuel as compared with hand-firing.

Based on the hand-firing performance, the use of pulverized fuel showed a saving of 22.5 per cent in fuel. The combustion was practically smokeless and the pulverized-fuel operating mechanism gave no trouble.

Fig. 1 shows a typical application of a pulverized-fuel-burning furnace as adapted to a modern steam-locomotive type of boiler for the use of any solid fuel having 15 per cent or higher volatile, or for fuel oil, regardless as to the other chemical characteristics.

Marine Service

During September 1918 quite a number of tests were made on the USS *Gem* (SP-41) on Long Island Sound to determine what results could be obtained from the use of Navy Department specification coal in pulverized form as compared with oil and other fuels.

One of the two Normand type of water-tube boilers was equipped with two pulverized-fuel feeders and burners, the furnace being fitted up with firebrick in a manner that would enable the use of either pulverized coal or fuel oil, or a combination of both. On account of the boiler not being equipped with induced draft the pulverized-fuel induced-air burners were connected to the regular air-blast system instead of being open to the atmosphere.

The characteristics of the coal used, after pulverization, were as follows:

Moisture, per cent	1.02
Volatile, per cent	18.70
Fixed carbon, per cent	75.10
Ash, per cent	5.18
Sulphur, per cent	0.65
B.t.u. per lb.	14,975
Fineness:	
Percentage through a 200-mesh screen	83.6
Percentage through a 100-mesh screen	92.0

On September 18, 1918, a four-hour run was made, from 8.30 a.m. to 12.30 p.m., during the last two hours of which the most economical speed for the ship, i.e., 16 knots per hour, obtained, and which enabled the engines to take the steam as fast as generated. This speed was maintained for the two-hour period, and then, as during the entire four-hour test run, the furnace operation was good—there was no heat effect on the refractory—and there was either no smoke, or it was very light; there was no accumulation of slag or ash on the boiler tubes or settings, and had the boiler been equipped with induced draft the efficiency results would have been better and the light smoke that was produced would have been entirely eliminated.

The log of the test for the last two hours of this four-hour continuous run was as follows:

TEST No. 23, SEPTEMBER 18, 1918

Time fired up	8.30 a.m.
Time of test	10.30 a.m. to 12.30 p.m.
Duration of test, hours	2
Average speed, knots	16 approx.
Average boiler pressure, lb.	210
Average superheat, deg. fahr.	67.5 (max. 86)
Average flue-gas temperature, deg. fahr.	541 (max. 570, min. 500)
Average indicated horsepower	751
Average revolutions per minute	261.5
Total pulverized fuel fired, lb.	3,235
Coal per i.hp.-hr., lb.	2.15
Total water evaporated from and at 212 deg. (on basis of 25 lb. per i.hp.-hr.), lb.	37,550
Water evaporated per lb. of coal from and at 212 deg., lb.	11.6
Boiler efficiency, per cent	75 approx.
CO_2, per cent	Avg. 13.5, max. 14, min. 13
Coal	Pocahontas Bituminous
Lopulco system equipment operation	Good
Lopulco system furnace operation	Good
Smoke	Light
Brickwork heat effect	None

This same boiler when using fuel oil of about 18,500 B.t.u. and when operating at a speed of 14 knots, develops an indicated horsepower-hour on 1.68 lb. of such fuel. Therefore, with coal of 14,975 B.t.u., in order to give equivalent results it should use 2.08 lb. per i.hp-hr.; whereas the performance at 16 knots shows 2.15 lb. per i.hp-hr.

A comparison of superheat as obtained with straight pulverized fuel and with fuel oil, respectively, on various test trips, is given in the following table:

Pulverized Fuel			Fuel Oil		
Trip No.	Average knots	Average superheat deg. fahr.	Trip No.	Average knots	Average superheat, deg. fahr.
22	10	43	14	10	45
17	12	73	16	12	70
23	16	66	24	14	58

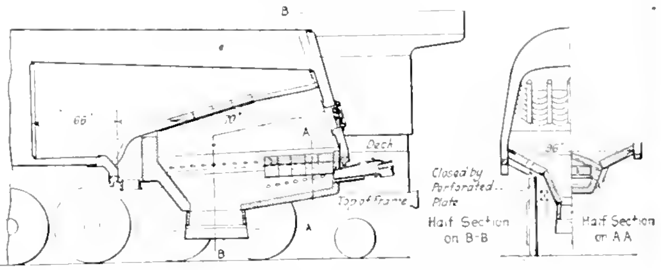

FIG. 1 TYPICAL APPLICATION OF A PULVERIZED - FULL - BURNING FURNACE TO A STEAM-LOCOMOTIVE BOILER

Closure of Messrs. Scheffler and Barnhurst

Mr. Marsh prefaces his remarks with a reference to the desirability of utilizing the by-products from coal. It appears to the authors that this is not pertinent to the discussion and that it will not require consideration until it becomes common practice to remove the by-products from coal before firing on hand grates or stokers. The inference is that pulverized coal cannot be burned after removing the volatile constituents, a supposition which is not borne out by the facts. His statements that pulverized coal is restricted to a field comprising forms that cannot be burned on stokers is an admission that pulverized fuels increase the latitude of combustibility and is not supported by evidence.

In reply to Mr. Marsh's objections to the tests submitted, it should be noted that with pulverized fuels uniformity of operation is obtained and maintained in a short time after firing the furnaces, and the variation in the figures need not be expected by prolonging the tests. In particular in the test made May 18, 1919, on one of the 600-hp. B. & W. boilers at the plant of the Puget Sound Traction, Light and Power Co. at Seattle, during which both the coal and water were weighed, the duration of the test being $13\frac{3}{4}$ hours, the efficiency obtained was 78.99 per cent with coal containing 10,106 B.t.u. per lb. as fired.

In regard to the figures assumed for stoker efficiency, it is submitted that the best information we have been able to obtain shows that an average efficiency of 65 per cent may be expected in modern power houses. Where power is not produced for sale this figure appears to be too high. Mr. Marsh does not substantiate his objections to these figures.

In regard to reliability, it is customary to duplicate a sufficient proportion of the pulverizing equipment to obviate irregular operation in pulverizing plants. This is taken care of in the figures on investment charges given in the paper and makes unnecessary Mr. Marsh's assumption that the investment charges quoted are too low.

In reply to Mr. Marsh's question as to the latitude of pulverized-coal furnaces, it should be stated that a furnace built for high-volatile bituminous coal will not handle anthracite or coke breeze. Where a considerable variation in the grade of available fuels is to be expected, however, the furnace may be designed to burn anthracite or coke breeze and will then be able to handle any grade of bituminous fuel with slight changes in the arrangement of the burners. It is a matter of surprise to the authors that the tests mentioned by Mr. Marsh show that the fire was unresponsive with low-volatile coals, since it has been their experience that the flexibility of all grades of fuels when pulverized exceeds that obtained when burned in lump form. The burner for pulverized fuel is very simple and has a wide range of adjustments, easily meeting any requirements made upon it by a change in the fuel.

In regard to adaptability, the effect of ash in coal is to carry away a small amount of heat as the percentage increases. The excess air required to burn fuels of the highest ash percentage is, however, negligible. It may be stated in regard to the varied efficiencies shown in the tests that pulverized-fuel furnaces require proper design as well as any other type, and that tests in many instances were a part of the experimental development and variations were to be expected.

In regard to the burning of high-ash coal on chain grates, it should be stated that the 28.4 per cent ash fuel mentioned by the authors was tried out on chain grates and was a failure. The stokers were taken out after they had been proved incapable and return was made to hand firing.

In regard to flexibility it is readily admitted that pulverized fuel requires large furnace volumes to burn successfully. It should be noted, however, that other types of fuels, including oil, are burned more efficiently with large furnace volumes, and that the best new stoker installations have furnace volumes as large as required for pulverized coal. The amount of heat that may be developed in a furnace with pulverized fuel is restricted only by the resisting powers of the refractories up to this maximum. The flexibility of control far exceeds that obtained with any other method of burning solid fuels. The upper limit is merely a matter of design and rating.

Under the head of furnace design Mr. Marsh again protests against the inclusion of tests of four or five hours' duration. This has been answered above.

Mr. Marsh objects to the figures used for moisture percentage in coals. It may be stated that our tables were based on a general average moisture content for the entire country. Further, the figures given for pulverizing cost are the result of present information and the best obtainable. They will not vary greatly except under unusual conditions.

We must take exception to Mr. Marsh's statement that three-quarters of the ash goes out of the chimney. Generally speaking, 20 to 25 per cent will remain in the combustion chamber and 30 to 40 per cent in the second and third pass, and the balance in the flues and out of the stacks. Very little settling takes place after the gases leave the boiler. With coal containing 10 to 15 per cent ash the stack discharge is not objectionable, even in cities. With higher ash content it might be necessary to provide dust collectors in the flues in city power plants.

In answer to Mr. Marsh's question, pulverized coal is stored in closed tanks, absorbs moisture very slowly, and under the methods of installation in use does not stay in storage for any considerable period.

Mr. Marsh criticizes the authors' claims for range of fuels, and follows by asking of what value the capacity to handle both anthracite and lignite may be. It is self-evident that with such a range as this many of the intermediate fuels may be burned. His statement that the cost of drying and pulverizing fuel in installations of from 500 to 600 tons daily capacity is over $1 per ton is at variance with figures obtained from hundreds of plants and upon which our estimates are based.

Mr. Diman is correct in stating that there is a limit to the quality of low-grade fuels that can be used in pulverized form. There is no doubt that if the coal is too low in combustible the cost of grinding would overcome any advantage obtained in economy of burning these coals in pulverized form. Success in burning anthracite depends upon the form of the furnace. As the coal lacks volatile, increased temperature must be generated near the burner, and this is accomplished by the use of some of the products of combustion from the furnace itself. This means designing the furnace so that there is a returning flame to ignite the incoming fuel. With this arrangement very satisfactory operating efficiencies are being obtained, and there is no trouble in starting a furnace so designed in but a little more time than that required with pulverized bituminous coal.

In Mr. Peabody's discussion of Mr. Harrison's paper he states that oil is undoubtedly superior to all other fuels for boiler purposes, and that the furnace volume required for oil fuel is only about one-quarter of the furnace volume specified in the paper for pulverized coal. Mr. Harrison recommends a larger combustion chamber than we know is actually required, but we have found that where oil is fired in pulverized-coal furnaces much better efficiency is obtained than is obtained in furnaces designed for oil alone. Larger combustion chambers are constantly being installed under all boilers for the purpose of obtaining better combustion conditions. This is due to the fact that the best mixtures of the air and carbon or coal cannot be made with the present method of oil or lump-coal firing.

The slight extra cost of the larger furnaces required is more than overcome by the increase in efficiency obtained over other methods of firing. It has been mentioned previously that combustion chambers recommended for pulverized coal are no larger than those now being used in a great many stoker installations.

Mr. Hirshfeld has probably not examined very many pulverized-coal-fired furnaces, or he would have found that there is hardly any trace of combustible in the ash in the furnace. We do not agree with his statement that a more uniform flame and temperature can be obtained with stoker practice due to the smooth bed of incandescent fuel. A fuel bed is a very uncertain quantity in the average furnace. It cannot remain of constant thickness or of constant quality. The conditions of the fuel bed are beyond control, and the coal must frequently be redistributed by the fireman. Certain types of stokers must be watched constantly and the holes in the fire bed kept covered with fuel.

In reply to Mr. Hibbard, the authors would state that drying of the coal is necessary for the purpose of properly pulverizing it. The injection of water or steam into the firebox is a dead loss, and is resorted to only as a means to overcome defects in the method of burning fuels. There is no occasion for this with pulverized fuel.

The experiments mentioned by Professor Young have no connection with the subject of pulverized-coal burning, because the quality of the material with which he has been experimenting is thousands of times coarser than the standard pulverized coal as now being used for commercial purposes.

Mr. Frey takes up the cost of pulverizing coal, basing his statements on data obtained from a first-class power house. We are doubtful, however, even in this power house, as to whether the evaporation from the coal that he is using would average 6 lb. of water on the average over a year's operation, and if the evaporation was increased only 50 per cent, certainly the increased efficiency obtained from the fuel would more than counterbalance the extra cost due to pulverizing unless the coal is obtained for practically nothing.

It is evident that the lower the price of the coal the larger must be the plant and the lower the cost of preparation to show economies warranting its application, but the cost of coal is going up steadily on account of the increased demands for fuel for manufacturing purposes.

Mr. Wotherspoon's remarks had no bearing on the subject of the application of pulverized coal to boiler-firing work, with the exception of his reference to the Bettington boiler experiments, which were made a number of years ago, and which were an entire failure so far as practical operation was concerned.

Mr. Snyder's remarks are noted with interest. The question of the adoption of pulverized coal to power houses is only warranted where the cost of operation would show a fair interest on the investment. We admit that stoker plants are operated with high efficiency under careful management, but we believe that pulverized coal will show increased efficiency and lower cost of operation than the average stoker installation, particularly in plants using a large enough quantity of coal to permit obtaining a low cost of preparation.

Mr. Stevens offers information, which he obtained from a prominent engineer, to the effect that 2¼ per cent of unconsumed carbon passes out of the stacks with stokers. This is a condition that is not possible with pulverized coal in furnaces properly proportioned and operated correctly.

Mr. Riley's remarks are particularly gratifying in that he fully realizes that the question of the adoption of pulverized coal is a matter of dollars and cents, and that its application in any installation is a question of which system will give the best returns for the money invested.

Mr. Trump spoke of experiments made in past years, and the writers particularly wish to point out that the furnace was too small for the boiler which he used, or else the quantity of coal fired to the furnace was beyond its capacity for satisfactory service. Furthermore, in the earlier days the fineness of pulverization was so much coarser than that now used in standard practice that there is no comparison, and the results obtained could not possibly have been satisfactory enough for commercial purposes.

Mr. Cary is correct in his statement that the idea of the use of pulverized coal has been in the minds of engineers for many years. Many experiments and thousands of dollars have been spent in an endeavor to accomplish this purpose. It has, however, been an evolution, and the earlier disastrous results were strictly due to the fact that sufficient knowledge of the subject was not at hand. The engineers did not realize that it was not the pulverizing of the coal that caused the trouble, but the fact that they tried to burn this kind of fuel, which is nearly in the form of a gas, in a furnace designed for lump fuels.

We would like to mention in regard to Mr. Cary's statements that today the fineness of pulverized coal is such that it practically all passes through the 50-mesh sieve, which means that the largest particles are less than 0.01 in. in diameter. The velocities are slow enough to insure the complete combustion of the particles of this size, hence it is not necessary to go to the extra cost of pulverizing to any higher degree of fineness than is now practically the standard, which equals 95 per cent through a 100-mesh sieve and 85 per cent through a 200-mesh sieve, all passing through the 50-mesh.

In closing, the authors wish to express their appreciation of the attention and interest accorded them, as evidenced by the discussion. It is not their wish to present the pulverizing of fuels as a modern panacea, but merely to lay before the Society a statement of its possibilities and to remove some of the fallacies in regard to it which have had more or less general circulation.

Mr. Harrison's Closure

I note that Mr. Marsh states in his discussion that I have used pre-war prices for the cost of pulverizing. He has cited the cost used in Table 1, whereas he should have used the cost shown in Table 3, or rates of 40 cents for millers and 35 cents for laborers and $5 a ton for coal. These are not pre-war prices, but are the present-day prices as paid by the Atlantic Steel Company.

Mr. Marsh also speaks about pulverized coal picking up moisture when stored. I thoroughly agree with him on this, but every one who uses pulverized coal has found by experience that this fuel must not be stored. It must be kept moving at all times in the bins, consequently there is very little moisture picked up by the pulverized coal from the air.

I note in several discussions that considerable comment has been made regarding the height of stacks necessary for the use of pulverized coal on boilers, as spoken of in my paper. During February I visited one plant installed in Kansas, and saw boilers working there very satisfactorily with a stack of about 35 ft. in height.

Most of the comment has been that we should have a draft of 0.10 in. in the combustion chamber and a draft of from 0.20 in. to 0.60 in. at the damper. This has not been my experience for the best burning of pulverized coal under boilers. I believe that we should have practically a balanced draft in the combustion chamber and first passage through the tubes, and from 0.10 in. to 0.20 in. at the damper. These figures are based on 150 per cent of rated capacity. Of course, if the boiler is intended to be worked at a larger rating than this, it would be necessary to have larger stacks.

CORRESPONDENCE

CONTRIBUTIONS to the Correspondence Departments of MECHANICAL ENGINEERING by members of The American Society of Mechanical Engineers are solicited by the Publication Committee. Contributions particularly welcomed are suggestions on Society Affairs, discussions of papers published in this journal, or brief articles of current interest to mechanical engineers.

Recognition of Engineering Service by the Government

To the Editor:

Those who are fortunate enough to live or work near the trunk-line railroads have grown accustomed to the daily passage of troop trains. For six months these have been homeward bound, to the delight and relief of all. "We are gladder to see them going that way than the other," has been the homely expression of the multitudes who have waved at the boys as they swept by.

And the most highly prized of the possessions of the returned soldier is his discharge. For many years this will be exhibited with pride. Money could not buy it. Long after his friends have forgotten his record of war service and the memory of those days has become dimmed, that bit of paper stands as evidence of the deeds which each man performed for his Government. That discharge is the only concrete form in which his part in the great struggle is preserved—a form that is universally accepted—one that may be of benefit to the holder in many ways in the years to come. No one but admits that this is little enough from his country to compensate for the sacrifice and no one but rejoices in his possession therof.

Turning now to the vast army behind the army, should not service in its forces be recognized by some tangible mark or document? No profession contributed more than that represented by our Society, and yet it seems that after the hour of need has passed its work will go without commemoration. Just as the engineer has not been given the recognition which was his due from the public, so is the engineer being officially slighted, though probably unintentionally.

Engineering services differ from all other purchasable commodities in that they cannot be manufactured or forced—no system of intensive production can glut the market with them; like the mighty oak, they are a product of slow growth. It was the rounding up of the country's resources of engineering that was largely responsible for the "year earlier than expected" result; and the world marvelled at the speed and volume with which the supplies, from bullets to ships, were turned out to back up the boys at the front.

There should be (at least upon request) available some form of recognition for those engineers who gave so freely out of their experience and learning. Such form should hold equal value with other documents in the business world, in politics, as civil-service rating, and in the eyes of the public at large.

Donald A. Hampson.

Middletown, N. Y.

Foreign Coals and Stoker Installations

To the Editor:

American engineers are at an increasing rate being called upon to design and build power plants in many other countries. Successful engineering will establish American engineering practice and will have a similar reflection upon the American equipment. It is therefore important that engineering be based on accurate knowledge instead of any uncertainties as are likely to exist, due to the remoteness of the market.

In power-plant design the one big variable in any location is the fuel. This is a major problem, because no stoker or method of firing so far developed is suitable for all fuels, necessitating a thorough knowledge of the coal and its characteristics for a proper selection of stokers and furnace equipment.

Some fuels are definitely known to be unsuitable for certain stoker types and yet not infrequently installations are made under these conditions, due usually to a lack of actual knowledge of the fuels available to the market.

While we have hundreds of books discussing the chemical analyses and geological formation of our various coals, there is a lamentable lack of knowledge of how to burn these coals as commercially received, considering combustion rates, clinker, attendant labor and other items. No engineer can predict successful installations without such knowledge of the coals of all districts into which he markets his product.

If it is necessary to know the fuel characteristics of American coals to produce successful installations, it is certainly much more imperative to know those of the foreign coals, if failures are to be eliminated and successes assured.

Those of us who have been fortunate enough to work on combustion problems with the fuels of practically every country have accumulated some data relative to the composition and characteristics of foreign fuels, a brief general outline of which is presented. Any discussion must of necessity be general, as it is impossible to become specific regarding fuels without taking them up district by district and seam by seam.

North America. The United States produces the maximum coal tonnage of the world, most of it being bituminous.

Canada has a good production, mostly bituminous and lignite, including coals of wide variation in characteristics as to moisture content, clinkering and coking.

Newfoundland. Some bituminous coals are found, but not extensively developed.

Mexico. The coals of Mexico are found along the northern border, being probably an extension of our own Rocky Mountain fields. Some fairly good bituminous and semi-bituminous coals are found.

Central America. A small amount of coal exists in this country.

South America. Colombia has a small production of bituminous coal, as has Venezuela, Argentine and Chile. Peru has some anthracite deposits in addition to the bituminous coal.

The grade of coal found in South America is not high and it is burned with difficulty. Much Welsh and American coal is now imported, as the native coals offer little competition even with Welsh and American coals selling at thirty to forty dollars per ton in Buenos Aires.

Africa. Bituminous coal is found in the Belgian Congo, Southern Nigeria, Rhodesia and the Union of South Africa. The latter country also has a considerable deposit of anthracite.

While the production of coal in Africa is not large, some very good fuel is mined, and some very creditable stoker installations have been made.

Asia. China and Japan produce coal in considerable quantities and there are many large power stations stoker-fired. China has deposits of anthracite equal to twenty times those of the United States, so it is natural that a good portion of the steam generated in China will be from this fuel.

One sometimes hears the statement that Japanese, Chinese or other coals are suitable for a particular type of stoker. The statement is just as loose and unscientific as to state that the coals of America are suitable for any specific stoker. These countries have coal deposits of every class that we have in the United States and a knowledge of the specific fuel is necessary before it can be positively said that a certain stoker is suitable.

Korea, Manchuria, Siberia, Indo-China, India and Persia have considerable coal, but not extensively produced. In the latter three countries anthracite predominates.

Europe. Great Britain and Ireland stand second in the world production of coal and first in quality. The Welsh coals are the finest and most widely distributed fuels of any in the world. The British merchant marine bring cargoes of food stuffs or merchandise to Great Britain and make the return trips with a cargo of Welsh coal. This is one of the difficulties with which we are confronted in attempting to secure a wider export market for American coals.

Our coals nearest approaching Welsh coal are Pocohontas and New River, but most Welsh coals are superior to all but the choicest samples of our coals. Fifteen thousand to fifteen thousand five hundred B.t.u. per pound is characteristic.

Spain and Portugal do not produce coal extensively. France is a large producer of all grades of coal and should offer a good field for stoker installations.

Italy, Greece, Bulgaria, Denmark, Netherlands, Bosnia, Servia, Roumania, Sweden and Spitzbergen are all small producers of coal—mostly bituminous and sub-bituminous.

Belgium, Germany, Austria and Russia are large producers, the latter country having extensive anthracite deposits (almost double those of the United States).

Oceania. Australia has extensive coal deposits, a large proportion of which are of a very fine quality; the production is fairly large.

New Zealand, British Borneo, Dutch East India and the Philippines all have a small production of various coals of a bituminous, subbituminous and lignite nature.

In practically all of these countries there are some stokers. Some of the installations have been characterized by a wrong selection of stoker types, due to reasons discussed in the foregoing paragraphs.

Chain grates, due to their simplicity of operation and adaptability to burn all grades of bituminous, sub-bituminous and lignite fuel, have produced noteworthy results in most foreign countries and over a wide range of operating conditions.

It is very much to be hoped that in combustion engineering as in other lines of endeavor, American engineers will base their conclusions on accurate knowledge of the fuel and its characteristics and will conscientiously refuse to install stokers for conditions which are for any reasons unsuitable. On any other basis the industry as a whole suffers and our engineering is discredited in foreign markets, to the detriment of future export trade.

T. A. Marsh.

Chicago, Ill.

Discussion of Society Policy Urged

Mr. Calvin W. Rice, *Secretary:*

On page 688 of the August number of Mechanical Engineering there is a letter on Contributions on Society Policy by Mr. Morris Llewellyn Cooke addressed to the Secretary and also a reply by the Secretary.

I wish to urge on the Publication Committee that it find room in the Journal for suggestions on Society affairs and other contributions in this Correspondence section. Particularly contributions on Society affairs are desirable as distinguished from technical matters. Theoretically the Journal is very ready to publish such contributions, but practically its attitude gives the impression that it rather discourages them. Mr. Rice mentions a suggestion by Mr. Crawford and which is: "My reply to that was in effect that we were already doing what he proposed, but nevertheless, if he would condense his letter, we would be glad to publish it. He never came back."

Would it not have been decidedly better to have published Mr. Crawford's communication, if necessary, by condensing it rather than let the impression go abroad that possibly such a contribution was not welcome? As suggestions are undoubtedly wanted and are undoubtedly also welcome, even though that may not seem to be the case, it would be well to give possibly unnecessary space, as that would prove the welcome to be an actual fact and would probably gradually draw out more comment, some of which, no doubt, would be useful and constructive even though a great deal of it might simply be the airing of personal opinions.

Every member who chooses to so air his opinions is entitled to that privilege and it should be unhesitatingly extended to him even though it might, to some extent, crowd out some other matter.

I believe that if a properly worded questionnaire on this point were to be sent out, it would show very considerable interest

among the membership along this line. Everything will, of course, depend upon the wording of the questionnaire, as nothing is easier than to draw out any desired information by skilful phrasing of the questions asked.

Henry Hess.

Philadelphia, Pa.

[The Secretary has frequently told Mr. Hess that he is one of the most useful members of the Society and the Secretary takes satisfaction in again acknowledging the excellence of Mr. Hess's suggestion, and the following is the letter from Lt.-Col. Crawford, published in full.—The Secretary.]

My dear Mr. Rice:

Some little time ago, there came to me a circular letter over the signature of Mr. Walter B. Snow, promoting the circulation of the journal Mechanical Engineering by asking members of the Society to tell young acquaintances something of its undoubted merits.

About the same time there came from a friend a personal letter which advised me that at the present time there are more than twenty local unions of draftsmen and engineers in subordinate capacities already in existence around over the country, claiming a membership of three thousand, who are affiliated with the American Federation of Labor. An unverified rumor of a Civil Engineers' Union somewhere in Connecticut has drifted in.

Every member of our Society worthy of the name is and should be glad to help it or its Journal, but before we make an effort to spread the Journal's circulation widely, might we not be advised in a little introspection for the sake of some of these prospective members whose state of mind is indicated by the facts above mentioned, as well as for ourselves?

In a letter "to the editor" in the February issue, it is suggested that the Society "encourage the publication of letters . . . about the life of the Society in each issue of Mechanical Engineering." So far as I know, there has been no decision upon this, and before it is decided either to do this or not to do it, the implication should be clearly recognized.

Without perhaps intending it, the policy of the A. S. M. E. always has appeared to be to deprecate the open discussion of its affairs—especially after such affairs had reached the controversial stage. This is one well-recognized method of conducting any enterprise and there is much that can be said in favor of it. Most of us practice it as a matter of course in our private affairs. The opposite method and the one evidently advocated by your correspondent is "to take the lid off" and permit members to register complaints freely either by voice or pen whenever they may feel the spirit's urge. The point I wish to emphasize right here is that between these two policies there is no middle course possible.

If it is decided to encourage the fullest possible discussion of the Society's affairs in the Journal and at its meetings, there is implied a willingness to publish any and every criticism that may be received. It would be obviously unfair to the membership to adopt the policy of an open forum and still retain the censor. Since the subscription lists are open to all who can pay the fee, it might not be out of place or even unwise to open the columns of criticism of our Society to any one who can write and has something to say.

Since this letter is written as a suggestion, why is it not a timely one? Why cannot such communications be encouraged by an unequivocal and emphatic statement that all criticisms received will be published? Surely, letters written by members in good standing are entitled to such treatment. There is another phase to this procedure, as it is the testimony of every one of whom I know who has had the experience of adopting such a course that during a short period there may be too many carping and fault-finding letters, but these soon exhaust themselves and the way is open and well paved for the era of constructive suggestions coming from the membership. It is these that we need and for which we can afford to pay the price in introspective housecleaning. Consider what our Society might be if we could induce each of its ten thousand members once in a while to express his views on the purposes of the Society and the methods of their realization.

Can we not wisely decide to encourage in every way at our disposal the freest possible expression of public opinion as to Society activities? If in rare instances there is no foundation for a criticism, it will fail from its own ineptitude and no harm will have been done. But when there is a cause for critical or fault-finding comment, we all want to know about it and see that the fault is corrected while at the same time its cause is removed.

The writer is neither a reformer nor a crusader, as you know, but he does feel that if we were doing all that our pooled intelligence, facilities and experience could make possible for the engineering sciences and the profession at large, crowds of our younger prospective members would not be forming labor unions and there would be no need for members of the Society to solicit subscriptions for its Journal.

With kindest personal regards and my best wishes at all times,

Very sincerely yours,

C. H. Crawford.

Rio de Janeiro, Brazil.
March 13, 1919.

Strengthening of the Patent Office

The Patents Committee of Engineering Council has collaborated with the similar committee of the National Research Council in developing a scheme for the improvement of the method of dealing with patents in this country. The staff of the Patent Office is itself actively engaged in this effort.

Out of the report prepared by the National Research Council, and approved and adopted by Engineering Council as the report also of its Patents Committee, remedial legislation has taken form, and the following bills have been introduced in the House of Representatives:

> House Bill 5011, being a bill "To establish a Patent and Trade-Mark Office independent of any other department and to provide for compensation and infringement of patents in the form of general damages, and for other purposes."
>
> House Bill 5012, being a bill "To establish a United States Court of Patent Appeals, and for other purposes."
>
> House Bill 7010, being a bill "To increase the force and salaries in the Patent Office."

Mr. Edwin J. Prindle, Mem.Am.Soc.M.E., Secretary of the Patents Committee of the National Research Council, has recommended the publication of this notice in Mechanical Engineering to prompt mechanical engineers to write to the chairmen or members of the Patents Committees of the Senate and of the House of Representatives urging passage of the bills approved by the National Research Council. The personnel of these committees is as follows:

Committee of Patents of the Senate

George W. Norris, *Chairman*	Nebraska
Frank B. Brandegee	Connecticut
Philander C. Knox	Pennsylvania
Frank B. Kellogg	Minnesota
William F. Kirby	Arkansas
Ellison D. Smith	South Carolina
Thomas P. Gore	Oklahoma

Committee on Patents of the House of Representatives

John I. Nolan, *Chairman*	California
Florian Lampert	Wisconsin
Loren E. Wheeler	Illinois
Albert H. Vestal	Indiana
William J. Burke	Pennsylvania
Albert W. Jefferies	Nebraska
John C. MacCrate	New York
Guy E. Campbell	Pennsylvania
John B. Johnston	New York
John J. Babka	Ohio
E. L. Davis	Tennessee
John McDuffie	Alabama

The report of the Patents Committee of the National Research Council was published in the February issue of Mechanical Engineering, page 147.

ENGINEERING RESEARCH

A Department Conducted by the Research Committee of the A. S. M. E.

The Bureau of Research of the American Society of Heating and Ventilating Engineers

THE American Society of Heating and Ventilating Engineers has recently issued a Bulletin on their Research Bureau under the Directorship of Prof. John R. Allen, who has resigned from the Deanship of the College of Engineering and Architecture of the University of Minnesota to take up these new duties.

The following regulations have been adopted by the Society for the control of the Bureau of Research:

First: That there be a standing committee known as the Research Committee and consisting of 15 members, each serving for three years, five retiring each year.

Second: *a* That the Council shall nominate, previous to October 1st of each year, five members to fill the vacancies of those retiring at the next annual meeting.

b That the nominations made by the Council shall be published in the October issue of the Society's Journal.

c That prior to December first of any year, any ten members over their own signatures, may nominate one or more additional members of the Research Committee, and such additional nominations shall be placed on the ballot opposite the nominations made by the Council.

d The election shall otherwise conform to the regulations provided for the election of officers.

e Vacancies may be filled by the Council, such persons chosen by the Council to serve until a successor is elected at the next Annual Meeting.

Third: The Research Committee shall be divided into various Sub-Committees, as may be found desirable to carry on the activities of the Bureau of Research.

Fourth: The activities of the Research Committee shall include:

a Investigations of the need for research in any particular subject, and if such need is sufficient to warrant consideration from the standpoint of pure engineering, to appoint a sub-committee to

1. Collect all existing data and records
2. Carefully examine the records and report on the actual need for further work
3. Report on all available laboratories of colleges and other institutions, which might be utilized
4. Make definite suggestions for the line of procedure to be followed in research work and to confer with and advise the Director of Research upon this particular subject.

b Where research work is found necessary and the course of procedure is obvious, to negotiate with laboratories of colleges or other organizations, as offered, or order work handled by the Director of the Bureau. No work should be assigned to the Bureau which can be handled equally well elsewhere.

c If a sufficient amount of existing data appears to be available for analysis by Committee, to present a synopsis of such data to the next regular meeting of the Society for discussion and approval.

d To report all conclusive data, whether originating through the Research Bureau or Committee, or elsewhere, to the next regular meeting of the Society for discussion and approval.

e To report on questions of finance, ethics and commercialism.

Fifth: *a* One of the sub-committees of the Research Committee shall be known as the Research Executive Committee, and shall be composed of four members, one of which shall be the Chairman of the Research Committee. The Research Executive Committee shall conduct all the business of the Research Committee. It shall make the necessary contracts for rental and purchasing of equipment or material. It shall select and employ the director and such assistants of the Bureau of Research as may be required. It shall determine all salaries and approve all expenses incurred. It shall determine the rotation in which the subjects shall be investigated by the Bureau of Research.

b The Executive Committee shall not make contracts in excess of the income to the Research Bureau without the approval of the Research Committee and the Council.

Sixth: The Chairman of the Research Committee shall be ex-officio member of all sub-committees.

Seventh: *a* All acts or reports of sub-committees shall be subject to the approval of the Research Committee.

b All acts of the Research Committee shall be subject to the approval of the Council.

Eighth: *a* Each Chapter of the Society shall appoint a Research Soliciting Committee, which once per year shall conduct a campaign in its locality to procure funds for the maintenance of the Bureau of Research. Committees may be appointed by the Research Executive Committee in other localities not covered by the Chapters to conduct such campaigns in such territories.

b All moneys received for the Bureau of Research shall be kept by the Treasurer of the Society and used only for the purpose specified.

c The Research Bureau shall operate upon the budget plan. All payments from the Research Bureau fund are to be made by the Treasurer in accordance with the existing present plan for payment of the Society's bills, as authorized by the Council meeting of August 16, 1917, excepting that certification of the voucher by the Secretary of the Society is to be replaced by certification by the Chairman of the Research Committee or the Research Executive Committee. All special items are to be approved by the Research Executive Committee instead of the Finance Committee of the Society.

Ninth: Reports of activities of the Bureau of Research shall be sent to all members of the Society and to all subscribers to the Research Bureau Fund.

The Research Committee at its first meeting on March 10, 1919, unanimously passed the following resolution:

Moved, That in order that the activities of the Research Bureau shall be above reproach, it is the sense of the Committee that no tests, experiments, or research shall be conducted for compensation.

At present the Society has had total subscriptions amounting to $18,000 per year. The Bureau of Mines will donate the services of investigators, office space, janitor service, physical and chemical laboratories, use of special laboratory in connection with power house, service in the form of steam at high and low pressure, direct and alternating current, hot and cold water, gas and the use of such apparatus as may be available. It is estimated that this will amount to a money value of $20,000 per year.

The special activities which will be undertaken by the Bureau of Research are the investigation of the various systems of heating and the accessories on the market which are claimed to increase the efficiency or the comfort of present installations. Another problem is the establishment of air standards, based on moisture content in place of temperature.

Past-President Still expresses his ideas as to the function of the Bureau of Research as follows:

One of the first things on which the work will be centered will be an effort to determine what physical condition of the atmosphere must be produced in order to maintain the same perfectly healthful effects as are obtained in pure, clean, fresh outdoor air. This condition is not known today to physicists, thus opening an avenue to constant assaults by physicians and others. Such criticisms are quoted repeatedly to the discredit of this branch of the engineering profession and to the business of the manufacturers and contractors.

Next in order will be a scientific determination of heat losses by the use of various materials employed in building construction.

Then will be investigated the efficiency of various kinds of radiation and the proper place to locate radiation to secure the best and most efficient results in different types of buildings.

The most efficient methods of burning different kinds of coal in different types of boilers and furnaces, warm-air furnaces, and furnace heating, pipe sizes for steam and water mains, and hundreds of other subjects will be investigated.

Many manufacturers have made a practice of conducting private investigations to develop their apparatus to the point of commercial perfection which is to them most desirable, finally submitting their products to the experimental laboratory of some prominent university so as to gain an endorsement having some semblance of impartiality. This never succeeds in convincing the public, as there is no comparison with other makes of the same apparatus, nor does this method establish any standard by which to measure the performance of the apparatus tested. Hence the time and expense thus employed are usually poorly invested if not entirely wasted.

This project is of such importance to every manufacturer, contractor, jobber and specialist in the heating and ventilating field that it should receive his unqualified approbation and financial support. It is a big undertaking and will entail a heavy expense for several years. The financial support of every manufacturer and engineering organization must therefore be enlisted, and such financial support must be supplemented by the personal support of every one concerned.

ARTHUR M. GREENE, JR.,
Chairman Research Committee

A—Research Results

Apparatus and Instruments A5-19 Wire-Testing Extensometer. An extensometer for testing wire and other thin sections has been developed at the laboratory of the Westinghouse Electric and Mfg. Co. It consists essentially of a metal block to which two flexible side pieces are attached, the free ends of these carrying rollers. The wire to be tested is clamped at the block and passes between the rollers. Extensions of the wire between the block and rollers due to loading the wire result in rotation of the rollers, which are held in contact with the wire by the flexibility of the side pieces.

Light from a small, straight-filament galvanometer lamp passes through a collimating lens to a mirror in the axis of one roller. From there it is reflected to a similarly placed mirror on the other roller, and reflected from there to a white scale divided into millimeters. An extension of approximately 0.0001 in. causes a movement of the spot of light to a distance of 1 mm. on the scale. The position of the spot of light could be read to $\frac{1}{5}$ mm.

The instrument has been in constant use over a period of several months with very satisfactory results. Specimens have been tested having sectional areas ranging from one-tenth to twenty-millionths of a square inch, with satisfactory results. A patent application has been made covering this instrument. Address, Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa.

Apparatus and Instruments A6-19 Standard Cement Sample 46-c for checking 200-mesh sieves has been prepared and is ready for distribution. 80.2 per cent passes this sieve. Obtainable in 160-gram samples at the Bureau of Standards for 25 cents per sample; one sample sufficient for three tests. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Apparatus and Instruments A7-19 Picnometer. A new type of picnometer for the determination of density of viscous substances. Viscous liquids, such as molasses and oils, owing to their high viscosity retain innumerable air bubbles. This fact makes accurate determination difficult. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Apparatus and Instruments A8-19 Lime Investigations. A plasticimeter designed to determine the plasticity or spreading properties of lime has been developed by the Bureau of Standards. This simulates the action of the plasterer in spreading the material on the wall. Means are provided for obtaining the effort which the plasterer must exert and for varying at will the base upon which the plaster is spread, the time required and the angle which the trowel makes with the surface. The force required to spread the plaster in conjunction with the time during which this force acts gives the measure of the plasticity. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Apparatus and Instruments A9-19 Gas-Engine Indicators. Comparison tests between three types of compression indicators show that one type varies from 15 to 30 per cent from two more accurate types which agree with each other. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Apparatus and Instruments A10-19 The Measurement of Radii of Profiles. A communication (B519) from the Gage Section of the Bureau of Standards. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Apparatus and Instruments A11-19 The Micrometer Microscope and Its Use in Gage Inspection. A communication (B521) from the Gage Section of the Bureau of Standards. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Apparatus and Instruments A12-19 The Measurement of Taper Gages. A communication (B522) from the Gage Section of the Bureau of Standards. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Boilers A1-19 Boiler Treatment. Technical Paper 3218 of the Bureau of Mines. Address Van H. Manning, Director. Washington, D. C.

Calorimetry, Pyrometry, Thermometry, A1-19 Combustion of Volatile Oils in Bomb Calorimetry. A new method of burning volatile oils in a bomb calorimeter as a check on the results from a Junker Calorimeter. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Calorimetry, Pyrometry, Thermometry A2-19 Naphthalene and Benzoic Acid Samples. The Bureau of Standards has prepared new samples of naphthalene and benzoic acid to be distributed as standard heat samples, and the heats of combustion have been determined. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Cement and Other Building Materials A6-19 Fire Tests of Reinforced-Concrete Columns. Tests indicate that columns of gravel aggregate largely of quartz or quartz and granite showed a strong tendency to spall when subjected to fire, especially with spiral reinforcement. One inch of plaster cement with light metal binder formed almost complete protection. This suggested metal-lath forms, using the concrete which passes the form as plaster. With coarse aggregate little material squeezes out. Three columns were tested in May, in two of which cement plaster was used as protection, while in a third cast tiles of gypsum were used. The outer coat of cement plaster did not remain in place under fire. The inner coat did not give sufficient protection. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Cement and Other Building Materials A7-19 Hardeners for Concrete Floors. At the end of six months' exposure to ordinary laboratory traffic, the applications of magnesium fluosilicates, varnishes and paints, wax preparations, sodium silicate, linseed oil and soap solutions were successful. A solution of commercial sodium silicate seems to be as effective as most of the expensive preparations. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Cement and Other Building Materials A8-19 Stucco Specifications. A tentative stucco specification has been prepared for the Committee on Treatment of Concrete Surfaces of the American Concrete Institute. It will be published in their Proceedings for 1919 and in a Technologic Paper of the Bureau of Standards. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Cement and Other Building Materials A9-19 Calcium Chloride Corrosion Tests. Plaques of 1:2 mortar and 1:3 mortar in which plain and galvanized wire mesh had been imbedded were broken during May at the Bureau of Standards when two years old. Plaques were made without using calcium chloride in mixing water and with 4 per cent calcium chloride. The mesh, both plain and galvanized, where imbedded in 1:2 and 1:3 mortar without the calcium chloride was found to be practically free from corrosion. A 1:3 mortar to which calcium chloride was added had the galvanized mesh badly rusted and the plain mesh disintegrated. The mesh in the 1:2 mortar was attacked, but not to such an extent as that in the 1:3 mortar. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Cement and Other Building Materials A10-19 Unsoundness of Lime Plaster. To prevent unsound lime plaster with its resulting popping, the plaster sand should not contain over 1 per cent of sodium chloride, 2 per cent of magnesium chloride, and 10 per cent of red clay. Inferior quality of clay is responsible for popping. The expansion of small particles of plaster is the cause of this. The experiments have not been completed, but these results are now evident. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Chemistry, General and Physical A1-19 Applications of Critical Solution Temperature Methods. Application of method to determine purity of chemical substances. When two

substances form two liquid layers, the highest temperature at which they can exist and the concentration at this point are the critical solution temperature and critical concentration, respectively. This fixed temperature in any particular case is greatly changed by small quantities of certain impurities. This phenomenon is being applied to the following problems:

1 Determination of the composition and constituents of petroleum products, especially gasoline
2 The quantity of water absorbed by gasoline, transformer oil and other liquids which do not mix readily with water
3 The miscibility relations of the alcohols and hydrocarbon mixtures such as kerosene, as bearing on the utilization of the higher-boiling hydrocarbons as internal-combustion-motor fuels.

Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Dyes and Textile Chemistry A1-19 Ink Tablets and Powders. Analysis of a large variety of permanent inks and powders for important records. Bureau of Standards is in a position to make valuable suggestions to manufacturers and Government agencies. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Electricity, General A2-19 Ignition of Cotton by Static Electricity. The Bureau of Standards has determined that the discharge from a static machine will ignite cotton under certain conditions of humidity, voltage and spark frequency, and that electricity is generated by rubbing dry cotton over a galvanized surface. Experiments were carried on because of considerable fire loss in cotton-ginning districts. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Electric Power A3-19 Relative Capacities of Plates of Storage Batteries. The relative capacity of positive and negative plates are compared, showing material improvement at slight additional cost when plates are of different capacities. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Electric Power A4-19 Impurities in Acid Electrolytes. Batteries affording poorest electrical performance contain largest amount of impurities in electrolytes. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Fuels, Gas, Tar and Coke A2-19 Motor-Gasoline Properties. Laboratory methods of testing and practical applications. Technical Paper No. 214 of the Bureau of Mines. Address Van H. Manning, Director, Bureau of Mines, Washington, D. C.

Fuels, Gas, Tar and Coke A3-19 Gas-Standards Investigation. Report of a Committee to the Public Service Commission of Indiana regarding the heat value of gas to be expected from gas plants using various grades of coal. Address Public Service Commission of Indiana, Indianapolis, Ind.

Glass and Ceramics A1-19 Joints of Glass to Metal. Platinized glass tubes fused into metal tubes will hold pressure up to 3000 lb. per sq. in.; capillary tubes to 6000 lb. per sq. in. Application to laboratory work in connection with glass bulbs and small valves for weighing liquid ammonia, carbon dioxide, and ethyl chloride. Used in determining gas densities by condensing gas and inclosing it within glass bulbs, and in determining the density of volatile liquids and liquefied gases for purification of gases at high pressure. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Glass and Ceramics A2-19 Heat Transfer by Radiation. Tests of plain, ribbed and hammered window glass used for greenhouses show that for a total rise of 50 deg. in temperature, the temperature rise in a given time was the same for all three within 1½ to 2 deg. cent. Aside from screening of plants from the direct sunlight, there is no apparent advantage in the use of special glass. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Glass and Ceramics A3-19 Glasses for the Protection of the Eyes from Injurious Radiation. Technologic Paper No. 119, on The Ultra-Violet and Visible Transmission of Protective Eyeglasses, discusses the results of the visible and ultra-violet transmissions of 82 samples of eye-protective glasses; the infra-red transmission having been covered by an earlier paper. Information is given regarding the approximate color, thickness, transmission between specific wave lengths compared with transmission of a sample of colorless crown glass and with the visibility or sensitiveness curve of the average human eye. The total light transmission is also given. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Internal-Combustion Motors A1-19 Deterioration of Spark-Plug Electrodes. Three phenomena appear to contribute to the sharp fractures which occur in several of the slide or "ground" electrodes of spark plugs: First, selective oxidation along the crystal borders with the formation of eutectic-like network; second, overheating and sudden cooling of one spot by spark gives rise to an intercrystalline network of fissures; third, tension on the hot wire will break it with a very low load with definite transverse intercrystalline cracks. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Internal-Combustion Motors A2-19 Radiator Investigations. Determinations of drop in pressure through air tubes of radiators show that smooth, clean and polished surfaces give higher efficiency than rough or corroded surfaces. The effect of indirect cooling surfaces and the effect of water speed on radiator efficiency have been determined. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Internal-Combustion Motors A3-19 Flame Propagation in Internal-Combustion Engines. The rate of flame propagation in engine cylinders is being measured at the Bureau of Standards, more than 150 individual photographic records being taken. The average value of this rate for aviation gasoline in engine cylinders is 10 meters per second under normal conditions. A velocity of 2.5 meters per second is obtained with lean air-fuel mixture. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Metallurgy and Metallography A6-19 The Microstructure of Very Low-Carbon Steel. Very little information is available regarding the structures which may be produced in steel containing but a few hundredths of one per cent of carbon. W. J. Brooke and F. F. Hunting (*Journal of the Iron and Steel Institute*, 1917, No. 2, p. 233) report an unusual structure found in Armco iron quenched from between 899 and 832 deg. cent. They offer the explanation that it is a eutectoid thrown out of solution between these temperatures. A study was made at Yale University, under the direction of Prof. C. H. Mathewson, to throw some light on the nature of this constituent and to determine the effect of various forms of heat treatment on the structure of very low-carbon steel. The material used was prepared by Dr. T. D. Yensen at the Westinghouse Research Laboratory by fusing electrolytic iron and carbon in a vacuum furnace. A series of exceptionally pure steels was thus made, with the carbon content ranging from 0.02 to 0.100. It was found that the "eutectoid" structures could be produced in this pure material by quenching from within the critical range. Further experiments produced conclusive evidence that the so-called eutectoid is not caused by impurities in the metal, but represents the transformation product of the austenite which is stable at the temperature of quenching.

When very low-carbon steel is quenched from above A_3 a large amount of free ferrite is found, the carbon being present in the form of sorbitic needles scattered throughout the material in the cleavage planes of the original austenite. Annealing at a temperature just below A_1 for a long period of time brings about a separation of the

sorbite needles into minute globules of cementite. Heating to just above A_1, followed by slow cooling, changes the sorbite into very small grains of pearlite uniformly distributed between the small ferrite grains. R. E. Bedworth. Address Westinghouse Electric & Manufacturing Co., Pittsburgh, Pa.

Paints, Varnishes and Resins A1-19 Specifications for Linseed Oil. Circular No. 82, Recommended Specifications for Linseed Oil, has been issued by the Bureau of Standards, this being the first of a series of paint specifications based on recommendations of a Committee composed of representatives of various Government organizations purchasing such materials. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Properties of Engineering Materials A2-19 Mechanical Properties of Materials. The Bureau of Standards has issued a 51-page circular letter giving the various properties of engineering materials such as iron, steel non-ferrous metals, rubber, leather, rope and wood from latest information. The properties include density, specific gravity, tensile and compressive strengths, elongation and reduction of area, modulus of elasticity, modulus of rupture, shearing and transverse strength, ductility, Brinell and scleroscope hardness. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Sugar A1-19 Sugar Technology. An investigation of the method of analysis of sucrose or cane sugar in the presence of other sugars has been completed. The polariscope is unable to differentiate between sucrose and other sugars. As a single observation merely gives the effect of all sugars in the solution, double observations are required in which all substances except sucrose remain unaltered, inversion being brought about by heating with acid. The constants upon which the method which has been hitherto widely used was founded have been found to be considerably in error. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Sugar A2-19 Density of Viscous Liquids. See *Apparatus and Instruments A7-19*. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

B—Research in Progress

Aircraft B1-19 Fuselage Shapes. Curtiss Engineering Corporation, Garden City, L. I.

Aircraft B2-19 New Wing Sections. Curtiss Engineering Corporation, Garden City, L. I.

Aircraft B3-19 New Types of Gasoline Pumps. Curtiss Engineering Corporation, Garden City, L. I.

Aircraft B4-19 New Types of Turbine Propellers with Special Characteristics as Constant Power at Various Air Speeds. Curtiss Engineering Corporation, Garden City, L. I.

Aircraft B5-19 Resistance of Flags. Address Curtiss Engineering Corporation, Garden City, L. I.

Apparatus and Instruments B10-19 Design of Aerodynamical Balance of New Type. Address Curtiss Engineering Corporation, Garden City, L. I.

Apparatus and Instruments B11-19 Experimental Determination of Influence of Air Conditions at High Altitudes on Indication of Air Speed Meters of Venturi and Pitot Types. Wind tunnel used under reduced air pressure. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Apparatus and Instruments B12-19 Orifice Gas Meters. An investigation of orifice meters to correlate and verify the work of previous investigators. Coefficients to be determined are of fundamental importance in establishing accuracy of measurements of steam, natural gas and other gases. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Apparatus and Instruments B13-19 Weather Tests of Building Stone. The Bureau of Standards is endeavoring to perfect an automatic freezing apparatus which will give a disintegrating effect comparable with weather conditions and at the same time facilitate the process in the laboratory. The indications are that it will be possible to produce as much disintegration in a few weeks in the laboratory as would occur in several years' exposure to the weather. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Cement and Other Building Materials A9-19 Expansion and Growth of Marble and Limestone. The thermal expansion of marble has been examined at the Bureau of Standards and the tendency to increase its dimensions permanently following successive heatings has been shown to be true. Experiments are being carried out to determine the amount of this growth for different types of marble and also to determine if it is appreciable for the ordinary diurnal temperature changes. Some slabs of marble 6 ft. long are exposed to the weather and measured each month. Tests are also being conducted on Indiana limestone. An examination was made on a marble floor which had been cracking. It is believed that this is due to the gradual growth. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Cement and Other Building Materials B10-19 Volume Changes in Cement Mortars. Continuation of work of previous months. Measurements are being made of slabs of cement mortar with the same mix of cement and sand but with 12, 13, 15, 16 and 18 per cent of water. The indications are that with the same mix and the same amount of water the contraction is the same although the slabs are made under different conditions of temperature and atmospheric humidity. Usually the contraction is greater with a larger amount of water. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Cement and Other Building Materials B11-19 Oil Storage in Concrete Tanks. The Bureau of Standards is examining concrete in connection with oil storage. So far lard oil and cocoanut oil are the only oils which have attacked concrete. After one year the surface of the concrete of the tank containing lard oil has disintegrated. After one year specimens of concrete stored in various oils and under normal conditions give the same compressive strengths. A paper presenting the results of these investigations was read before the annual meeting of the American Concrete Institute. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Chemistry, Inorganic B1-19 Spectroscopic Researches. The Bureau of Standards is investigating the spectra of many metals over a wide range of wave lengths and into the infra-red region. About fifty different elements have been investigated throughout the entire range which can be photographed by using special means of treating ordinary photographic plates so that they become sensitive to the light and to the longer wave lengths as well as the ultra-violet light. This work requires careful manipulation and skillful measurement and it is considered to be of fundamental importance. Small samples may be burned in an arc and the spectra photographed. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Electrochemistry B2-19 Tests of Dry Cells and Storage Batteries. The Bureau of Standards has designed and constructed an improved apparatus to connect in the discharge circuit of batteries to be tested a selected group of cells for any period of time. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Electroplating B1-19 Effect of Pickling and Plating on Properties of Steel. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Electroplating B2-19 Lead Plating. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Electroplating B3-19 Study of Bancroft's Axioms as Applied to Electroplating. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Electric Power B3-19 Survey of Electric-Pole-Line Construction.

An investigation of present practice of pole-line construction to increase the requirements for initial strength as proposed by the Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Fuels, Gas, Tar and Coke B1-19 Gas-Appliances Investigation. The Bureau of Standards is coöperating with the Industrial Fuel Committee of the American Gas Association, studying various types of burners used in industrial applications to correct their faults and deficiencies. The proper designs of air shutter, gas orifice, and burner throat are being worked out by the Bureau of Standards. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Internal-Combustion Motors B6-19 Carburetor Investigations. An investigation is being made of the effect of the pulsations in the air flow through carburetors on account of the intermittent intake on the action of the carburetor. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Illumination B1-19 Miniature Lamps. Life tests of miniature lamps are being planned. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Leather and Glue B2-19 Deterioration of Leather. Tests have been instituted to determine the effect of varying amounts of free acids on tensile strength of leather, using aging test at a fairly high temperature and also at room temperature. In the latter test the effect of light on the rate of deterioration will be studied. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Metallurgy and Metallography B3-19 Phosphorus Content of Steel. The effect of varying amounts of phosphorus on the physical properties of steel including the determination of the limits of quantities permissible in various grades. Effect of phosphorus on the microstructure of basic and acid open-hearth carbon steel after various heat treatments. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Metallurgy and Metallography B4-19 Magnetic Analysis of Steel. The study of the possibility of correlating the magnetic and mechanical properties of steel with the ultimate object of developing methods for testing the quality and homogeneity of steel articles without injuring the specimens. Papers discussing the application to ball-bearing races and rifle barrels have been prepared. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Non-Ferrous Metals B1-19 Pure Aluminum. It has been deemed advisable to produce and determine the properties of pure aluminum. A special furnace has been constructed for this purpose and especially to eliminate the active impurities of silicon and iron. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Oils B1-19 Color Grading of Cottonseed Oils. Specific recommendations of color grading of cottonseed oils have been submitted to the Society of Cotton Products Analysts by the Bureau of Standards. Coöperative work is being carried on. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Pumps B1-19 Pump Valves. The Bureau of Standards is coöperating with two rubber companies and an insurance laboratory representing a Committee on Rubber Products of the American Society for Testing Materials in conducting hardness tests on pump valves, using the plastometer and scleroscope to determine a standard specification for hardness so that this property may be suitably related to temperature and pressure. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Railroad Rolling Stock and Accessories B3-19 Braking Stresses in Chilled-Iron Car Wheels. An investigation of stresses occasioned by braking. Results obtained so far show a marked difference in behavior of wheels of different designs and weight. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Sugar B1-19 Sugar Technology. A preliminary study of the problems of clarification of sugar liquors by other means than the sugar-filtration processes now used. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

D—Research Equipment

Aircraft D4-19 Wind Tunnel of the Bureau of Standards. The wind tunnel of the Bureau of Standards has been completed and investigations have shown that in the working section of the flow at 75 miles per hour is the lines parallel to the channel axis. The velocity at any point was not more than 0.5 per cent from the mean. Air speeds of 150 miles per hour have been attained. Power for this speed is 60 hp. Alterations just completed permit speeds of 180 miles per hour. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Apparatus and Instruments D6-19 Charpy Impact Machine at the Watertown Arsenal. The Charpy impact machine consists of a pendulum of known weight swinging freely on an axis of suspension, the pendulum having the following constants:

Weight of breaking mass (pendulum)	96.370 kg.
Height of fall of center of gravity (max.)	3.1558 m.
Radius of center of gravity	1.627 m.
Angle of fall corresponding to H (max.)	160 deg.
Distance of axis of suspension from middle of impact	2.00 m.
Radius of center of percussion	1.8229 m.
Velocity of shock	7.858 m. per sec.
Theoretical work of fall (PH)	304.124 m-kg.

The principle of operation of this machine is that when the kinetic energy of the pendulum is at a maximum, the specimen to be broken is struck by the pendulum. The energy absorbed in breaking a given specimen is determined by substracting from the known kinetic energy of the pendulum at the instant of impact, the kinetic energy remaining in the pendulum after the specimen is broken. The residual energy after the specimen is broken is determined by measuring the angle through which the pendulum swings after striking the specimen.

Two types of test can be carried out on this machine, namely, transverse and tensile tests. A specimen which is to be broken by a transverse shock is supported at each end on an anvil at the lowest point of swing of the pendulum, and is struck midway between the points of support. The specimen is 16 cm. long and 3 cm. square. A slot is cut in the specimen on the opposite side from the point of impact so as to leave a sectional area to be ruptured exactly 3 cm. by 1.5 cm.

A tensile specimen can be made with or without a notch, but in any case the area of rupture is maintained at 0.2 sq. in. so that direct comparisons can be drawn between the static tensile test and the impact tensile test. The "excess angle," or in other words the angle which enables the measuring of the residual energy of the pendulum, is measured by means of a pointer and dial fixed to the axis of suspension.

From the observed readings of the excess angle at the time of rupture, and the above constants of the machine, the total amount of energy absorbed may be calculated, taking into account the energy absorbed by mechanical friction and the resistance to the air.

The large Charpy machine (Fig. 1) differs from the small machine by having a motor fastened directly to the pendulum supports for raising the pendulum, and furthermore it is equipped with a ratchet brake so as to bring the pendulum quickly to rest after a specimen is ruptured. United States Arsenal, Watertown, Mass., Address Commandant.

Apparatus and Instruments D7-19 Standard Cement Sample 46-*e* for checking 200-mesh sieves has been prepared and is ready for distribution. 80.2 per cent passes this sieve.

Obtainable in 160-gram samples at the Bureau of Standards for 25 cents per sample, one sample for three tests. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Apparatus and Instruments D8-19 Picnometer. A new type of picnometer for the determination of density of viscous substances. Viscous liquids such as molasses and oils owing to their high viscosity retain innumerable air bubbles. This fact makes accurate determination difficult. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Apparatus and Instruments D9-19 Lime Investigations. A plasticimeter designed to determine the plasticity or spreading properties of lime has been developed by the Bureau of Standards. This simulates the action of the plasterer in spreading the material on the wall. Means are provided for obtaining the effort which the plasterer must exert and for varying at will the base upon which the plaster is spread, the time required, and the angle which the trowel makes with the surface. The force required to spread the plaster in conjunction with the time during which this force acts gives the measure of the plasticity. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Apparatus and Instruments D10-19 The Micrometer Microscope and Its Use in Gage Inspection. A communication from the Gage Section of the Bureau of Standards. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Calorimetry, Pyrometry, Thermometry D1-19 Naphthalene and Benzoic Acid Samples. The Bureau of Standards has prepared new samples of naphthalene and benzoic acid to be distributed as standard heat samples, and the heats of combustion have been determined. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director of the Bureau.

Metallurgy and Metallography D4-19 New Furnace Equipment. The Bureau of Standards has recently installed a Héroult type of electric smelting furnace of 600 lb. capacity. It has an electrically heated crucible furnace of 70 lb. capacity; also an oil-fired reverberatory furnace for cast iron and brass of 300 lb. capacity. A new type of electrically heated muffle furnace for heat-treatment operation is being installed. A Northrup-Ajax high-frequency electric furnace melting about 10 lb. of iron has been installed. It is used for the preparation of pure metal alloys in vacuo. The Bureau is equipped to roll and forge this metal. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Correction to Paper on Present Condition of Research in the United States

In preparing my Spring Meeting paper on The Present Condition of Research in the United States and in reading the proof I failed to realize that I had made a misstatement in attributing the laboratories at Pittsburgh and Washington to the United States Geological Survey. [See Mechanical Engineering, July 1919, p. 588.] These laboratories should be attributed to the Bureau of Mines. In writing this paper and in reading proof I did not notice this error, although the statement was not due to misinformation or lack of knowledge on my part.

Arthur M. Greene, Jr.

ENGINEERING SURVEY

A Review of Progress and Attainment in Mechanical Engineering and Related Fields, as Gathered from Current Technical Periodicals and Other Sources

AERONAUTICS (See also Internal-Combustion Engineering)

Monoplane vs. Biplane, Grover C. Loening. An argument for the monoplane by the inventor of the first monoplane bought by the United States Government.

There is no question as to the monoplane being the simplest type of machine (having only one set of wings and ailerons) and the lightest type, in that the wing structure itself for any given weight can carry more load than a biplane. The ordinary biplane, however, has two serious defects: (1) lack of strength, particularly against twisting and drift stresses; and (2) a bad range of vision. These objectionable features are claimed to have been eliminated in the Loening biplane, which puts it on a footing of equality with, and perhaps makes it preferable to biplanes for certain purposes.

To maintain the strength against drift and a general rigidity to the wing structure against twisting stresses, the monoplane wing is braced rigidly by large struts at a good angle in much the same way as the overhang section of some biplanes.

As regards the bad range of vision in the Loening monoplane the following structure has been adopted. Instead of raising the wing above the body parasol fashion, the pilot is seated low—so low that his eyes are on a level with the wing—and the side of the fuselage is open on either side of him. In such a position the motor in front shuts off the view forward, but in the Loening monoplane the body is so narrow in front that the pilot by shifting his head a little can see ahead of him on either side.

The author frankly recognizes this as a trick of construction, but states that it had much to do with giving this particular type of monoplane the range of vision which it has been found to have.

Aerodynamically, it is claimed that the centers of thrust, weight, head resistance, etc., have actually by test been found to be every bit as good in the monoplane as in the biplane. The only distinction is that the center of thrust on the monoplane is but a small distance below the wing, and the action of the spiral slip stream of the propeller in washing itself out against the wing results in neutralizing the torque of the motor. Thus no correction whatsoever is made in the wing alignment for the torque and the motor can be thrown on and off without affecting to any noticeable degree the balance and stability of the machine.

Further, on the monoplane a very large and definite area of the wing rides in the slip stream of the propeller under a most efficient condition. The proportional increase in lift so derived is considerable. Actual test has shown that the monoplane with a load of 11 or 12 lb. per sq. ft. will be as buoyant and land as well as the biplane with a load of about 7½ lb.

In fact, the author looks forward to the possibility of having large monoplanes with a 20- or 25-ft. chord carrying 18 or 19 lb. per sq. ft. at a low speed. (*U. S. Air Service*, vol. 2, no. 1, August 1919, pp. 25-27, *tc*)

CORROSION (See Engineering Materials)

ENGINEERING MATERIALS

Corrosion Phenomena in Non-Ferrous Materials

Effect of Corrosion on Wrought Manganese Bronze Under Tensile Stress, P. D. Merica and R. W. Woodward. An investigation to determine what service stresses may with safety be applied to physically normal wrought brass and bronze, and the types ordinarily used for structural purposes.

In the course of a previous investigation by the authors of a series of failures of brass and bronze bolts by fracturing, it was suspected that many cases of such failures were not due to defective material but to the fact that the bolts had been overstressed in service.

An investigation has shown that brass rods exposed to the action of concentrated ammonium hydroxide and subjected at the same time to the very gradual application of tensile stress would break with little elongation at any values of the stress greater than the yield point of the material. From this it appears that the effect of combined tensile stress and surface corrosion is to decrease the stress at which fracture will occur.

This matter is of considerable importance. Brass and bronze usually take the place of steel only because of their supposed superior resistance to corrosion, and if it were proven that such superior resistance is not as great as hitherto assumed, the usefulness of brass and bronze for structural purposes would be very largely limited.

The paper describes in some detail the method of carrying out the tests and making the measurements. The period of exposure was two years, which is relatively short in comparison with the periods for which such materials may actually be used in service. Furthermore, the test bars used were given a low-temperature anneal in order to relieve the initial stresses and consequently their behavior may differ during test from that of brass in which the stresses still remain. Therefore, as pointed out by the authors themselves, any conclusions to be derived from the results given in the paper must be regarded as quite restricted in their definite application and as more or less tentative in their more general aspects.

The general conclusion seems to be that brass or bronze might not be subjected to corrosion (in ammonium hydroxide) while under a tensile stress greater than 20,000 lb. per sq. in. or greater than 5000 lb. per sq. in. above the yield point without danger of failure.

The authors' tests indicate that the proportional limit is to be regarded as the maximum safe stress for manganese bronze of harder tempers, but that it is not certain that this limit may not be slightly exceeded in materials which are soft, that is, free from work hardness. (Paper presented at the Annual Meeting of the American Society for Testing Materials, June 24-27, 1919. Com-

pare *American Machinist,* vol. 51, no. 5, July 31, 1919, pp. 217-220, *ep*)

Mechanical Properties and Resistance to Corrosion of Rolled Light Alloys of Aluminum and Magnesium with Copper, Nickel and Manganese, P. D. Merica, R. G. Waltenberg and J. R. Freeman. The paper is summarized by the authors as follows:

Light aluminum alloys of several compositions belonging to each of the three ternary series, aluminum-magnesium-copper, aluminum - magnesium - manganese, and aluminum - magnesium-nickel, were rolled out into sheets and tested in tension as cold-rolled, after annealing, and after heat treatment consisting of quenching from about 500 deg. cent. and aging at ordinary temperature.

The tensile properties of the alloys of the aluminum-magnesium-copper series were superior in all conditions to those of the other series. They may be much improved by an appropriate heat treatment. The alloys of the aluminum-magnesium-nickel series are also improved by heat treatment, but not in the same degree as the former series. The alloys of the aluminum-magnesium-manganese series are not improved by heat treatment.

Samples of representative compositions of each series were exposed to corrosion in the salt-spray test, and the appearance of the samples observed after exposure to the action of the salt spray for one and for two months. The alloys of the aluminum-magnesium-manganese series resisted corrosion, in general, better than those of the other series, and this observation agrees with other experience in the corrosion of such alloys. The heat-treated specimens of the aluminum-magnesium-copper series, however, were but little inferior to those of the manganese series in their resistance to corrosion; the annealed and the cold-rolled samples of that series were the least resistant to corrosion of any of the alloys tested. Hard-rolled commercial aluminum corroded much more than any of the alloys. Annealed aluminum was more resistant to corrosion than the hard-rolled aluminum, but did not compare favorably with most of the alloys. (*Bulletin of the American Institute of Mining and Metallurgical Engineers,* no. 151, July 1919, pp. 1051-1062, *e*)

Variation of Physical Properties of Test Pieces with Age After Machining

Effect of Time and Low Temperature on Physical Properties of Medium-Carbon Steel, G. A. Reinhardt and H. L. Cutler. Data based on the experience of the Youngstown Sheet and Tube Company in making acceptance tests of medium-carbon steel.

This company produced a large tonnage of 0.35 to 0.45 carbon forging steel, the acceptance of which was based on the physical properties of test specimens obtained by forging the original 5.75-in. square bloom to 0.75-in. round. No difficulty was experienced in meeting the specifications called for.

Soon after, production of slightly higher-carbon forging steel was started. The method of testing this material required that test blooms be either normalized or annealed. The normalizing consisted in heating to 850 to 900 deg. cent. and cooling in still air; the annealing in heating to the same temperatures and cooling in the furnace or mica. From the treated bloom the test pieces were taken either by core drilling or by sawing from joints midway between the edges and the intersection of the diagonals. The cores or blocks were turned to a standard 2-in. test piece with a diameter of 0.564 in. and tested without further treatment.

Difficulty was encountered as soon as work on this material was started. Many precautions and refinements were instituted, but it was found very difficult to secure the required elongation. Still a very good chemical analysis was produced. Great care was taken during the heating and rolling as well as in heat-treating and machining the test pieces, but none of these precautions helped in producing uniform results, although occasionally the results were very good.

A careful examination disclosed the fact that invariably these good results were obtained from test pieces that had been machined the day before they were tested. The experience of several other men in and out of the company showed the similar behavior of rail-steel test pieces. As a result, it was decided to rest all pieces over night and test them the following day. As soon as this practice was adopted the difficulty in heating the elongation requirement of the specification disappeared.

Since it was at times undesirable to hold a shipment long enough to afford a 24-hr. rest for the test pieces, experiments were made, and it was found that a rest of a few hours at about 120 deg. cent. was equal to a 24-hr. rest at room temperature.

A series of tests were also made to determine the cause for the great difference in elongation and reduction of area shown by test pieces which had or had not periods of rest. The cause of this was not found, but some interesting data were collected.

This series of tests showed that a slight increase in temperature during the rest period resulted in a great improvement of elongation and reduction of area. The increase in tensile strength was considerable and greater in the case of a two-day rest than in the case of a four-day rest.

Tests were also made to determine the effect of speed of machining on the physical properties of a test piece and it was found that the rate of machining has practically no influence.

A further series of tests on 16 cores showed that the elongation increased with increased length of rest at the temperature of the top of the furnace. A rest of 16 days at room temperature increased the elongation and reduction of area to about the same extent as a rest of 25 hours on the electric furnace. On the other hand, test pieces heated to 500 and 600 deg. cent. after rests of four and 16 days, respectively, tested immediately after making it, gave lower elongation and reduction-of-area values than pieces that had been rested at lower temperatures. No explanation for this is offered. On the whole, the writers come to the conclusion that the ductility of steel expressed by elongation is greatly improved by some equilibrium adjustment which takes place slowly at room temperature and much more rapidly at slightly increased temperature. It seems possible that the difference in the results obtained on tests taken from blooms and on tests taken from small billets may be due to a combination of solidificatione and rolling strains. (*Bulletin of the American Institute of Mining and Metallurgical Engineers,* No. 151, July 1919, pp. 1091-1098.)

Graphitization Ranges of Temperature in White Cast Iron

Graphitization of White Cast Iron upon Annealing, P. D. Merica and L. J. Gurevich. This investigation was mainly undertaken in connection with other investigations on the properties and characteristics of chilled-iron car wheels, in particular to determine the best range of annealing temperatures.

Chilled-iron wheels are cast with a chill against the thread and the inside of the flange, the remainder being in sand. The composition of the metal is so chosen that under these conditions the tread and inside of the flange will show white iron to a depth of from ⅝ to ⅞ in. (15 to 22 mm.), the remainder of the wheel becoming graphitized or gray. In order to relieve the stresses set up during cooling under such drastic conditions, the wheels are stripped from the mold, while still red hot, piled in a soaking pit, and allowed to cool very slowly from their temperature at stripping.

Obviously, the most suitable temperature for this annealing is the highest at which no formation of graphite occurs within the white tread and at which the wheels can be stripped from the molds. Inasmuch as no direct determinations have been made of the temperature at which the formation of graphite takes place in white iron of compositions used in car wheels upon annealing, it was considered worth while to determine these temperatures as a means of establishing the maximum temperatures at which the annealing of the wheels may be carried out. In the course of this work some incidental observations were made which are of interest in connection with the theory of graphitization in white iron.

The paper is summarized by the authors as follows:

The annealing or graphitization ranges of temperatures were determined for three different compositions used for car wheels.

The temperature of initial precipitation of temper carbon for six hours of annealing was not noticeably affected by variation of sulphur content from 0.10 to 0.20 per cent or by variation of total carbon content from 3.60 to 3.90 per cent, although the effect of greater carbon content is to narrow the temperature range within which graphitization is complete.

The temperature of beginning precipitation of temper carbon was about 830 deg. for the 6-hr period of annealing, and about 730 deg. cent. for the 48-hr. period. The maximum allowable temperature, therefore, for the annealing, or "pitting," of car wheels is about 730 deg. cent.

After complete decomposition of all free cementite by annealing at from 1000 deg. to 1100 deg. cent. and cooling at equal rates in a laboratory electric furnace, less graphite is found in a specimen cooled from 1100 deg. than in one of the same composition cooled from 1000 deg. cent. This indicates that graphite separates directly from solid solution upon cooling, when its nuclei are already present.

The fact that only 0.20 per cent of combined carbon was found in some specimens after annealing at high temperatures and cooling slowly in the furnace, would indicate either that the graphite eutectoid lies at much lower values of carbon content than has been previously supposed, that there is at those rates of cooling a direct precipitation of graphite eutectoid, or that there is a formation of graphite from pearlite at temperatures directly below that of its formation. (*Bulletin of the American Institute of Mining and Metallurgical Engineers,* no. 151, July 1919, pp. 1063-1072, *e*)

HYDRAULIC ENGINEERING

HEXAGONAL CHART FOR FINDING VELOCITY OF WATER IN PIPES, C. Warington Anthony. Reprint of a brief but highly suggestive article and accompanying illustrations.

Exponential formulæ are very much used nowadays in hydraulic problems dealing with the flow of water in pipes and sewers. Many charts or diagrams have been drawn to represent each formula, some taking a variable coefficient into account, which depends on the nature of the inner surface of the conduit, but the writer has never seen one made that does equally well for all the exponential formulæ. For this reason I have designed a hexagonal chart (Fig. 1) that takes care of six variable quantities—the velocity of flow, coefficient of roughness, hydraulic mean radius and slope, together with the powers to which these last two quantities are raised—and yet in spite of all this apparent complexity this chart is as easy to handle as a chart made for working out only one kind of exponential formula. Evidently a chart of his description will prove of great value, since it may be used for rapidly computing and comparing results obtained for a given case by applying different formulæ. It may also be used to deduce the best equation to fit in with the results of experiments that have actually been carried out.

The exponential formula is usually written: $V = C\ (D/4)^p S^q$, or $V = CR^p S^q$, since the hydraulic mean radius of a pipe flowing full is the fourth part of its diameter. There will be seen to be three binary scales in the chart, arranged in the form of an equilateral triangle. The coefficient and velocity go together on

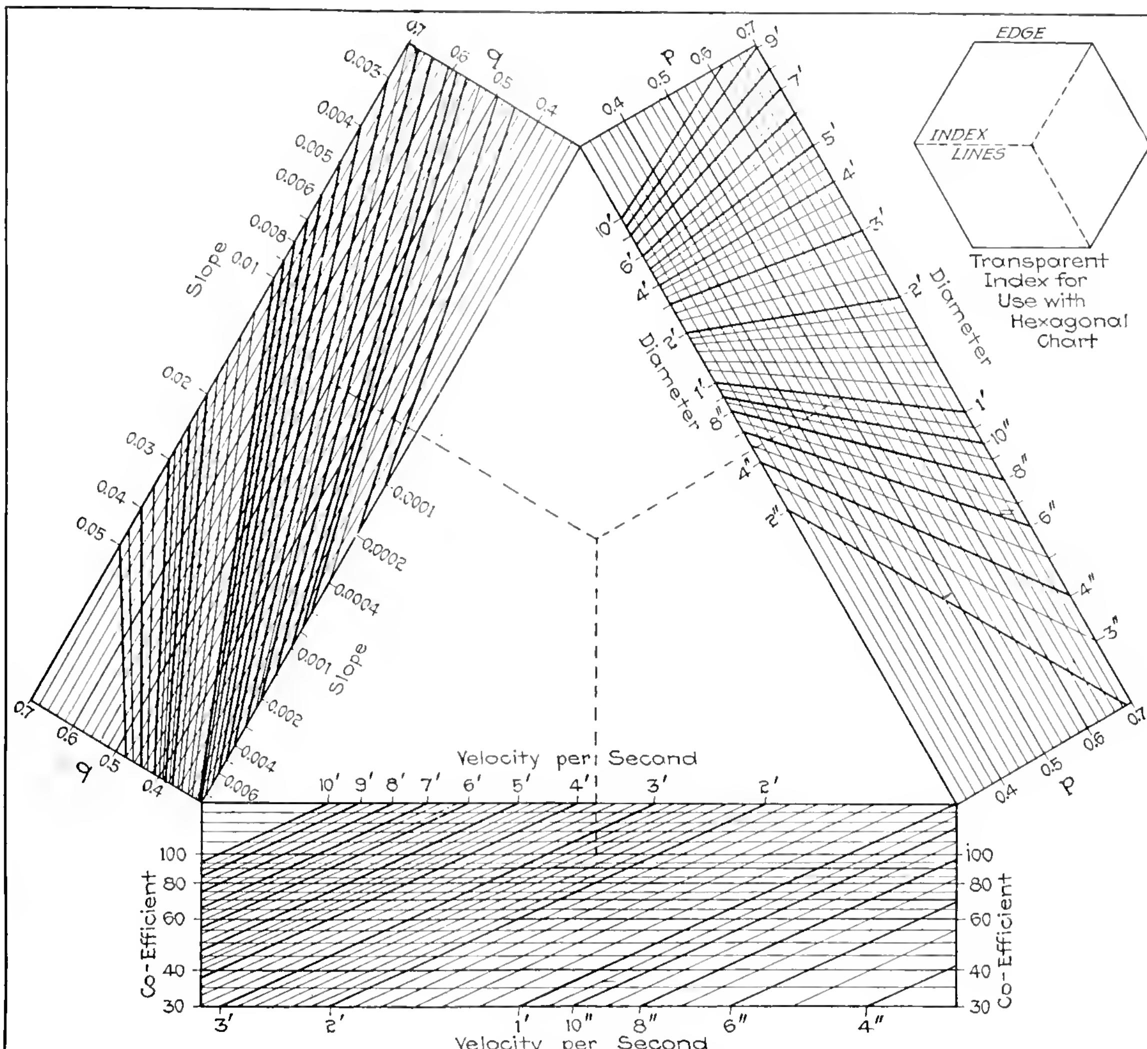

FIG. 1 HEXAGONAL DIAGRAM FOR FINDING VELOCITY OF WATER IN PIPES

one scale, and the diameter and slope, together with their respective powers, on the other two scales. The way the diagram is used is illustrated with dotted lines for the following case:

Diameter, 1 ft.; slope, 0.0025; coefficient, 100, $p = q = \frac{1}{2}$. The velocity is seen to be 2½ ft. per sec.

When using the chart it is convenient to have a hexagonal transparent index, as shown in the upper right-hand corner of the illustration, with its sides parallel to the three index lines. By placing a straight edge against one side, the index lines may be moved without changing their orientation or displacing the one parallel to the straight edge.

The great beauty of the chart lies in the fact that it does not contain a single curve, which makes it much easier to draw and at the same time a high degree of accuracy is insured. This is attained by employing logarithmic instead of equally spaced coordinates. (*Engineering News-Record*, vol. 83, no. 4, July 24, 1919, p. 169, *tpA*)

INTERNAL COMBUSTION ENGINEERING (See also Machine Elements)

Novel Features in Oil-Engine Design

THE DOXFORD OIL ENGINE. Description of an internal-combustion engine of British construction. The engine was first built as a Diesel but has now been changed to a hot-surface type with solid injection of fuel.

As regards the latter the present arrangement is that three rams are used, the fuel pump being driven through small cranks on the camshaft set at 120 deg. so that the work may be divided over the revolution and eliminate the very heavy shock which would occur if but one ram were used. These rams force the oil into two small air vessels initially charged with air at a pressure of 1000 lb. per sq. in., the ram pressure being 8000 lb. per sq. in.

The pumps are said to be a very beautiful piece of work; so good, indeed, is the fit that no packing is required even at this enormous pressure, the leakage representing little more than an overflow of lubricant. This end has been reached by a departure from the ordinary method of driving the fuel pump. In the Doxford machine there is used a slotted crosshead with the sliding block for the driving pin to work in, the crosshead being carried in very closely fitting guides at each side. The plunger is connected to the crosshead with an ordinary union nut, so that provided the center lines are parallel, which of course can be insured, any want of exact concentricity may be allowed for, and the thrust of the ram must be absolutely axial.

The fuel valves present a new feature in that they have only a light spring to keep them on their faces when the engine is not running. The size of a spring strong enough to keep them closed against an oil pressure of 8000 lb. per sq. in. when working would be on the heavy side, but if 8000 lb. will blow the valves off their faces it will equally well keep them on, if applied to a larger diameter and that is, in fact, the plan adopted again with unpacked plungers.

The elimination of the blast air forced the use of a different arrangement of valves. Formerly the fuel was blown in by air tangentially on opposite sides of the cylinder so as to create a turbulence. With the solid jet of fuel no turbulence can be obtained, so that the fuel must be diffused as much as possible, and the valves are now arranged opposite to each other, but one above the other so as to cover as large a volume of air as possible.

One of the peculiar features of the engine is the fact that instead of attempting to keep the piston as cool as possible in this case every effort is made to allow the crown to reach a temperature of not less than 1000 deg. fahr., and it is the piston crown which forms the hot surface which really fires the charge with heavy oils. Such a high temperature is rendered possible by the special design of the piston, Fig. 2. Here *C* is the heatable cap which keeps the fire off *D*, the piston proper. *C* is a steel forging, of which the crown is some 4 in. thick and is water-jacketed on the under side. Thermocouples attached to a point a few millimeters inside the top surface showed a temperature reading of about 950 deg. fahr. at the load on which the engine was running on the occasion of the writer's visit, and a temperature of only 350 deg. fahr. at a corresponding point on the bottom surface. It will be noticed that the cap *C* only comes into contact with the actual piston *B* at the bottom where everything is well cooled, and that there is a good clearance at the sides and top and also between the cylinder liner and the edge of the forging, so that it can expand or distort to a very considerable extent without doing any harm. The water passages *D* are ribbed at close intervals, the alternate ribs having holes at the top and bottom so that the water has to take a very devious course and keeps the cast iron cool, the final outlet being from the passage *E*, which, as a matter of fact, is carried up by a tube to just under the crown and not cut off short as shown in the figure.

The engine has been running for several months and is said to completely consume Mexican oil with its very high percentage of

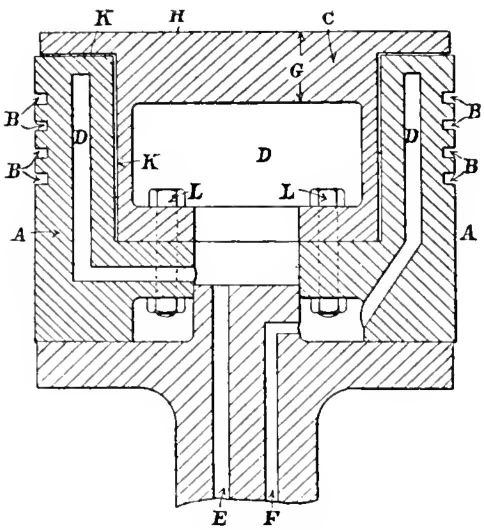

FIG. 2 PISTON OF THE DOXFORD OIL ENGINE

asphaltum, and to give an absolutely clean exhaust. The consumption is said to be 0.42 lb. per b.hp-hr.

The elimination of the high-pressure air compressor for blast injection means, of course, a saving both in fuel and first cost, weight and maintenance. (*The Engineer*, vol. 128, no. 3316, July 18, 1919, pp. 64-65, 2 figs., *d*)

Temperature Relations in an Internal-Combustion Engine Due to Presence of Residual Gases

THE EFFECT OF NEUTRAL GASES ON THE TEMPERATURE OF THE WORKING FLUID IN AN INTERNAL-COMBUSTION ENGINE, Kango Takemura. Discussion of a subject which attracted a considerable amount of attention in the early days of the introduction of the Otto cycle.

The writer believes that the neutral gases left in the cylinder at the end of the previous stroke have a considerable influence on the temperature of the new combustible charge, and gives a mathematical estimate of the rise of temperature which they effect. He uses the following notation:

Let θ_1 = temperature of the neutral gases left in the combustion chamber

c_1 = specific heat of those gases

w_1 = weight of the gases

θ_2 = temperature of a new charge, supposed to be constant and equal to that of the atmosphere

c_2 = specific heat of the charge

w_2 = weight of the charge

θ_3 = temperature of the working fluid or the mixture of the neutral gas and the new charge

c_3 = specific heat of the fluid.

An assumption is made that the new charge is drawn through the neutral or residual gases and that a temperature equilibrium is established instantaneously.

The writer derives the following equation

$$\Theta_3 = \frac{\theta_1 + \theta_2 \dfrac{\theta_1 + 273}{\theta_2 + 273} \times \dfrac{.x}{.l}}{1 + \dfrac{\theta_1 + 273}{\theta_2 + 273} \times \dfrac{.x}{.l}}$$

where Θ_3 is temperature in absolute degrees and the values of θ_1 and θ_2 are in cent. deg; also $.x$ stands for x/L, where x is a portion of the stroke and L is the full length of the stroke; $.l$

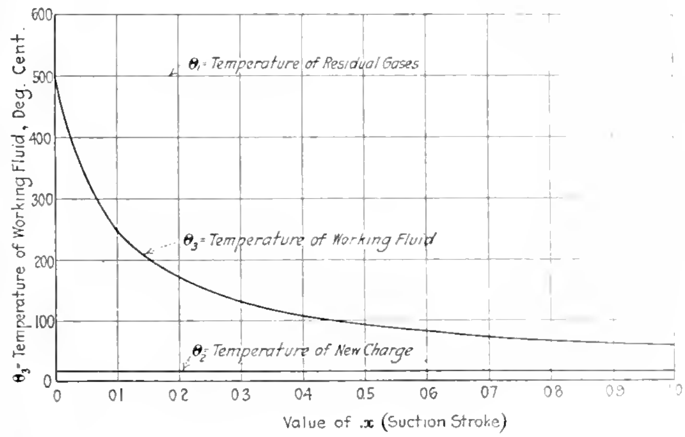

Fig. 3 Relation between the Temperature of Residual Gases and Working Fluid in an Internal-Combustion Engine

stands for l/L, where l is the height of a "equivalent combustion chamber" on a base equal to the area of the piston. The value of $.l$ depends on the ratio of compression and is equal to 0.25, if the latter is taken at 5.

Adopting these figures the writer obtains

$$\frac{D_1}{D_2} = \frac{\theta_1 + 273}{\theta_2 + 273} = \frac{500 + 273}{16 + 273} = 2.67$$

and

$$\theta_3 = \frac{500 + 16 \times 2.67 \times 4 \times (.x)}{1 + 2.67 \times 4 \times (.x)}$$

$$= \frac{500 + 170.9 \times (.x)}{1 + 10.7 \times (.x)}$$

where D_1 = density of the neutral gases at the moment when their mixing with the new charge begins and D_2 is the density of the new charge.

TABLE 1

$.x$	θ_3	$.x$	θ_3	x	θ_3	[illegible]	θ_3
0.1	250	0.4	108	0.7	73	1.0	57
0.2	170	0.5	92	0.8	66		
0.3	130	0.6	82	0.9	62		

The values of θ_3 calculated by means of the foregoing equation are given in Table 1 and shown graphically in Fig. 3. (*Journal of the Society of Mechanical Engineers*, Tokyo, Japan, vol. 22, no. 56, *tm*)

War-Time Research in Aeroplane Feuls

The Investigation of Airplane Fuels. E. W. Dean and Clarence Netzen. Data of recent work carried out chiefly by the United States Bureau of Mines and of considerable importance not only in aviation but in the general design of automotive apparatus.

In the course of this work E. R. Hewitt showed that such fuels as benzol and alcohol did not ignite until heated several hundred degrees fahrenheit hotter than the ignition temperature of paraffin hydrocarbons. These data were of use in indicating the order of ease with which various fuel mixtures could be made to preignite in engine cylinders.

Simultaneously with this the research organization maintained by the Dayton Metal Products Company studied the relation between the nature of the fuel and the maximum compression ratio that could be maintained in an engine without interfering with smooth operations. Data of this investigation have been published quite fully elsewhere. The experiments of the Dayton laboratory have shown, however, that the chemical properties of the fuels were more important than the physical ones, and therefore a large number of fuels were collected and tested. In addition, an extensive research was devoted to the production of cyclohexane.

Attention to this fuel was particularly drawn by the reports that the Germans were using it as an airplane-engine fuel. Actually, though, there does not seem to be any evidence that this was the fact.

The engine fuel actually tested after the first few engine runs was not pure cyclohexane, but a mixture called "heeter," composed of from 70 to 80 per cent cyclohexane and 20 to 30 per cent of benzol.

Through the courtesy of the engineers at McCook Field, the Bureau of Mines obtained the loan of a testing engine made by equipping one cylinder of a standard Liberty engine with a special crankcase, shaft and flywheel (compare Mechanical Engineering, March 1919, p. 249). A set of pistons was obtained which gave compression ratios ranging from 5.3 to 1 to 8.2 to 1. Pressures measured with an Edelman gage, with the engine turned at 400 r. p. m., varied from 113 to 185 lb. per sq. in.

A considerable number of fuels were tested with this equipment, and results obtained showing that gasoline composed of paraffin hydrocarbons had a marked tendency to knock at the 5.3-to-1 compression ratio, whereas heeter-benzol-alcohol and a special alcohol-benzol-gasoline mixture known as Taylor fuel No. 4 showed only a slight tendency to knock under an 8.2-to-1 compression ratio.

Cracked gasoline and California gasolines were intermediate in resistance to knocking, and were notably better in this respect than the paraffin-base products. This superiority is attributed to the presence of unsaturated and cyclic hydrocarbons in the cracked distillates and to cyclic hydrocarbons in the California gasoline. In some of these fuels, however, undesirable properties have been found, and as a last analysis the most promising product was found to be heeter, with California gasoline or gasoline-benzol mixtures as a second choice.

Supplementary tests were carried out on a standard Liberty engine with a full set of 12 special pistons permitting the adjustment to 70 per cent cyclohexane and 30 per cent of benzol in a DeHaviland-4 plane. The results of these tests, however, were unfavorable.

The next series of tests were tried with the same pistons on another Liberty engine, also in a DeHaviland plane. From the figures given in the paper it does not appear quite clear what the composition of the fuel was in this series of tests, the results of which were, however, favorable, the engine operating smoothly and yielding the additional power that was to have been expected on account of its high compression ratio. Similar tests in the altitude chamber of the Bureau of Standards also gave favorable results.

The comparative data obtained with the single-cylinder Liberty engine indicate where by proper selection of fuel it is possible to employ considerably higher compression ratios than the maximum now considered practical for aviation engines.

The establishment of this part is considered of importance, even if it proves that a 7.2-to-1 ratio is too high, and that heeter is not as practicable or desirable as other mixed types of fuels. (Paper before the Society of Automotive Engineers, published by permission of the Director of the United States Bureau of Mines. *Journal of the Society of Automotive Engineers*, vol. 5, no. 2, pp. 126-130, *ea*)

MACHINE ELEMENTS

Tests on Pin-Riveted Joints Made by the Schuch Process (*Zeitschrift des Vereines deutscher Ingenieure*, June 14, 1919). This article describes tests performed on riveted joints made with pin rivets according to a new process (German Patent No. 302,-269). The advantages of the new system of riveting are claimed to be: (1) Cheaper cost of rivets; (2) the rivets are more evenly heated; (3) the hammer scale is removed when the rivets are snapped home. The result is that the rivet heads do not loosen and calking is no longer necessary, thus showing a considerable saving in wages and tools, also time taken on the operation. The new form of rivet is shown in Fig. 4.

The firm of Schuch & Co., who hold the patent rights, have designed a work-controlling apparatus for hydraulic riveting machines for use in connection with the new process. This device records automatically the riveting force and the time taken in snapping a rivet.

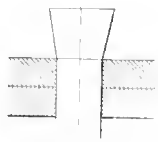

Fig. 4 Schuch Pin Rivet

A riveted joint made as shown in Fig. 5 was sent for test to the Material Test Laboratory of the Stuttgart Technical College, and the following are the conclusions arrived at:

1 The rivet heads were only very slightly warped
2 The plates suffered slight curvature or bulging
3 The plates do not show any appreciable crushing at the margings of the holes.
4 The stresses with which the rivets press the plates together were found to be about the same as with ordinary rivets.

Numerous locomotive boilers have been riveted on the new system and have given satisfaction. (*Technical Supplement to the Review of the Foreign Press*, vol. 4, no. 2, July 22, 1919, p. 45, no. 5643, *d*)

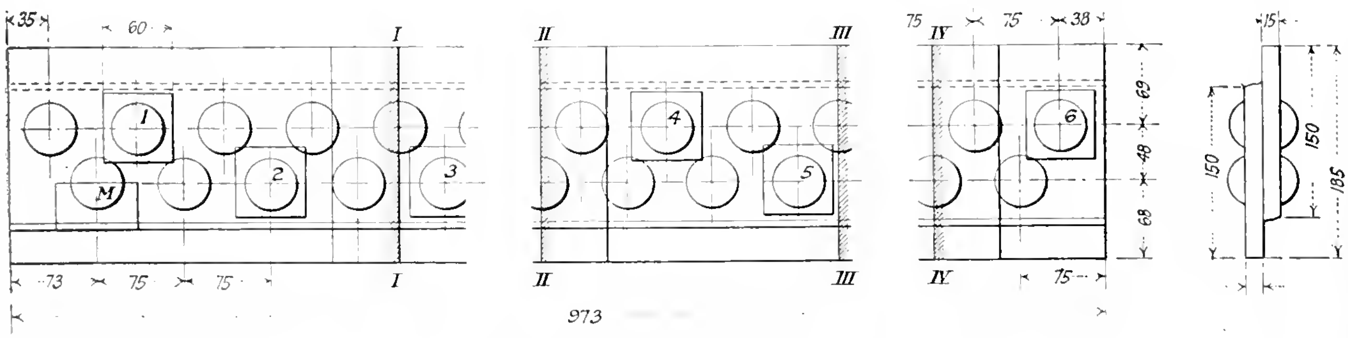

Fig. 5 Schuch Pin-Riveted Joint

Two-Part Piston Ring, Ellsworth Sheldon. Description of a piston ring manufactured by the Yale Piston Ring Company.

The ring as shown in Fig. 6 is made in two parts: the outer part of soft gray iron performing the usual function of piston rings; and an inner ring of tempered steel which furnishes the tension necessary to hold the outer part in contact with the cylinder walls and also serves to keep the ring in contact with the sides of its groove in the piston, thus preventing the leakage of gas past the piston that would occur with the ordinary form of ring as soon as the latter had worn or if it was badly fitted to the groove in the first place. It is also claimed that with this construction worn rings may be reground on their edges, the grooves faced, and the ring still retain its seal.

The outer ring resembles an ordinary gray-iron piston ring, with three differences, however. First, as the ring is not required to exert pressure of itself it may be made of the softest gray iron obtainable; second, for the same reason, the outer diameter is ground to the same size as the cylinder instead of 1/8 to 3/8 in. larger, as in the case of the snap ring; and third, the inside of the ring is not parallel with the outer surface but is bored taper or at an angle of 15 deg., so that the ring has one thick edge and one thin edge.

The inner ring is of tempered steel and is of a section complementary to the outer one, that is, its tapered or beveled surface is on the inside and when the steel ring is pushed into the gray-iron one its tension not only holds the latter against the cylinder walls, but also by reason of the two beveled surfaces coming together the iron ring is pressed against one side of the groove and the steel one against the other side, forming a sort of automatic adjustment for maintaining the width.

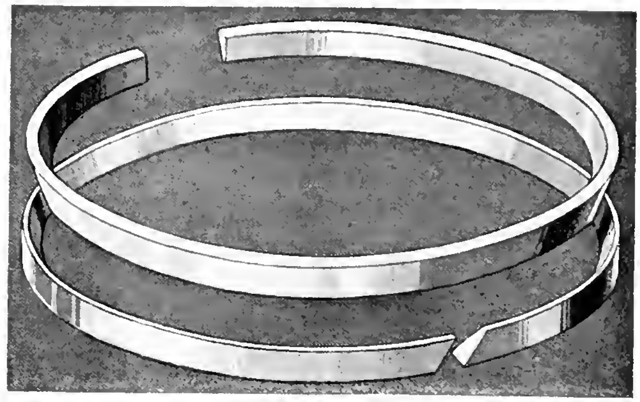

Fig. 6 Two-Part Piston Ring

The article describes in detail the method of manufacture of these rings and the tools used. Of particular interest is a machine especially designed for polishing the outer surface of the ring. As this surface is not parallel to the bore and consequently not square with the ground edges, and further as the ring being sprung open is not round, the job of polishing the outer surface is by no means simple, especially as it is necessary to maintain the bevel at a constant angle to keep the surface flat widthwise and to avoid grinding hollow spots in the contour of the ring.

In this machine a circular table somewhat larger in diameter than the largest ring to be polished is provided for each wheel, the table being supported on the upper end of a rod, which, when the machine is in operation, is given a slowly reciprocating endwise movement in a direction parallel to the axle wheel so that whatever work is held upon the table in contact with the wheel is automatically passed back and forth across the face of the latter. It is stated that by this means the tendency to wear grooves in the surface of the work is obviated.

As the ring is not round, owing to its having been sprung open to give it initial tension, it cannot be rigidly held to the wheel and the operation is therefore somewhat dependent upon the skill of

the operator to avoid grinding hollow spots on the periphery of the ring, but the men soon become experts in this work. (*American Machinist,* vol. 51, no. 5, July 31, 1919, pp. 199-202, 10 figs., *d*)

Design of Ball and Roller Bearings Subject to Centrifugal Loads

Ball and Roller Bearings, Capt. J. B. Swan, R.A.F. Data obtained from the records of the Technical Department, Aircraft Production (British) and dealing with the consideration of the behavior of ball and roller bearings when subjected to centrifugal loads.

When a ball or roller bearing is rotating as a whole about an axis without its own geometric center the condition of loading is quite peculiar, and it has been found that if the rollers or balls are above a certain size and the speed of rotation high the ordinary type of caged and uncaged bearing has a very short life. This particular type of loading is exemplified in practice when ball or roller bearings are used in big ends of connecting rods or in types of reduction gears in which the spider carrying the bearings rotates.

In a 10-cylinder radial engine developed by the Admiralty Air Department in 1916 a ball-bearing type of big end was used and as the engine was a two-throw radial, the big-end loading was necessarily high. When the engine was put into production the bearings were ruined after about five or six hours. At first it

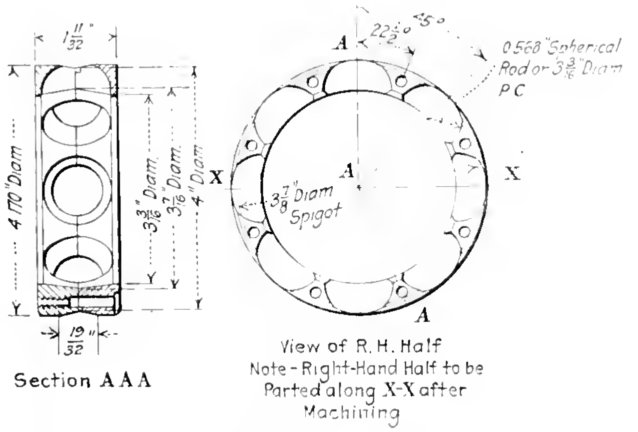

Fig. 7 Located Cage for Ball Bearings

was thought that the cages for the balls were at fault and so cageless races were tried, with the result that the balls were worn with flat belts around them.

As it was also noticed that the balls always showed the first signs of wear, it was deduced that the wear was probably due to the fact that the balls were subject to an undue crowding action which made them abrade each other, and when once the ball surface was roughened the race became speedily destroyed. This appeared to be especially so, as the load if normally applied would have been quite low for a bearing of the size used.

It appeared that as the bearing rotated about the crank center the balls, in the case of a cageless bearing, were crowded away from the center of rotation by a centrifugal force acting on them and rubbed against one another, the balls remote from the crank-pin center being pressed together by the combined centrifugal force of the other balls. As the balls were rotating about their own centers at about 2500 r.p.m. and the points that touched were moving in opposite directions, the abrasive action was very considerable.

When a cage of the steel-plate type was used a similar action took place. The cage was subjected to its own centrifugal force and also to the cumulative centrifugal load of the balls which it carried. This combined load was acting in line with the crank radius but away from the crank center and caused a displacement of the cage in that direction until a point was reached when the bearing load on the balls nearest the crank center due to the cage wedging between them, was equal to the combined load on the cage and this caused a heavy abrasive action between the balls and the cage at the point of application of the mean load on the race, producing a tendency for the balls to skid on the race at this point and causing in a short time serious damage to the balls, races and cage.

The foregoing experience indicated that the function of the cage was to carry independently the rubbing loads on each ball due to the centrifugal force and to prevent abrasive action on the

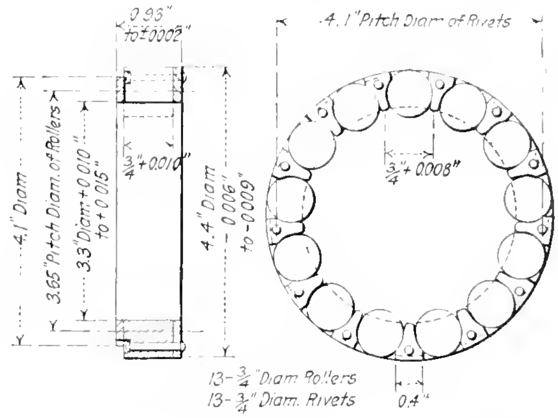

Fig. 8 Located Cage for Roller Bearings

balls. Because of this in designing the cage the following points had to be observed:

1 The cage must be strong enough to take the independent loads from the balls without distortion
2 Sufficient bearing surface must be provided at the surface of location of the cage to carry safely the combined centrifugal load due to the cage itself and the balls
3 Ample bearing surface must be provided between the balls and the cage to prevent wear on the cage
4 The cage must be made of a metal which gives a minimum abrasive action with the steel of the ball and race and at the same time has sufficient strength
5 All surfaces must run with a continuous film of oil over them.

A cage was devised, Fig. 7, which would be definitely located and could not be displaced by more than a few thousandths of an inch by the centrifugal load. It is made in two halves, split in a plane at right angles to the axis of the bearing and spigoted together; eight hemispherical holes were made with 0.010 in. clearance for the balls; the outside circumference was turned down in a flat V to avoid the actual ball path and on either side of the V was a cylindrical surface turned dead true about 5/16 in. wide. The outside diameter of the cage was made to fit in the outer ball race which had two cylindrical surfaces ground on to it on either side of the ball path and a clearance between the cage and the cylindrical part of the outer race was 0.005 in. to 0.007 in. The material of the cage was cast phosphor bronze.

Fig. 8 shows a similar type of cage, except that it was made for a railway bearing. With this cage a radial engine was run at speeds above 1800 r.p.m. for considerable periods and no signs of wear could be detected. In general, it would seem that at speed above 1600 r.p.m. and with a radius of rotation above 2½ in. cageless bearings will not run satisfactorily if the balls or rollers are larger than ⅜ in. in diameter and the inner race larger than ½ in. in diameter.

As regards the design of the located cage, the principal point besides making the cage of ample strength is to avoid any chance of the location of the cage being provided by the balls or rollers themselves, as this would cause the heavy abrasive loads which quickly ruin this type of bearing.

In addition to the above an appendix is attached giving some particulars of the big-end roller and ball bearings which have been found both successful and unsuccessful in practice. Also, a general method is given for finding the abrasive loads on the balls in an uncaged bearing subject to rotation about an external center.

In the case of a caged bearing a method is given whereby the

pressure load on the cage bearing surface may be found for a located cage design. A method is also given by which the total bearing load due to the cage itself and the cumulative loads from the rollers or balls may be estimated when the bearing as a whole rotates about a center without its axis.

In considering the constant comparison for the various bearings, since the wear on the bearing appears to depend almost entirely on the abrasion of the roller, an attempt has been made to find a constant for any bearing which will incorporate the factors controlling the roller abrasion.

The roller abrasion depends, it would appear from observation, on three factors: the pressure between adjacent rollers, the rubbing speed between these rollers, and the length of the line of contact. For this reason the constant K has been chosen equal to the product of the first two items divided by the last—that is: K = inter-roller pressure $\times$ inter-roller rubbing speed length of rollers, the pressure being in lb., the rubbing speed in ft. per sec., and the roller length in inches.

From this it will be at once obvious that the ball bearing, having only point contact between the balls, is at the outset at a very great disadvantage if used without a cage.

Ball bearings should not be used for a bearing rotating about an external center unless an efficient form of located cage is provided.

From the results tabulated in the original article for the uncaged roller bearings it will be seen that for an indefinite endurance the value of K should not be more than 1000.

If the line of the bearing may be limited to about 50 hours before replacement, values of K as high as 1500 may be used; in general this value should not be exceeded.

In regard to the caged bearings, the constant of comparison K_c is equal to the rubbing speed of the cage multiplied by the bearing pressure on the cage. It will be seen that the value of K may for a bearing of indefinite life be safely more than 2500, though this figure should serve as a good guide to designers. (*The Automobile Engineer*, vol. 9, no. 128, July 1919, pp. 200-204, 10 figs., *pt.A*)

MUNITIONS AND MILITARY ENGINEERING

Characteristics of Rifle-Barrel Steel. Abstract of an advance publication of two papers to be presented at the September Chicago meeting of the American Institute of Mining and Metallurgical Engineers.

One of these papers, by G. F. Butterworth, of the U. S. Armory, Springfield, Mass., deals with the Metallography of Rifle Barrel Steel; the other, on Erosion Tests of Rifle Barrels, is by A. E. Bellis, Ordnance Department, U. S. Army.

The first paper points out that the metallographic structures most frequently encountered in rifle barrels fall naturally into two groups distinguished by the method used to produce in the stock a physical condition having the requisite properties. The first group consists of rolled barrels or barrels subjected to hot-working by rolling in or near the critical range. In the second group the stock is upset to form the butt end and then heat-treated by giving it a quench and a draw. These barrels are referred to in the paper as heat-treated barrels.

The structure of the rolled barrels resembles closely that of the same steel after annealing, the grain size being closely related to the rolling temperature. Barrels rolled within the temperature range between 1300 and 1350 deg. fahr. give an exceedingly fine grain, but as the temperature is increased the grains are found to be larger. If the rolling temperature is below the critical range given above, the structure previous to rolling is not obliterated, the only effect of rolling being to elongate the coarse sorbite grains in the direction of rolling.

Heat-treated barrels are quenched in oil from above the critical range, which should give a martensitic structure, but the presence of some troostite in the martensite is frequently noted when the quench has not been sufficiently drastic. The structure brought about by the subsequent draw is sorbitic or sorbito-pearlitic. The structure is substantially the same for all drawing temperatures from 800 to 1300 deg. fahr., but the color of the specimen varies with the drawing temperature, becoming lighter as the temperature increases. Microscopic evidences of defective heat treatment are also discussed.

The paper by Maj. A. E. Bellis on Erosion Tests of Rifle Barrels calls attention to the fact that the extent to which the nature of the steel is a factor in erosion is still a much-discussed question. The paper describes tests made to determine the factor of erosion of gun barrels. The experiments performed appear to indicate that the homogeneous structure of a heat-treated barrel offers the best resistance to erosion. On the other hand, a barrel showing a network of free ferrite apparently offered easily eroded channels to the washing-out action of hot gases and metals. (*Iron Age*, vol. 104, no. 4, July 24, 1919, pp. 225-228, 23 figs., *etA*)

PHYSICS

Langmuir Postulates Regarding Structure of Matter

The Arrangement of Electrons in Atoms and Molecules, Irving Langmuir. Abstract of the first installment of a paper on the structure of matter. Particular attention is called to this paper, as it represents a development of possibly fundamental importance in our knowledge of atomic structure. The main assumption in this theory is that the electrons are stationary and situated in concentrated shells. By means of this theory the writer found that it is possible to explain the periodic properties of the elements and also succeeded in evolving a new view of chemical valency.

In the opinion of the author there is much chemical evidence, especially in the field of stereochemistry, that the primary balance forces between atoms act in directions nearly fixed with respect to each other. This can only be satisfactorily accounted for or explained by electrons arranged in three dimensions. There is conclusive evidence that in substances such as wood carbonized under certain conditions or finely divided WO_3 (tungsten trioxide) reduced in very dry hydrogen the atoms are arranged in branching chains in which most atoms are surrounded by only two or three others. Since the bodies are definitely solid it must follow that the atoms are not able to shift their relative positions except when acted on by strong external forces. Such structures are inconceivable if atoms contain only electrons revolving in orbits about their nuclei.

In attempting to determine the arrangement of electrons in atoms the author was guided by the numbers of electrons which make up the atoms of the inert gases; in other words, by the atomic numbers of these elements, namely, helium 2, neon 10, argon 18, krypton 36, xenon 54 and niton 86. Rydberg has pointed out that these numbers are obtained from the series

$$N = 2\ (1 + 2^2 + 2^2 + 3^2 + 3^2 + 4^2 +)$$

The factor 2 suggests a fundamental twofold symmetry for all stable atoms. By a consideration of this factor and principles of chemistry and from other data the writer has been led to the seven postulates reproduced below.

Postulate 1 The electrons in the atoms of the inert gases are arranged about the nucleus in pairs symmetrically placed with respect to a plane passing through the nucleus which we may call the equatorial plane. The atoms are symmetrical with respect to a polar axis perpendicular to the plane and passing through the nucleus. They have also four secondary planes of symmetry passing through the polar axis and making angles of 45 deg. with each other. The symmetry thus corresponds to that of a tetragonal crystal. Since the electrons must occur in pairs symmetrical to the equational plane there are no electrons in this plane.

Postulate 2 The electrons in the atoms are distributed through a series of concentric spherical shells. All the shells in a given atom are of equal thickness. If the mean of the inner and outer radii be considered to be the effective radius of the shell then the radii of the different shells stand in the ratio 1:2:3:4, and the effective surfaces of the shells are in the ratio $1:2^2:3^2:4^2$.

Postulate 3 Each spherical shell is divided into a number of

cellular spaces each of which may contain one or two electrons. The thickness of these cells measured in a radial direction is equal to the thickness of the shell and is therefore the same (Postulate 2) for all the cells in the atom. In any given atom the cells occupy equal areas in their respective shells. All the cells in an atom have therefore equal volumes. The first postulate, regarding symmetry, applies also to the location of the cells. The first shell therefore contains two cells obtained by dividing the shell into two equal parts by the equatorial plane. The second shell having four times the surface (Postulate 2) must contain eight cells. The third shell thus contains 18 while the fourth contains 32 cells. Or if we consider only one hemisphere the numbers in the successive shells are 1, 4, 9 and 16.

Postulate 4 Each of the two innermost cells can contain only one electron but each of the other cells is capable of holding two. There can be no electrons in the outside shell until all the inner shells contain their maximum numbers of electrons. In the outside shell two electrons can occupy a single cell only when all other cells contain at least one electron. We may assume that two electrons occupying the same cell are at different distances from the nucleus. Each shell, containing its full quota of electrons, thus consists of two "layers." We will find it convenient to refer to these layers of electrons by the symbols I, II*a*, II*b*, III*a*, III*b* and IV*a*, where the Roman numerals denote the shell containing the layer. Helium, neon, argon, krypton or xenon contains respectively the first 1, 2, 3, 4 or 5 of these layers, while niton contains all six.

The two-fold symmetry assumed in Postulate 1 is derived from the factor 2 which occurs in Rydberg's equation. The fourfold symmetry is derived from the remarkable numerical relation brought out in Table 2.

TABLE 2

Shell	Radius	n	Number of cells	
			in axis	in zones
I	1	1	1	0
II	2	4	0	4
III	3	9	1	8
IV	4	16	0	16

Here n represents the number of cells in one of the hemispheres of the shell. If this number is odd one of the cells must lie along the polar axis; all other cells must be distributed in zones about this axis.

We see from this table that the number of cells which must be arranged in zones is always a multiple of four. We can therefore assume tetragonal symmetry for the atoms of the inert gases.

Postulate 5 It is assumed that electrons contained in the same cell are nearly without effect on each other. But the electrons in the outside layer tend to line themselves up (in a radial direction) with those of the underlying shell because of a magnetic field, probably always to be associated with electrons bound in atoms (Parson's magneton theory). This attraction may be more or less counteracted by the electrostatic repulsion between the outside electrons and those in the underlying shell. The electrons in the outside layer also repel each other and thus tend to distribute themselves among the available cells so as to be as far apart as possible. The actual positions of equilibrium depend on a balance between these three sets of forces, together with the attractive force exerted by the nucleus.

Postulate 6 When the number of electrons in the outside layer is small, the magnetic attraction exerted by the electrons of the inner shells tends to predominate over the electrostatic repulsion, but when the atomic number and the number of electrons in the outside layer increase, the electrostatic forces become the controlling factor. As a result, when there are few electrons in the outer layer these arrange themselves in the cells over those of the underlying shell, but where the outside layer begins to approach its full quota of electrons, the cells over the underlying electrons tend to remain empty.

Postulate 7 The properties of the atoms are determined by the number and arrangement of electrons in the outside layer, and the ease with which they are able to revert to more stable forms by giving up or taking up electrons, or by sharing their outside electrons with the atoms with which they combine. The tendencies to revert to the forms represented by the atoms of the inert gases are the strongest, but there are a few other forms of high symmetry such as those corresponding to certain possible forms of Ni, Pd, Er and Pt atoms toward which atoms have a weaker tendency to revert (by giving up electrons only).

These seven postulates are applied by the author to derive the properties of the chemical elements, thus establishing a new basis for the theory of the structure of matter. This part of the paper will be abstracted in an early issue. (*General Electric Review*, vol. 22, no. 7, July 1919, pp. 505-516, 1 fig., to be continued. The paper has also been published in the *Journal of the American Chemical Society*, vol. 41.)

RAILROAD ENGINEERING

Pennsylvania Mallet Compound Locomotives. Description of pusher Mallet locomotives of the 0-8-8-0 type built for the Pennsylvania Lines West by the Baldwin Locomotive Works.

The locomotives are designed for heavy yard service and develop a tractive force of 100,000 lb.

These locomotives embody some features of the Baldwin practice not previously used on the Pennsylvania. They have conical wagon-type boilers with radially stayed fireboxes and three rows of Baldwin expansion stays to support the front end of the crown. The arch is supported on five tubes and firing is done by means of a Duplex stoker. The throttle is equipped with an auxiliary drifting valve.

The equalization of the rear group of wheels is continuous on each side of the locomotive. In the case of the front group the springs of the leading wheels are cross-equalized, while those of the remaining three pairs of wheels are equalized together on each side. The valve gear of the Walschaerts type and the gears are controlled by the Ragonnet type B reverse mechanism. The diameter of the driving wheels is only 51 in., because of which the low-pressure cylinders are placed at an angle of 1 in 35 to provide sufficient clearance above the rails. (*Railway Review*, vol. 65, no. 5, August 2, 1919, pp. 157-159, 5 figs., *d*)

REFRIGERATION

Novel Features in Ice-Plant Design, Including Copper Steam Condensers

Ice Plant of the Colorado Ice and Cold Storage Company in Denver, Victor J. Azbe, Mem.Am.Soc.M.E. Description of a plant having some novel features of design. The plant, the full capacity of which is 350 tons of ice per day, is driven by Corliss engines which exhaust at atmospheric pressure into steam condensers. Contrary to standard practice, however, these condensers are drums 10 ft. long and 37 in. in diameter made of thin-gage copper. When the plant is operated under full capacity there are 14 of these condensers in use, which means that each unit condenses steam for 25 tons of ice each 24 hours.

It is stated that copper condensers not only give better heat conduction than iron, but are also self-cleaning. The writer describes the following demonstration made for his benefit: From a heavy-scale-coated condenser steam was shut off but cooling water allowed to circulate. Immediately the scale began to crack and fall off and expose the clean, smooth copper surface. In this way most of the scale came off and after a few minutes the water was turned off and the steam on. This dried the surface

and by tapping slightly with a wooden mallet the remaining scale was removed. The whole operation of cleaning did not require much over five minutes. Another advantage of this type of condenser is that it is more durable and eventually easily repaired.

The freezing system is of the can type, freezing 800-lb. ice blocks, which it does very successfully. The cans proper are $23\frac{1}{2}$ in. by $12\frac{1}{2}$ in. at the top, $22\frac{1}{2}$ in. by 12 in. at the bottom and 7 ft. 11 in. long. As far as the effort of pulling is concerned, there is stated to be less of it here than is usually encountered with cans of half the size, which is, however, due to the type of electric crane that is employed.

Ammonia refrigeration is used. The ammonia condensing system consists of 29 spans of drip condensers, all being 24 pipes high and 20 ft. long. In addition, the plant is equipped with

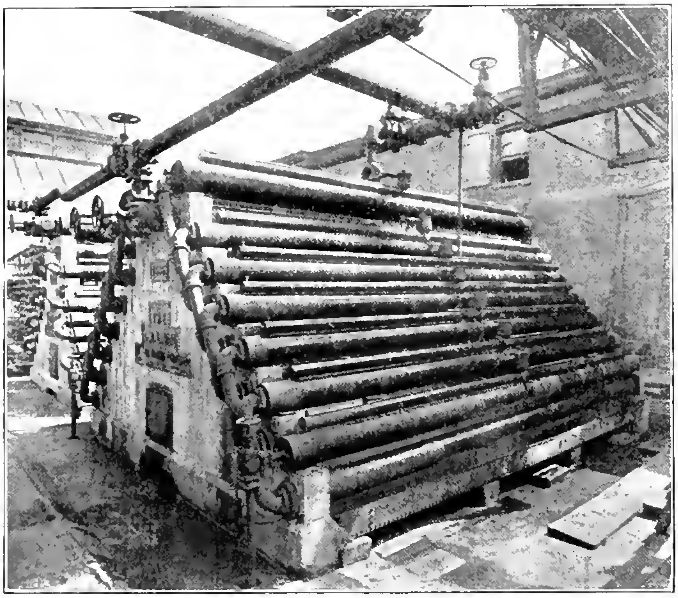

Fig. 9 Vail Ammonia Condenser

condensers designed by George L. Vail, chief engineer of the company, made up of 8-in. standard pipes and arranged as shown in Fig. 9.

Ammonia vapor flows successively through 14 lengths of 8-in. pipe, each having 18 ft. of effective length. The 8-in. pipes are interconnected by 2-in. pipes. While the velocity in this condenser is relatively low, the results obtained are said to be good.

The ice-storage house is 175 ft. long, 60 ft. wide and as much as 60 ft. high, which means that there are 30 layers and 500 tons of ice to the layer. At first objections were offered to building an ice-storage house of such a height as it was thought that the lower layers would not sustain the weight, but tests with an ice block under a hydraulic press showed that such fears were groundless. (*Power*, vol. 50, no. 5, July 29, 1919, pp. 168-170, 6 figs., *d*)

Just How Much Do We Know About Carbon Dioxide?

The Design of CO_2 Machines, John E. Starr, Mem.Am.Soc. M.E. The author points out that while the design of ammonia machines has advanced to a rather fine point and the knowledge of the behavior of ammonia is nearly perfect, the same does not apply to the case of machines employing other fluids, especially carbon dioxide. Machines of this class are often made either too large or too small for their intended duty and tables on the properties of carbon dioxide give results varying to such an extent as to produce at times as much as 50 or 60 per cent variation in the design of the engine.

For example, the curves in Fig. 10 compare the results of the heat content of liquid CO_2 in Siebel's Compendium of Mechanical Refrigeration and Engineering and in Le Doux' Ice-Making Machines with the work credited to Mollier and Amagat.

At first glance the last three sets of the curves do not appear to present discrepancies which would lead to a very great difference in ultimate design of the machines, but in a fluid such as CO_2 where the heat of liquid constitutes so great a proportion of the heat of vaporization, the actual variation greatly affects the results.

The following calculation reproduced from the original article is of considerable interest:

Taking the two principal tabulations and assuming 0 deg. fahr.

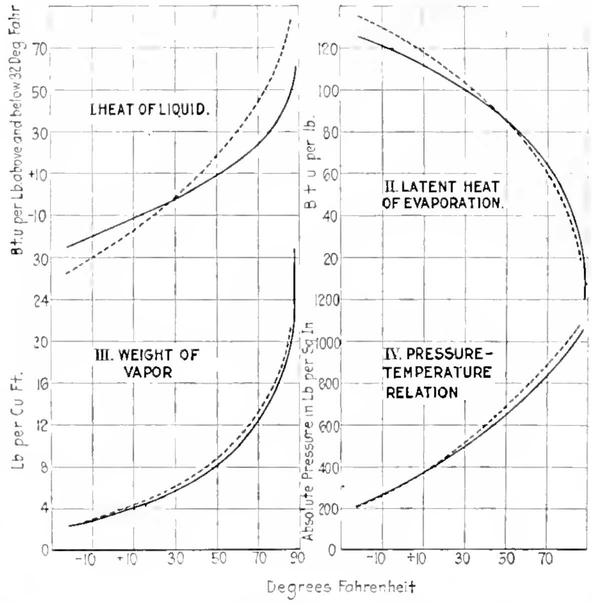

Fig. 10 Properties of Carbon Dioxide as Given by Different Authorities

(Broken Lines—Data given by Professor Schroeter in Le Doux's Book; Full Lines—More recent observations credited to Amagat and Mollier by Macintire.)

for the refrigerating temperature, and 80 deg. fahr. for the average temperature at which heat is rejected in the condenser the designer at once finds himself in a quandary. From the older set of tables (Schroeter, page 174 of Le Doux's book, 1902) he finds the following values:

Heat of vaporization at 0 fahr........125.5 B.t.u.
Heat of liquid at 0 deg.............. —24 B.t.u.
Heat of liquid at 80 deg.............. +63 B.t.u.

Hence, net heat taken up per lb. = 125.5 — (— 24 + 63) = 38.5 B.t.u. Therefore, 200 B.t.u. per min. (= 1 ton of refrigeration) ÷ 38.5 = 5.2 lb. of CO_2 required per ton. He further finds the weight of a cubic foot of gas to be 3.45 lb., or 0.2898 cu. ft. for 1 lb., or total for the necessary 5.2 lb. = 5.2 × 0.2898 = *1.506 cu. ft.* to be compressed per ton from 310 lb. up to 990 lb. absolute pressure.

From the newer tables (prepared by Mollier) he finds:

Heat of vaporization at 0 deg. fahr.... 117 B.t.u.
Heat of liquid at 0 deg. fahr.......... —17 B.t.u.
Heat of liquid at 80 deg. fahr......... +36 B.t.u.

Hence, net heat abstracted per pound = 117 — (— 17 + 36) = 64 B.t.u., and 200/64 = 3.12 lb. CO_2 to be circulated per minute per ton of refrigeration. Weight of vapor per cubic foot = 3.45 lb., and 1/3.45 = 0.2898 cu. ft. per lb. Therefore 3.12 × 0.2898 = *0.9041 cu. ft.* of vapor to be compressed per minute per ton from 310 to 965 lb. absolute pressure.

This is a difference of $66\frac{1}{2}$ per cent in the size of the machine, and as there is very little difference shown in pressures, the economy will also vary about $66\frac{1}{2}$ per cent!

The writer suggests that the Bureau of Standards is the proper authority to settle this matter. (*Refrigerating World*, vol. 54, no. 7, July 1919, pp. 11 to 12 and 20, 1 fig., *t*)

STEAM ENGINEERING

Drop Valves for Steam Engines. Discussion and criticism of the usual Cornish double-beat valve, especially as applied to engines working with superheated steam, and of the Lentz gear.

The author proposes to use instead the valve shown in Fig. 11,

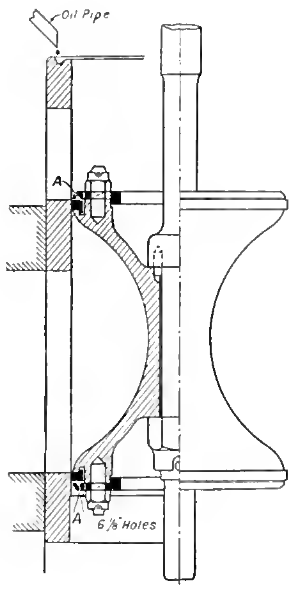

Fig. 11 Piston-Type Drop Valve for Steam Engines

only, however, as a steam-admission valve, and states that such a valve has been used in one instance for seven years and has shown practically no wear.

The valve works in a separate liner forced into the cylinder, the seatings being machined and, if necessary, scraped, so as to be circular when cold. The result of pressing the liner in is that where it touches the cylinder it is contracted. Hence, where the rings seat the bore of the liner becomes less than on either side of that seating. If the ports be cast in, the liner has a tendency to crack, and they are therefore cut from the solid. Now, the rings are restrained by a return flange on the faces. In the steam valve shown they are on the inner faces, but in the exhaust valves they are on the opposite faces. On those faces between the restraining flange and the liner, the rings are a ground fit to the valve, hence steamtight. The ring is not a tight fit in the grooves, but is kept up to its face by a wave spring in the recess *A* shown. Further, the rings are steam-packed, in the case of the inlet valve, by the incoming steam, and of the exhaust valve by the cylinder steam, or from the side on which there is the greatest pressure. The points in the rings are not lapped, but usually just radial, and the joint is pegged opposite one of the grids in the liner. The valve body is clear of the liner, and does not touch in work. It is pegged so that it cannot turn on the spindle, and all is so arranged that once set the valve commences and ends its life without circular movement. But it is necessary that the gland should not prevent the spindle from making slight movements at right angles to the axis of the liner. In work, then, the cylinder will distort the valve liner more in some designs of cylinders than others, but the rings being flexible to the necessary slight amount, follow at the first irregularities and later wear to them. At first sight the restraining flange may appear to prevent this automatic adjustment, and it was at first only used to prevent parts of the rings getting into the ports in case of breakage; but piston rings in work, whether in the piston or valve, expand more than the cylinder or liner—at least, all the writer's experiments have proved this—and, again, the rings are made a fit to the liner before it is forced in. Hence, when the valve is on the seating part of the liner, the rings are off their restraint. With care, then, these valves can be maintained reasonably steamtight. (*The Engineer*, vol. 128, no. 3315, July 11, 1919, pp. 25-26, 4 figs. *d*)

THERMODYNAMICS (See Refrigeration)

VARIA

Absolute Measurement of the Intensity of Sound, Prof. A. G. Webster. Description of a series of acoustical researches dealing, among other things, with the properties of vibrating bodies and the subject of elastic hysteresis.

An instrument has been developed called, the "phone," which is a standard of sound and is capable of reproducing at any time a sound of the simplest character and permits measuring the output of sound in watts of energy.

A second instrument has been developed for measuring the sound in absolute measure. This instrument, called a "phonometer," is now practically as sensitive as the human ear.

By means of these instruments the determination of the space distribution of sound, of the effect of disturbing bodies and measurement of the reflecting coefficient of surfaces have been accomplished.

In the same paper is briefly described an instrument called a "phonotrope," the purpose of which is to find the direction of location of a source of sound—for example, a false signal. Owing to the Doppler effect it cannot yet be used to determine the direction of an aeroplane at night. (*Proceedings of the American Institute of Electrical Engineers*, vol. 38, no. 7, July 1919, pp. 889-900, 7 figs., *dA*)

Dazzle Painting of Ships, Lt.-Comm. Norman Wilkinson, R. N. V. R. Dazzle painting is defined as a method to produce, by paint, an effect in such a way that all accepted forms of a ship are broken up by masses of strangely contrasted colors. The purpose of it is to make it difficult for a submarine to decide on the exact course of the vessel to be attacked.

Invisibility against submarines is not only impossible but said to be dangerous, and marine camouflage is in this respect radically different from sea camouflage. The primary object of the camouflaged vessel was not so much to cause the enemy to miss its shot when actually in firing position (although this has happened in a number of cases) but to mislead him when the ship was first sighted as to the correct position to take up. With a vessel of 10 knots or over a submarine having once failed to obtain a good position has little or no likelihood of regaining that position owing to insufficient underwater speed.

Should the submarine decide to come up the ship attacked, being armed, has every chance of a successful escape, and, in fact, the coming out of the submarine would in itself be a good testimony to the success of the painting.

The striped type of dazzle design which was most successful was arrived at some time before the end of the war. In the initial stages a small wooden model of each ship was made to scale. On this a design was painted in wash colors and the model was carefully studied on a prepared theater through a submarine periscope, various sky backgrounds being placed behind her alternately. A satisfactory design having been evolved giving the maximum distortion, the model was then handed to a trained plan-maker and copied.

The most important parts of a ship on which distortion should be obtained are in the neighborhood of the stem and the fore-bridge, both of these being of great use to a submarine in determining the course. The colors mostly in use were black, white, blue and green, either in their primary condition or mixed to various tones. The speed developed in dazzle painting was such that, for example, the Leviathan was marked out in just over two days. (Paper read before the Northeast Coast Institution of Engineers and Shipbuilders, July 10, 1919. Compare *Engineering*, vol. 108, no. 2797, August 8, 1919, pp. 192-195, 5 figs., *d*)

CLASSIFICATION OF ARTICLES

Articles appearing in the Survey are classified as *c* comparative; *d* descriptive; *e* experimental; *g* general; *h* historical; *m* mathematical; *p* practical; *s* statistical; *t* theoretical. Articles of especial merit are rated *A* by the reviewer. Opinions expressed are those of the reviewer, not of the Society.

MECHANICAL ENGINEERING

Contributions of interest to the profession are solicited. Communications should be addressed to the Editor.

Engineering Societies Employment Bureau

The work of the Engineering Societies Employment Bureau has increased rather than decreased during the summer months. Engineers just being released from Government service continue in as great numbers as during last spring to seek employment through the agency of the Bureau. Employers, realizing the good material which may be secured by means of the Bureau, are increasing their demands upon it. In addition to the calls for engineers there are many requests for designers, draftsmen, and minor assistants. Statistics of the work of the Bureau for the eight months ending July 31 last are as follows:

Applications for employment	3763
Positions registered	1334
Positions open at present	350
Applicants placed to date	744
Average number of men visiting Bureau per month	1690
Average number of men sent out for interview per month	675
Average number of letters of application for positions forwarded per month	1457

There is every reason, however, to believe that many more than 744 applicants have been placed who have failed to notify the Bureau.

Recataloging the Engineering Societies Library

Attention is called to the interesting report in another column by Director Harrison W. Craver of the library in the Engineering Societies Building, New York, on the subject of library cataloging and the classification of engineering literature. This great library originally comprised the books of the libraries of the Mining, Mechanical and Electrical Engineers, to which later was added the large and very complete collection of the Civil Engineers. Each originally had its own library catalog, from which, as explained by Mr. Craver, a general authors' catalog was made by interfiling the catalogs of the constituent libraries. There is also an alphabetical classified catalog of the three original collections, a classified subject catalog of the Civil Engineers, and other catalogs and lists.

Work of recataloging is now under way, a very large undertaking which will require from two to three years to complete. There will be an authors' catalog to enable the reader to find a book when the name of an author is known, or what books by any author are in the library; a subject catalog to enable the reader to find a book when the subject is known, and to exhibit the resources of the library on every chief and most subordinate topics; and an alphabetical index which will comprise the names of the various subjects upon which there are important books or pamphlets and which will direct the user to that section of the subject catalog where the books are listed and to the department of the library where they are to be found.

The Dewey system of classification will be used as extended and modified by the Institut International de Bibliographie, usually known as the "Brussels" classification.

The principles underlying this work are explained in the report as well as the details of the system of classification used. The report should prove of value to engineers generally, apart from its direct bearing on the work now in hand for the library of the Engineering Societies.

The Training of Industrial Executives

The successful conduct of manufacturing enterprises demands that type of managerial talent which fully comprehends and effectively coördinates the social, commercial and technical forces which condition the life and prosperity of such institutions. The proper embodiment of physical, chemical and mechanical laws in industrial processes is the first essential in establishing a manufacturing enterprise upon a good technical foundation.

The provision of those conditions which release the creative faculties of the mind, which bring about the coöperative efforts of men and which establish understanding between labor and capital, are the golden fruits of management.

The distribution and marketing of the products of the factory, the financing of the enterprise and control of its activities in the light of market conditions are among the most serious problems dealt with in directing the affairs of an industrial undertaking. Accordingly, therefore, any training for service in manufacturing and industry which has for its object the development of men who shall occupy executive positions should be directed toward the great problems of labor and the human side of engineering, the problems of costs, accounting and finance, as well as the scientific and technical problems arising in industrial processes.

We are beginning to realize that the management of industrial enterprises is a matter of public interest and concern. The late war has demonstrated most forcefully the fact that our ability to combat is in direct proportion to our ability to produce goods; and between nations of equal resources the decision is generally in favor of the one which can produce, handle and use its goods most economically. As we enter the reconstruction period and begin to adjust ourselves to the new economic and social conditions which have arisen as a consequence of the war, we realize as never before that one of our greatest natural problems is the economic production and distribution of goods. And the greatest factor in this problem is that of man power or executive ability. We do not lack devices for production, systems of credit, methods of management—the tools to work with—but our need is men of vision, ability and force, well trained in commerce, finance and technology to direct our industrial organizations and cause them to function properly in all these particulars.

The development of men for such service is important to the public welfare. It is of more than passing interest, therefore, to note that the Engineering Schools of Columbia University have given serious consideration to this question and have developed a plan for training men for this service. Some years past Columbia, appreciating the growing importance of all engineering service to the public welfare and the increasing responsibility of the engineer to the public, raised its requirements for attainment of its engineering degrees to provide a more liberal education in the arts and the humanities. It is provided that this new development shall also stand on the same broad educational foundation. An equivalent of three years' college training will therefore be required of all candidates for instruction in this branch of service.

The instruction under the supervision of the engineering faculty extends over a period of three years, and is about equally divided between technical and commercial subjects. The School of Business of Columbia University is coöperating in the project and will give instruction in commercial practice and finance.

At a recent meeting of business men and educators held in Washington it developed that the Carnegie Institute of Technology and the University of Cincinnati were also working out similar projects and were offering instruction at the present time in those commercial subjects which are most important in matters dealing with the management of factories and the conduct of commercial enterprise.

With our universities and colleges developing men of broad vision and understanding in matters relating to the industrial and commercial development of our country, and with the introduction of these men into our business life, it is felt that the whole plane of commercial operation will be lifted and the problems perplexing labor and capital will be more thoroughly understood and more wisely handled.

Walter Rautenstrauch.

Aeroplane Fuels

About the time when the United States entered into the war the air was full of rumors of wonderful German achievements in the field of heavier-than-air flying. The usefulness of the zeppelin as an engine of warfare was pretty well discredited, but it was said that the Germans had some wonderful invisible aeroplanes, armored aeroplanes, etc. One particularly persistent and disquieting rumor was that the Germans had developed mass production of a new fuel belonging to the class of hydrogenated benzols and known as cyclohexane.

An extensive research undertaken by the Bureau of Mines, together with other governmental and private agencies, had for its purpose (1) to determine the conditions surrounding the combustion of fuels in aeroplane engines of varying ratios of compression, and (2) to develop the production of synthetic fuels of the hydrogenated-benzol type.

Highly gratifying results were secured in both lines of this research, even though neither was developed in time to be of practical use before the signing of the armistice in November of last year.

In the first place, it was found that the various fuels behaved in a definite manner under various degrees of compression. It was found that a fuel could actually be "crushed" under the compression so that it would ignite spontaneously. It appears that of the commercially known fuels kerosene has a comparatively low upper limit of usage in high-compression engines; gasoline comes next; following which come the various compound and synthetic fuels.

It was further determined that under a compression ratio of 8.221, corresponding to a pressure of 185 lb. per sq. in. as measured with an Edelman gage, cyclohexane-benzol alcohol and alcohol-benzol-gasoline mixtures showed only a slight tendency to cause knocking, which, when it occurs, may mean either preignition or excessively rapid combustion.

A mixture composed of 70 to 80 per cent cyclohexane and 20 to 30 per cent benzol, called "hecter," was developed and rapid strides were being made in volume production of cyclohexane when the armistice put an end to this kind of work so far as the Government was concerned.

The immense value of research of this nature is obvious to any engineer and it can only be regretted that the pressure of the terrible war emergency was apparently needed to attract sufficient interest and secure adequate means for work of the character indicated.

Corrosion of Non-Ferrous Metals and Alloys

In the Engineering Survey of this number will be found abstracts of two papers presented before the American Institute of Mining and Metallurgical Engineers on the general subject of corrosion of non-ferrous metals and alloys. These report valuable work done at the U. S. Bureau of Standards and point to a new and promising field of research concerning the behavior of our basic materials of engineering construction.

When the average man speaks of corrosion of metals he has primarily in mind the corrosion of the universal metal, steel, which unfortunately is so subject to the action of the elements. The general assumption is that non-ferrous metals, in particular those with a copper base, are fairly free from corrosion. Because of this, copper, brass and bronze are used in places where the element of construction is particularly subject to corrosion and, as a rule, it is assumed that the yellow metal or alloy will insure practically complete protection from corrosion.

The work done by the Bureau of Standards, however, shows that this is not always the case and that not only aluminum alloys, which it is well known are subject to corrosive action, but under certain conditions brass and bronze suffer from corrosion to an extent sufficient to impair their usefulness as structural materials.

In particular, the paper by P. D. Merica and R. W. Woodward indicates that brass and bronze may be subject to failure when under tensile stress greater than 20,000 lb. per sq. in. and at the same time under corrosive action such as results, for example, from concentrated ammonium hydroxide.

The value of this investigation lies in its contribution toward a clearer knowledge of the life and factors of safety of basic materials of engineering construction and if carried further may indicate the need for more stringent rules for the employment of these factors in places where the metal is subject to hitherto little-suspected destructive agencies.

Ball and Roller Bearings Under Centrifugal Loads

The development of aeronautical engines had made it necessary to use somewhat unusual combinations of machine elements or to employ known elements under new and unusual conditions of operation. One such case was that of a ball and roller bearing rotating as a whole about an axis external to its own geometric center. It was found that if the rollers or balls were above a certain size and the speed of rotation high, bearings with cages of the ordinary type, and bearings without cages, had a very short life.

A series of tests and investigations have been undertaken by the Technical Department, British Aircraft Production, which show that in such cases we have to deal with piling up of the balls or rollers due to the action of centrifugal forces. This in its turn led not only to the development of a new type of bearing, but also to the evolution of the theory of "located" cage design and special uncaged roller bearings. This matter is covered in the abstract of a report of the investigation published in the Engineering Survey section of this number.

The National Budget

A National Budget System is favored by both the republican and democratic parties, and a resolution has been adopted in both Houses, whereby select committees on the budget system have been appointed consisting of 10 members on the Senate Committee and 12 members on House Committee. To these committees will be referred all reports on bills, resolutions and documents for the establishment of a National Budget System, as well as proposed changes in dealing with appropriations, estimates and expenditures.

An outline of the budget plans for our own Government and the budget system used in foreign countries has been submitted, together with an outline of the essentials of the budget system and anticipated results. The Senate Committee, of which Senator McCormick of Illinois is chairman, is now framing and will later present proposed legislation for a Budget System on or before March 1, 1920.

AFTER-WAR EUROPEAN INDUSTRIAL ACTIVITY

EARLY in March 1919 a large delegation of the Cleveland Chamber of Commerce went to Europe to study industrial conditions for the benefit of their community. Mr. E. S. Carman, the former chairman of the Cleveland Section of The American Society of Mechanical Engineers, and the president of the Cleveland Engineering Society, was a member of the delegation and since returning has delivered a number of addresses giving in a general way the results of his observations on after-war European industrial activity. In these he has told his audiences most interestingly his impressions of the trade conditions in the several countries of the Allies and of the destruction wrought in Belgium. In what follows are given excerpts from his remarks that we believe will be equally as interesting to the larger audience comprised by the members of this Society and the other readers of MECHANICAL ENGINEERING. In these addresses Mr. Carman has said in part:

"I have had the great privilege of visiting England, France and Italy and Belgium's industrial plants and of coming in personal contact with their managing directors and engineers and have seen and heard first hand just the condition existing in the various countries from four to six months after the signing of the armistice.

"Arriving in England in early March, I spent two weeks studying the Englishman at home. I heard his complaint, his grumble, his expressed dissatisfaction with his government, with labor, with railroads, with the weather, in fact with everything and everybody—even Americans. His home was cold, exchange value of sterling made the American dollar standard, his food was poor and portions small; he did not have butter, sugar, or cream and he feared that which he did have President Wilson was going to give to the Huns. There was not much activity industrially and labor as a whole threatened to strike on Sunday morning, March 23. The arrogant demands of labor was the paramount talk of the day. The Englishman needed the holiday he had not had for five long years.

"In France the people seemed to be enjoying their new-found and unexpected freedom from the bitter fighting of the past five years. They seemed happy, content and ambitious to take up again the life of peace and happiness. In Paris one is surprised at the gaiety of the throng.

"After visiting the northwest battlefields I left France for a time, entering Belgium. It was here that one asked the question, 'Can Belgium ever regain the industrial position she once held? Can she be a factor in the competition for the export trade of the world?'

"Her industrial plants, stripped by the Hun, are as skeletons, standing upright in all their ghastly nakedness; their hearts have ceased to beat, their flesh, yea, their souls have disappeared, and through their broken windows there shines a light to show the occasional visitor the heartlessness of the Hun.

"We have heard and read of the wilful destruction of the cities and industrial plants of Belgium and Northern France, but neither words nor pen can adequately convey to the mind the real conception of what the eyes can see and the heart can feel—for one must see with his own eyes and hear with his own ears, before he can conceive of the completeness of the devastation that was wrought.

"Then, too, one sees there the human side of after-war, and, if at all sympathetic, his heart is deeply touched.

"I called on a former customer of ours at his office-home in Brussels; a builder of large engines, both steam and gas, also general engineering work. I was shown into the office of the owner (a man of about 55 years of age) and there—after I had convinced him that I was not trying to sell him something but just sympathetically inquiring what I could do to help—he told me the story of his misfortune.

"It developed that his plant was equipped thoroughly with machines of English, Belgian, American and Dutch manufacture. He further stated that of all this large equipment the only thing left was that which was made in Holland as the equipment manufactured in England, Belgium and America had been carried away into Germany.

"It was a sad situation indeed and one that pulled severely at the heart strings to sit in conversation with one who, like the owner of this works, had been well-to-do practically all his life and now, at the age of about 55, did not have a single thing left, and the only people in this large establishment were about six people in the outer office in Brussels.

"In a discussion as to how this vast amount of equipment would be replaced, he admitted he could not see how it could be purchased from America or England, and in answer to the question as to whether or not Belgium could manufacture it, he replied that it could not as they have nothing to manufacture it with. The only course left open for him will be to purchase his machinery and the question is where will he purchase it. Now let us consider this problem from his standpoint. He thinks in terms of francs; they are his standard by which he gages the cost of anything, just as the dollar is ours. The franc is at a discount in dealing both with England and with America. If we quote \$1000 on a piece of machinery, this would normally be approximately 5000 francs, but now with the depreciated value of the franc, he would have to pay 7500 francs for what would still appear to him to be 5000 francs worth of machinery. The same thing is true of English quotations, but on the other hand, consider German quotations. They quote him in marks and a piece of machinery valued at \$1000 will be quoted by a German concern at approximately 4000 marks. Normally 4000 marks would mean practically a price of 8000 francs, but now with the depreciated value of the mark, a quotation of 4000 marks means only 2000 francs, so that if this Belgian manufacturer receives quotations from both America and Germany on a piece of machinery, the normal value of which is \$1000, he will receive a quotation of 7500 francs for the American machinery and only 2000 francs or less than one-third for the German machinery. With money normal, his hatred of the Hun would undoubtedly cause him to purchase the equipment here, but being poverty-stricken, as every Belgian is today, the money consideration becomes one of paramount importance. This is the great question before American manufacturers today. We have the desire to help our Allies, but can we meet conditions in such a way that it will be possible for us to do so?

"The sentiment of the large portion of the Belgian population is very much in favor of America. This was noticeable at every village and city which I visited and I especially call to mind visiting the city of Dinant with its great fortress—the city on which was based the last hopes of Belgium withstanding the German invasion of five years ago; the city that was laid low not by shell fire but by wilful destruction—it was after visiting this city and being entertained by the burgomaster and others, that, in leaving in our automobile and swinging from their main thoroughfare across the River Meuse, a large crowd of school children, waiving their handkerchiefs, cried, 'Vive L' Amerique.'

"Regarding the labor conditions in Belgium, while there was not much being said, nevertheless, upon inquiry, it was found that the workman did not care to work and that where an attempt was made to stir him to industrial activity strike after strike occurred. In many places the demands were immediately granted and then before the workers would accept that which they were striking for, they would immediately ask for more and continue the strike.

"In the city of Alost, the headquarters of the American Food Relief which has now been taken over by the Belgian Government as their headquarters, I found the squares of the city crowded with idle workmen and upon inquiry learned that men out of work were receiving 27 francs per week and with this money, which was paid by the government, they purchased their supplies cheaply from the Belgian Food Relief Stations and lived on this all week. There were at that time about 150,000 Belgians drawing this 'idle' pay.

"In contrast with this idleness it is quite evident that the farms

surrounding the cities required the help of every available man and especially so since all their horses and oxen have been killed or taken away from them by the Huns. One of the most pitiful sights which I saw was two men harnessed together drawing a heavy drag or harrow across the spaded ground.

"Italy has been a consuming nation, importing large quantities of food, clothing materials, and nearly all her iron and steel products of consumption; she has never been known as an industrial or manufacturing nation, but it is my understanding that her after-war aspiration is to become a producer instead of a consumer.

"She feels that the mechanical experience gained in war time should enable her to manufacture and so she has continued and is producing several types of machine tools, hydroelectric power units, motors, etc., as a whole they are crude looking in design and poorly built.

"It was my good fortune to visit many plants in all her large cities, excepting Venice, also a few of the Royal Navy yards and arsenals, including the largest; it was at this plant that I was shown the foundries, machine, pattern, boiler, plate and electric-welding shops. These shops were furnished with only an average equipment and that did not seem to be producing an average output. This being the largest and best navy yard, I was beginning to wonder what the others would look like, when, much to my surprise, upon arriving at the ship yard and entering an enclosure, there lay before me on the ways, a submarine just about ready for launching; it was the last of an order of six; about 20 ft. in diameter and 200 ft. long.

"We give the Italian credit for being an artist and rightly so, but when we think of art we think of painting and sculpture, of palaces and song, but hardly do we expect to see such graceful lines and curves upon a submarine, an engine of destruction. As I looked upon this thing of elegance and beauty, an artistic design with workmanship most skillful in the bending, shaping and riveting of the heavy plates, the American instinct began inquiring within, Was not this built for fighting? Was not this built to win a war, and at a time when labor, capital and skill was in great demand? Why, pray tell me, why the utter waste of labor, capital and skill necessary to fashion these heavy plates in such an artistic manner? Would not a more simple design accomplish the same work?

"What position will Italy hold in the after-war struggle for commercial supremacy? Can she put into articles for general world-wide consumption all the laborious skill that she now puts in her works of art? And can she put into her products that exceptional amount of labor which she puts in the construction of her public works? For I recall that while passing in a train I observed that a winding river in the bottom of a valley was being straightened; the cut being perhaps a mile long and the section which was being excavated was approximately 50 ft. wide by 8 ft. deep; and all this vast amount of earth was being removed by spade and wheelbarrow methods.

"As one travels throughout Italy it becomes at once apparent that the business and home life of the Italians is one of ease and primitive in manner and habits; there are not to be found the many conveniences, and in fact the necessities of the American home and office; mechanical appliances in everyday life are unknown. Labor is plentiful and cheap. Yet when output and cost are compared with ours, their costs will doubtless be much higher.

"Before Italy can export she must consume, and to teach her people to consume requires the changing of customs as old as history itself—a great task indeed.

"In France the conditions are quite different. France has a people whose habits are advanced and her workmen know how to produce a day's work for a day's pay. There seems to be a willingness on the part of the workmen.

"It was my privilege to be the first American civilian to inspect the greatly enlarged works of Schneider & Co., at Le Creusot. I have heard this company spoken of as "The Krupps of France" and so it is, for on every hand was to be seen ordnance of all sizes and description.

"This great plant which was responsible for the furnishing of much of France's war weapons, is now at work building instruments of peace and the preparation is now being made to convert still more of its many shops to the manufacture of useful peace time machinery.

"France is busily at work now, but France has years of work ahead to rebuild, repair and reëstablish her industries and that too with over three million of her best and most skillful workers either dead or disabled. Can France give attention to world-wide trade? Not yet,

"And now, what about England? Yes, England has all that is necessary in the way of equipment to have and to hold the world's trade, but one thing she lacks—a willing labor. England's labor will not work, regardless of the rate of pay; the day's output is restricted and retarded.

"Her plants are not busy. Her labor is unemployed. Her masters are indifferent and I fear in many instances unconscious of the storm that will sooner or later break in great fury. We must look further back than the near past before we can begin to suggest the causes for all this present unrest. Europe's age-old curse—man and master, snobbery and hatred—is at the bottom of all her troubles. She does not and will not recognize that all men have an inalienable right to earn a livelihood and pursue the paths of peaceful, honest and happy living. Many of the masters of industry are autocratic, as are also the masters of labor. They are continually striving one with the other.

"Can England be a factor in the race for world-wide commercial supremacy? The question is a hard one to answer and I believe from observation we shall have plenty of time to wait for a reply. England has troubles of her own."

Business Engineering at Stevens

In another column, Prof. Walter Rautenstrauch of Columbia University comments upon the movement in several colleges, including Columbia, toward courses in administrative work in combination with engineering training to prepare young men for broader activities of engineering and manufacturing. In this connection attention should be called also to the fact that in certain institutions lectures are given in business administration and economics as a part of the regular course of engineering, in distinction from the new courses referred to by Professor Rautenstrauch in which business administration is coördinate with the engineering subjects.

A pioneer in adopting such instruction is Stevens Institute of Technology. Dr. Alex. C. Humphreys, President of the Institute and Past-President of The American Society of Mechanical Engineers, combined with H. de B. Parsons in suggesting that as far as time would permit, instruction should be given at least to members of the senior class on commercial conditions and methods affecting engineering enterprises. The result of these suggestions was that a course of four lectures was delivered to the senior class in the spring of 1897, the first being prepared by Dr. Humphreys and the second by Mr. Parsons. Additional lectures were prepared by George R. Turnbull, vice-president of the Guaranty Trust Company of New York, on Accounts and Accounting, and by William Sherrer, manager of the New York Clearing House, on the Relation of Money and Banking to Engineering Work. During the next college year it was not found practicable to provide regular instruction along the lines suggested, but a brief course in accountancy was offered to the senior class in the spring of 1899.

When Dr. Humphreys assumed the presidency of Stevens Institute, he promptly determined to enlarge the scope of this instruction and, as a result, the Department of Business Engineering was established under his direct supervision; the title of the department being later changed to "Economics of Engineering."

Other lectures have been given from time to time and a selection of these have been gathered together in book form as lecture notes for the use of students. These now comprise a volume of nearly 600 pages upon such subjects as accountancy, depreciation, shop costs, analysis of data, specifications, estimates, law of contracts, patent law, and business methods in general. These probably constitute the most complete volume which has been published on what Dr. Humphreys is pleased to call The Economics of Engineering for the use of engineering students.

FORMULATION OF POWER TEST CODES

Methods of Testing Power-Plant Apparatus now being Standardized by the Largest Committee of Mechanical Engineers

TEN years ago a committee was appointed by The American Society of Mechanical Engineers, known as the Committee on Power Tests, to revise the various testing codes of the Society pertaining to boilers, pumping engines, locomotives, steam engines, internal-combustion engines, etc., and to extend these codes to include other apparatus. The report was presented at the Annual Meeting in 1915 and has since been in extensive use throughout the country.

Appreciation of the Code by the profession led to a proposal for its thorough revision, including the amplification of its several sections where necessary and the formulation of new codes to cover other types of power-plant apparatus. Accordingly, in December 1918 a committee was appointed by the Council to revise and extend the Power Test Code. Nineteen individual committees of specialists in different fields were also appointed, as listed in what follows. The following instructions and directions defining the work of these individual committees in order to facilitate coöperation and avoid conflict have been issued by the committee:

Plan of Organization

The Main Committee has charge of the plan and scope of the work, determines what codes shall be formulated, nominates or suggests those to be appointed by the Council as members of the committees charged with the formulation of the individual codes and suggests revisions if necessary to correlate their work with that of the other committees and with the general plan. When a code submitted by an individual committee is complete and satisfactory, the Main Committee transmits it to the Council with its recommendations, and when approved by the Council it is published as the A. S. M. E. Code upon its particular subject over the signatures of the members of the Individual Committee that formulated it.

The Main Committee holds stated meetings on the first Monday preceding the first Tuesday in March, June, October and December to consider reports from the Individual Committees and such other business as may properly come before it. An Executive Committee of nine of its members, easily accessible to headquarters, functions in the interim. A secretary is assigned to the committee by the Society.

Committees on Individual Codes

The policy of the Main Committee has been to select committees to formulate the individual codes with a view to obtaining the best thought and experience of the profession with regard to the special subjects in hand. The choice of members has not been confined to men belonging to the Society. Special knowledge of the subject is considered more important than society affiliation. A list of the committees, with their personnel as determined to date, is given below.

The committees are favored by the coöperation of other societies. The Committee on Hydraulic Power Plants is composed, for instance, of three representatives each from the American Society of Civil Engineers, the American Institute of Electrical Engineers, the National Electric Light Association, and our own Society. Our Committee on Refrigerating Machines and Plants is identical in its membership with the committees appointed for a similar purpose by the American Society of Refrigerating Engineers. The Mechanical Section of the American Railroad Association has officially designated Mr. A. W. Gibbs to represent that body on our Committee on Locomotives, and our Individual Committees include representatives from the U. S. Bureau of Standards, the U. S. Naval Academy Testing Station, the Machinery Builders' Society, the Hydraulic Society, etc.

The Individual Committees are expected to choose their own officers and perfect their own organization. They are free to seek the coöperation of everybody having information upon or interest in their respective subjects, especially those whose interests will be affected by the Codes. The Committee on Steam Engines, for example, wrote to 119 engine builders, telling them that the Steam Engine Code was to be revised and soliciting their suggestions and interest. Committees may avail themselves of the coöperation of other societies or committees interested in their subjects; but if it is desired to add to their membership or to invite an organization to formal participation in their work by the appointment of representatives upon their committee, recommendations should be made to the Main Committee that the persons desired be appointed or an invitation for such representation be extended by the Council.

Records of the meetings of Individual Committees are to be sent in duplicate to the Secretary of the Main Committee, in whose office one set will be kept intact for reference, the other set being available for circulation among other committees that may ask to see it.

General Instructions

The work of some of the committees is so interrelated that an interchange of records of conclusions reached or important points under consideration will be helpful if not necessary.

The chairman or secretaries of Individual Committees are to indicate to the Secretary of the Main Committee what other committees are likely to be interested in their reports and in the reports of what committees they are likely to be interested. Differences of opinion as between committees will be reconciled if possible by correspondence or joint meetings, but if irreconcilable will be reported to the Main Committee.

Description of instruments, apparatus and methods—such as the salt or color method for measuring the rate of flow of water—and their correction, calibration and use will be treated by a special committee.

Instructions which are not special to their particular codes will be referred by Individual Committees to Committee No. 1 on General Instructions.

Individual Committees will refer the definitions of terms and the fixing of values of physical constants, etc., to Committee No. 2 on Definitions and Values.

The codes formulated by the Individual Committees will treat of special applications of such instruments to their particular code; but refer to the section on Instruments and Apparatus for directions for the calibration, correction and utilization of the instruments themselves. Matter in the codes under revision or suggestions as to points desired to be included in the treatment of instruments, apparatus or methods involved in their work, or already completed upon such instruments applicable to other codes, are to be referred by Individual Committees to Committee No. 19 on Instruments and Apparatus.

The codes will eventually be available in printed form, both in a single volume and separately. Each code when printed as a monograph will be accompanied by the General Instructions, Definitions and Values, and pertinent selections from the section on Instruments and Apparatus and from the Appendices.

Special Instructions

No. 3. Committee on Fuels will formulate a code for the testing of all kinds of fuels, liquid and gaseous as well as solid, and will include the treatment of Flue-Gas Analysis, sampling, the determination of the fusibility of ash, etc.

No. 4. Economizers will be treated by Committee No. 4 on Boilers.

No. 7. Displacement Pumps do not include rotary displacement pumps. (See No. 8.)

No. 8. Centrifugal and Rotary Pumps include displacement pumps of the rotary type as well as those acting by centrifugal force.

No. 9. Displacement Compressors and Blowers include displacement compressors and blowers of all classes, rotary as well as reciprocating.

No. 12. Condenser Units and Feedwater Heaters. The title of this code has been changed to "Condensers, Water Heating and Cooling Equipment." This committee considers cooling towers, spray systems, etc., as well as condensing and heating apparatus proper.

No. 17. Gas and Oil Engines. The title of this code has been changed from the above to "Internal-Combustion Engines."

No. 18. Water Wheel Code. The title of this code has been changed to "Hydraulic Power Plants." This committee will prepare the code for testing turbines and all prime movers actuated by water.

No. 19. Instruments and Apparatus. This committee will prepare directions for the calibration, correction and application of instruments and methods for determining test values and conditions.

The Secretary of the Main Committee will furnish an account of the conclusions arrived at:

By any of the Individual Committees	to all members of the Main Committee
By committees 1 General Instructions 2 Definitions and Values	to all members of all committees
By committee 19 Instruments and Apparatus	to all members of all committees in the work of which the instrument or apparatus reported upon is involved

By committee 3 Fuels { to committees
4 Boilers
11 Complete Power Plants
15 Locomotives
16 Gas Producers

The members of the Individual Committees have been selected with especial reference to their special knowledge of their respective subjects and it is the intention to have the codes when issued embody the best thought and experience of the profession. Advance proofs of each code will be sent to all who are qualified to discuss and constructively criticize them, inviting their comments before the code is issued. The members of the committees are widely distributed geographically and most of their work will have to be done by correspondence; it being impracticable for the Society to reimburse the many who are helping to carry out its purposes for expenses incurred in attending meetings.

TORPEDO-BOAT DESTROYERS IN THE MAKING

(*Continued from page 743*)

From a management standpoint, it is of value to note that the interest and enthusiasm of the working force who accomplished this feat were worked up and maintained by the men themselves. They produced their own cartoonists, banners, graphic daily records, and vaudeville stunts, and jealously guarded the industrious performance on the part of each workman. Not a man or boy was discovered loafing on any part of the work, and it was the usual thing for both mechanics and helpers to move "on the run" while employed on the *Ward*.

Reference has not been made in the above to the introduction of gas and arc welding in destroyer construction, but the progress along these lines has been such as to warrant the prediction that a very considerable amount of riveting work will in the future be performed by welding. At the present time certain bracket stiffeners are arc-welded on many vessels and similar means are being used for securing various deck fittings, such as cleats, bolts, chocks, bitts, trunks, etc. Also, gas welding and cutting are extensively used in the intricate stapling and other furnace work formerly tediously and expensively done by the anglesmith.

The development of the torpedo-boat-destroyer type is still in progress. The British Navy had in service during the war a vessel of the torpedo-boat-destroyer type but of about 50 per cent greater displacement. These boats are known as "flotilla leaders," that is, they are employed as the flagboats of destroyer flotillas or divisions. They carry a heavier armament, more power and the added personnel necessitated by their increased displacement over that of regular destroyers. Consideration has been given to the addition of units of this type for our service but no definite information is available as to the status of this question at the present time.

RECATALOGING THE U. E. S. LIBRARY

A Discussion of Interest and Value to the Profession Generally, Dealing with the Principles of Cataloging and Systems of Classification

TO THE LIBRARY BOARD
OF THE UNITED ENGINEERING SOCIETY.

Gentlemen:

In accordance with your desire to have a brief statement of the principles upon which it is proposed to recatalog the Engineering Societies Library, I beg to present the following account.

In order that the technical terms used may be clearly understood, some general definition of them is desirable. The principal purpose of library catalogs is to enable a reader to find a book of which either (1) the author, (2) the title, or (3) the subject is known; to show what the library has (4) by a given author, or (5) on a given subject; and to assist in the choice of a book, (6) as to its edition, or (7) as to its character.

An Author Catalog fulfills the 1st, 2d, 4th, 6th and 7th of these subjects. The *author* in a narrow sense is the person who writes a book; in a wider sense it is applied to him who is the cause of the book's existence, e.g., editor, translator, compiler, etc. Bodies of men, societies and countries are, from a cataloging point of view, considered the authors of their official publications, memoirs, transactions, journals, proceedings, reports, etc. All names selected as author names are arranged in strict alphabetical order.

A Subject Catalog fulfills the 3rd and 5th of the objects named above by entering or registering each book under the name of that subject or topic of which the book chiefly treats. It may or may not be alphabetical in arrangement. If the arrangement is not alphabetical the catalog is commonly called a Classed Subject Catalog, although this name might with equal propriety be applied to some alphabetical arrangements.

The present catalog of this Library is composed of several parts, as follows:

1 An author catalog, formed by interfiling the catalogs of the four constituent libraries
2 An alphabetical classed catalog covering three of the original collections
3 A classed subject catalog of the Library of the American Society of Civil Engineers
4 An alphabetically classed catalog supplementing No. 3 and acting as an index to it as well
5 A printed index to periodicals, published in 1915, and now vitiated by the changes that have occurred. These periodicals are not represented in Nos. 1 and 2.

It is proposed to substitute for these catalogs an author catalog and a classed subject catalog, the latter to be accompanied by a very full index.

AUTHOR CATALOG

The nature of this catalog is best shown by a statement of the kind of entries that the books will be entered under. These are:

1 Full names of the author or authors, with identifying information when books by different individuals of the same name appear
2 Corporate entries; names of societies, organizations, countries, cities, etc., which are considered the authors of the publications issued in their name or by their authority
3 Titles of periodicals
4 Added entries, comprising the names of joint authors, editors, translators and other persons or bodies other than the one under whom the main entry is made, who had some connection with the making of the book.
5 Analytical author entries for books or articles contained in a collection, e.g., a volume of monographs by various authors, a series, a collection of reports, etc.
6 Cross-reference cards, referring from any form of a name under which a book may be sought, to that form which has been selected for the catalog. These cards take care of alternative, incomplete or foreign forms of names, variations in spelling, translation or transliteration.

The present author catalog, except for the omission of periodicals, is reasonably satisfactorily. Work upon it will be restricted to the addition of these, correction of errors, revision of the location marks, harmonizing of differences of method of entry in the original catalogs composing it and the insertion of additional analytical entries.

SUBJECT CATALOG

For the various alphabetical and classed subject classifications now extant it is proposed to substitute a single classed subject catalog in which the books will be arranged systematically according to their chief contents and to the classification adopted.

Classification has been defined as "the art of placing a book in that part of the library where all similar books on the same subject are placed." In a classed subject catalog it means the entry of a book in that place in the catalog where all similar entries on the subject are collected.

In the classification of books on the library shelves certain difficulties arise to prevent complete attainment of the ideal. The physical book can of course stand in but one place and the business of the classifier is to determine the group to which it belongs and place it there. It is a common thing, however, for a book to treat of more than one important subject. Books on water supply, for example, frequently have long chapters or sections on dams; similarly, books on steel making often give considerable space to rolling mills. These conditious make it impossible to collect the library's resources on the shelves.

It is the business of the catalog to furnish a means by which the reader who desires to see what the library has on dams or rolling mills is made cognizant of the valuable information contained in books treating of water supply or steel making, as well as of the books treating solely of the former subjects. This can be accomplished in the catalog by inserting additioual entries at as many points as seem desirable, so that it will reveal the real resources of the library, insure the efficient use of all the books, and prevent the overlooking of important material germane to the subject under investigation.

The order in which our subject groups follow each other in the catalog will not be alphabetical but a systematic one, in which subjects are divided and subdivided in subordinate groups which succeed each other. As a guide to this arrangement an alphabetical index will be necessary, showing the location of each subject in the catalog. With it, it will be possible to ascertain without delay whether or not the library possesses books on a subject and where these are listed in the catalog.

When these catalogs are completed the catalog equipment of the Engineering Societies Library will be as complete, detailed and satisfactory as it is possible to make it. Our catalogs will be true and helpful guides for all reasonable methods of approach by readers. They will give the information that may properly be expected of them, and a little more. It must, however, be kept clearly in mind that it is not the province of a library catalog to do a reader's work for him or to indicate all possible or probable sources of information on a subject. This is decidedly not the case; but many persous too often approach a great reference collection with the expectation that the information they want and the precise form in which they want it are contained in the catalog or the heads of the assistants. It is common experience for readers to want a book or article treating a subject from exactly the angle or point of view in which they are for the moment interested. They will, for example, ask for a book on Materials Used in Pump Construction. No work exclusively devoted to this topic has, I think, ever been written. Information on these materials may, however, be found scattered through scores of works on the strength of materials, materials of engineering, pumping engines, metallurgy, etc. The work of collecting the scattered data is the duty of the reader and not of the catalog, which should only be expected to reveal the material on which whole books or articles have been written. In other words, the catalog cannot be expected to act as an index to all the books in the library.

The author catalog will enable the reader to find a book when the name of the author is known, to find what books by any author are in the library and also the various editions available; translations as well as their originals will be shown.

The subject catalog will enable the reader to fiud a book when the subject is known, and will exhibit the resources of the Library in orderly form on every chief and most suborbinate topics within its chosen field.

The alphabetical index will comprise the names of the subjects of knowledge upon which we possess important books or pamphlets, and it will at once direct the user to that section of the subject catalog where these books are listed and to the department of the Library where these works are shelved.

These three instruments, properly and patiently used, will give all the assistance that may fairly be expected of them. They will be guides and indicators, not dictionaries, or encyclopedias, but the latter functions should not be demanded of a catalog.

CLASSIFICATION

Two distinct but related problems in classification confront the librarian: the classification of the actual books in order to bring the volumes on each subject together on the shelves, and the classification of the cards representing the works in the library, so that its resources on any subject can be ascertained from the catalog.

It is obviously desirable that the same classification should be adopted for both these purposes; but it is not essential, and as a matter

of fact, some variations between the arrangement of the two classifications are found in most libraries, occasioned by local conditions that seem to warrant a deviation from the logical plan.

We propose to adopt the same classification for all our work, but in doing so it is the intention to keep clearly in mind the basic difference between the classification of the two kinds of material, due to their fundamental physical differences.

Books frequently treat of several subjects or the relations of two subjects to each other. One copy of a book can be shelved in but one place, with the result that only in the broadest sense can it be said that the books in any section of shelves contain the library's resources on a subject. If the books on the metallurgy of iron, copper, etc., are segregated under these specific headings, the alcove for electric furnaces cannot contain all the material on that subject. In the catalog this dispersal of material can be overcome by placing cards under both subjects, or under as many as may be thought desirable.

For many years librarians have been divided into advocates of "broad" classification and "close" classification. Those of the former party base their arguments on the expense of close classification, the impossibility of closely grouping the books on a subject and the cumbersome notation involved in the close classification of a large collection of books, causing frequent mistakes in replacing books on the shelves.

Those who favor close classification point to the saving of the readers' time resulting from it, especially in growing and large libraries.

The point of view adopted seems dependent upon whether classification on the shelves or in the catalog is actually in mind. Close classification in the catalog is undoubtedly desirable; on the shelves it is practically impossible.

In our work we intend to adopt a plan by which the classes on the shelves will be small enough to be conveniently surveyed by a reader, but not so small that extremely long location numbers will be necessary or that every book on a subdivision of a topic is actually touched by another book on the same subdivision; while at the same time the classification in the catalog will be carried to a point where it will be possible to locate a specific subject without examining much related matter.

The scheme of classification that seems best adapted for our needs as indicated above is the Dewey classification as extended and modified by the Institute International de Bibliographie, usually known as the "Brussels" classification, to differentiate it from its progenitor.

This classification follows Dewey's plan in the adoption of a decimal notation and in the arrangement of its main classes. Human knowledge is divided into nine classes and each is given a decimal number as .1, .2, .3, etc. The numbers beginning with .0 are reserved for encyclopedias, newspapers and other material too general in inclusion to be assigned to a specific class.

Each class is divided and subdivided as may be necessary, the location of the classes being indicated by the addition of numbers at the right of the class numbers, as is illustrated by the following example:

.6	Applied Science
.62	Engineering
.622	Mining
.6223	Exploitation of Mines
.62233	Of Coal Mines

This process can be repeated indefinitely.

The Brussels classification differs from the Dewey classification in two important particulars, one of which is a matter of minuteness, the other of form. As regards the first difference, it is probably sufficient to state that the published tables cover 2259 pages, in comparison with the 808 pages of the latest edition of Dewey. This extension of the tables permits a much closer direct classification of material.

The other change is much more important. One of the chief defects of the original Dewey classification is that, owing to the fact that it was planned primarily for the arrangement of books, it lacks certain apparatus needed in classed catalogs. It is not sufficiently minute for the latter purpose and it lacks a method for subdividing existing headings in order to express details, various points of view and the relations between different subjects. For example, it is sometimes convenient to separate the material on some subject into classes by date, language or thoroughness of treatment; or to separate the statistical works on a subject from the technical ones.

The Brussels classification provides for such needs by the addition of certain symbols to express relations and of detailed general tables of usual relations, which can be added to any subject by means of these marks. The symbols adopted are few, their position in the arrangement of items is clearly specified and their use carefully explained. They are outlined below in the adopted sequence.

Accretion Sign: The sign of addition, +, is issued to indicate that a book treats of all the subject number connected by it: e.g., 621.32-621.33, a book on electric lighting and electric traction.

Coupling Sign: The hyphen, —, is used in certain special cases to enable one subdivision within a class to be combined with another in the same class without confusion. The class number for agricultural land drainage is 63.11 and for forestry 63.49; the number 63.49-11 can be composed to indicate works on the drainage of forests.

Relation Sign: The most important of the symbols adopted is the relation sign, the colon, : . When used in the classification to join two numbers it indicates that the subjects represented by them are considered in relation to each other. It enables us to extend the classification to great lengths in order to express relations, without having to provide the apparatus in advance. Taking, for example, the number for rolling mills, 621.77, and the number 310, statistics, we can form the combination 621.77:31 representing the statistics of rolling mills.

Form Sign: Divisions of the literature of a subject by form are made by using a parenthetic number beginning with zero, (0 ——). This is further divided into form divisions which can be used at any place, and divisions restricted to special subjects.

These forms enable the classifier to express such differences in the form of material as are represented by treatises, dictionaries, periodicals, histories, etc. A periodical on metallurgy has the number 669(05), a history of that subject is 669(09).

Examples of the special form division are 621.313(008), Patents on dynamos; 621.325(003), specifications for electric arc lighting; and 622(007) mining law.

Place Sign: Place is indicated by numbers which are written in parentheses and refer to a special geographical table. The table also provides for the differentiation of geologic periods. Examples are: 625(41) railways of Scotland; 621.19(73) steam-power plants in the United States.

Language Sign: Language divisions are indicated by the equality sign, =, followed by a number. We are thus enabled to divide a subject by language if we wish, as 62(05)= 44, French engineering periodicals.

Time Sign: It is sometimes convenient to specify time in our classification. This is done by adding the date in parentheses, as 623(09) "17", the history of military engineering in the eighteenth century.

General Points of View: The sign for these is a double zero, 00. The supplementary tables are:

001 Speculative: idea, plan, purpose, etc.
002 Realization: execution, construction, etc.
003 Economic: industrial production, cost, etc.
004 Service and use: workings, administration
005 Equipment and apparatus
006 Buildings and establishments; organization and service
007 Special personnel

Subdivisions are provided for these numbers.

These supplementary tables are especially useful for the classification of scientific material, such as that in the Engineering Societies Library. They enable us to indicate the point of view of any article when the main division to which it belongs lacks the necessary intention. They provide, for example, for such an analysis of material as

62163.0012 Theory of centrifugal ventilators
62163.0031 Manufacturing costs of centrifugal ventilators
62163.0042 Operation of centrifugal ventilators

As examples of the classification the following arrangements of material by form and by point of view may be interesting:

By Form		
621.13	Locomotives	
621.13(02)	Treatises on the locomotive	
621.13(44)	Locomotives in France	
621.13(5)	Locomotives in Asia	
621.13 "19"	Locomotives in the twentieth century	
621.13 : 622	Locomotives in mining	
621.13 B	Baldwin locomotives	
621.13.0014	Locomotive tests	
621.13.04	Locomotive boilers	
621.13.42	Locomotive valve gears	
By Point of View		
621.12	Marine engine

These examples illustrate the minuteness with which material can be classified if necessary, and the various forms of classification that may be used to meet special needs or the peculiarities of certain kinds of material. It is not necessary, of course, to introduce such great refinement in all cases, nor, in fact, in many, but the possibility of such subdivision, whenever desired, is very valuable.

A frequent objection to the decimal notation is the lengthy numbers that it requires. This objection is sound if the classification of books on library shelves is intended, for it is difficult to mark long numbers clearly on books, or to arrange these rapidly when so marked. The objection loses its force when the numbers are only used for filing cards in catalog trays, for these are not removed after having been once filed and there is also no necessity for copying the numbers.

ENGINEERING COUNCIL

Engineering Council[1] is an Organization of National Technical Societies of America, Created to Consider Matters of Common Concern to Engineers, as Well as Those of Public Welfare in Which the Profession is Interested

Activities of Council Representatives on Government Boards and Commissions

It is the desire of Engineering Council to be represented in all government bodies and commissions, and to that end the Council recently decided to urge upon President Wilson the appointment of one or more engineers to fill vacancies now existing in the Interstate Commerce Commission. Such representation would unquestionably prove of mutual benefit to the Interstate Commerce Commission and Engineering Council, and it is hoped that the President will approve of and act upon the suggestion offered.

Mr. Rudolph P. Miller, Mem.Am.Soc.C.E. and a consulting engineer of New York has been appointed as the Council's representative on the National Board for Jurisdictional Awards in the Building Industries. This board, whose function it is to settle disputes arising among the various parties engaged in the building industries, held its first meeting on August 11 in Washington, D. C. E. J. Russell of St. Louis, the representative of the American Institute of Architects, was elected chairman, and William L. Hutcheson of the American Federation of Labor vice-chairman. No further action was taken at this first meeting, as the cases on hand were not in the form required. They accordingly will be returned, to be resubmitted in the prescribed manner, and will be considered at the next meeting of the board, which will be held early in November.

Philip N. Moore, a past-president of the American Institute of Mining and Metallurgical Engineers, and the only engineer member of the War Minerals Relief Commission (see MECHANICAL ENGINEERING for May p. 489 and for July p. 634), is now engaged in holding in many of the western cities hearings of claims submitted to the commission. While thus engaged Mr. Moore has been the guest of several of the western engineering societies, and has been offered the opportunity of speaking before the engineers of Portland, Ore., Spokane, Wash., and Butte, Mont.

To the courtesies thus extended Mr. Moore has responded by discussing the activities of the Council and its efforts in behalf of the proposed Department of Public Works to which reference has frequently been made in MECHANICAL ENGINEERING.

Mr. Moore pointed out that the agitation for centralization of engineering work in this country is not new, but has been the hope of the profession for years. In fact, so much so that it has been given definite form many times when the question has been considered. A National Department of Public Works has therefore been proposed, and the profession is now again urging the creation of such a Department in which the engineering activities of the country will be brought together under one head instead of being dissipated as at present among many bureaus.

NATIONAL SERVICE COMMITTEE

Contributed by the Washington Office[2]

A Comment on the Department of Public Works

On October 28, 1884, Mr. Clemens Herschel, Mem.Am.Soc.C.E., published a pamphlet which contained the following statement:

Let those who may shun the proper organization of the States and of the General Government for the systematic construction and maintenance of public works think of one thing: no nation has yet existed that was wholly without them, and this nation, no less than most or all of its states, in spite of all obstacles, has had them, and *is constantly having them*. The question becomes reduced then to this simple proposition: shall our public works be built, and, what is of equal importance, maintained, in a proper, business-like manner, getting year by year a dollar's worth for a dollar's expenditure, or shall the shiftless, hand-to-mouth method of procedure, which looks not forward, and hides its shiftlessness by denying that we have any public works—shall this wastefulness of the public funds be allowed to continue?"

Mr. Herschel is one of the few Public Works Department pioneers who still remain among us, and it will therefore be of interest to read what he has to say thirty-five years subsequent to the date of the foregoing. We accordingly quote from a recent letter to the National Service Committee:

It appears to be no longer necessary, as I can well remember it was in times past, to argue that public works are an essential accompaniment of a civilized state. Formerly such works were, with us, called "Internal Improvements," and schools of political philosophers spent much time in proving, from their view of the Constitution of the United States, that private enterprise was all-sufficient, and consequently should be solely allowed to construct our public works; and again, the reverse of this proposition. That day has gone by. What Henry Clay thought about it, what those opposed to him wanted done on those lines, are both of small importance at the present day. This is a present-day nation of 110 million inhabitants; not a parcel of pioneer colonies, beginning to develop as a modern state. This is the year 1919; not 1819, when the building of the Wheeling turnpike, and of the Erie and other canals first brought the Government at Washington face to face with the need of a governmental executive agency, for the design and construction of public works; not to mention their repair, maintenance and operation, after they had been completed.

In the emergency thus created, midst the clash of resounding rhetoric of the "strict constructionists" who denied the right or power of the United States to undertake any public works; and of the statesmen who argued for the development of the country by the aid of United States governmental agencies, was born the system still in vogue—at the time intended as a temporary measure—of calling upon the military branch of the Government to assume civil-engineering functions. It could not well then have been otherwise. There were no civil engineers in the country, or at least so few, that they formed no material part of the body politic.

The first use of the word engineer, as is well known, came from the exercise of refined military work, and there were none but military engineers, as far as is known, until about 1780, which was some 40 years before the rise of the discussion concerning "Internal Improvements" in the United States.

In 1782, "a Mr. Smeaton," as the law books have it, in the leading case of Folkes vs. Chadd, was called to give his opinion (not testimony) from the witness stand, and thus became the first "expert witness" in English court procedure. This was no other than the celebrated John Smeaton, F.R.S., and of many other titles; the builder of the renowned first built permanent Eddystone Light in the English Channel, and who was the first man to sign his reports as coming from a Civil (not military) Engineer, and thus, also, the first English-speaking "Civil Engineer."

Forty years later, in America, there were, to be sure, surveyors—George Washington had been one of them—but no engineers that were noticeable, except the graduates of West Point, and other military engineers that had been imported for and had survived the Revolutionary War. And so the country turned for its civil engineering, for its turnpikes and canals, to the Department of War, and as an emergency measure designated members of the Corps of Engineers, U. S. Army, were temporarily detailed to supervise the construction of these works.

The wide world over there are today but two systems of providing for the construction and operation of public works: first, either to ignore the necessity for their existence in a civilized state, and thus provide for them by emergency measures; or second, to consider them as forming part of the every-year work of the government of a civilized state, and provide for them in the fundamental law governing such states, in the same way that Departments of War, Navy, Treasury, and even the bodies exercising police powers or the judiciary are provided.

Under the first caption come Great Britain and her dependencies, but even these do not call upon the Royal Engineers (corresponding to our Corps of Engineers, U. S. A.), unless exceptionally to approve the construction of a new railroad, before it is opened for travel.

[1] Officers of Engineering Council: J. Parke Channing, *Chairman*; Alfred D. Flinn, *Secretary*, Engineering Societies Building, 29 West 39th Street, New York.

[2] Washington Office in charge of M. O. Leighton, *Chairman*, National Service Committee, McLachlen Building, 10th and G Streets.

Under the second caption comes each and every European continental country, and, so far as I am informed, the civilized countries of all the rest of the world.

The great exemplar of relying for all public works upon private enterprise, is England. When public works had to be built, harbor works, works of water supply, metropolitan sewerage, and others, the emergency system was followed. For each case a select body of laymen, a so-called commission, would be appointed, and an emergency corps of civil engineers gathered as an executive agency. The commission would studiously, and in some measure, qualify itself for its task, works would be executed, and the whole organization would then dissolve into its original elements. Of course there are exceptions to and variations from this normal state of affairs. And England, it may be said, has grown heartily tired of its want of organization for purposes of constantly recurring and as constantly necessary work, which has been described. The light is beginning to break in upon her, as it must also sooner be apparent to the United States.

The second method for a state to care for its public works a host of our civil engineers and others have no doubt recently seen in operation, even in war times, in France and in other European countries. The Minister of Public Works, an important member of the Cabinet, stands at the head of the organization. In the United States, let me say at once, the Secretary of the Interior could without much disturbance, be converted into such a Secretary of Public Works.

The great change that must come, if public works are to be economically and efficiently designed and constructed, is that of constituting a permanent corps of civil engineers to do the civil-engineering work of the country, under a Secretary for Public Works such as described. It is the only efficient way. Organizations built up as emergency measures must give way to it.

It is its permanence of organization, the holding of like service to the Government, that has always given the Corps of Engineers the respect of the President and Congress. A commissioned corps of U. S. Civil Engineers would equally have the respect of the President and of Congress. It would also and to the same extent have the *esprit du corps*, the trustworthiness and the like desirable attributes that naturally belong to and go with a fixity of tenure of office, and with governmental responsibility.

The Secretary for Public Works and his corps of civil engineers once organized, other and allied work of the Government not already there would naturally come to the same department; for instance, the Geological Survey, Bureau of Mines, Bureau of Standards. Once form a Department whose chief functions are those of civil engineering, and the perfection of its organization and its power to do efficient work for the United States would naturally follow.

The Coast and Geodetic Survey

It is the function of the Coast and Geodetic Survey to chart the coast lines and the waters of the United States and its possessions; make studies and prepare tables and charts of tides and currents; to provide an accurate triangulation control of the interior of the United States; to establish precise level stations; and to make magnetic surveys for the determination of true declination.

The history of the Survey shows that it has been under the Treasury, Navy and Commerce Departments, and that it is now following out a general policy laid down in 1843 while it was subordinate to the Treasury Department. Its early years were marked by many changes of policy and of authority and by little effective work. The survey of the coasts was first authorized by Congress on February 10, 1807. Broad plans for the conduct of the survey were made by F. R. Hessler, a scientist of Swiss birth, and the Treasury Department was made responsible for carrying out these plans. Precision instruments were not available, however, in this country, and had to be secured from abroad, and this, together with the war with Great Britain in 1812, delayed all work on the survey until 1816.

The Survey had barely begun its work when Congress, on April 14, 1818, repealed much of the statute authorizing the employment of other than Army and Navy Officers in the Survey. The War Department made no surveys and the work of the Navy Department was also quite unsatisfactory and so, on the recommendation of the Secretary of the Navy and of others, this Survey was given back to the Treasury Department by Congress in July, 1832, and the law of 1807 with broader powers was reenacted.

The Survey remained under the Treasury Department only two years and in March, 1834, was again transferred to the Navy Department under whose jurisdiction it remained for a similar period, and then was again given back to the Treasury Department, where it remained until July 1, 1903. It was then placed under the Department of Commerce by Act of Congress approved February 14, 1903.

In 1843, while this Department was still under the Treasury Department and the question of retransference back to the Navy Department was being discussed, the President appointed a board to formulate and develop a plan for a permanent organization of the Survey. The report of this board was approved by the President on April 29, 1843, and the work of the Survey has ever since been modeled along the lines then laid down. After the adoption of this report until the war with Spain in 1898, nearly one-half of the vessels of the Survey were manned and officered by the Navy, but since that time the civilian officers and employees of the Survey have officered and manned all vessels.

The results of the Survey's work are made use of by commerce, by the railways, by land owners of every kind and by all enterprises whose primary investigations require the use of maps. The placing of all of these surveys, therefore, whether by land or by sea, under the proposed Department of Public Works would insure a comprehensive mapping plan, the use of consistent scales and legends on all maps, and would bring together a permanent corps of skilled surveyors who would be capable of mapping the interior of the United States with such exactitude as would make their results of unlimited value in time of peace as well as in time of war.

Instead of twelve independent bureaus making surveys, each without liaison with the other eleven bureaus, there would thus be one central department planning and conducting this work, weighing the comparative needs of different sections, and so directing the efforts of the department that the greatest good to the greatest number would result. There is no work that this Survey does that will not fit in with the work planned for the Department of Public Works. It is essentially an engineering work and consequently belongs in the National Department of Public Works together with the other engineering activities of the Government.

The Proposed Department of Aeronautics

Aeronautics is to come in for special governmental attention if the bill providing a Department of Aeronautics is established. The proposed Department will be headed by a Secretary of Aeronautics at $12,000 per annum and an assistant at $5,000 per annum. A commissioned personnel of approximately 5000 and a non-commissioned personnel of approximately 50,000, together with a large number of civilians to carry on the commercial work is also proposed.

The Aviation Section of the Signal Corps; the Division of Military Aeronautics; the Bureau of Aircraft Production; the Air Service of the Army; the Motor Transport Corps; the Naval Flying Corps; the Marine Corps Flying Corps, and the Aerial Mail Service are all to be transferred to this new proposed Department. With each will go their respective clerks and other civilian employees.

It is to be the duty of the new Department to foster, develop and promote all matters pertaining to aeronautics, including purchase, manufacture, maintenance and production of all aircraft for the United States, and to lay down rules and regulations to govern aviators and aeronautics in general. The Department is to establish and supervise aerial landing fields for both military and commercial purposes, and is to care for the coast, border and forest reserve patrol. An aeronautic academy is also to be established.

The Engineering Division under the Secretary of Aeronautics is to select types and designs of all aircraft equipment, including ordnance and communicating equipment, and is to care for the repair and maintenance thereof. The Division is also to operate and maintain aircraft factories, repair shops and experimental stations. Aerial photographic apparatus will likewise be developed by this Division, with which aerial photographic maps of the United States and its territories are to be made and provided for the public good.

NATIONAL RESEARCH COUNCIL

The National Research Council is Devoted to the Advancement of Research in the Mathematical, Physical and Biological Sciences, and in the Application of These to Engineering, Agriculture, Medicine, and Other Useful Arts

DIVISION OF ENGINEERING[1]

Dr. HENRY M. HOWE, who recently returned from Paris, where for three months he served as Scientific Attaché to the American Embassy, has made public, in a recent report to the Division of Engineering, a brief account of his activities during his stay abroad. While in London, on his way to Paris, Dr. Howe states that he was able to interest many in the work of the National Research Council, and in particular to explain its aims and needs to the Council of the Department of Scientific and Technical Research. Dr. Howe also took steps to bring about coöperation between the National Physical Laboratory and the Committee on Fatigue Phenomena of Metals of the Division of Engineering in their work dealing with the heat treatment of carbon steel and with alloy steels.

Dr. Howe was further instrumental in arranging a meeting, under the chairmanship of Dr. Unwin, at the Institution of Civil Engineers, which considered the formation of an International Association for Testing Materials which should carry on the work formerly done by the old society of that name. This meeting was attended by a large and distinguished body of unofficial representatives of many important engineering bodies. It was thought best to call a second meeting of official delegates of these societies, and at this meeting it was decided that the time was not yet ripe for action.

In Paris Dr. Howe consulted several of those best qualified to pass judgment on the question of an international testing society, among them being Professor Le Chatelier and Professor Mesnager, Vice-President of the old International Association for Testing Materials. Their attitude also inclined toward the belief that the decision reached in London was proper.

From May 20 to 23 Dr. Howe took part in the meeting of the Executive Committee of the International Research Council, which formulated more fully the work of that Council and arranged for its first regular meeting, which was held in Brussels during July.

The Division of Engineering now has twenty-one committees engaged in research. Fifteen of these deal with metallurgical subjects, four with civil engineering, one with mining engineering, and one with electrical engineering. Progress reports of all of these committees are now available.

Committee on the Fatigue Phenomena of Metals. The total number of fatigue tests made thus far by the committee is about 90, with the number of repetitions of stress running up to 2,000,000 and 3,000,000. There have been filed with the committee records of fatigue tests of metals made in various governmental and commercial laboratories, and these will be of service in establishing and in checking conclusions. Records of about 100 such tests are now on file.

Because of the change to peace conditions an entirely new and comprehensive program has been adopted, and this should yield results of the first importance. A very valuable report on the present status of our knowledge of fatigue has been prepared by the committee and will be found elsewhere in this issue of Mechanical Engineering.

The Engineering Foundation is to give $15,000 a year for two years to the work of this committee. This will be carried out in large part at the University of Illinois, which contributes for two years the use of its laboratories and the services of Professor Moore. This contribution is estimated conservatively as the equivalent of $6000 a year. The University reserves the right to publish the results in its own bulletin.

Committee on Improvement of Metals at a Blue Heat. It has long been known that working steel at a blue heat and even simple exposure to blue heat under certain conditions, may injure it seriously. This committee investigates this general subject and the influence of exposure and treatment at temperatures below the transformation range on the properties of steel. Three important reports have been issued, and these bring together and analyze a large amount of new information, much of which is as yet unpublished.

The committee has outlined considerable work for the future, and will study among other things the physical properties of boiler-plate steel at high temperatures—reaching approximately 1000 or 1200 deg. fahr. (540 to 650 deg. cent.), the tempering temperatures of high-speed steel, and the quenching of various alloy steels from a blue heat.

Committee on Pyrometry. It is the purpose of this committee to investigate improvements in pyrometry, including the measurement of the temperature of the bath of steel in the open-hearth and electric steel-making processes. Direct experiments have been made at the Midvale Steel Works with an optical pyrometer sighted on the bottom of a closed tube of refractory material immersed in the bath. A suitable material for this tube has not yet been found. For the tip of such a tube Acheson graphite is the best material thus far found.

The committee finds that the Burgess method of taking a series of readings with an optical pyrometer of the temperature of a stream of molten steel, poured from a hand ladle and calculating back to the temperature at the moment of dipping the ladle, gives trustworthy results with an accuracy of 10 to 20 deg. cent. Other methods to be tested are: (1) to determine optically the temperature of a plug of Acheson graphite immediately after immersion in the steel for a fixed time, and (2) to determine optically the temperature of the immersed end of a fused quartz rod or tube immersed in the metal. The transparency of the quartz permits us to see its immersed end, and thus to measure its temperature optically.

The committee has caused sixty-six papers on pyrometry to be written. Of these fifty-seven have been accepted by the American Institute of Mining Engineers, and will be published as a symposium on pyrometry in a separate volume. This symposium is the most important event in pyrometry since the invention of the Le Chatelier thermoelectric pyrometer.

Committee on Substitute Deoxidizers. The original purpose of this committee was to find ways of saving manganese by replacing the iron-manganese alloys now used for deoxidizing steel made by the bessemer, open-hearth and electric processes. It is of the first importance that the oxidized products resulting from the use of such alloys should be readily fusible and fluid, so that they may separate readily from the molten steel. Hence the first work of this committee was to determine systematically the melting points of the oxidized products of the alloys of promise for this purpose. A new method of determining melting points was devised. About one-third of this work has now been done, and steps are to be taken to complete it.

Committee on Welding—Research Committee of the American Bureau of Welding. This committee succeeds the old Welding Research Sub-Committee and the Sub-Committee on Metallurgy of the Welding Committee for the Emergency Fleet Corporation. The purpose of the committee is to carry on the research work inaugurated by the two former committees. They expect to cover the whole field of research in welding, including electric, gas and spot welding. A great deal of useful work was accomplished by the old committees, which derived their financial support from the Emergency Fleet Corporation, whereas the new committee intends to secure support and coöperation from those interested in welding through the medium of the American Bureau of Welding. It is believed that the new committee will continue vigorously the fruitful work of the old.

Committee on Elimination of Sonims (Inclusions) of Steel. It is the purpose of this Committee to study the sources, methods

[1] Dr. H. M. Howe, *Chairman*; G. H. Clevenger, *Vice Chairman*, Engineering Societies Building, 29 West 39th Street, New York.

of occurrence and effects of sonims (solid non-metallic impurities), as well as means for eliminating them from steel. The methods employed are: First, to procure samples of good and bad steels and determine the total sonims; and second, to examine them microscopically to determine their shapes and sizes and ascertain their proximate and ultimate composition. Methods for separating them must also be worked out, solution of the soluble metallic part of the steels being effected by iodine, double chloride of copper and ammonia, dilute acids, electrolysis or other means.

The aid of several of the steel companies has been enlisted, and a number have worked on the scum which gathers on ingot tops of low-carbon effervescing steel. This has been shown to be chiefly formed of sonims which have collected from the molten steel. It is now proposed to form a syndicate of beneficiaries of such an investigation.

PULVERIZED COAL AS A FUEL FOR BOILERS

(*Continued from page 749*)

subordinate to the performance of the boiler; and just as the design of boiler is varied to satisfy the steam requirements, so must the furnace proportions and mode of burning coal vary to supply the necessary gases for the efficient operation of the boiler, and in so doing, secure the greatest fuel economy.

The nature of fuels plays the all-important part in the efficiency and performance of furnaces, regardless of their calorific value. By pulverizing and proper treatment all grades of coals may be dealt with on the basis of their burnable content, thereby rendering their use equally applicable to all heating services.

Design of Pulverized-Fuel Furnace for a 500-Hp. Boiler

To demonstrate the possibilities of pulverized fuel along the lines indicated, a furnace for burning efficiently all grades of coal from the average best bituminous and anthracite qualities to lignite, and of such size as would be applied to a water-tube boiler of about 500-hp. capacity, has been designed, particulars being given in the following paragraphs.

In working out this design for a boiler with a steam pressure of 175 lb. and operating at 100 per cent and 200 per cent rating, consideration has been given to the best features of furnaces successfully burning pulverized coal and fuel oil. The temperatures of the gases as delivered to the boiler have been assumed to be 1800 deg. fahr. and 2750 deg. fahr., respectively, for the two ratings, the boiler efficiency being taken at approximately 80 per cent in both cases.

The purpose of this design is to study the possibilities of meeting as severe demands as are made at the boiler ratings selected, using all grades of powdered fuel. Fig. 4 shows two views of the furnace and Fig. 5 the gas performance of three different fuels.

The distinctive features of this furnace are the delivery of the fuel mixture and of the dilution air to insure perfect combustion, to permit regulation of the fire, and to guard against the slagging and destructive difficulties heretofore encountered. The air is supplied by suitable blowers and is heated before use by the waste flue gases for fuel mixing and by the body of the furnace for dilution purposes.

Regulation is accomplished by control of the fuel and of the air, the fuel-mixture spout outlets being proportioned to deliver, at maximum duty, a mixture containing 75 per cent of the air required for perfect combustion.

The purpose of the air jets *c* (Fig. 4) under the flame is to blow toward the ashpit the ash particles that may fall from the flame as well as the partially consumed particles of fuel. The latter are brought into the deflagration zone with a fresh supply of air and given a new chance to burn completely.

The rows of air jets *d* on top of the flame are for the purpose of directing the flame over a longer path and providing thereby longer time for the complete oxidation of the fuel particles, protecting the furnace from the hottest portion of the flame and aiding in the precipitation of ash toward the ashpit. Aside from supplying additional combustion and dilution air, the joint effect of the two rows of air jets is to carry the flame in *suspension*, away from the furnace walls and the ash deposit, and fulfill thereby one of the chief requirements for burning pulverized coal.

The idea of precipitating the ash by rapidly expanding the flame into a large space is applied, but it is not expected that all the ash can be thus collected. Some of the ash dust will be carried by the gases and deposited on the boiler tubes and surfaces beyond the hearth and must be blown off occasionally by soot blowers to a collecting hopper in the rear chamber of the boiler setting, from which it is discharged in a manner similar to that employed in removing the ash from the furnace.

The furnace design presented in Fig. 4, though possessing good features, is not necessarily typical. In an actual case the conditions of the service would influence largely the most suitable arrangement.

Furnaces for burning pulverized fuel demand careful consideration, not so much on account of the novelty of the fuel, but because, like other fuels, it possesses its peculiarities, which do not obey a general rule and which must be carefully considered to secure the maximum of usefulness for each kind and size of service.

AIRPLANE-WING DESIGN

(*Continued from page 730*)

apply them to conditions where the speed obtained is as great as 600 miles per hour. While the use of scaling rules and empirical factors worked out in practice has enabled us to produce very fair results, the need for accurate data has been pressing.

The high-speed wind tunnel operated by the Technical Section of the Department of Military Aeronautics is of the venturi type and shows an exceptionally uniform flow at all speeds up to about 500 miles per hour. The flow is produced by means of an especially designed 24-blade propeller which produces a suction of about 16 in. of water at the large end of the venturi.

An extensive series of experiments has been started on propeller airfoils in order to determine the effect of speed on the lift and drag coefficients.

It is desired to call attention to the fact that it is not sufficient to understand and be able to calculate the circulation about a horizontal axis perpendicular to the direction of motion; there are also very important vortices about axes parallel to the direction of motion. These are particularly apparent in the form of tip vortices. Their intensity might be estimated similarly to the calculation for fore and aft circulation.

F. E. Cardullo.[1] As I understand the theory which Mr. Durfee is attempting to develop, instead of considering the reactions due to the acceleration produced under the action of the motion through the air of a plate, which may be straight or curved, he considers these reactions from the standpoint of the Bernoulli theory, on the basis that differences in velocity of air relative to the plate will exist on its two sides, and that in consequence to these differences there will be a difference of pressure and a lifting force. As a result, he points out that there are certain vortex motions at the ends and at the trailing edges of the plate. The problem is to reduce these vortex motions to a minimum so that the air comes from the plate in a stream, the filaments of which are as nearly parallel to one another as possible. The best method of attack would seem to me to be that of testing wing sections either by the emission of smoke from a fine orifice or with threads attached to needles. This method gives an opportunity for studying the vortices which represent irregular motion and lost energy. Mr. Durfee prefers to attack the problem from the standpoint of the investigation of these stream lines and velocities rather than the development of the theory of the reaction on the surface produced by acceleration. I do not know that there is much choice in the mathematics of the two methods, but in either case the mathematics is too difficult to offer a practical solution.

[1] Engineer of Tests, Curtiss Aeroplane & Motor Corpn., Buffalo, N. Y. Mem. Am. Soc. M. E.

ANDREW CARNEGIE

ANDREW CARNEGIE, philanthropist and one-time steel master, whose generosity made possible the erection of the Engineering Societies Building and that of the Engineers' Club, died August 11 at his summer home near Lenox, Mass., in his eighty-fourth year.

Mr. Carnegie was born in Dunfermline, Fifeshire, Scotland, on November 25, 1837. When eleven years old his father, a master weaver, suffered such reverses through the introduction of the power loom that he decided to abandon his occupation and emigrate to America with his wife and two sons. Settling in Allegheny City, the father and son found work in a cotton mill, the latter as a bobbin boy at $1.20 a week. A year later Andrew obtained employment in the bobbin factory of a distant relative, John Hay, where he fired the boiler, and ran the engine. At the age of fifteen he became a messenger boy for the Ohio Telegraph Company and a short time later had perfected himself as an operator. When the Pennsylvania Railroad decided to install its own telegraph lines, in 1854, he became clerk under Thomas A. Scott, then superintendent of its Western Division. When the Civil War broke out he was assigned to duty in and around Washington, where he was instrumental in devising a war cipher system that was later adopted. In 1863 he had been promoted to the superintendency of the division, and, largely because of the interest which Mr. Scott took in his fortunes, had been successful in a number of business investments, notably oil and the Woodruff sleeping car.

Mr. Carnegie first became interested in the iron industry in 1864, when he bought a one-sixth interest in the Iron City Forge Company. Foreseeing a great demand for structural iron to be used in railway bridges, he also took part in organizing the Cyclops Iron Co., a rival to the former concern. A year later, however, the two companies were merged as the Union Iron Mills Company with a capital of $500,000. Mr. Carnegie then organized another company, the Keystone Bridge Works, which was prosperous from the first. Into it he drew Colonel Scott, at that time vice-president of the Pennsylvania Railroad, and J. Edgar Thomson, its president.

In 1867 he was sent to England by the Pennsylvania Railroad to sell about $9,000,000 in bonds. While in that country he saw a giant bessemer converter in operation and investigated the process. From that moment his vision was steel. He returned to Pittsburgh and organized the firm of Carnegie, McCandless & Co., the first step being the purchase of a 110-acre tract at Braddock, a dozen miles or so outside of Pittsburgh, where a bessemer plant was promptly erected and named the Edgar Thomson Steel Works.

In 1874 Mr. Carnegie began to realize abundantly on his efforts. The year before the first of the famous Lucy furnaces had been built, to be duplicated two years later, when they forced up the average output of iron from fifty to a hundred tons a day.

As the profits mounted one by one Mr. Carnegie's partners dropped out and by 1881 he owned more than half of the entire business. A reorganization was then undertaken under the name of Carnegie Brothers & Co. The new concern was a $5,000,000 affair, with Carnegie at the head. It operated the Edgar Thomson Steel Works, while a second limited partnership called Carnegie, Phipps & Co., operated the Homestead Mills, the armor-plate mill near the same plant, the Keystone Bridge Works, and other properties. A few years later Phipps and Carnegie alone remained of the original fourteen partners, and in 1888 Mr. Carnegie found himself in control of seven great iron and steel works, whose output was estimated to be in the neighborhood of 190,000 tons of steel rails and 140,000 tons of pig iron a month.

For two years from 1899 the Carnegie Steel Company dominated the industry, but in 1901 it was absorbed by the United States Steel Corporation for $460,000,000. The same year Mr. Carnegie retired from business with a fortune estimated at $250,000,000.

Mr. Carnegie's Donation to the Engineers

Mr. Carnegie was early invited to take an interest in a building for the American Institute of Electrical Engineers, but without success for the reported reason that he felt the building which had been planned to be inadequate. Somewhat later, on account of his interest in libraries, he was approached to contribute to the amount necessary to abstract and catalog the Sir Latimer Clark Collection which had been presented to the Institute and which was mainly in Latin, many volumes being written by hand on parchment. Scarcely any volume was less than one hundred years old and many over three hundred.

It was in connection with a banquet, at which Mr. Carnegie was the guest of honor, given by the Institute under the auspices of its Library Committee, that Mr. Carnegie's interest in a union building was aroused. On the day following the banquet he sent for the chairman of the Institute's Building Committee, Mr. Calvin W. Rice, now secretary of The American Society of Mechanical Engineers. Mr. Rice and Mr. Charles F. Scott, then president of the Institute, called upon Mr. Carnegie, who expressed an interest in the addresses of the previous evening and in the work of the engineering societies.

Anticipating the line of questioning which Mr. Carnegie would be likely to follow, information had been secured upon the number of engineering societies in the city of New York and the amount of rent in the aggregate annually paid by these societies for their respective headquarters. There were then over thirty prominent societies and the gross annual rents amounted to over $75,000.

Mr. Carnegie always gave in the same businesslike manner that he conducted any enterprise. He never gave unless there was every prospect that his gift would make successful and efficient an already promising activity. He consequently wanted assurance that a union engineers' building could and would be maintained and also that the societies would be able to purchase the land, which was another uniform requirement in Mr. Carnegie's gift of buildings.

An estimate of the cost of a union building had been made, so that when Mr. Carnegie inquired the cost Mr. Rice was prompt to say "one million dollars."

Mr. Carnegie replied "that is a lot of money," to which Mr. Rice said, "You would not wish to be identified with anything not creditable to you." Mr. Carnegie immediately assented, adding, "if it should cost $7.50 more, never mind."

The original plan for a union building placed the Engineers' Club in the upper floors, much like the Transportation Club in the Manhattan Hotel, but it later seemed best to erect two buildings, principally on account of the Club's property being taxable and the Engineering Societies' property non-taxable. It therefore became necessary to ask Mr. Carnegie to increase his gift sufficiently to provide for separate buildings, and Mr. Rice made a trip to Europe, visiting Mr. Carnegie at Skibo, and successfully presented the desire of the Societies and of the Club for an additional $500,000.

One of the interesting incidents in connection with the purchase of the several contiguous lots for the Engineering Societies Building was the demand by an elderly lady of $100,000 cash before noon of the day the negotiations were consummated. Mr. Carnegie saw the humor of the situation and loaned the representatives of the Societies ten ten-thousand-dollar bills.

Mr. Carnegie's motive in this benefaction was both appreciation of the engineer's contribution to his personal success and the desire to promote the solidarity and coöperation of all branches of the engineering profession. "Coöperation," he said, "is America's secret of success."

The cornerstone of the Engineering Societies Building was laid on May 8, 1906, the Council of the Society being present by invitation. The building was brought to completion in the following spring and impressive dedicatory exercises held April 16 and 17, 1907. At the close of these exercises a bronze bust of Mr. Carne-

DONOR OF THE ENGINEERING SOCIETIES BUILDING
AND THE BUILDING OF THE ENGINEER'S CLUB
MEMBER OF THE SOCIETY FROM 1890
HONORARY MEMBER FROM 1907

7 89

gie, presented by the past-presidents of the Founder Societies, was unveiled in the Library.

The inaugural banquet of the Engineers' Club on December 9, 1907, was made the occasion for conferring honorary membership on Mr. Carnegie, John Fritz, honorary member and past-president, making the presentation speech, and T. Commerford Martin, president of the Club, receiving the certificate from the President and Secretary of the Society and tendering it to Mr. Carnegie. The latter in accepting the certificate generously acknowledged his indebtedness to the engineer, and expressed heartfelt appreciation of the honor conferred upon him. Mr. Carnegie had been a member of the Society since 1890. He was also elected a member of the American Institute of Mining Engineers in 1888 and an honorary member in 1905.

Mr. Carnegie's Literary Work, His Honors, and His Benefactions

Despite the demands of business, Mr. Carnegie found time for literary work and wrote several books as well as a number of essays on economic and philosophical subjects for the magazines and reviews. His first work, published in 1883, was An American Four-in-Hand in Great Britain. In 1884 he wrote in Round the World an account of a trip he had made. Among his other writings are: Triumphant Democracy (1886), The Gospel of Wealth (1900), The Empire of Business (1902), The Life of James Watt (1906) and Problems of Today (1909). Triumphant Democracy, his best-known work, passed through eight editions and has been translated into eight languages. In it Mr. Carnegie treated of the progress of the American Republic largely as an advance in material prosperity, which he regarded as the surest test of the validity of the claims of popular government to superiority.

Mr. Carnegie received honors and decorations from rulers and people all over the world. He received as a result of his benefactions abroad the freedom of fifty-four cities in Great Britain and Ireland. He was Lord Rector of St. Andrew's University from 1903 to 1907 and of Aberdeen University from 1912 to 1914, and held the honorary degree of Doctor of Laws from the universities of Glasgow, Edinburgh, Birmingham, Manchester and McGill, as well as from Brown, Pennsylvania, Cornell and other American colleges. In addition to his connection with our Society and with the Mining Engineers, he was a member of numerous philosophical, civic and scientific bodies, among them being the American Institute of Architects, the National Civic Federation, the American Philosophic Society, and the New York Chamber of Commerce. He was commander of the Legion of Honor of France, and had also received the Grand Crosses of the Order of Orange, of Nassau, and of the Order of Daneborg.

Holding as his gospel of wealth that the millionaire should be but a trustee for the poor, "entrusted for a season with a great part of the increased wealth of the community, but administering it for the community far better than it could or would have done for itself," Mr. Carnegie established six great institutions for the furthering of those philanthropic causes which most appealed to his interest. The Pittsburgh Institute, the oldest of the six, was founded in 1896, the Research Institution at Washington in 1902, the Hero Fund in 1904, the Foundation for the Advancement of Teaching in 1905, the Peace Endowment in 1910, and the Carnegie Corporation of New York, with an endowment of $125,000,000, in 1912.

The Carnegie Foundation for the Advancement of Teaching was the outcome of Mr. Carnegie's sympathy with the cause of education and his desire to be of service to the teachers of America. The act of incorporation obtained by Congress enabled the foundation to receive and maintain funds for paying pensions to college teachers in the United States, Canada and Newfoundland, and "in general to do and perform all things necessary to encourage, uphold and dignify the profession of the teacher and the cause of higher education." Seventy-four institutions of higher learning, seventy-one in the United States and three in Canada, have been admitted to the list of associated institutions. In these colleges, universities and technical schools there were on April 1, 1917, 6593 teachers, including professors, associate or assistant professors and instructors. Of these 715 were women.

The largest of Mr. Carnegie's single gifts was that creating the Carnegie Institute of Pittsburgh. This gift to the city of his prosperity called for a total outlay for building equipment and endowment of over $25,000,000.

Mr. Carnegie's benefactions amounted in all to more than $350,000,000, among the more important ones being the following: Library buildings (over 3000), $64,000,000; church organs (over 7500), $6,200,000; Carnegie Corporation, $125,000,000; Carnegie Foundation, $29,500,000; Carnegie Institute, $26,700,000; Carnegie Institution of Washington, $22,300,000; hero funds, $10,500,000; Scottish universities, $10,000,000.

One of Mr. Carnegie's greatest ideals was the abolition of war, a hope that he cherished in the face of international conflicts. He gave $10,000,000 toward an International Peace Fund, and at a cost of $1,500,000 built the peace palace at The Hague, which was dedicated in 1913. He also gave $750,000 for the Bureau of American Republics at Washington.

Resolutions by the Trustees of the U. E. S.

On August 14, 1919, the following resolutions relating to Andrew Carnegie were passed by the Trustees of the United Engineering Societies:

Andrew Carnegie's death August 11, 1919, at Lenox, Massachusetts, brought to its close a career which greatly advanced all the engineering arts and sciences. By the introduction into the United States of the bessemer process for the production of steel and by the establishment and development of steel plants, which became the greatest in the world, he made available for engineers the most useful modern material for engineering construction. In the successful conduct of many industrial enterprises he amassed great wealth, the possession of which he came to regard with deep seriousness as a public trusteeship. He devoted himself to the distribution of large portions of his fortune to projects for the benefit of mankind. He distributed his wealth not only in many directions, but also with the exercise of great wisdom based on careful investigation. His munificence provided large funds for the building of a home for the great national engineering societies and many associate societies. He was an honorary member of the American Institute of Mining and Metallurgical Engineers and American Society of Mechanical Engineers. He was personally known and loved by many engineers. In view of these facts, be it

Resolved, That the American Societies of Civil, Mining, Metallurgical, Mechanical and Electrical Engineers, the United Engineering Society and the Engineers' Club, herein express to the family of Mr. Carnegie and record their sincere appreciation of the great contributions of Andrew Carnegie to the advancement of engineering, and of his friendly assistance in making possible beautiful homes for the Engineering Societies and the Engineers' Club, thus fostering the spirit of unity in the profession.

Recataloging the U. E. S. Library

(Continued from page 783)

An incidental advantage of this classification, but one which is not to be despised, is its wide use. The Dewey classification is used more generally by libraries than any other classification, and the Brussels classification has found greater favor than any other for indexing and cataloging. The latter is now used by a number of Belgian and French magazines to classify the abstracts which they publish and was in use by several other organizations that suspended during the war. It has more international acceptance than any other system and its principles and notation are quite generally understood. The fact that many users of the catalog will have some previous familiarity with its system will enable them to use it more readily and with less assistance.

This outline of the proposed plans is incomplete; many points having been omitted in the desire for brevity upon a subject of considerable magnitude. It is hoped, however, that it will demonstrate to you that the system is sufficiently comprehensive and elastic to meet successfully any demand that this library may have to place upon it. It is also hoped that it will show that the preparation of an efficient catalog is not an easy task, but one requiring professional skill, good judgment and the expenditure of a considerable sum of money. Many library catalogs are unsatisfactory because this has not been realized, and efficiency has been sacrificed in an attempt to do the work too cheaply. The catalog is part of the permanent equipment of a library and is a vitally important part; economy in its construction may easily be carried to excess.

Respectfully submitted,

Harrison W. Craver.

NECROLOGY

FREDERICK SARGENT

Frederick Sargent, senior member of the firm of Sargent & Lundy, of Chicago, and probably the most prominent consulting engineer in the United States specializing in the design of electrical generating sections, died at his home, in Glencoe, Ill., July 26, having been taken ill while abroad. An Englishman by birth, Mr. Sargent had made numerous trips to his native country, the last of which was made in April and May of this year in company with his close friend, Samuel Insull.

Frederick Sargent was born in Liskeard, Cornwall, England, on Nov. 11, 1859, which is also the exact date of the birth of Samuel Insull, another Englishman and Chicagoan, with whom Mr. Sargent was destined to be intimately associated during practically all of his engineering activities. His people were of the farming class, but young Sargent developed a decided mechanical bent, and eight years of his boyhood and youth were spent in acquiring practical mechanical knowledge and experience in the works of John Elder & Co., the great shipbuilders on the River Clyde, near Glasgow. During this time he gained an extensive and practical knowledge of mechanical engineering, paying particular attention to heavy machinery. He also improved his education by going to night school at Glasgow University. Coming to the United States about 1880, he found employment in Eastern shipbuilding yards as a designer of steam engines. He then went West as a designer for the Sioux City (Iowa) Engine Co. A year or so later he accepted a position with E. P. Allis & Co., of Milwaukee, predecessors of the present Allis-Chalmers Manufacturing Co. Here he attracted the attention of the officers of the Western Edison Light Co., organized in Chicago in 1882 to exploit the electric-lighting inventions of Thomas A. Edison in the West, and in the fall of 1884 he moved to Chicago and began his career as an electrical engineer in that city.

Succeeding the Western Edison Light Co., the Chicago Edison Co. was formed in 1887. This was the first distinctively Edison central-station company in Chicago. Mr. Sargent became its consulting engineer, and he has been consulting engineer of that company and its successor, the present Commonwealth Edison Co., ever since.

About 1889 he went to New York under contract with the Edison United Manufacturing Co. In this position he had general charge of all the work done by that company in the United States and Canada. Shortly after this the company in New York was reorganized as the Edison General Electric Co. Mr. Sargent was made assistant chief engineer of the new corporation, of which Samuel Insull was vice-president in charge of manufacturing. But Mr. Sargent had determined to open an office of his own, and, in August 1890 he returned to Chicago and established himself as an independent electrical and mechanical engineer. The firm of Sargent & Lundy was formed in 1891.

In 1891 and 1892 Mr. Sargent was consulting electrical engineer for the World's Columbian Exposition, and he designed the power plant and had much to do with the other mechanical and electrical features of the great World's Fair of 1893.

The original Edison central station in Chicago was built about 1889. Mr. Sargent made the plans for the machinery layout of that station. In 1892 Samuel Insull came to Chicago as president of the Chicago Edison Co., and that company at once took on a new lease of life. Under Mr. Insull's direction the old Harrison Street station, recently torn down to make way for the Union Station railroad improvements, was built. Mr. Sargent was the designer of that station, also the Fisk Street Station, the Quarry Street Station and the Northwest generating stations of the Commonwealth Edison Company.

He was one of the first mechanical engineers who recognized the great part that the steam turbine was destined to play in the development of electric generating stations. The Fisk Street Station was the pioneer of all the large turbine central stations of the world, and it became deservedly famous for its many original features of design and for its simplicity and economy of operation. After this station had been in operation for a short time, Mr. Sargent, at the request of Mr. Insull, President of the Commonwealth Edison Co., went to London to follow the inquiry of the Parliamentary Committee in charge of the London Power-Supply Bill. This hearing crystallized in Mr. Sargent's mind some ideas he had been developing about the importance of unified power supply for great industrial centers so as to reduce the cost of production, and on his return he submitted his ideas to Mr. Insull, and they were worked out in the power-station development of the Commonwealth Edison Company.

Mr. Sargent's engineering work was not confined to Chicago. He was consulting engineer for many of the important electric-light and power companies throughout the country, including the Edison Electric Illuminating Co., Boston; American Gas and Electric Co., New York; Electric Bond and Share Co., New York; the Union Gas and Electric Co., Cincinnati, and many other smaller organizations.

He designed the great combined central power station of the American Gas and Electric Co., and the West Penn Power Co., located on the Ohio River, north of Wheeling, W. Va., which was the first large electric station to be built in a favorable locality near a coal mine for the distribution of power to industrial centers at long distances.

He designed the great new station of the Union Gas and Electric Co., at Cincinnati, which was recently completed. He also designed the new station for the Kansas City Light and Power Co., which is soon to be put into operation. He went to Chile in 1916 as consulting engineer for the Guggenheim mining interests on the development of a power supply for their mine at Chuquicamata.

During the war Mr. Sargent was consulting engineer for the power station of the Edgewood Arsenal, at Edgewood, Md., and also consulting engineer for the United States Government in other wartime projects demanding the application of power on a large scale.

In his profession Mr. Sargent was noteworthy for the clear vision and strong common sense with which he grappled with the essentials of an engineering problem. He was simple, clear, direct and practical. He was a man of broad outlook, tolerant, modest, seeking to achieve results rather than to uphold theories. And he was eminently successful in obtaining results, for his electrical generating stations were milestones of achievement in the economical production of electrical energy.

FREDERICK SARGENT

An idea of the esteem with which Mr. Sargent was held by his business associates was shown in an interview with Wm. S. Monroe, his friend and partner in the firm of Sargent & Lundy for many years, who said:

"Mr. Sargent had an exceptionally keen and active intellect and a vigorous and forceful personality. He was a man of absolute integrity and fearless independence and high idealism in his work. He had an infallible intuition regarding engineering and scientific matters, and the responsible men in the companies for which he was doing his engineering learned to place the utmost confidence in his judgment. He had a remarkable combination of extreme daring and careful conservatism. With a broad and ambitious view of important and fundamental principles of his engineering work, Mr. Sargent combined an accurate knowledge of all the underlying details, and no detail was too small for his personal attention.

"He kept in close touch with everything that was new in the engineering profession. He was a great traveler and made repeated trips to Europe as well as through this country in order to post himself on the important developments not only in the direct line of his own work but in all departments of the engineering field.

"His idealism was at times almost prophetic and he was very ambitious for the highest achievements in his work, but his idealism was held in restraint by a practical common-sense judgment, which combined to give a distinct originality to every new power station which he designed, and made it systematic and harmonious, economical and a perfect working machine."

Mr. Sargent was awarded a medal by the World's Columbian Ex-

position in 1893. He was a member of the jury of awards in power engineering at the St. Louis Exposition of 1904. He was a member of several societies and clubs, including the Western Society of Engineers' University Club, Chicago Yacht Club, and the Engineers' Club, New York. He became a member of our Society in 1901.

He is survived by a widow, one daughter and two sons.

WILLIAM A. BOLE

William A. Bole, Assistant to Vice-President H. T. Herr of the Westinghouse Electric & Manufacturing Co., Machine Works, died at his home in Pittsburgh on June 16. Mr. Bole was born on July 12, 1859, in Pittsburgh, Pa. He received his early education in the schools of Allegheny, later attending the University of Western Pennsylvania, now the University of Pittsburgh.

In 1878 he left school and was employed by his father who at that time was a manufacturer of steam engines in Pittsburgh. Here he gained considerable information regarding the manufacture of the mechanical parts of steam engines. After serving his father for three years he entered the employ of the Westinghouse Machine Co. in 1882 in the capacity of cost and time clerk. In 1883 he became foreman of the company and the following year was appointed Superintendent of Works and Purchasing Agent and in 1900 Manager of Works. In 1906 he was advanced to the position of Consulting Engineer and in 1908 became General Manager. In 1914 he was appointed Vice-President in Charge of Manufacture for the Machine Works and Trafford City Foundry. He was a veteran of thirty-seven years with the company.

Mr. Bole was a member of the Engineers' Society of Western Pennsylvania, of which he was president for one year, and of the American Foundrymen's Association. He became a member of our Society in 1887.

ALLEN EUGENE NICHOLS

Allen E. Nichols, of the firm of E. M. Nichols & Sons, Philadelphia and Chicago, died at his home in the latter city of pneumonia on May 8, 1919. Mr. Nichols was born on September 30, 1888, in Madison, Wis. He was graduated from Purdue University in 1910 with the degree of B. S. and in 1913 received his C. E. degree. He was formerly employed by the Baltimore & Ohio Railroad, R. L. Sackett, consulting engineer for the State of Indiana, the Chicago & Western Indiana Railroad and the firm of Alvord & Burdick, consulting engineers. From 1915 to 1918 he was engineer in direct charge of design, specifications and contracts for the Bureau of Waste Disposal for the City of Chicago. Owing to a permanent injury, Mr. Nichols was not accepted by the military authorities for enlistment in the Army, whereupon he entered the employ of the DuPont Engineering Co. as engineer of construction for a seventy-million-gallon water-filtration plant for the Government powder factory at Old Hickory Works, Nashville, Tenn., which position he retained until construction was completed. Early in the present year he entered into the general engineering and contracting business in conjunction with his father and brother.

Mr. Nichols was an associate member of the American Society of Civil Engineers and was a member of the Franklin Institute, the American Water Works Association and the Sons of the American Revolution. He became an associate-member of the Society in 1917.

PERSONALS

In these columns are inserted items concerning members of the Society and their professional activities. Members are always interested in the doings of their fellow-members, and the Society welcomes notes from members and concerning members for insertion in this section. All communications of personal notes should be addressed to the Secretary, and items should be received by September 15 in order to appear in the October issue.

CHANGES OF POSITION

MAURICE L. BULLARD, formerly associated with L. H. Shattuck, Inc., Manchester, N. H., has become affiliated with the Atlantic Corporation, of Portsmouth, N. H., as superintendent of the marine department.

FREDERICK R. PRATT has resigned as mechanical superintendent with D. Goff and Sons, Pawtucket, R. I., and has accepted the position of engineer with B. B. and R. Knight, of Providence, R. I.

WILLIAM H. CHURCHMAN has severed his connection with the East Bay Water Company, Oakland, Cal., as superintendent of pumping stations, and has assumed the duties of constructing and erecting engineer of steam, electrical and hydraulic machinery with the California Hydraulic Engineering and Supply Company, of San Francisco, Cal.

LEWIS S. MAXFIELD, until recently assistant to the secretary of the Heating and Piping Contractors National Association, has resigned to accept a position in the office of the mechanical engineer, New York Central Railroad.

CHARLES C. TRUMP, formerly with the Humphrey Gas Pump Company and Stumpf Una-Flow Engine Company, Inc., Syracuse, N. Y., is now employed by the Fuller-Lehigh Company, of Fullerton, Pa., and the Fuller Engineering Company, of Allentown, Pa., as sales engineer in the New York office.

CHARLES O'C. SLOANE has resigned his connection with the Allied Machinery Company of America, New York, and has joined the sales organization of the Betts Machine Company, of Rochester, N. Y.

WILFORD L. STORK, formerly metallurgist of the Michigan Motor Casting Company, Division of Buick, Flint, Mich., has resigned and is now associated with the Detroit Valve and Fitting Company, of Wyandotte, Mich., in the capacity of foundry superintendent.

LAWRENCE T. CUMMINGS, one of the senior engineers of Miller, Franklin, Basset and Company, consulting industrial and production engineers of New York City, has resigned his position in order to assume the duties of vice-president with the firm of Drefs, Cummings and Drefs, Inc., business consultants, Detroit, Mich.

CHARLES H. SCHMALZ has assumed the position of assistant factory manager with the Holt Manufacturing Company, of Peoria, Ill. He was, until recently, associated with the Hanna Engineering Works, Chicago, Ill., in the capacity of superintendent.

JOSEPH B. LINCOLN, formerly mechanical engineer, Naval Engineering Experiment Station, Annapolis, Md., has become affiliated with the New Departure Manufacturing Company, Bristol, Conn.

WILLIAM H. HAZARD has resigned his position as designing mechanical engineer for the Hercules Powder Company and has accepted the position of industrial engineer for the General Motors Corporation, assigned to work at the Janesville Machine Company and Samson Tractor Company plants.

CECIL R. HUBBARD has resigned his position of designing engineer with the National Metal Molding Company, Ambridge, Pa., and has taken up industrial engineering work with the Revere Rubber Company, Providence, R. I.

FRANCIS J. MCGRAIL, formerly of the Henry R. Worthington Pump Company, Harrison, N. J., and for eight years employed as foundry superintendent of the Struthers-Wells Company, Warren, Pa., has resigned his position to take charge of the iron and brass foundries operated by the Honolulu Iron Works Company, of Honolulu, Hawaii. Mr. McGrail assumed his new duties May 1.

A. L. VALENTINE, who for 19 years was connected with the small tool department of the Pratt and Whitney Company, Hartford, Conn., the last 15 as superintendent, has resigned. He sailed for France recently to become works manager of the Société des Usines Curial, Paris, France, manufacturer of small tools.

ELLWOOD A. METZ, formerly with the De Laval Steam Turbine Company of Trenton, N. J., has become associated with F. X. Hooper Company, Inc., Glanarm, Md., in the capacity of superintendent.

WILLIAM T. CLARK has left the employ of the Moline Plow Company, Moline, Ill., and has assumed the duties of factory manager with The Fuller and Sons Manufacturing Company, Kalamazoo, Mich.

P. J. BRYANT, formerly chief engineer, U. S. Military Academy, West Point, N. Y., has become affiliated with the Wabash Ice and Fuel Company, Wabash, Ind.

ALFRED L. FITCH has become associated with the Ashton Valve Company, Cambridge, Mass., in the capacity of mechanical engineer. He was until recently designer with the Blanchard Machine Company, Cambridge, Mass.

F. G. HECHLER has resigned his position as mechanical engineer at the U. S. Naval Engineering Experiment Station, Annapolis, Md., and has become associated with the Vibration Specialty Company, Philadelphia, Pa., as engineer and superintendent.

ANNOUNCEMENTS

J. J. BROWN, formerly vice-president and general manager of the Wheeler Condenser and Engineering Company, Carteret, N. J., was elected president of the company succeeding Charles W. Wheeler, recently deceased.

F. B. WILLIAMS has been discharged as Captain in the Ordnance Department, U. S. A., after two years' service and has accepted a position as assistant superintendent of the Watertown, Mass., plant of the Walker and Pratt Manufacturing Company.

John B. Price has been transferred from the managership of the Cincinnati office of the Refinite Company and now has charge of the New York office of the company.

Otto R. Kihm, formerly associated with the American Can Company, Edgewater, N. J., in the capacity of chief mechanical engineer, has started in business for himself under the firm name of the Kihm-Bowen Machine Company, Irvington, N. J., specializing in sheet metal working machinery, shear blades and re-grinding shear blades.

R. Sanford Riley, of Worcester, Mass., has gone to England and the Continent in the interest of the Sanford Riley Stoker Company and the Norton Company. Mr. Riley was appointed honorary vice-president to represent the A. S. M. E. at the James Watt Centenary, held at Birmingham, England, the latter part of August.

Thayer P. Gates, consulting engineer and textile specialist, announces the opening of offices in Providence, R. I. He will handle mill and power plant engineering, appraisal and special reports, operation and management, production engineering and textile engineering.

Webster Tallmadge has been transferred to the service department, Westinghouse Electric and Manufacturing Company, East Pittsburgh, Pa. He was, until recently, connected with the Boston office of the company, as superintendent of the steam division.

E. H. Bull, associated with the Green Engineering Company, East Chicago, Ind., for seven years as engineer, is a member of the firm of Bull and Liversparger which has been appointed sales representative of the Green Engineering Company in Chicago and northern Illinois territory.

I. D. Everitt, recently discharged from the U. S. Army, is the New England manager for the Blackmer Rotary Pump Company. He is located in Boston, Mass.

Harry I. Lewis has been discharged from military service as first lieutenant in the Ordnance Department and has become connected with the firm of Bishop and Babcock Company, Cleveland, Ohio, in the capacity of chief engineer in the refrigeration division.

George H. Piman, formerly with the American Woolen Company's mills of Lawrence, Mass., has retired from active duty with this company after 32 years of continuous service. He is still retained by them as a member of the general advisory board.

Fred V. Larkin, assistant general superintendent of the Harrisburg Pipe and Pipe Bending Company, Harrisburg, Pa., formerly assistant professor of mechanical engineering in Lehigh University, will return to Lehigh as professor of mechanical engineering on September 1, to fill the chair vacated by the death of Prof. J. F. Klein, head of that department for many years.

Parry Keller has received his discharge as a first lieutenant, Ordnance Department, U. S. A., and has accepted a position with the Goodyear Tire and Rubber Company, Akron, Ohio, in connection with the development and manufacture of tires and tubes.

Walter W. Tangeman, Major, Ordnance Department, has recently returned from service in France, and has become re-associated with the Cincinnati Milling Machine Company, Cincinnati, Ohio, in the capacity of sales engineer.

L. F. Graff has become affiliated with the Compania Minera del Mirasol, S. A., Cusihuiriachic, Chihuahua, Mexico.

R. R. Shafter has returned to the sales organization of Traylor Engineering and Manufacturing Company, mining, milling, crushing and smelting equipment, Allentown, Pa., after an absence of two years as general superintendent of the Traylor Shipbuilding Corporation. Mr. Shafter as district manager will have charge of the New York office.

M. M. Shuster has become production engineer with the Clip-Bar Manufacturing Company, Philadelphia, Pa., manufacturers of the Shuster Speed Wrench. Mr. Shuster was recently discharged from the Naval Air Service.

Howard Coonley, president of the Walworth Manufacturing Company, Boston, Mass., has been elected a vice-president of the Massachusetts Credit Union Association.

Captain Edward Van Winkle, recently regimental engineer officer of the 24th Engineers, American Expeditionary Forces, desires to announce that he has resumed his practice as consulting engineer and has formed an association with Frederick A. Waldron, consulting engineer, New York, for the general practice of engineering with special reference to the problems relating to the construction, development and operation of industrials.

David S. Wegg, Jr., has left the Army Ordnance, where he was chief examiner, Chicago District Claims Board, and has become testing engineer for the Isko Company, Chicago, Ill., manufacturers of electric refrigerating machinery.

Robert P. Lay has accepted a position with the H. H. Franklin Manufacturing Company, Syracuse, N. Y., in the capacity of special engineer in the engineering department.

Prof. Arthur M. Greene, Jr., was elected president of the Society of the Promotion of Engineering Education at the 27th annual meeting of the Society held in Baltimore, Md., during the last week of June.

L. E. Strothman, who for several years has been manager of the Steam Turbine and Pumping Department of the Allis-Chalmers Manufacturing Co., has left the firm and has become vice-president and general manager of the Richardson-Phenix Co., in which firm he has acquired a financial interest. J. W. Peterson, formerly vice-president and general manager of the Richardson-Phenix Co., has assumed the duties of president and treasurer of the company.

THE HORSE-POWER OF RESISTANCE IN AEROPLANE DESIGN

(Continued from page 727)

estimate on a four-motored machine, for which the fuel must now be computed at $10{,}150 \times 4/2 = 20{,}000$ lb. approx. The new machine weight can now be estimated as follows:

Fuel	20,000 lb.
Four motors and equipment	3600 lb.
Crew (3 men)	450 lb.
Dead load (machine)	8000 lb.
Total weight	32,050 lb.

The total weight would therefore be about 32,000 lb. The approximate wing area (R. A. F. No. 15) is given by the formula $32{,}000 = 0.002958 \times 3025 \times A$ (for 14 deg. angle of incidence) $= 3570$ sq. ft. The ratio of linear dimensions N is 1.77:1, and the ratio of weights m is 3.14:1.

Investigating the problem, we have

$N = 1.77$; $m = 3.14$, hence

$$V_a = \frac{\sqrt{3.14}}{1.77} V_b = V_b$$

i.e., the velocities correspond. Also,

$$\text{Thrust}_a = 3.14 \times \text{Thrust}_b$$

and

$$\text{HP}_a = \frac{3.14\sqrt{3.14}}{1.77}\text{HP}_b = 3.14\text{HP}_b$$

The original type had 800 hp. in two motors. If the new machine were to fly at 100 m.p.h., the effective L/D would be 5.50, which would considerably lower the radius of flight. However, at 80 m.p.h. a value of 6.90 may be realized for the L/D factor. Further, the horsepower requirement at this speed is 320, as compared to 600 for the basic machine. If the new machine be equipped with four motors of the high-compression type, the available horsepower $= 0.82 \times 4 \times 430 = 1410$. This is equivalent to the $1410/3.14 = 450$ hp. flying requirement in the basic machine—about 97 m.p.h. Hence a flying speed of 95 m.p.h. may be counted on, with an effective L/D of 6.0. If the course as laid out were 2000 miles and 300 were allowed for variation, the trip would require 24 hours. With the four motors running continuously the total weight of gasoline necessary would be $33 \times 4 \times 24 \times 6.15 = 19{,}500$ lb., whereas the contemplated quantity was 20,000 lb.

The flight could be successfully accomplished, then, with a flying boat, similar to existing types, of about 32,000 lb. in weight, equipped with four motors, and having a gasoline supply of about 3250 gal., assuming flight at continued full speed and at maximum r.p.m. of the four motors. At economical speed the gasoline supply necessary would be approximately 85 per cent, or 2760 gal.[1]

[1] The NC-4 (total weight, 28,000 lb.) flew 1390 miles in 15 hours 18 minutes and carried a gasoline load of 1650 gal.

LIBRARY NOTES AND BOOK REVIEWS

Abrasives and Abrasive Wheels. Their Nature, Manufacture and Use. A Complete Treatise on the Manufacture and Practical Use of Abrasives, Abrasive Wheels and Grinding Operations. By Fred B. Jacobs. The Norman W. Henley Publishing Co., New York, 1919. Cloth, 5 x 8 in., 338 pp., 174 illus., 1 por., $3.

This work opens with descriptions of the various natural and artificial abrasives, the manufacture of grinding wheels and artificial sharpening stones, the grades established in commerce and the methods of testing grinding wheels, dust-collecting systems and safeguards, abrasive papers and cloths, methods of surface, cylindrical and internal grinding, special grinding operations, and cutter and saw sharpening. The author writes from experience as a machinist and as a salesman of grinding wheels.

Airplane Design and Construction. By Ottorino Pomilo. First edition. McGraw-Hill Book Co., Inc., New York, 1919. Cloth, 6 x 9 in., 403 pp., 248 illus., 58 tables, $5.

A book on the structure and design of airplanes, in which the results of European experimental research in aerodynamics are presented in considerable detail. The problems relating to airplane design and operation are analyzed, working formulæ are derived and the data needed by designers are presented.

The Applications of Electrolysis in Chemical Industry. By Arthur J. Hale. Longmans, Green & Co., New York, 1918. Cloth, 6 x 9 in., 148 pp., 56 illus., $2.50. (Monograms on Industrial Chemistry.)

The author describes briefly the electrolytic refining and winning of metals; the production of hydrogen and oxygen, chlorin, caustic soda, hypochlorites, chlorates and perchlorates; and of various other organic and inorganic compounds. References to the literature and patents are included.

A Century of Science in America. With Special Reference to the American Journal of Science, 1818-1918. By Edward Salisbury Dana and Others. Yale University Press, New Haven, 1918. Cloth, 6 x 9 in., 458 pp., 22 por., $4.

The present book commemorates the one-hundreth anniversary of the founding of the *American Journal of Science* by Benjamin Silliman in July, 1818. The opening chapter gives a somewhat detailed account of the early days of the *Journal*, with a sketch of its subsequent history. The remaining chapters are devoted to the principal branches of science which have been prominent in the pages of the *Journal;* geology, paleontology, mineralogy, chemistry, physics, zoology and botany. They have been written with a view to showing in each case the position of the science in 1818 and the general progress made during the century. Special prominence is given to American science and particularly to the contributions to it to be found in the *Journal's* pages.

Electrical Aids to Greater Production. Plans, Methods and Appliances by Which Industrial Electrical Engineers are Meeting Increased Demands for Power. Compiled and edited by Allen M. Perry. First edition. Published by *Electrical World*, McGraw-Hill Book Co., Inc., New York, 1919. Cloth, 6 x 9 in., 332 pp., illus., chart, tables, $2.

Contents: General Power Problems of Industrial Plants; Distribution, Transformation, Switching and Protection; Motors, Control, Specific Applications, Troubles and Remedies; Illumination—Selection of Equipment, Economics, and Specific Applications; Electric Furnaces, Welding, etc.; Meters and Measurements as Applied to Industries; Handling Material in Industrial Plants with Electric Tractors; Outdoor Substations.

The engineering editor of the *Electrical World* has prepared this volume from the articles on the application of electricity to plants which have appeared in that periodical during the last few years. It summarizes the methods that have arisen from the necessity for increased factory output and reduced cost of production caused by the war in many classes of industries.

Induction Coils in Theory and Practice. By F. E. Austin. (Hanover, N. H., copyright 1919.) Cloth, 6 x 9 in., 64 pp., 45 illus., $1.

A presentation of the fundamental principles of the induction coil, for use as a textbook. Intended to enable the student to construct induction coils to meet a variety of demands as well as to construct coils to fulfill specific requirements.

An Introduction to the Physics and Chemistry of Colloids. By Emil Hatschek. Third edition. P. Blakiston's Son & Co., Philadelphia, 1919. Cloth 5 x 7 in., 116 pp., 17 illus., $1.50.

This small volume is intended to introduce readers with a reasonable knowledge of physics and chemistry to the fundamental facts and methods of this important branch of physical chemistry. Small additions and corrections have been made to this edition, to include such recent advances as fall within the scope of a brief introductory work.

James Woodhouse, A Pioneer in Chemistry, 1770-1809. By Edgar F. Smith. The John C. Winston Co., Philadelphia, 1918. Cloth, 5 x 8 in., 299 pp., 1 pl., 1 por., $1.50.

Dr. Smith's account of the life and labors of James Woodhouse is a valuable contribution to the early history of chemistry in America. Woodhouse was elected professor of chemistry at the University of Pennsylvania in 1795 and retained this connection until his death in 1809. He was an industrious and ingenious chemist, who by his work and writings did much to establish the teaching of chemistry on a sound basis and to arouse interest in the industrial applications of the science.

Laboratory Experiments with Direct Currents. By F. E. Austin. (Hanover, N. H., copyright 1917). Flexible cloth, 5 x 7 in., 152 pp., illus.

A laboratory course, covering about forty hours, for students in technical and industrial high schools, etc., based on the author's experience as a teacher. The chief aim is to make evident some of the engineering applications of direct currents.

MacRae's Blue Book. MacRae's Blue Book Co., New York, 1919. Cloth, 9 x 12 in., 1846 pp., $10.

This record of manufacturers is intended for use by purchasing agents interested in iron and steel products, building materials, railway supplies, etc. It includes an alphabetical address list of the principal manufacturers in the United States, a classified index of the makers of 10,000 products, an index of trade names, a collection of miscellaneous data useful to purchasers and users of the articles considered, and the standard list prices of building materials, iron and steel products, etc.

Military Geology and Topography. A Presentation of Certain Phases of Geology, Geography and Topography for Military Purposes. Herbert E. Gregory, Editor. Prepared and issued under the auspices of the Division of Geology and Geography, National Research Council. Yale University Press, New Haven, 1918. Cloth, 6 x 9 in., 281 pp., illus., pl., maps, $1.25.

This book is the result of a preliminary effort to meet the need which the Great War has demonstrated for a more widely diffused knowledge of geology as an aid in conducting military operations and in the solution of economic problems relating to raw materials. Attention is given mainly to those facts and principles that have proven to be applicable to military problems. Bibliographies for supplementary reference study are included.

ACCESSIONS TO THE LIBRARY

American Book Trade Manual. 1919. Purchase.

American Bureau of Shipping. Extract from the Rules for Building and Classing Vessels. Sections 39-42, inclusive, and Sec. 49. 1917. Revised June 1918. Gift of Bureau.

America's Munitions. 1917-1918. Report of Benedict Crowell, Asst. Sec'y of War, Director of Munitions. Gift of U. S. War Dept.

Bibliography of the Occurrence, Geology and Mining of Manganese with Some References on its Metallurgy and Uses. Compiled by Harold L. Wheeler. Reprint. Gift of author.

Managing for Maximum Production. By L. V. Estes. Pts. I, II and III. Reprints. Gift of author.

Marine and Dock Labor—Work, Wages, and Industrial Relations During the Period of the War. Report of the Director of the Marine and Dock Industrial Relations Division, U. S. Shipping Board. 1918. Gift of Board.

Mechanics' and Engineers' Pocket-Book. By Chas. H. Haswell. 60th edit. *1895*. Gift of Prof. F. R. Hutton.

Missouri Bureau of Geology and Mines. Biennial Report of the State Geologist. *1919*. Purchase.

Monograph on the Constitution of Coal. Dept. of Scientific and Industrial Research. *London, 1918*. Purchase.

Moody's Manual of Railroads & Corporation Securities. 20th Annual Number. Public Utility Section, *New York, 1919*. Purchase.

National Association of Owners of Railroad Securities. Resolutions adopted. By S. Davies Warfield, President. *1919*. Gift of author.

New York Central Railroad Company. Annual Report. 1918. Gift of N. Y. Central R. R. Co.

New York State Department of Labor. 26th Annual Report of the Bureau of Labor Statistics. 1908. Pt. I. Industrial Training. Gift of Prof. F. R. Hutton.

Preliminary Report of the Mineral Production of Canada. 1918. By John McLeish. Gift of Canada Dept. of Mines.

Report of an Investigation of The Akron Industrial Salvage Company. Dept. of Commerce Waste-Reclamation Service. 1919. Gift of Dept.

Report of the Tests of Metals. 1917. Gift of Prof. F. R. Hutton.

Report on the "Hawk's Nest" Group of Copper Claims Located on Talumkwan Island, Queen Charlotte Islands, B. C. By Ronald C. Campbell-Johnston. *1909*. Gift of Kirby Thomas.

The Return and Regulation of the Railroads. By S. Davies Warfield. Gift of author.

The Rockefeller Foundation. Review for 1918. By Geo. E. Vincent.

Safeguards. For the Prevention of Industrial Accidents. Edit. by David van Schaack.

The Salinity of the Waters in the Harbor of New York, One Year's Record of Temperatures, Specific Gravities, and Percentages of Land Water. By H. deB. Parsons. Gift of author.

Silver and Gold. Review of the Bullion Market for 1918. By Srinivas R. Wagel. Gift of author.

Some Economic Considerations in Coke-Oven Practice. By W. Colquhoun. *1918*. Excerpt. Gift of author.

State of New York. Second Report of the Factory Investigating Commission. Vols. I & II. *1913*. Gift of Prof. F. R. Hutton.

The Steam Engine. By Daniel K. Clark. Half-Vols. I, II, III, IV. Gift of Prof. F. R. Hutton.

THE ENGINEERING INDEX

Published Monthly by The American Society of Mechanical Engineers

The Engineering Index was Founded in 1884 by the Association of Engineering Societies; Published from 1895 to 1919 by The Engineering Magazine Company; and Acquired January 1919 by The American Society of Mechanical Engineers

THE following pages form a descriptive Index to articles on engineering and related subjects in current periodicals. In its preparation the Society's engineering staff regularly examines all of the technical journals and society publications received by the Engineering Societies Library, which form one of the greatest and most complete collections of scientific periodicals in the world, comprising upward of 1100 distinct publications in some ten languages. Cross-references are freely introduced in the Index, and in all cases where the titles of articles are not sufficiently descriptive, explanatory sentences are appended. The main abbreviations used in the items are given at the bottom of this page.

PHOTOSTATIC COPIES OF ARTICLES LISTED

THE Society is prepared to supply photostatic copies (white printing on black background) of any of the articles listed. Copies of the periodicals themselves, or clippings of articles, cannot be supplied.

Price of each print (up to 11 x 14 in. in size), 25 cents plus postage. A separate print is required for each page of the larger-size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

Those holding coupon books for clippings formerly issued by The Engineering Magazine Company may use the coupons in payment for photostatic prints. In ordering, state plainly

(1) Page number of Index on which item appears
(2) Title of article
(3) Name of periodical.

Orders should be sent to

Harrison W. Craver, *Director*,
Engineering Societies Library,
29 West 39th Street, New York City.

DIVISIONS OF THE ENGINEERING INDEX

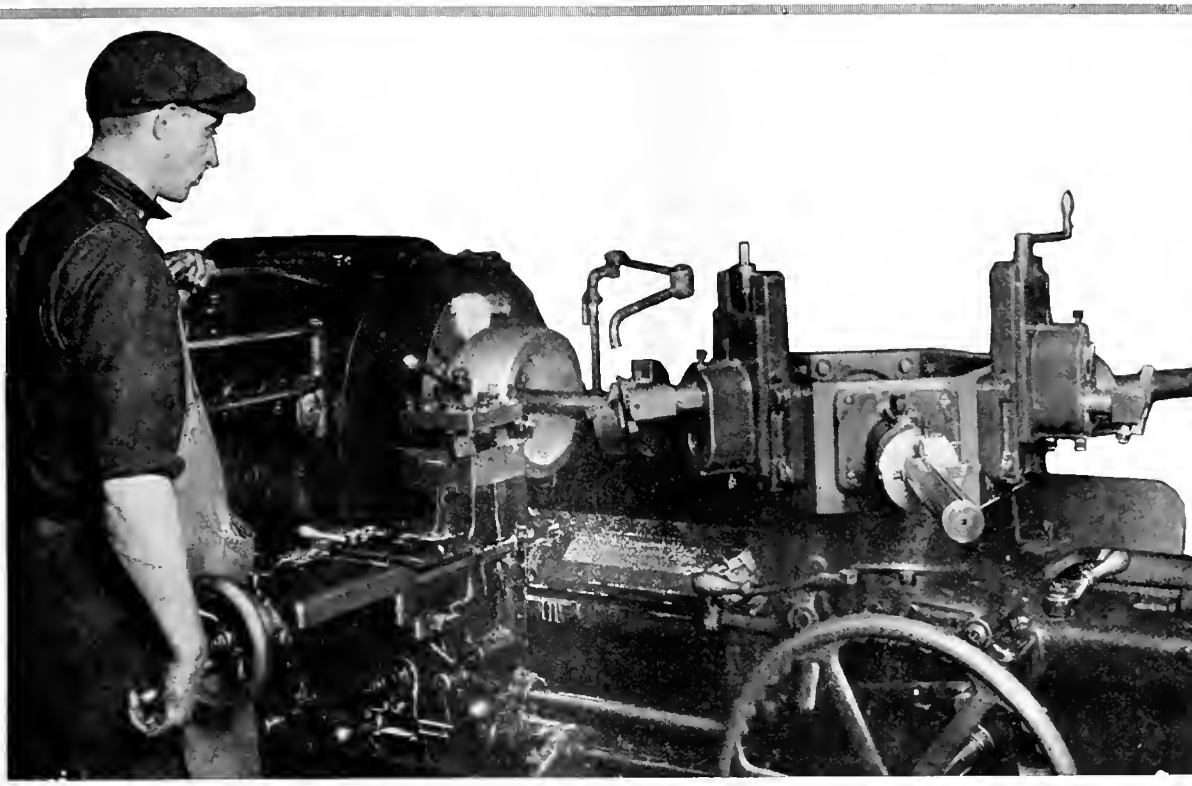
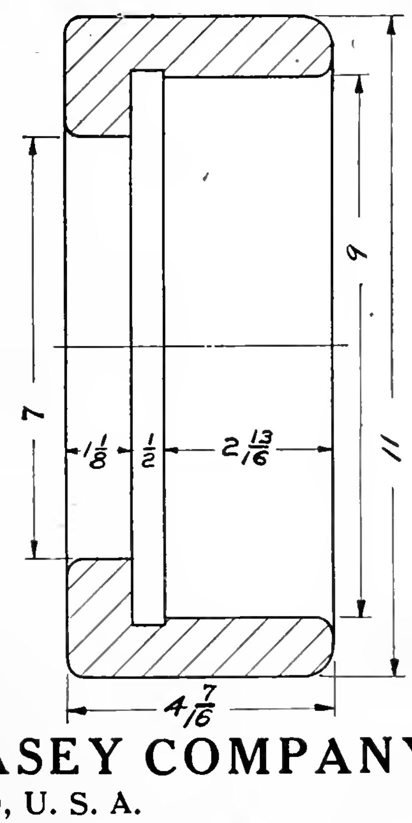
LIST OF TOPICS IN THE ENGINEERING INDEX SEPTEMBER, 1919



Breaks Another Time Record

The Hahn Manufacturing Company, a jobbing machine shop in Cleveland, reduced production time one-half on this drop forged Clutch Ring when the work was transferred from an engine lathe to a



No. 3-A Universal Hollow Hexagon Turret Lathe

Because of the flexibility of the tool equipment of the No. 3-A, the jobbing shop finds it adaptable for finishing small lots of different pieces as well as long runs of the same piece. Then the time saved by operating both square and hexagon turrets simultaneously, and the wide range of feeds and speeds for all classes of work makes the Universal Hollow Hex the machine for the jobber.

No. 4 Universal, 1½" x 10",	**16" Swing**
No. 2-A Universal, 2½" or 3¼" x 29",	**16½" Swing**
No. 3-A Universal, 3½" or 4½" x 44",	**21½" Swing**

Mechanical Engineering

AIR MACHINERY

Air Leakage

Determination of Amount of Air Leakage for a System of Pipes and Receivers the Volume of Which Cannot Easily Be Measured. P. H. Trout, Jr. Compressed Air Magazine, vol. 24, no. 7, July 1919, pp. 9216-9218, 1 fig. By cutting off compressors after filling system to convenient pressure and taking readings of pressure gage and times, readings are plotted in two curves from which amount of leakage is calculated.

Psychrometric Chart

The Psychrometric Chart Explained. L. A. Wilson. Sibley Jl., vol. 33, no. 5, June 1919, pp. 68-70, 1 fig. How it can be constructed for any given pressure.

Receivers

The Air Receiver—II. Frank Richards. Engr., vol. 127, no. 3311, June 13, 1919, pp. 573-574. Features of two-stage compressor arrangement.

CORROSION

Calcium Chloride

Corrosion Tests on Commercial Calcium Chloride Used in Automobile "Anti-Freeze Solutions." Paul Rudnick. Jl. Indus. & Eng Chem., vol. 11, no. 7, July 1, 1919, pp. 668-670, 3 figs. Reported that aluminum was attacked most severely, iron next, and copper least; rate of corrosion increased sharply on eighteenth to twentieth day of immersion. Composition of solutions varied from 28 to 30 per cent of calcium chloride and from 0.5 to 3.0 per cent magnesium chloride. Paper read before Div. of Indus. Chemists & Chem. Engrs., at meeting of Am. Chem. Soc.

Conduits

Apparatus for the Prevention of Corrosion in Conduits, Flue-Gas Feed Heaters, Superheaters, Boilers and Steam Turbines (Ueber Apparate zur Verhütung von Anfressungen in Rohrleitungen, Rauchgasvorwärmern, Ueberhitzern, Dampfkesseln und Dampfturbinen). M. R. Schulz. Zeitschrift für Dampfkessel u. Maschinenbetrieb, vol. 42, no. 8, Feb. 21, 1919, pp. 49-51, 4 figs. Types described are the Steinmüller, Hülsmeyer and Balcke apparatus and those made by the Deutsche Sanitätswerke at Frankfort, Germany.

Copper

Corrosion of Copper—VI. Metal Industry, vol. 15, no. 1, July 4, 1919, pp. 8-10, 2 figs. Experiment with sea water, one electrode aerated. From 4th report of Corrosion Committee of Inst. of Metals.

Manganese Bronze

Effect of Corrosion on Wrought Manganese Bronze Under Tensile Stress. P. D. Merica and R. W. Woodward. Am. Mach., vol. 51, no. 5, July 31, 1919, pp. 217-220, 3 figs. Tests claimed to have indicated that proportional limit is to be regarded as maximum safe stress for bronzes of harder tempers, but that it is not certain that this limit may not be slightly exceeded in materials which are soft, i. e., free from work hardness.

Paints

Efficient Protection of Iron and Steel Structures Obtained by Properly Selected Paints. John Grieve. Contract Rec., vol. 33, no. 26, June 25, 1919, pp. 617-619. Functions of various coats and factors governing their efficient application.

Rust Prevention

Rust Prevention. Edward T. Birdsall. Jl. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp. 55-57. Classification of rust-proofing processes and enumeration of principal requirements of a rust-prevention process as applied to automobiles, aircraft and other machined and hardened parts.

FORGING

Drop-Stamping

Drop-Stamping, Drop Forgings, Etc. IV & V. Joseph Horner. Mech. World, vol. 65 & 66, no. 1694 & 1697, June 20 & July 11, 1919, p. 295 & 18, 14 figs. Method of fastening stamps into anvil and top of steam hammer. Manufacturing operations. (Continuation of serial.)

Forge Shops

An Example of Forge Shop Construction. Iron Age, vol. 104, no. 4, July 24, 1919, pp. 219-223, 7 figs. Arrangement providing for high and economical production.

Forging Plants

Equips Plant to Make Forgings. Mar. Rev., vol. 49, no. 8, August 1919, pp. 384-385, 4 figs. Addition to Camden Forge Co.'s plant to enable it to handle marine forgings besides the railroad work in which plant formerly specialized.

Welding

Fusion Welding Applied to Drop Forgings. S. W. Miller. Iron Age, vol. 104, no. 5, July 31, 1919, pp. 287-293. Oxyacetylene and electric welds and their applicability to defective forgings. Paper read before Am. Drop Forge Assn.

FOUNDRIES

Automobile Cylinders

Making Automobile Cylinders Without Flasks. Pat Dwyer. Foundry, vol. 47, no. 326, July 1, 1919, pp. 421-425, 9 figs. Cylinders are cast in vertical cores at plant of Buda Co., Harvey, Ill.

Brass Foundries

Materials and Chemicals Used in Brass Foundry Practice, Phosphorus—VII, Charles Vickers. Brass World, vol. 15, no. 7, July 1919, pp. 231-233, 2 figs. Series of articles dealing with history, properties, appearance, physiological action and commercial use of substances commonly employed in brass founding.

Bronze Castings

Cupola Metal for Bronze Castings. Charles Vickers. Foundry, vol. 47, no. 327, July 15, 1919, pp. 479-481, 3 figs. Methods used in large Canadian plant.

Bronze Statuary. Foundry Trade Jl., vol. 21, no. 210, June 1919, pp. 383-385, 7 figs. Historical account of industry with reference to composition of bronzes used by ancient craftsmen as determined by recent analytical analysis, and standard compositions adopted in various nations. From Stahl und Eisen.

Cupola Practice

Notes on Cupola Practice. J. Bagley. Foundry Trade Jl., vol. 21, no. 210, June 1919, pp. 391-395. Based on operating practice and results obtained at various plants. Paper read before Lancashire Branch of British Foundrymen's Assn.

Die Casting

Modern Developments in Die Casting. Adolph Bregman. Metal Indus., vol. 17, no. 7, July 1919, pp. 327-330, 7 figs. Description of plant of Doehler Die-Casting Co.

Use Die Casting and Eliminate Machining. Can. Machy., vol. 22, no. 3, July 17, 1919, pp. 46-47, 4 figs. Viewpoint of Franklin Co. as to why die castings should be used in design of machinery to greater extent than they are at present.

Electric Furnace

Employment of Electric Furnace in Foundry Work (Utilisation du four électrique en fonderie). Fonderie Moderne, no. 2, Feb. 1919, pp. 266-267. Result of experiences had with a 6-ton Héroult furnace. Advantage of electric furnace considered to lie chiefly in reducing cost of production.

French Foundry

Modern French Foundry in Suburbs of Paris. H. Cole Estep. Foundry, vol. 47, no. 326, July 1, 1919, pp. 429-434, and p. 437, 17 figs. Equipped with hydraulic molding machines. Special machine mentioned is one which fills both cope and drag flasks with sand simultaneously and rams two parts of mold at one stroke.

Layout

Steel Foundry Opened in Wilkes-Barre, Pa. Iron Trade Rev., vol. 64, no. 26, June 26, 1919, pp. 1677-1678, 3 figs. Plan showing location of furnace with reference to molding and pouring-off floors.

Semi-Steel

Semi-Steel and General Foundry Practice. David McLain. Can. Foundryman, vol. 10, no. 7, July 1919, pp. 180-183. Suggestions in regard to various foundry processes. Address delivered at annual Convention of Southern Metal Trades Assn.

Ship Castings

Eastern Plant Makes Ship Castings. E. C. Kreutzberg. Foundry, vol. 47, no. 327, July 15, 1919, pp. 468-471, 9 figs. Castings for stern frames, anchors, rudders and stems.

Making Castings Used in Ship Construction—V. Ben Shaw and James Edgar. Foundry, vol. 47, no. 326, July 1, 1919, pp. 417-420, 22 figs. Solid and skeleton construction contrasted.

Stem-Piece Casting

Castings for Ship Construction—VI. Ben Shaw and James Edgar. Foundry, vol. 47, no. 327, July 15, 1919, pp. 474-478, 17 figs. Difficulties attendant upon molding and casting three common types of stem pieces are described.

Valve Castings

Producing Sound Nonferrous Castings for Valves. R. R. Clarke. Foundry, vol. 47, no. 326, July 1, 1919, pp. 441-447, 4 figs. With reference to practice of Eagle Brass Foundry Co., Seattle.

Zinc Castings

The Production of Zinc Castings. E. H. Schulz and R. Fielder. Metal Industry, vol. 14, no. 23, June 6, 1919, pp. 461-462, 3 figs. Copper and aluminum, preferably together, are believed to form most suitable metals for alloying with zinc for production of castings. From Giesserei Zeitung.

FUELS AND FIRING

Anthracite Burning

Burning Steam Sizes of Anthracite With or Without Admixture of Soft Coal. Bur. of Mines, technical paper no. 220, reprint of eng. bul. no. 5, prepared by U. S. Fuel Administration, 1919, 8 pp., 1 fig. Emphasizes that greatest loss in burning fine anthracite is on account of excess air of fire and advises that best way to keep this down to proper minimum is by using uptake damper, throttled as much as possible so as to produce highest CO_2 without formation of unburnt gases.

Coal Combustion

The Economic Use of Coal for Steam-Raising and House Heating. John Blizard. Can. Dept. of Mines, bul. 28, no. 502, Jan. 30, 1919, 21 pp. General principles of combustion of coal and generation and uses of steam.

Gas Fired Furnaces

The Utilization of Gaseous Fuel in Commercial Practice. With Consideration of the Types of Gas-Fired Furnaces and Methods for Their Control. F. W. Epworth. Gas Jl., vol. 146, no. 2927-2928, June 17 & 24, 1919, pp. 755-759 & 804-806, 9 figs. Gas-fired furnaces are grouped under three main headings—(1) natural-draft furnaces, (2) forced-draft furnaces, and (3) compressed gas and air furnaces. A scheme for placing any furnace in its correct group is developed from this classification. (Concluded.)

Gas Fuel

Some Considerations with Regard to Fuel Gas. Fred Crabtree. Proc. Engrs. Soc. Western Pa., vol. 35, no. 3, April 1919, pp. 117-125 and (discussion) pp. 126-139, 1 fig. Based on survey of various works. Remarks refer to stages in manufacturing processes, methods of cleaning and costs.

Holbeck System Pulverized Coal

The Combustion of Powdered Fuel. J. S. Atkinson. Elecn., vol. 82, no. 26, June 27, 1919, pp. 730-732, 2 figs. Details of Holbeck system described and importance of proper design of burner emphasized.

Illinois Coal

Characteristics of Illinois Coal and How to Burn It. T. A. Marsh. Power, vol. 50, no. 3, July 15, 1919, pp. 93-95. Relative values of steaming coals, their characteristics and analysis.

Lignite

Methods for More Efficiently Utilizing Our Fuel Resources. Arthur V. White. General Elec. Rev., vol. 22, no. 6, June 1919, pp. 465-474. Steps being taken in Canada toward development of vast deposits of lignite in Saskatchewan and Alberta.

Low-Grade Fuels

Problems in the Utilisation of Fuels. Raymond F. Bacon and William A. Hamor. Jl. Soc. Chem. Indus., vol. 38, no. 12, June 30, 1919, pp. 161T-168T. Problems to be found in developing methods for utilizing various low-grade fuels, with notes on work done in this direction both in Europe and America.

Oil Fuel

The Utilization of Oil as Fuel (Neues über Oelfeuerung). Petroleum, vol. 14, no. 14, Apr. 15, 1919, pp. 658-661, 6 figs. Koerting

"No, sir! there's no depreciation on '85% Magnesia.'"

Photo by permission of Ordnance Dept., U. S. A.

That's what the chief engineer told his president—

They were figuring on Depreciation of Equipment. The engineer was saying, "Some fellow the other day was knocking our '85% Magnesia' pipe-coverings. So I wrote to W. A. Macan, Chairman of the Magnesia Association. He has been in the pipe-covering business for over 30 years and I wanted his straight experience. He says *there's no such thing as '85% Magnesia' depreciation.* Here's part of his letter":

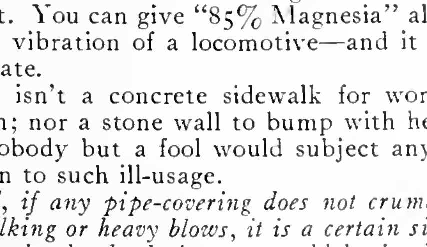
Time-proof—Usage-proof—Not Fool-proof

You can soak "85% Magnesia"—and it dries out as good as ever. You can hold "85% Magnesia" on a shovel over a fire till the shovel gets red-hot—and it isn't hurt. You can give "85% Magnesia" all the tremendous vibration of a locomotive—and it does not disintegrate.

But it isn't a concrete sidewalk for workmen to tramp on; nor a stone wall to bump with heavy ladders. Nobody but a fool would subject any cellular insulation to such ill-usage.

Indeed, if any pipe-covering does not crumble under heavy walking or heavy blows, it is a certain sign that it is lacking in the dead-air spaces which give it its real insulation value.

We invite specific questions on the durability as well as the efficiency of "85% Magnesia." The Engineers of the members of this Association, as well as the experts of the Mellon Institute who have been specially investigating pipe-coverings for three years, are at your service through our Committee. Send for our literature. Also for Specifications for the proper application of "85% Magnesia" compiled and endorsed by the Mellon Institute of Industrial Research of Pittsburgh University, which are furnished to Engineers and Architects on request.



MAGNESIA ASSOCIATION OF AMERICA
721 Bulletin Building, Philadelphia, Penna.

EXECUTIVE COMMITTEE, W. A. Macan, *Chairman*
George D. Crabbs . The Philip Carey Co. . . Cincinnati, Ohio
Alvin M. Ehret . Ehret Magnesia Mfg. Co. . Valley Forge, Penna.
J. R. Swift . . . The Franklin Mfg. Co. . . . Franklin, Penna.
R. V. Mattison, Jr. . Keasbey & Mattison Co. . . . Ambler, Penna

From a Veteran's Experience in "85% Magnesia"

"While it is a common practice to charge up each year a percentage of the cost of a plant for depreciation, in the case of '85% Magnesia' this is not necessary.

"Thus in the Niagara Power Station, '85% Magnesia' covering has been in service nearly twenty years; when recently a section and block of this '85% Magnesia' were analyzed and tested, it showed a depreciation after all those years of approximately 3%—so small that it could hardly be figured.

"Again, the Mellon Institute of Industrial Research of Pittsburgh University has on file many letters from Operating Engineers who have had '85% Magnesia' in service for ten years to twenty-five years stating that those coverings are as efficient today as when first placed in service.

"As long ago as 1888 Mr. J. J. DeKinder was a Consulting Engineer in Philadelphia, having the Pennsylvania Railroad among his numerous clients. A short time ago he wrote me:—

"'I have specified '85% Magnesia' covering for a great many years, in fact, during all my active practice. I have used it under all procurable temperatures, and under all conditions that stationary and locomotive service furnish, and can recall *no time* in which it failed to render efficient service.'

"It may become soaking wet through steam-leaks, floods, sinking of a vessel, or any similar cause, not only once but several times, and when steam is turned on the boilers again, it dries out without shrinking or warping, and continues saving heat units just the same as it did before.

"I challenge anyone to give good evidence of any case where '85% Magnesia' properly applied and properly treated has failed to give maximum and satisfactory service through any inherent defect."

W. A. MACAN
Chairman Magnesia Association of America

steam jet sprayer, centrifugal atomizers; oil-fired crucible furnace for melting tungsten; air atomizers.

Powdered Coal

See Pulverized Coal.

Pulverized Coal

Firing Boilers with Powdered Coal, L. C. Harvey. Blast Furnace & Steel Plant, vol. 7, no. 7, July 1919, pp. 352-353, 2 figs. Also Elecn., vol. 82, no. 26, June 27, 1919, pp. 740-741, 1 fig. Points out that it is essential to provide sufficient combustion area per pound of coal burned per unit time; otherwise ash is not deposited in slag chamber. "Fuller" powdered coal equipment.

Pulverized Coal as a Fuel, N. C. Harrison. Mech. Eng., vol. 41, no. 8, August 1919, pp. 645-649. Review of uses in industries. Report of tests of 468-hp. Edge Moor boiler with pulverized-coal equipment is included.

Pulverized Coal for Stationary Boilers, Fred'k A. Scheffler and H. G. Barnhurst. Mech. Eng., vol. 41, no. 8, August 1919, pp. 650-652. Comparison of stoker and pulverized-fuel plants with particular reference to reliability, cost, adaptability and efficiency.

See also Holbeck System.

Smoke Prevention

Fuel Economy and Smoke Prevention. Can. Ry. & Mar. World, no. 257, July 1919, pp. 357-361, 3 figs. Report of Mech. Section Committee of Am. RR. Assn.

Spontaneous Combustion

"Spontaneous Combustion," Especially with Reference to Ships' Cargoes. Coal, Charcoal, Cotton, and Textile Fibres Generally; Hay, Tobacco, and Certain Chemicals; Dyestuffs and Pigments, etc., Watson Smith. Jl. Roy. Soc. Arts, vol. 67, no. 3474, June 20, 1919, pp. 500-507. Study of causes producing it based on records of accidents as reported in various publications.

FURNACES

Brickwork, Coke-Oven

Patching of Jamb Leaks on Coke-Oven Brickwork, R. L. Fletcher. Gas Age, vol. 44, no. 1, July 1, 1919, pp. 15-17, 5 figs. Blowing material into crack in just sufficient quantity to insure getting inner part of joint filled while outer part will be covered by hand work.

Gas Burners

The Development of Gas Burners for Industrial Purposes (Zur Entwicklungsgeschichte der Gasbrenner für industrielle Feuerungsanlagen), Dr. Gwosdz. Feuerungstechnik, vol. 7, nos. 9 & 10, Feb. 1 & 15, 1919, pp. 69-71 and 78-80, 9 figs. Description of burners developed by Gesellschaft Westfälische Maschinenbau-Industrie Gustav Moll & Co. Type described is principally used for heating steam boilers.

Heat-Treating Furnaces

Heating Furnaces and Annealing Furnaces —VII, W. Trinks. Blast Furnace and Steel Plant, vol. 7, no. 7, July 1919, pp. 321-324, 7 figs. Curves are given for finding recuperator surface for any recuperative furnace.

Anchor Chain Heat Treating Furnaces, T. F. Baily. Blast Furnace & Steel Plant, vol. 7, no. 7, July 1919, pp. 329-330. Heat-treating rails in electric furnaces suggested.

Continuous Furnaces for Heating Forgings. Blast Furnace & Steel Plant, vol. 7, no. 7, July 1919, pp. 346-348, 2 figs. "Oilgas" type. Advantages claimed are uniform heating, maximum economy and constant production.

Kilns

What to Consider in the Design and Layout of Periodic Kilns, T. W. Garve. Brick & Clay Rec., vol. 55, no. 1, July 1, 1919, pp. 29-35, 19 figs. Comparison of various arrangements.

GAGES

Gage Making

Various Examples in the Art of Gauge Making, H. G. Robson. Can. Machy., vol. 22, no. 1, July 3, 1919, pp. 9-12, 33 figs. Illustrating particularly modus operandi rather than extent of calculations required.

Hoke Gages

A Millionth of an Inch. How the Wave Length of Light is Used to Detect Errors of This Infinitesimal Amount. Sci. Am., vol. 121, no. 3, July 19, 1919, pp. 62-63, 8 figs. Light-interference method of measuring gages developed by Bur. of Standards. Apparatus for throwing beam of monochromatic light and photograph of interference fringes thus obtained are illustrated.

Thread Gages

Improved Design of "Not Go" Thread Gage, H. L. Van Keuren and I. H. Fullmer. Machinery, vol. 25, no. 11, July 1919, pp. 1076-1077, 2 figs. Thread form.

GAS ENGINEERING

Carbonizing Plants

Carbonizing Plants of the Future, Having Regard to the Scarcity of Labor, and the Gas Best Fitted to the Consumer, H. D. Madden. Gas Jl., vol. 146, no. 2928, June 24, 1919, pp. 809-810, and (discussion) pp. 810-811. Gas best suited to consumer is believed to be one having for its basis a heating standard. Paper read before Wales and Monmouthshire District Instn. of Gas Engrs.

Gas Investigating Committee Report

Second Report of the Gas Investigating Committee. Gas World, vol. 70, no. 1819, May 31, 1919, pp. 429-440, 16 figs., and Gas Jl., vol. 146, no. 2925, June 3, 1919, pp. 607-619, 16 figs. Data with regard to performance of gases of relatively low calorific value. Tests were made with ring and incandescent burners of various types. Account of tests on relative efficiencies in use of different grades of gas continued from first report.

Governors

A New Governor for Close Pressure Regulation of Gas Exhausters and Boosters. Chem. & Metallurgical Eng., vol. 21, no. 2, July 15, 1919, pp. 99-100, 2 figs. Two-fold type, provided with compensating return.

Providence Gas Company

Manufacturing Plant of the Providence Gas Co.—I & II, Walter M. Russell. Chem. & Metallurgical Eng., vol. 21, no. 1 & 2, July 1 & 15, 1919, pp. 34-39 & 88-95, 19 figs. Water and producer-gas machinery and apparatus. Measuring and recording instruments. Review of gas industry in Providence. Paper read before Am. Inst. of Chem. Engrs.

Water Gas

Exhaust Steam in Water Gas Machines, Raymond L. Greene. Gas Age, vol. 44, no. 1, July 1, 1919, pp. 1-5, 7 figs. Results obtained in actual experience.

HANDLING OF MATERIALS

Bunkering

See Coal Handling.

Coal Handling

Coal-Handling Plant at Pembrey. Engineering, vol. 108, no. 2793, July 11, 1919, pp. 38-41 and 50, 29 figs. partly on supp plate. Equipment designed to permit delivery to be made (1) direct from coal wagon to boiler-house overhead coal bunker, (2) from coal wagon to reserve coal store, or (3) from reserve coal store to overhead coal bunker, leaving clear way for (4) trucking on portable railway or wheeling coal into boiler-house at stoking-floor level, for providing machinery in case of breakdown of mechanical plant.

A British Plant for Handling Domestic Coal, H Hubert. Coal Trade Jl., vol. 50, no. 28, July 9, 1919, pp. 835-837, 3 figs. Description of tidewater coal plant for handling domestic grades and notes on difference between American and British systems of handling.

Bunkering Big Ships, J. F. Springer. Sci. Am., vol. 108, no. 2, July 12, 1919, pp. 34-35, 3 figs. Conveyor apparatus for moving coal from barge to bunker and distributing it evenly in bunker.

Mechanical Coaling Stage at Hull, North Eastern Railway. Ry. Gaz., vol. 30, no. 26, June 27, 1919, pp. 1027-1029, 5 figs. Coal is emptied from wagons into underground hopper, from which it is mechanically elevated to overhead storage bunkers which are provided with chutes for delivering it to various locomotives as required.

The Atlas Coal Co.'s Plant at Louisville, Ky. Coal Trade Jl., vol. 50, no. 27, July 2, 1919, pp. 806-808. Installation of two 50-ton hoppers.

Grain Loading

Mechanical Grain Loading Devices on the Roumanian Danube. Eng. & Indus. Management, vol. 2, no. 1, July 3, 1919, pp. 28-31, 6 figs. Floating grain elevators and pneumatic unloading plant. (Continuation of serial.)

Oil, Vegetable, Handling

Handling Vegetable Oils at Pacific Coast Port Terminals. Eng. News-Rec., vol. 83, no. 5, July 31, 1919, pp. 204-207, 5 figs. Layout of Philippine Vegetable Company's terminal at San Francisco.

Ore, Unloading

Unloading Ore Quickly And Cheaply. Elec. Rev., vol. 75, no. 2, July 12, 1919, pp. 56-59, 3 figs. How iron ore is unloaded from lake steamers by means of electrically operated automatic ore unloaders.

See also Unloading Machines.

Shell Parts, Handling

Making Three Million Trench Mortar Shells, E. C. DeWolfe. Iron Age, vol. 104, no. 1, July 3, 1919, pp. 1-7, 12 figs. System of conveyors, belt, roller, gravity and slat, used in transfer of parts from operation to operation, until delivery of completed and boxed shells to freight cars.

Unloading Machine

A Rapid Unloading Machine. Coal Age, vol. 16, no. 5, July 31, 1919, pp. 188-190, 2 figs. Wellman-Seaver-Morgan Co. Machine consists of main framework mounted on trucks which travel along runway rails. Design is heavy.

Description of Automatic Ore Unloader. Blast Furnace and Steel Plant, vol. 7, no. 7, July 1919, pp. 317-320, 4 figs. Unloader consists of main framework mounted on trucks which travel along railway rails; hoisting mechanism is located in enclosed house at rear end of walking beam.

HEAT-TREATING

Case-Hardening

Improved Case-Hardening Process. Iron Age, vol. 104, no. 3, July 17, 1919, pp. 163-165, 5 figs. Slow cooling of nickel-steel gears for automobile and airplane engines prevents flaking and chipping. Paper read before Iron & Steel Inst.

Modern Practice in Case-Hardening, A Best. Machy. (Lond.), vol. 14, no. 354, July 10, 1919, pp. 436-439, 5 figs. Material suitable for carburizing and notes on selection of carburizing furnace.

Cast Iron, Graphitization of

Graphitization of White Cast Iron Upon Annealing, Paul D. Merica and Louis J. Gurevich. Bul. Am. Inst. Min. & Metallurgical Engrs. no. 151, July 1919, pp. 1063-1072, 7 figs. Annealing ranges of temperatures determined for three different compositions used for car wheels.

See also Metallurgy, Iron and Steel (Graphitization.)

Cast Iron, Gray

The Heat Treatment of Grey Cast Iron at Low Temperatures, J. E. Hurst. Eng., vol. 108, no. 2792, July 4, 1919, pp. 1-3, 2 figs. Results of experiments of heat treatment at temperatures of 575 to 600 deg. cent. of a series of commercial cast-iron bars.

Chrome-Nickel Steel

Heat Treating Chrome Nickel Steel, with Special Reference to Impact Testing, Mr. Loudenbeck. Proc. Steel Treating Research, vol. 2, no. 5, 1919, pp. 18-24 & 54, and 58, 7 figs. Photomicrographs of pieces tested under both high and low impact.

Electrical Heat Treatment of Steel

Electrical Heat Treatment of Steel, H. P. MacDonald. J. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp. 69-74, 10 figs. Processes developed at plant of Snead & Co. Iron Works, Jersey City.

Hardening Steel

Modern View of the Hardening of Steel, Haakon Styri. Jl. Am. Steel Treaters Soc., vol. 1, no. 9, June 1919, pp. 286-298, 14 figs. Review of facts occurring when steel is heated and cooled, with reference to what takes place when steel is hardened.

Heat Treating Plants

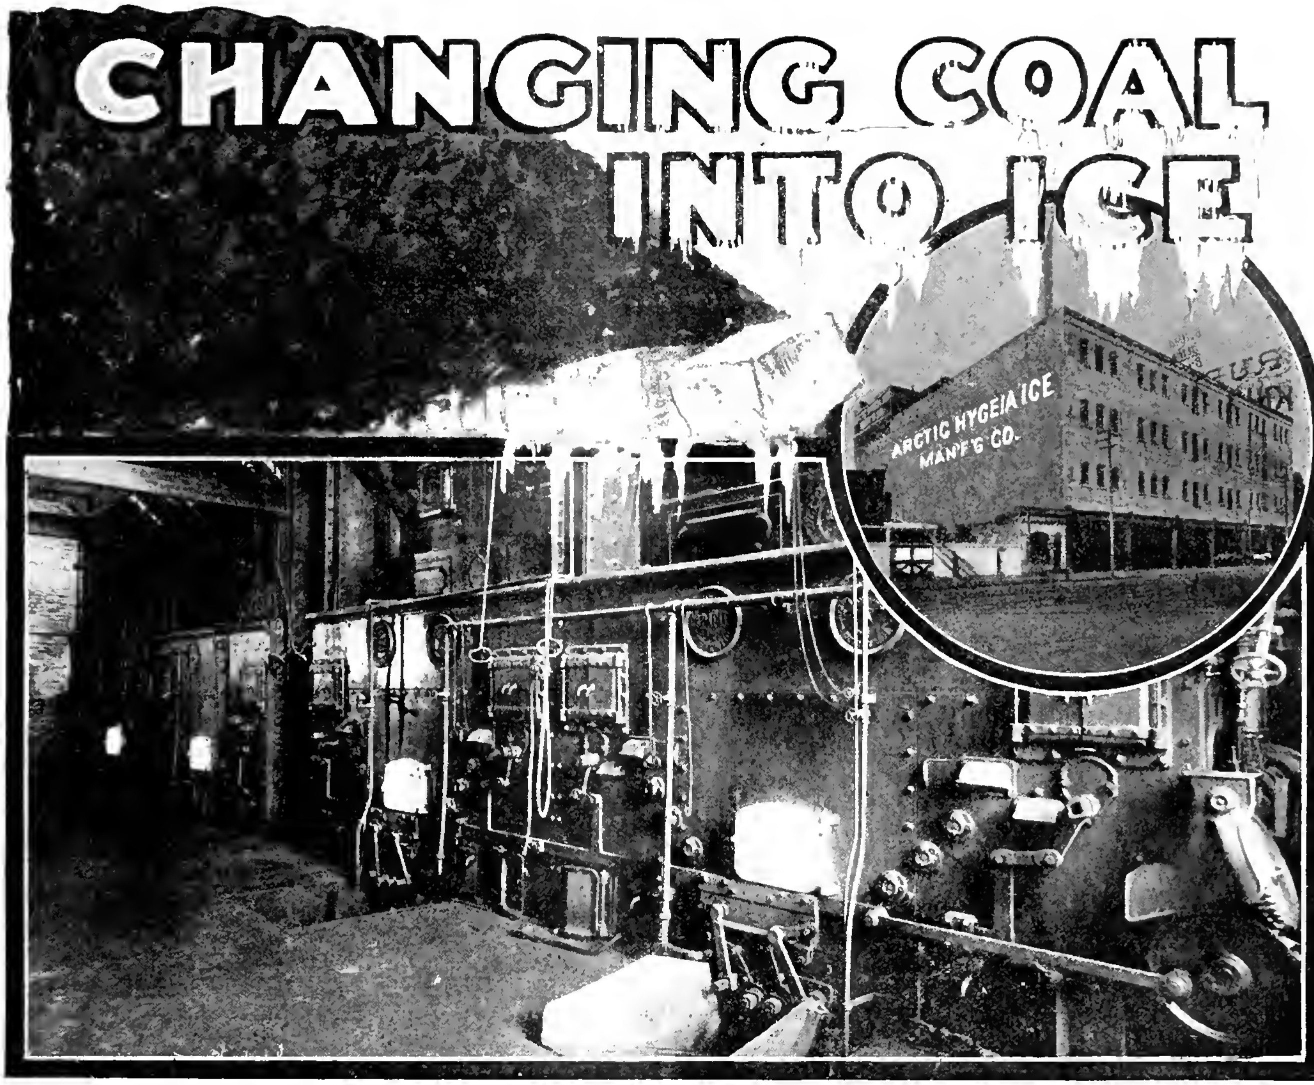
A Complete and Modern Heat-Treating Plant, L. A. Danse. Am. Mach., vol. 51, no. 4, July 24, 1919, pp. 149-160, 24 figs. Structural features of building and details of equipment of Lincoln Motor Co. plant.

High-Speed Steel

The Heat Treatment of High Speed Steel, C. U. Scott. Jl. Am. Steel Treaters Soc., vol. 1, no. 9, June 1919, pp. 299-301. Recommendations in regard to various operations in process of heat-treating.

Malleable Iron

Experiments in Annealing Malleable Iron, H. E. Diller. Can. Foundryman, vol. 10, no. 7, July 1919, pp. 184-186, 4 figs. While manner in which annealing process is proceeded with is considered of vital importance, it is further observed that proper analysis of raw material must not be neglected.



While sweltering New Yorkers are perfectly willing to see heat wasted, one of the largest ice-making companies in the city strives not to waste a heat unit—as heat units saved make more ice.

The Arctic Hygeia Ice Manufacturing Company depends on

MURPHY AUTOMATIC FURNACES

to utilize every heat unit in the coal. While, of course, Murphy Furnaces can't put heat units into coal, they can, however, get them all out.

Do these Murphy Furnaces do it? The entire satisfaction expressed by the management is the answer. They know that Murphy Furnaces will burn *any fuel that has heat in it,* for most every quality of coal has been used during the last 20 years—the service period of the first Murphy Furnace in this plant.

If your boilers are 50 H. P. or larger send for Catalog A-9.

MURPHY IRON WORKS, Detroit, Michigan

BURN ANY FUEL THAT HAS HEAT IN IT

Railroad Materials

Heat Treatment of Railroad Materials, C. B. Bronson. Ry. Rev., vol. 65, no. 2, July 12, 1919, pp. 71-73. Also Iron Age, vol. 104, no. 1, July 3, 1919, p. 25-27. Practice of New York Central RR., particularly in use and treatment of manganese-steel rails, carbon and alloy steel axles, tires and cast-steel wheels. Paper presented before N. Y. Chap. Am. Steel Treaters' Soc.

Size in Heat Treatment

Relative Size in Heat Treatment, T. G. Straub. Iron Age, vol. 104, no. 3, July 17, 1919, pp. 167-168. Conclusion is drawn from experiments that in actual practice large forgings require considerable judgment regarding heat treatment in order to bring desired results.

Steel, Medium-Carbon

Effect of Time and Low Temperature on Physical Properties of Medium-Carbon Steel, G. A. Heinhardt and H. L. Cutler. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 151, July 1919, pp. 1091-1098. Test to determine cause of difference in elongation and reduction of area shown by core tests made directly after drilling and machining and of core tests that had rested after these operations.

HEATING AND VENTILATION

Gas and Electric Heating Compared

Comparative Cost of Electric and Gas Heating (Prix de revient comparés du chauffage électrique et du chauffage au gaz), Ach. Delamarre. Revue Générale de l'Electricité, vol. 6, no. 2, July 12, 1919, pp. 45-47, 1 fig. Graph based on assumption that kilowatt-hour and cubic meter of gas are sold at the same price.

Schools

New Heating and Ventilating System for Chicago Schools, John Howatt. Power, vol. 50, no. 3, July 15, 1919, pp. 109-110, 1 fig. Piping layout designed by Bureau of School Engineering, Chicago.

Workshops

The Heating and Ventilation of Workshops —II. Engr., vol. 127, no. 3312, June 30, 1919, pp. 599-602 and 608, 12 figs. System employed in works of Austin Motor Co. Ltd.

Heating of Large Industrial Plants (Chauffage des Grands Locaux Industriels. Utilisation du chauffage comme régulateur de charge des centrales électriques), M. A. Beaurrienne, Mémoires et Compte rendu des Travaux de la Société des Ingénieurs Civils de France, Bulletin, vol. 8, no. 1, 2 & 3, Jan-Mar. 1919, pp. 49-77, 10 figs. Technical study of comparative economy of various systems of heating.

HOISTING AND CONVEYING

Belt Conveyor, Steel

The Steel Belt Conveyor, or How the Rubber Shortage Can be Met by Employing Flexible Steel Bands. Eng. & Indus. Management, vol. 1, no. 19, June 19, 1919, pp. 605-609, 12 figs. Concerning flexible Swedish steel bands known under the name "Sandvik."

Barnard's Automatic Grab

"Barnard's Automatic Grab," G. F. Zimmer. Eng. & Indus. Management, vol. 2, no. 1, July 3, 1919, pp. 25-27, 6 figs. It works on block-and-tackle principle. Light self-weight for given capacity claimed as important feature.

Cable Transportation

Aerial Cable Transportation (Transporte aereo por cable), Walter C. Kretz. Ingeniería Internacional, vol. 2, no. 1, July 1919, pp. 13-17, 7 figs. As auxiliary service in railway and steamship traffic. Application in mines.

Cranes, Ladle, Main Hoists for

Main Hoists for Open Hearth Ladle Cranes, W. W. Garrett, Jr. Jl. Engrs. Club of Philadelphia, vol. 36, no. 177, August 1919, pp. 319-321. Tests made on main hoists of two overhead electric traveling open-hearth ladle cranes.

Cranes, Pontoon

Designs Massive Pontoon Cranes. Mar Rev., vol. 49, no. 8, August 1919, pp. 372-373, 2 figs. Revolving crane of 150-ton capacity recently installed at Navy Yard, Norfolk, Va.

Hoisting Bucket

Handling Materials in Construction of New York Hotels. Eng. News-Rec., vol. 83, no. 5, July 31, 1919, pp. 222-223, 3 figs. Type of hoisting bucket designed, it is said, to prevent excessive vibration of steel frame. Cost figures.

Hoisting Equipment, Electric

Electric Hoisting Equipment at the Butte & Superior Mine, Oliver E. Jager. Min. & Sci. Press, vol. 119, no. 1, July 5, 1919, pp. 18-21, 3 figs. Historical account of its installation.

Swing-Span Bridges

Protecting Platforms and Fenders for Swing Span Bridge. Commonwealth Engr., vol. 6, no. 8, Mar. 1, 1919, pp. 242-244 2 figs. Particulars of piers.

HYDRAULIC MACHINERY

Governors, Hydraulic Turbine

The Seewer Universal Governor for High-Pressure-Pelton Turbines (Universal Regulierung System Seewer für Hochdruck-Pelton-Turbinen), Franz Prasil. Schweizerische Bauzeitung, vol. 73, no. 22, May 31, 1919, pp. 251-254, 8 figs. Details of method of regulating by changing cylindrical jet to one of hollow conical type.

Ground-Water Movement

Ground Water Movement Between Canals with a Different Water Level (Grondwaterbeweging tusschen kanalen met verchillende waterstanden), J. Versluys. Ingenieur, vol. 34, no. 24, June 14, 1919, pp. 454-456. Questions to be considered when planning irrigation or drainage canals.

Pipe, Wood-Stave

Extension to the Ontario Power Co.'s Plant. Contract Rec., vol. 33, no. 29, July 16, 1919, pp. 685-693, 15 figs. Features particularly remarked are wood-stave pipe 13½ in. in diameter and 6,700 ft. long, dimensions of differential surge tank, and power house with walls designed to withstand 40 ft. rise in tail water.

Pipes

Diagrams for Excess Loss of Head in Pipe Lines, Frank S. Bailey. Eng. News-Rec., vol. 83, no. 4, July 24, 1919, pp. 162-163, 2 figs. For determining losses due to 90 deg. bends, increasers, gate valves, reducers and branches.

Pipes, Velocity of Water in

Hexagonal Chart for Finding Velocity of Water in Pipes, C. Warrington Anthony. Eng. News-Rec., vol. 83, no. 4, July 24, 1919, p. 169. Diagram embraces six variable quantities without using a single curve.

Spain

Hydro-Electric Central Station at Seros (Spain) Le station centrale de Seros (Espagne). Génie Civil, vol. 74, no. 26, June 28, 1919, pp. 517-521, 8 figs. Illustrating Escher Wyss 14,500-hp. vertical turbines used in installation.

Turbines, Hydraulic

New Kern River Development, G. E. Armstrong. Elec. World, vol. 74, no. 3, July 19, 1919, pp. 116-118, 3 figs. Francis turbines to operate under head of 800-ft. at Southern California Edison plant. Two turbines, each with two runners and distributers, furnish 32,000-kw. energy of either 50 cycles or 60 cycles at maximum efficiency.

Break in No. 2 Hydraulic Turbine at Wachusett Power Station, Clinton, Mass., William E. Foss. N. E. Water Works Assn., vol. 33, no. 2, June 1919, pp. 143-152, 5 figs. Section of scroll case blew out immediately after pulling out governor clutch to change from automatic to hand control. Accident attributed to sudden closing of gates causing sufficient water ram to break casting.

See also Governors.

Water Hammer

Water Hammer in Conduits Under Pressure (Note sur le calcul du coup de bélier dans les conduites sous pression), Ed. Carey. Bulletin Technique de la Suisse Romande, vol. 45, nos. 11 & 13, May 31 & June 28, 1919, pp. 102-104, and 122-127, 8 figs. Distribution of force along conduits. In two cases when distributor is open and when sluice is opened suddenly. (Continuation of serial.)

INTERNAL-COMBUSTION ENGINES

Acetylene

Acetylene as a Motor Fuel (Das Azetylen als Motorenbetriebsstoff), A. Wimplinger. Dinglers Polytechnisches Journal, vol. 334, no. 5, Mar. 8, 1919, pp. 50-51, 1 fig. Changes necessary in gasoline motor if acetylene is to be used as fuel; automobile using acetylene. Developments along this line in Switzerland.

Alcohol

Alcohol as Motor Fuel. Autocar, vol 43, no. 1237, July 5, 1919, pp. 10-11. Summary of report of Government's Alcohol Committee. Report does not specifically advocate modification of engines so as to use alcohol but favors rather employment of alcohol mixtures in existing engines.

Bolinder Marine Engine

The Bolinder Crude Oil Marine Engine. Mar. Eng. & Can. Merchant Service Guild Rev., vol. 9, no. 7, July 1919, pp. 236-238, 5 figs. Fuel is mixed with compressed air before injecting it in cylinder, special nozzle being used for this purpose. Engine is manufactured by Bolinder Co. of Stockholm, Sweden.

Carburetor Performance Standard

Standards of Carburetor Performance, O. C. Berry. Mech. Eng., vol. 41, no. 8, August 1919, pp. 674-678, 12 figs. List of essential factors to proper carburetion and record of experimental data.

Cycles, Future

Working Processes of Future Internal Combustion Engines, C. A. Norman. Jl. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp. 3-12, 10 figs. Theoretical and practically attainable energy utilization of engines and turbines of the compression, explosion and evaporation types are given.

Design

An Unconventional British Engine. Automotive Industries, vol. 41, no. 1, July 3, 1919, pp. 27-28, 5 figs. Aluminum jackets with cast-iron cylinder sleeves inserted.

Diesel-Engine Regulation

Kinematics of Diesel Motor Regulation (Studio cinematico della regolazione nei motori Diesel), Guglielmo Piperno. Industria, vol. 33, no. 10, May 31, 1919, pp. 292-297, 12 figs. Calculations and diagrams for studying operation of valves.

Diesel Engines

A British 400 H.P. Highspeed Diesel Engine. Motorship, vol. 4, no. 8, August 1919, pp. 46-47, 2 figs. Details and trial results of Armstrong-Whitworth type used in British submarines.

Piston and Valve Cooling in Diesel Engines. Motorship, vol. 4, no. 8, August 1919, pp. 36-37, 9 figs. Examples of designs in use. (Concluded.)

Diesel Engines with Supercompressed Air Injection

Super-Compressed-Air Applied to Solid-Injection Diesel Engines, Chas. G. Barrett. Motorship, vol. 4, no. 8, August 1919, pp. 43-44, 1 fig. Recommends compressing small portion of air in cylinder walls to pressure considerably in excess of prevailing compression pressure of engine and describes arrangement for effecting this compression.

Exhaust Utilization

Plan to Use Exhaust Heat in Vaporization of Low Grade Fuels, F. C. Mock. Automotive Indus., vol. 41, no. 3, July 17, 1919, pp. 110-114, 4 figs. Curve claimed to simplify computation of air velocity.

Gas Engines

Operation of Large Gas Engines, Frank Foster. Power, vol. 50, no. 3, July 15, 1919, pp. 100-102. Considerations in regard to valve timing, ignition timing, overrating of power and blower engines.

Kerosene Engine Rating

Suggested Formula for Rating Kerosene Engines, D. L. Arnold. Mech. Eng., vol. 41, no. 8, August 1919, pp. 672-673. Suggests that piston displacement of 13,000 cu. in. per min. be taken as one brake horsepower.

Lubrication

See Oiling.

Motorship Engines

Internal Combustion Engine on the Pacific Coast, George Dow. Jl. Electricity, vol. 43, no. 1, July 1, 1919, pp. 27-29, 3 figs. With particular reference to motorship installation.

Oiling

Accessible Oiling System Features New Allen Engine. Automotive Indus., vol. 41, no. 3, July 17, 1919, pp. 106-107, 4 figs. New engine has bore of 3½-in. and stroke of 5-in., its four cylinders being cast in block.

Still Engine

A New Prime Mover of High Efficiency, Frank E. D. Acland. Motorship, vol. 4, no. 7, July 1919, pp. 25-27, 6 figs. Still-Acland com-

Chips from cold cutting saw

Chips from hack saw

Starrett Hack Saws
make less waste

Economy of material is almost as important as economy of time—or power.

The Starrett idea is to always use the particular blade that does the work in hand most economically—to save material, time and power.

That's why the Starrett Hack Saw Chart recommends blades of different thicknesses as well as different numbers of teeth to the inch for certain classes of work. And it's the reason why you find Starrett Hack Saw blades and charts in the tool rooms of so many shops—it pays to use them.

THE L. S. STARRETT CO., ATHOL, MASS.

THE WORLD'S GREATEST TOOLMAKERS
Manufacturers of Hack Saws Unexcelled

42-955

STARRETT HACK SAWS

sination type steam and Diesel engine. Consumption of 0.302 lb. of fuel oil per shaft hp. said to be obtained. From paper read before Roy. Soc. Arts.

Tank Motors

Motors Used in British Tanks (Moteurs Thermiques), Genie Civil, vol. 75, no. 1, July 5, 1919, pp. 14-16, 1 fig. Motors are six-cylinder, of 158 hp. Construction of piston, which is provided with inner structure for gliding in cylinder guide and acting as crosshead, noted as special feature.

Torque Recoil

Torque Recoil and Car Weight, L. H. Pomeroy. Jl. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp 45-47 Factors governing torque recoil, particularly in multi-cylinder engines.

Tractor Engines

The Rayol Agricultural Show—1. Engr., vol. 127, no. 3315, June 27, 1919, pp. 627-630, 10 figs. Notes on oil engines and tractors driven by gasoline exhibited at annual show at Cardiff.

Trego Company Engines

Valve-in-Head and "L" Engines Built of Common Parts, P. M. Heldt. Can. Machy., vol. 22, no. 4, July 24, 1919, pp. 157-161, 10 figs. Twin six-cylinder models being built by Trego Motors Corp. Oil distributing pipes cast in crankcase and arrangement for hot spots in manifold quoted as notable features.

Valve Setting

Valve Setting. Automobile Engr., vol. 9, no. 128, July 1919, pp. 231-232, 4 figs. Systems for defining timing.

LUBRICATION

Carbonization

Carbonizing in Valve Chambers and Cylinders, F. P. Roesch. Ry. Rev., vol. 65, no. 1, July 5, 1919, pp. 30-33, 4 figs. With respect to use of relief and drifting valves for overcoming carbonizing troubles in lubrication. Paper read before Am. R.R. Assn.

Friction, Static

Note on Static Friction and on the Lubricating Properties of Certain Chemical Substances, W. B. Hardy and J. K. Hardy. Lond., Edinburgh and Dublin Phil. Mag., vol. 38, no. 223, July 1919, pp. 32-48. Examining further Lord Rayleigh's experimental research into the reason why "a few drops of water wetting the parts in contact will prevent a cup of tea from slipping about in a saucer." (Phil. Mag., Febr. 1918.)

Michell Thrust Block

See Pressure-Film Lubrication.

Oil Grooves

Arrangement of Oil Grooves (Die Anordnung der Schmiernuten). W. Kucharski. Dinglers Polytechnisches Journal, vol. 334, nos. 1 & 2, Jan. 11 & 25, 1919, pp. 2-4 and 14-16, 7 figs. Critical discussion of Reynolds' theory of lubrication friction. Experiments made by writer especially with reference to temperature changes and thickness of layer of lubricant.

Pressure-Film Lubrication

The Michell Thrust Block, J. Hamilton Gibson. Eng., vol. 107, no. 2789, June 13, 1919, pp. 765-768, 19 figs. Application of pressure-film lubrication principle to thrust bearing. Paper read before Instn. Naval Architects.

Viscosity

Lubrication in the Power Plant, J. D. Roberts. Power, vol. 50, no. 4, July 22, 1919, pp. 134-135. Tests suggested to determine viscosity of lubricants.

See also Internal-Combustion Engineering (Oiling).

MACHINE ELEMENTS AND DESIGN

Bearings

Ball and Roller Bearings, J. H. Swan. Automobile Engr., vol 9, no. 128, July 1919, pp. 200-204, 5 figs. Consideration of their behavior when subjected to centrifugal loads. From data compiled in records of Technical Dept., Aircraft Production, Min. of Munitions.

Load-Carrying Possibilities of Angular-Contact Ball Bearings, F. C. Goldsmith. Jl. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp. 49-53, 8 figs. Writer analyzes possibilities of angular-contact type of bearing, and tries to determine the load-carrying powers of such bearings, both for axial (thrust) loads as well as for radial loads and to determine the law of variation of load-carrying capacity in such a bearing.

Cams

Analytical Method of Investigating Motion produced by Cams, B. C. Carter. Automobile Engr., vol. 9, no. 128, July 1919, pp. 209-210, 3 figs. Direct-attack cams and flat tappets.

A New Design for a High-Speed Inlet Cam, H. S. Burdett. Automobile Engr., vol. 9, no. 128, July 1919, pp. 224-230, 8 figs. Exemplifying manner of proceeding in actual case. Paper presented to Instn. Automobile Engrs.

Crankshafts, Power-Press

The Strength of Power-Press Crankshafts, W. J. Smith. Machinery (Lond.), vol. 14, no. 351, June 19, 1919, pp. 337-340, 5 figs. Method of determining approximately safe working loads. Following types of crankshafts are dealt with: overhanging, single-throw, double-throw, double-throw with central support, and double-throw with two supports. Stresses considered are those caused by actual blow or load on shaft.

Gear Design

Involute Gear Tooth Contact, A. Fisher. Machy. (Lond.), vol. 14, no. 354, July 10, 1919, pp. 456-460, 3 figs. Technical study of relation of gear diameters, number of teeth and line of action. Derivation of interference formulæ and contact formulæ.

Gears, Bevel

The Correction of Spiral and Straight Bevel Gears. Machinery (Lond.), vol. 14, no. 352, June 26, 1919, pp. 368-369. Table intended to be used in conjunction with a pressure angle of $14\frac{1}{2}$ deg.

Michell Thrust Bearing

Development of the "Michell" Marine Thrust Shaft Bearing, J. Hamilton Gibson. Shipping, vol. 8, no. 1, July 5, 1919, pp. 17-19, 13 figs. Said to be built on principle of application "pressure oil film lubrication" to thrust bearing. Paper read before Instn. of Naval Architects.

See also Lubrication (Pressure-Film Lubrication).

Piston Rings

A Novel Two-Part Piston Ring, Ellsworth Sheldon. Am. Mach., vol 51, no. 5, July 31, 1919, pp. 199-202, 10 figs. Consists of outer part of soft gray iron performing usual function of piston rings, and an inner ring of tempered steel which furnishes tension necessary to hold outer part in contact with cylinder walls.

Snap Valve Rings

Use of Bronze for Snap Valve Rings and Piston Surfaces, C. E. Fuller. Ry. Rev., vol. 64, no. 26, June 28, 1919, pp. 992-994, 1 fig. Experience of Union Pacific Ry. in reducing piston and valve ring wear by introducing bronze as material for those parts. Bronze-faced pistons when worn are built up by autogenous welding processes. Paper read before Am. R.R. Assn.

Williams-Janney Speed Gear

Applications of the Williams-Janney variable Speed Gear. Eng., vol. 107, no. 2790, June 20, 1919, pp. 794-796. Examples of application to traction purposes. (Concluded.)

MACHINE SHOP

Broach

A Special Tension Broach. Machy. (Lond.), vol. 14, no. 354, July 10, 1919, pp. 434-435, 3 figs. Claims that method of slotting may be greatly cheapened by roughly slotting to within 0.02 in. of finished size; then by pulling a series of broaches through the work a fine finish may readily be obtained and of correct size.

Chucking

Chucking Methods. Machy. (Lond.), vol. 14, no. 353, July 3, 1919, pp. 424-427, 14 figs. Uses to which Coventry's chuck is put.

Connecting Rods, Machining

Machining Connecting Rods, A Thomas. Automobile Engr., vol. 9, no. 128, July 1919, pp. 222-223, 9 figs. Operations in making connecting rod for 4-cylinder motor lorry engine from nickel-steel drop forging.

Grinding

Latest Practice in Cutter Grinding—I & II. Am. Mach., vol. 51, no. 3 & 4, July 17 & 24, 1919, pp. 135-138 & 185-188, 20 figs. Grinding of modern shank and shell end mills, large face mills, side milling cutters and staggered-tooth slotting cutters, as recommended by Cincinnati Milling Machine Co.

Grinding at the C. L. Best Plant. Metal Trades, vol 10, no. 7, July 1919, pp. 291-294, 10 figs. Arrangement of machines which is said to permit minimum amount of handling.

Cylinder Grinding. Machy. (Lond.), vol. 14, no. 354, July 10, 1919, pp. 440-443, 11 figs. Advantages claimed for finishing cylinder bores by grinding; practice in plants making automobile and airplane engines. (Second article.)

Lathes

Inspection and Adjustment of Lathes. Machy. (Lond.), vol. 14, no. 354, July 10, 1919, pp. 429-433, 7 figs. Alignment tests between different parts and calculations for determining amount of metal to remove for a given adjustment when fitting carriage or headstock to bed.

Inspection and Adjustment of Lathes, James Forrest. Machy. (N. Y.), vol. 25, no. 11, July, 1919, pp. 1039-1043. 7 figs. Alignment tests between different parts and calculations ofr determining amoutn of metal to remove for a given adjustment when fitting carriage or headstock to bed.

Microscope in the Tool-Room

The Microscope in the Tool-Room, John Scott. Machy. (Lond.), vol. 14, no. 352, June 26, 1919, pp. 370-373, 6 figs. Application of simple and micrometer type microscopes to precision work on master plates and for cutting screw threads.

Milling, Rotary

Continuous Rotary Milling—II. Machy. (Lond.), vol. 14, no. 350, June 12, 1919, pp. 305-309, 10 figs. Work-holding fixtures and methods of setting up parts to be milled.

Motor Drive

New Plant for Manufacturing Radio Apparatus, W. A. Scott. Elec. Rev., vol. 75, no. 3, July 19, 1919, pp. 103-104, 3 figs. Motor drive throughout a feature of plant.

Operations

A Plea for Better Harmony Between Theory and Practice. Machy. (Lond.), vol. 14, no. 353, July 3, 1919, pp. 397-402, 35 figs. In casting and machining operations with illustrations of actual cases.

Planer Milling

Planer Milling Practice in Automobile Plants, Edward K. Hammond. Machy. (N. Y.), vol. 25, no. 11, July 1919, pp. 1044-1049, 9 figs. Also Machy. (Lond.), vol. 14, no. 352, June 26, 1919, pp. 374-379, 8 figs. Milling operations on cylinder blocks and cylinder heads. Second and last article.

Standardized Part Production

Jigs, Tools and Special Machines. Model Engr. & Elecn., vol. 40, no 944, May 29, 1919, pp. 422-426, 4 figs. With relation to production of standardized parts. Investigating possibilities of continuous cutting with special machine tools. (Concluded.)

MACHINERY, METAL-WORKING

Broach-Making, Materials for

Materials for Broach Making. Machinery (Lond.), vol. 14, no. 351, June 10, 1919, pp. 341-343. Former analysis of bar which is said to have been used in making a successful set of 6 broaches, and note on maintenance of broaches.

Chucks, Magnetic

Relative Characteristics of Magnetic Chucks, Otis Allen Kenyon. Elec. World, vol. 74, no. 1, July 5, 1919, pp. 11-14, 12 figs. Three general types, neutral-pole, single-pole, and multiple-pole, intended for holding work on surface grinders, milling machines, planers, etc.

Gorton Planing Machines

See Planing Machines.

Lathes

Notes on Capstan and Turret Lathes—I, Joseph Horner. Mech. World, vol. 65, no. 1695, June 27, 1919, pp. 302-303, 3 figs. Features of construction.

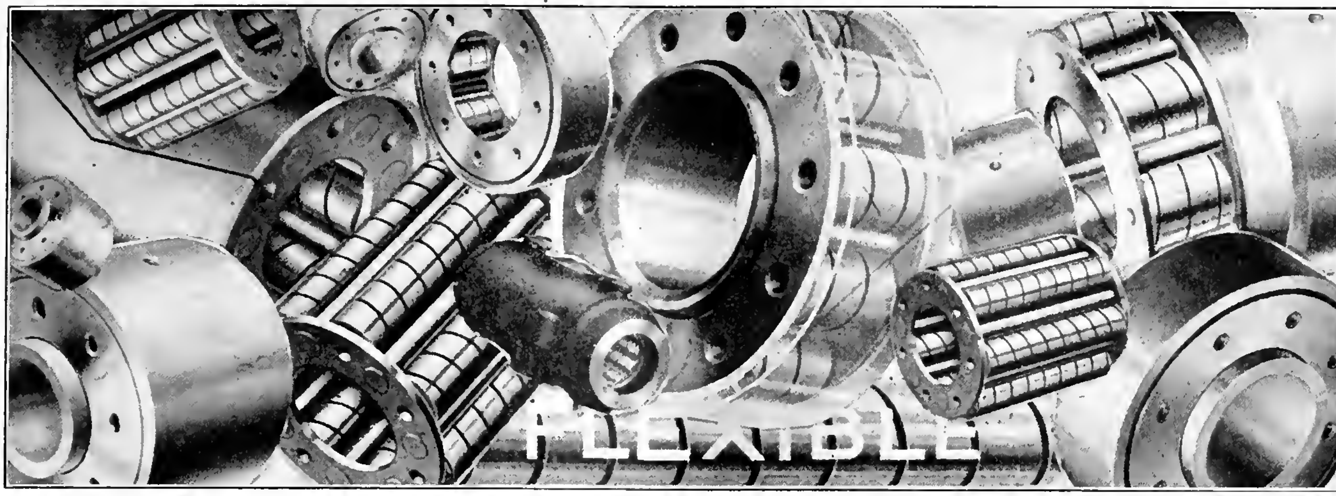
Lathe for Cutting Screw Threads on Gauges. Eng., vol. 107, no. 2790, June 20, 1919, pp. 799-801, 10 figs. Lathe consists of rigid cast-iron cylindrical bed, with a portion cut away to allow work to be placed between centers in the head and tailstocks and for the operator to view the work.

Machine-Tool Developments

Recent Machine Tool Developments—I, Joseph Horner. Engineering, vol. 108, no. 2793, July 11, 1919, pp. 36-38. First article of a series. Classifies and divides subject.

Milling Cutters

Inserted-Tooth Milling Cutters, Joseph Horner. Machinery (Lond.), vol. 14, no. 351, June 19, 1919, pp. 344-347, 28 figs. Illustrat-



ARE BEARINGS IMPORTANT?

It has been an unfortunate practice in machine design in the past to consider bearings as a detail—worthy of only minor consideration. The fallacy of this view has been demonstrated every time an otherwise carefully designed machine developed bearing trouble, necessitating a shut down for repairs or replacements with the consequent loss in production.

All Engineers recognize the merits of Hyatt Bearings, but many feel that the increased initial cost will be prohibitive. This is a mistaken view. The additional expense is very nominal and is soon earned many times over through reduced power, oil and maintenance costs. Both Good Engineering and Economical Operation call for a machine designed UP to a Standard rather than DOWN to a Selling Price.

Remember, whatever conditions of load, speed, or size of shaft you may have, it is probable that there is a Hyatt Roller Bearing which will exactly meet your requirements. Our Engineers will be glad to consult with you at any time on the proper application of Hyatt Roller Bearings to your new design.

Send for our complete engineering data on Hyatt Roller Bearings for whatever class of machinery you are interested in.

MOTOR BEARINGS DIVISION
DETROIT, MICHIGAN

**HYATT ROLLER BEARING COMPANY
INDUSTRIAL BEARINGS DIVISION
METROPOLITAN TOWER, NEW YORK**

TRACTOR BEARINGS DIVISION

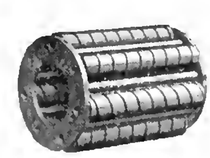
Manufacturers of Bearings for Mine Cars, Ore Cars, Steel Mill Cars, Roller Tables, Trolleys, Cranes, Hoists, Machine Tools, Line Shafts, Countershafts, Concrete Machinery, Textile Machinery, Conveyors, Lift Trucks, Industrial Trucks, Railway Service Cars, Storage Battery Locomotives, etc.



ing methods of tool fastening and designs of face mills.

Drop-Forging High-Speed Milling Cutters, J. V. Hunter. Am. Mach., vol. 51, no. 4, July 24, 1919, pp. 165-168, 8 figs. Tests made by Ford Motor Co. on high-speed-steel milling cutters.

Piston-Ring Tooling Equipment

Tooling Equipment for an Automobile Piston-ring, Thomas Orchard. Machy. (N. Y.), vol. 25, no. 11, July, 1919, pp. 1058-1060, 7 figs. Fixture for holding ring and special multiple-spindle milling head having capacity for holding two cutters.

Planers

Bement Horizontal and Vertical Wall Planer. Machy. (N. Y.), vol. 25, no. 11, July 1919, pp. 1087-1088, 1 fig. Consists of wall plate on which vertical rail is mounted and is so arranged as to permit horizontal and vertical planing.

Planing Machines

The Gorton Planing Machines, J. V. Hunter. Am. Mach., vol. 51, no. 1, July 3, 1919, pp. 1-4, 8 figs. Heavy design intended for use without foundation excepting when placed on soil that is soft and yielding.

Thread-Milling Machine

Continuous Thread Milling Machine of Unusual Design. Machy. (Lond.), vol. 14, no. 350, June 12, 1919, pp. 317-319, 2 figs. Machine is furnished with means for turning bar down to required diameter ready to start thread-milling operation, thus bringing actual center of bar into accurate alignment with milled threads.

Threading Tools

Description of a New Automatic Threading Tool. Can. Machy., vol. 22, no. 2, July 10, 1919, pp. 26-27, 6 figs. In its assembled state it is in two parts: a tool box and an abutment or stop piece.

MACHINERY, SPECIAL

Breaking Machine

Breaking Machine for Handling Frozen Coal, J. P. Considine. Coal Trade Jl., vol. 50, no. 28, July 9, 1919, pp. 838-839, 3 figs. Said to be capable of breaking up in a few minutes a car of frozen coal.

Crusher, Gyratory

Largest Gyratory Crusher in the World, William B. Eastwood. Cement, Mill & Quarry, vol. 15, no. 1, July 5, 1919, pp. 13-17, 5 figs. Bulldog crusher said to be capable of producing 2500 tons of material per hr.

Drilling Machine

A Small Sensitive Drilling Machine, C. H. Copeland. Model Engr. & Elecn., vol. 40, no. 947, June 19, 1919, pp. 498-500, 3 figs. Designed to be made for greater part from ½-in. standard pipe fittings, only castings being table and driving and jockey pulleys.

Molten-Metal Discharger

Device for the Uninterrupted Discharge of Molten Metals (Eine Vorrichtung zur ununterbrochenen Ausstossung geschmolzener Metalle). Metall-Technik, vol. 45, no. 11-12, Mar. 22, 1919, p. 42, 1 fig. It is claimed that this device does not require complicated pumping apparatus nor special liquids nor any interruption while recharging.

Periodograph

The Periodograph, a Decimal Time-Keeping Machine—II, J. V. Hunter. Am. Mach., vol. 51, no. 4, July 24, 1919, pp. 161-164, 17 figs. Milling, drilling and inspecting operations.

Sand Blast

Application of the Sand Blast, H. D. Gates. Compressed Air Magazine, vol. 24, no. 7, July 1919, pp. 9229-9232, 3 figs. Effect of air pressure on abrasive action. From address before Newark Foundrymen's Assn.

Tinning Machine

The Thomas & Davies Tinning Machine, Melingriffith Works, Cardiff. Iron & Coal Trades Rev., vol. 99, no. 2679, July 4, 1919, pp. 4-5, 2 figs. Diagrammatic details of tinning machine.

Typewriters

Typewriter Mechanism — Typewheel Machines, Nathan Sharpe. Model Engr. & Elecn., vol. 40, nos. 944 and 945, May 29, and June 5, 1919, pp. 426-429, and 444-447, 12 figs. Features of Block machine. Shift mechanism of Blick. Third article.

Evaporators, Vacuum

Industrial Vacuum Evaporators—IX, Frank Coxon. Mech. World, vol. 66, no. 1696, July 4, 1919, p. 6, 8 figs. Instrument reliability. (Continuation of serial.)

MATERIALS OF CONSTRUCTION AND TESTING OF MATERIALS

Abrasive Wheels, Testing

Testing Machines for Grading Abrasive Wheels, J. H. Vincent. Am. Mach., vol. 51, no. 4, July 24, 1919, pp. 177-179, 7 figs. Machines for testing the cutting or abrasive factor and for abrasive wheels and their degree of hardness.

Ball Bearings, Magnetic Analysis of

Application of Magnetic Analysis to the Testing of Ball Bearing Races, R. L. Sanford and M. F. Fischer. Preprint, Am. Soc. for Testing Materials, University of Pa. Topical Discussion on Magnetic Analysis, 1919, pp. 65-75, 4 figs. It is concluded that magnetic properties and in particular coercive force and rotary hysteresis measurements constitute good criteria of degree of hardness of a ball-bearing race.

Coir

The Mechanical Properties of Philippine Coir and Coir Cordage Compared with Abacá (Manila Hemp), Albert E. W. King. Philippine Jl. Sci., vol. 13, Sec. A, no. 6, November 1918, pp. 285-338, 4 figs. Cocoanut fiber in Philippines is extracted in small quantities entirely by retting and beating process. Retted filaments average 228 mm., and machine-cleaned filaments 245 mm. in length. Tensile tests conducted on single filaments averaged, it is said, 832 kg. per sq. cm. for retting, and 1208 kg. per sq. cm. for machine-cleaned fiber.

Columns, Concrete

Hooped Concrete Columns with Cast Iron Cores, L. J. Mensch. Am. Architect, vol. 116, no. 2275, July 30, 1919, pp. 155-162, 4 figs. Testing machine of U. S. Bureau of Standards at Pittsburgh, Pa. and results obtained with it.

Gas Tubing

Flexible Gas Tubing Tests, R. S. McBride and W. M. Berry. Gas Rec., vol. 15, no. 12, June 25, 1919, pp. 393-400, 2 figs. Scope of investigations made by U. S. Bur. of Standards and tentative specifications proposed for criticism before adoption.

Machinability Tests

Machinability Tests on Copper Alloys, Alex. E. Tucker. Metal Industry, vol. 14, no. 25, June 20, 1919, pp. 501-502, 3 figs. Machine for making tests. Its action consists in measuring comparative depth of holes cut in piece under test and standard piece by same number of revolutions of ¼-in. drill under constant load.

Magnetic Analysis

Magnetic Analysis as a Criterion of the Quality of Steel and Steel Products, Chas. W. Burrows and Frank P. Fahy. Preprint, Am. Soc. for Testing Materials, University of Pa., Topical Discussion on Magnetic Analysis, 1919, pp. 1-46, 25 figs. Based upon experimental work conducted by writers at U. S. Bur. of Standards. Among objects examined were steel rails, knife blades, drills, etc. Conclusion is reached that there is a very close relationship between magnetic and mechanical characteristics of steel and that the commercial application of this to shop routine is practicable.

Certain Aspects of Magnetic Analysis, C. Nusbaum. Preprint, Am. Soc. for Testing Materials, University of Pa., Topical Discussion on Magnetic Analysis, 1919, pp. 92-112, 8 figs. Methods based on following propositions which are termed experimental facts: (1) that magnetic properties of steel are indicative of transformations which it undergoes with heat treatment; (2) that definite relationship exists between magnetic and mechanical properties of a steel product.

See also Steel, Rails, Ball Bearings.

Malleable Iron

What and Why is Malleable Iron, H. A. Schwartz. Proc. Car Foremen's Assn. of Chicago, no. 163, May 1919, pp. 20-42 and (discussion) pp. 42-62. Processes of manufacture followed by National Malleable Castings Co., Indianapolis.

Physical Constants for Malleable, H. A. Schwartz. Foundry, vol. 47, no. 327, July 15, 1919, pp. 462-466, 12 figs. Based upon tests made on material described as complying with present specifications. Curves indicate tensile strength in relation to chemical composition and effect of heat on dimensions and tensile strength.

Monel Metal Sheets

Monel Metal Sheets and Their Characteristics. Metal Worker, vol. 92, no. 4, July 25, 1919, pp. 93-95. Some of physical properties mentioned are: Melting point 2480 deg. fahr.; specific gravity, 8.87; modulus of elasticity, 22,000,000 to 23,000,000 lb. per sq. in.

Nickel Steel

Some Fatigue Tests of Nickel Steel and Chrome-Nickel Steel, H. F. Moore and Arthur G. Gehrig. Am. Soc. for Testing Materials, University of Pa. Annual Meeting, June 24-27, 1919, 13 pp., 5 figs. Results interpreted as indicating that neither static tension tests nor high-stress short-time fatigue tests are a reliable index of fatigue strength of a material under oft-repeated low stresses.

Plates, Flat Steel, Stress Determination in

Further Experiments on Stress Determination in Flat Steel Plates, J. Montgomerie. Eng., vol. 107, no. 2789, June 13, 1919, pp. 786-790, 13 figs. Investigation to determine condition of walls below elastic limit.

Rails, Magnetic Analysis

Magnetic Surveys on New and Failed Rails, P. H. Dudley. Preprint, Am. Soc. for Testing Materials, University of Pa., Topical Discussion on Magnetic Analysis, 1919, pp. 47-63, 9 figs. Possibility is visualized of developing magnetic apparatus for testing railroad axles, crankpins, connecting, parallel and piston rods, etc., without destruction.

Rubber

The Tensile Strength of Rubber-Sulphur Mixtures, O. de Vries and H. J. Hellendoorn. India-Rubber Jl., vol. 57, no. 26, June 28, 1919, pp. 17-19, 4 figs. Stress-strain curves obtained on Schopper testing machine.

Steel, Electric

Electrically-Melted Steel Castings, John A. Holden. Iron & Coal Trades Rev., vol. 98, no. 2677, June 20, 1919, p. 851, 2 figs. Tests obtained from castings made from Héroult steel.

Steel, Magnetic and Mechanical Properties of

A Systematic Investigation of the Correlation of the Magnetic and Mechanical Properties of Steel, N. J. Gebert. Jl. Am. Steel Treaters Soc., vol. 1, no. 9, June 1919, pp. 302-311, 10 figs. Tests with nickel steel, chrome-nickel steel, straight carbon tool steel, and Swedish chrome file steel.

Steel, Time Factor in Tests

Time is Factor in Tests on Steel, G. A. Reinhardt and H. L. Cutler. Iron Trade Rev., vol. 65, no. 3, July 17, 1919, pp. 164-166. Experiments carried on in laboratories of Youngstown Sheet & Tube Co. said to have indicated that specimens of medium-carbon steel show widely varying tensile strengths, influenced by temperature and time elapsing between moment metal is tested and time it is machined.

Torsion Testing Machine

A Simple Apparatus for Repeated Torsion Test, F. Yamanouchi. (In Japanese.) Jl. Soc. Mech. Engrs., Tokyo, Japan, vol. 22, no. 56, Feb. 1919.

MEASUREMENTS AND MEASURING APPARATUS

Brinell Hardness-Testing Machine

A New Brinell Hardness Testing Machine. Automobile Engr., vol. 9, no. 128, July 1919, pp. 211-212, 2 figs. "Avery" machine designed on dead-weight lever system.

Dynamometers

Commercial Dynamometers—XII, P. Field Foster. Mech. World, vol. 65, no. 1695, June 27, 1919, pp. 307-309, 3 figs. Torsion meter type. (Continuation of serial.)

Manometer, Glass

Glass Manometer with Elastic Walls (Sur un manomètre en verre, à parois élastiques), Georges Baume and Marius Robert. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 24, June 16, 1919, pp. 1199-1201, 3 figs. For measuring pressure of fluids which attack mercury. Fluid does not come in contact with mercury but acts on bulb of thin glass which, by its change in size, forces mercury along vertical tube.

Meters, Gas-Flow

Gas-Flow Meters for Small Rates of Flow, A. F. Benton. Jl. Indus. & Eng. Chem., vol. 11, no 7, July 1, 1919, pp. 623-629, 6 figs. Resistance-tube flow meter, developed in Bur. of Mines, and specifications for construction, calibration and operation are included, and influence of temperature and pressure changes discussed.

Meters, Steam and Water

The Measurement of Steam and Water in Power Stations, W. M. Selvey. Elecn., vol. 82, no. 26, June 27, 1919, pp. 721-729, 26 figs. After briefly indicating application of Bernoulli's theorem to meters of steam and water, writer discusses various types which he classifies under headings (1) direct weighing, (2) automatic weighing, (3) automatic volume measurements, (4) flow meters, and (5) motor meters.

Steam Meters. Engr., vol. 127, no. 3311, June 13, 1919, pp. 580-582, 8 figs. Kent meters; they depend for their action on law governing volume of a gas which will pass through an orifice in a plate when impelled by a known difference in pressures on opposite sides of plate.

Minimeter

The National Physical Laboratory. Engineering, vol. 108, no. 2793, July 11, 1919, pp. 33-36, 11 figs. Minimeter for slip gages and electric graphite ring furnace. (Continuation of serial).

Pine, Yellow, Shear Tests

Concentrated Load Tests of Yellow-Pine Beams for Shear, L. R. Manville and C. R. Hill. Eng. News-Rec., vol. 83, no. 2, July 10, 1919, pp. 69-71, 4 figs. Results considered as showing previous horizontal shear values used in design too low, and 50 per cent increase is recommended.

Pyrometers

Thermo-Electric Pyrometers for Plant Use, A. O. Aseman. Chem. & Metallurgical Eng., vol. 21, no. 2, July 15, 1919, pp. 85-87, 3 figs. Illustrating temperature millivolt relation for principal types of couples.

Refractometry

Refractometry and Its Applications in Technical Analysis, James C. Philip. Chem. Indus., vol. 38, no. 11, June 16, 1919, pp. 139T-146T and (discussion) pp. 146T-150T, 5 figs. Plan of Pulfrich's refractometer, which is used in examination of liquids and in commercial testing of optical glass; accuracy control in manufacture of Abbe and Pulfrich's refractometer; use of refractometer in determination of protein content of sera, and in examination of chlorhydrin.

Temperature Indicators

Electric Temperature Indicator, Victor H. Todd. Power, vol. 50, no. 5, July 29, 1919, pp. 180-181, 7 figs. Illustrates various methods of applying temperature indicator.

Temperature Indicating and Controlling Systems, Franklin D. Jones. Machy. (N. Y.), vol. 25, no. 11, July 1919, pp. 1015-1023, 16 figs. Types of thermoelectric apparatus for indicating and recording temperatures in heat-treating furnaces and for controlling temperatures by signals and by automatic regulation. First of three articles.

Volumeter

Direct Volume-Determination in a Volumeter of the Pycnometer Type, J. B. Shaw. Jl. Am. Ceramic Soc., vol. 2, no. 6, June 1919, pp. 481-483, and (discussion) pp. 483-487, 2 figs. Experimental error obtained in manipulating writer's pycnometer which is described as similar to type developed by H. G. Schurecht. (See Jl. Am. Ceramic Soc., 1, 556, 1918.)

MECHANICS

Beam Committee Report

Report of the Beam Committee (Berich des Trägertypen-Ausschusses). Zeitschrift des österr. Ingenieur-und Architekten-Vereins, vol. 70, nos. 51 & 52, Dec. 20 & 27, 1918, pp. 539-542, and 549-555, 11 figs. Tables and equations for angles with equal and unequal legs, Z-bars, Phoenix column sections, etc. (Concluded.)

Columns

Résumé of Study on the Resistance of columns (Résumé d'une étude sur la resistance des colonnes. H. Lefebvre. Mémoires et Compte rendu des Travaux de la Société des Ingénieurs Civils de France, Bulletin, vol. 8, no. 1, 2 & 3, Jan-Mar. 1919, pp. 78-82. Formula for computing dimensions in case of non-homogeneous reinforced-concrete columns and also in case of homogeneous columns.

Girders, Elastic Curve of

The Elastic Curve of Girders with Double Bend (Die elastische Linie des doppelt gekrümmten Trägers), H. Marcus. Zeitschrift für Bauwesen, vol. 69, nos. 1-3, 1919, pp. 163-179, 15 figs. Regarding deformation, stresses, center of pressure, etc.

Shafting

Shafting Calculations Simplified, H. N. Trumbull. Belting, vol. 15, no. 2, July 20, 1919, pp. 34-37, 3 figs. Charts giving relations between power, shaft diameter, torsional stress and speed.

Stresses, Combined

Combined Stresses, Victor M. Summa, Machinery, vol. 25, no. 11, July 1919, pp. 1061-1062, 2 figs. Application to square and rectangular bars of Rankine's general equations for composition of tensile or compressive stress and of shearing stress acting simultaneously and normally to each other on the same particle of a strained body.

Vibration, Struts

Vibration and Strength of Struts and Continuous Beams under End Thrusts, W. L. Cowley. Proc. Roy. Soc., Series A, vol. 95, no. A 672, June 4, 1919, pp. 440-457, 1 fig. Method of analysis outlined in Proc. Roy. Soc., A, vol. 94, 1918, p. 405, extended to include general problem of vibration of continuous beam simply supported at any number of non-collinear points, external loading being constant longitudinal end thrust, varying from bay to bay and periodic lateral loading. In addition, supports are assumed in state of periodic vibration. Generalized form of equation of three moments is derived and conditions for resonance and crippling are expressed in determinantal form.

MECHANICAL PROCESSES

Boxes, Packing

Balanced Packing-Box Construction. India Rubber World, vol. 60, no. 6, August 1, 1919, pp. 626-628, 4 figs. Investigations and tests to determine box design conducted during war by Forest Products Laboratory.

Crushing, Stone

Plant of Temescal Rock Company, W. A. Scott. Cement, Mill & Quarry, vol. 15, no. 1, July 5, 1919, pp. 19-21, 4 figs. Equipment which is said to permit attainment of high capacity and speed in handling crushed stone and riprap simultaneously.

Drill Chucks, Ettco

Manufacturing the Ettco Drill Chuck. Am. Mach., vol. 51, no. 5, July 31, 1919, pp. 209-212, 10 figs. Chuck consists of five components—body, cone screw, jaws, cap and ball thrust bearing. Operations on each of these are explained.

Files

Some Points in the Manufacture of Files—III. Machy. (Lond.), vol. 14, no. 350, June 12, 1919, pp. 322-324, 4 figs. Influence of overcut and upcut to axle of file on efficiency of tool.

Grinding Wood Pulp

Groundwood Pulpstones. Paper, vol. 24, no. 20, July 23, 1919, pp. 15-20, 4 figs. Experimentation with Canadian sandstone in connection with mechanical grinding of wood pulp.

Lens Manufacture

Making Lenses for Optical Apparatus—I & II (Die Herstellung von Linsen für optisches Gerät), Reishaus. Deutsche Optische Wochenschrift, nos. 11-12 and 13-14, Mar. 17, and 31, 1919, pp. 67-69, and 83-84, 12 figs. Describes manufacture of lenses, especially of very large lenses used in astronomic instruments.

Liberty Motor

Assembling Liberty Motor Cylinders, H. A. Carhart. Am. Mach., vol. 51, no. 1, July 3, 1919, pp. 27-30, 4 figs. Final minor operations before assembling.

Marine-Engine Building

Building Marine Engines on a Quantity Basis, F. B. Jacobs. Mar. Rev., vol. 49, no. 8, August 1919, pp. 388-392 & 397, 5 figs. Assembly operations at works of Hooven, Owens, Rentschler Co., Hamilton, O.

Motor-Car Manufacture

Manufacturing the Chevrolet Motor Car. J. H. Moore. Can. Machy., vol. 22, no. 1, July 3, 1919, pp. 1-7, 10 figs. Steps in production from framework to finished car, ready for shipment.

Pebbles for Tube Mills

Man's Onyx Pebbles for Tube Mills, William B. Eastwood. Cement, Mill and Quarry, vol. 15, no. 2, July 20, 1919, pp. 11-14, 6 figs. Claimed as results of tests that artificial balls from immense onyx deposit in Nevada prove equal to foreign flint product for efficient grinding service in ore and cement plants.

Rolling Mills

Rolling Equipment of the Inland Steel Co. Iron Age, vol. 104, no. 3, July 17, 1919, pp. 155-161, 11 figs. Details of 28-in. 32-in. and 40-in rolling mills, motor room and turbine station.

The New Steel Works and Rolling Mills of the Witkowitz Iron Works (Die neue Stahl- und Walzwerksanlage des Eisenwerkes Witkowitz). Montanistische Rundschau, vol. 11, nos. 7 & 8, Apr. 1-16, 1919, pp. 198-202 and 228-232, 14 figs. Describes rolling mill running at 160 r.p.m. and used for manufacture of channels, beams, rails; tank-plate rolling mill and preheating furnace; yards for storing rails and beams; employees' cafeteria; kitchen for same. (Concluded.)

The Morgan Continuous Wire-rod Rolling Mill. Engr., vol. 127, no. 3312, June 20, 1919, pp. 597-599, 16 figs., partly on supp. plates. Plant at Sheffield built in accordance with system developed by Morgan Construction Co. of Worcester, Mass.

Builds Steel Plant in Far East. Iron Trade Rev., vol. 65, no. 4, July 24, 1919, pp. 230-231, 3 figs. General plans of plate and structural mill for Kiushu Steel Works, Japan, which is expected to cost about $3,000,000.

Sheet Iron

Manufacture of Sheet Iron in Southern Russia (La fabrication des toles minces dans la Russie meridionale), F. Couleru. Génie Civil, vol. 75, no. 1, July 5, 1919, pp. 10-14, 8 figs. Details of processes in manufacture of sheet iron for use in roofs at various works, particularly at plant of Russian Tube Mfg. Co. (To be continued.) From Stahl und Eisen.

MOTOR-CAR ENGINEERING

Autovac Gasoline Feed System

The Autovac Petrol Feed System. Autocar, vol. 43, no. 1237, July 5, 1919, pp. 8-9, 4 figs. Mounted in position above level of carburetor is small cylindrical tank divided into two chambers, and so arranged and connected that it utilizes partial vacuum created in induction pipe of engine for supplying continuous stream of gasoline to carburetor from main storage tank regardless of position of latter.

Bianchi

The New 12 hp. Bianchi. Autocar, vol. 42, no. 1235, June 21, 1919, pp. 971-972, 7 figs. Four cylinders, 65 x 110 mm.; thermo-siphon cooling; single-disk dry clutch.

Carburetors

Tests on the Homa Carburetor (Versuchsergebnisse mit dem Homa-Vergaser), Ing. Praetorius. Motorwagen, vol. 22, no. 7, Mar. 10, 1919, pp. 114-115, 4 figs. Results of tests made. Lowest consumption at various loads and constant speed. Tests made on motor of passenger automobile.

Design

The Relation of Motor Truck Ability to the Trend of Design, Lewis P. Kalb. Jl. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp. 18-22, 1 fig. An ability formula is developed, the purpose of which is said to be to determine a factor of experience from which the proper engine size and gear radius can be calculated.

Differentials

Is the Differential Indispensable? (Ist das Differential unentbehrlich?), W. Rödiger. Automobil-Rundschau, vol. 18, nos. 5-6, Mar. 1919, pp. 54-56. Discusses various attempts to replace the differential, as for instance the belt transmission. Special reference is made to the free wheel mechanism.

Enfield-Allday

The 10 hp. Enfield-Allday. Autocar, vol. 42, no. 1234, June 14, 1919, pp. 913-916, 9 figs. Chassis fitted with 5-cylinder air-cooled radial power units.

Fuel Problem

The Engine Fuel Problem, Joseph E. Pogue. Jl. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp. 14-17. As situation now stands, writer considers that "most effective means for expanding supply of gasoline is through rapid development of cracking methods of refining whereby gasoline is made from fuel oil and kerosene."

Liberty Engine Applications

Application of Liberty Engine Materials to the Automotive Industry, Harold F. Wood. Jl. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp. 23-30. Various materials are considered and it is particularly noted that one of the most important developments during the Liberty engine program was the fact that it is not necessary to use a high-analysis alloy steel

to secure a finished part which will give proper service.

Locks

Foiling the Car Thief. Autocar, vol. 43, no. 1237, July 5, 1919, pp. 12-14, 6 figs. Locking mechanisms, notably Cowey's patent arrangement which, when actuated, short-circuits to earth high-tension leads from magneto to sparking plugs.

Maudslay

Maudslay Industrial Chassis. Motor Traction, vol. 28, no. 747, June 25, 1919, pp. 550-552, 5 figs. Three- four- five-ton chassis, the three-ton having engine of 32 hp. and other engines of 40 hp.

Spyker

The 13-30 hp. Spyker. Autocar, vol. 43, no. 1238, July 12, 1919, pp. 43-44, 6 figs. Dutch car with engine-operated-type pump.

Tires

Important and Neglected Features of Tire Maintenance, A. F. Masury. Eng. News-Rec., vol. 82, no. 26, June 26, 1919, pp. 1262-1264, 5 figs. Effects of overloading, overspeeding, running in car tracks, neglecting cuts and tears, spinning, skidding and sliding, and wheel misalignment.

Tractors

Agricultural Tractors (La Motoculture), M. Paul Lecler. Mémoires et Compte rendu des Travaux de la Société des Ingénieurs Civils de France, Bulletin, vol. 8, no. 1, 2 & 3, Jan.-Mar. 1919, pp. 97-124, 14 figs. Classification and description of various types.

Tractor Rating Chart

Tractor Rating Chart Prepared by the S. A. E. Automotive Industries, vol. 40, no. 26, June 26, 1919, p. 1436, 1 fig. Based on formula: Horsepower = $0.7854\ D^2\ LRN$/13,000.

Tractor Tests

Class B Rules for Tractor Tests. Jl. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp. 58-60. Compiled and copyrighted by Am. Soc. of Agricultural Engrs. and designed to govern state or national demonstrations conducted by manufacturers, distributors, dealers, etc.

Truck, Ideal

British Idea of a Truck That Will Meet the Widest Demand. Automotive Indns., vol. 41, no. 4, July 24, 1919, pp. 164-166, 6 figs. Truck is of two-ton capacity, has four-speed gear box, medium-speed engine with first speed of 26.5:1, overhead worm drive, three-plate type of clutch, and cast-steel wheels with hollow spokes.

Visualizing the Future Truck. Automotive Industries, vol. 40, no. 26, June 26, 1919, pp. 1432-1435, and (discussion) pp. 1435 and 1451. Develops ability formula. Paper read before Soc. Automotive Engrs.

PIPE

Cast-Iron Pipe

Flanges for Light Cast Iron Pipe, John Knickerbocker. Fire & Water Eng., vol. 66, no. 3, July 16, 1919, pp. 122-123, 1 fig. Analysis of proposed standard suggested by Am. Soc. Mech. Engrs.' Committee, and proposal that Am. Water Works Assn. take matter up with other societies. Paper read before Am. Water Works Assn.

Cement Joints

Successful Use of Cement Joints for Cast Iron Water and Gas Mains, Stephen E. Kieffer. Mun. & County Eng., vol. 57, no. 1, July 1919, p. 42. Results in construction of U. S. Housing Corporation project at Vallejo, Cal.

Cement Pipe

Friction Tests and Capacity Table for Cement Pipe, G. E. P. Smith. Eng. & Contracting, vol. 52, no. 2, July 9, 1919, pp. 37-38. Conducted at University of Arizona. Paper read before Am. Water Works Assn.

Concrete Pipe

Concrete Pipe Fails From Unequal Expansion of Shell, G. E. P. Smith. Eng. News-Rec., vol. 83, no. 3, July 17, 1919, pp. 113-115, 3 figs. Longitudinal cracks in non-reinforced pipe conduit believed to be due to differential movement because of partial wetness.

Discharge Pipes

Machinery and Pipe Arrangement—XVIII, C. C. Pounder. Mech. World, vol. 66, no. 1696, July 4, 1919, p. 7, 2 figs. Arrangement of discharge pipes. (Continuation of serial.)

Metalium Joints

Experience with Metalium Joints in Water Pipe Lines in Davenport, Iowa, Thomas Healy. Mun. & County Eng., vol. 57, no. 1, July 1919, pp. 47-48. Among advantages claimed is that material is cheaper per joint than lead.

See also Hydraulic Machinery (Pipe, Wood-Stave) and CIVIL ENGINEERING, Cement and Concrete (Concrete Pipe Manufacture.)

POWER GENERATION

France

New Project for Establishing a Law Governing Utilization of Hydraulic Forces (Le nouveau projet de loi sur les forces hydrauliques). Houille Blanche, vol. 18, nos. 29 & 30, May-June 1919, pp. 81-108. Including review of world situation and legislation existing in various countries.

Hydroelectric Power Station at Barberine (Valais) France (Construction de l'usine électrique de la Barberine (Valais)). Bulletin Technique de la Suisse Romande, vol. 45, no. 12, June 14, 1919, pp. 109-112, 3 figs. Concerning union of two waterfalls which is expected will furnish an aggregate of 38,500 hp.

Harnessing the French Rhone (L'aménagement hydraulique du Rhône Français), Auguste Pawlowski. Génie Civil, vol. 74, no. 24, June 14, 1919, pp. 481-487, 3 figs. Projects to make it navigable, of irrigation and of power utilization. Presented to the Congrès de la Houille Blanche (Grenoble, June 1919.)

Hydroelectric Energy in France, C. W. A. Vedits. Elec. World, vol. 74, no. 4, July 26, 1919, pp. 182-183. France possesses about 5,857,000 available hydroelectric horsepower. Writer explains that coöperation of American engineers and American financiers would be welcomed in developing natural resources of republic and in reorganizing her war-stricken industries.

Government Ownership

Government Ownership of Water Power in Relation to Electrochemical Industry, F. A. J. FitzGerald. Chem. & Metallurgical Eng., vol. 21, no. 2, July 15, 1919, pp. 95-98. Claims that arguments advanced by advocates of Government ownership are generally a priori and not based on actual experiences, and presents examples of Government activities in various fields which can be undertaken by private enterprise as offering evidence against public ownership in such cases.

Spain

Spain Plans National Transmission Network, George F. Paul. Elec. World, vol. 74, no. 3, July 19, 1919, pp. 122-123, 1 fig. To connect all industrial centers with power plants at larger waterfalls and coal mines. Contemplated development will harness 2,000,000 hp.

Stand-by Operation

Converting a Steam Plant to Stand-by Operation, L. M. Klauber. Nat. Elec. Light Assn. Bul., vol. 6, no. 6, June 1919, pp. 343-347, 3 figs. Problems met in actual case following tie-in with transmission service.

Water Power

Some Features of Hydroelectric Engineering Practice and Possibilities, H. de B. Parsons. Mun. & County Eng., vol. 57, no. 1, July 1919, pp. 13-16. Advocates nation-wide plan and policy to encourage use of water power to the fullest extent and conserve mineral fuels.

Hydraulic Energy (Creacion de la fuerza hidráulica). Boletin Minero de la Sociedad Nacional de Mineria, vol. 31, no. 241, March 1919, pp. 236-254. Notes on legislation relative to utilization of water power in France, England, United States and other nations.

Water Works, Engines for

Engines for Small Water Works, Henry A. Symonds. N. E. Water Works Assn., vol. 33, no. 2, June 1919, pp. 153-169 and (discussion) pp. 169-185, 3 figs. Economical selection.

POWER PLANTS

Boiler Auxiliaries

Boilers and Auxiliaries. Power Plant Eng., vol. 23, no. 14, July 15, 1919, pp. 624-627. From report of Committee on Prime Movers read at Convention of Nat. Elec. Light Assn.

Boiler-House Equipment

Steam-Electric Plant of the Dominion Power and Transmission Company, Hamilton. Elec. News, vol. 28, no. 10, May 15, 1919, pp. 26-29, 6 figs. Coal-handling and boiler-house equipment. (First article.)

Condensers

Particulars of a 56,000 Sq. Ft. Surface Condenser. Power, vol. 50, no. 3, July 15, 1919, pp. 90-92, 5 figs. Condenser is of Worthington type.

Draft, Induced

Artificial Induced Draft in Steam Boilers (Künstlicher Saugzug bei Dampfkesselanlagen), Mr. Nerger. Zeitschrift für Dampfkessel u. Maschinenbetrieb, vol. 42, nos. 5 & 6, Jan. 31 & Feb. 7, 1919, pp. 25-27 and 33-37, 9 figs. Draft blower with casing governor for Burkhardt boiler. Writer points out close connection between proper draft and fuel economy and discusses various types of blowers.

Economizers

Economizers and Economizer Practice, Robert June. Power House, vol. 12, no. 10, July 5, 1919, pp. 270-272, 4 figs. Illustrating its usefulness as aid to boiler-room economy.

Power Plant Management, Robert June. Refrigerating World, vol. 54, no. 7, July 1919, pp. 24-26, 4 figs. Claimed advantages and disadvantages of economizers.

Equipment, Moving

New Power Plant for St. Mary's Training School. Power, vol. 50, no. 1, July 1, 1919, pp. 2-6, 8 figs. Difficulty encountered while moving equipment from old to new plant without interrupting service.

Fuel Consumption

Steam and Coal Consumption in Power Stations, R. H. Parsons. Eng., vol. 108, no. 2792, July 4, 1919, pp. 3-4, 1 fig. Record of station having rated capacity of about 6000 kw. presented with view to indicating general possibilities of improvement in economy.

Furnace Patents

New Patents Regarding Steam Boiler Furnaces (Neue Patente auf dem Gebiete der Dampfkesselfeuerung), Pradel. Zeitschrift für Dampfkessel u. Maschinenbetrieb, vol. 42, nos. 1 and 3, Jan. 3 and 17, 1919, pp. 3-5 and 11-15, 19 figs. Stopping device for Babcock-Wilcox traveling grate; regulator for fuel layer on Kropelin traveling grates; safety pressure regulation, Gentrup type; exhaust suction and cleaning apparatus, Simon type.

Soot Blowers

What the Mechanical Soot Blower Accomplishes, Robert June. Power House, vol. 12, no. 11, July 19, 1919, pp. 310-315, 6 figs. Results of tests in power station. Importance of keeping tubes free from soot is emphasized.

Steam-Consumption Charts

Finding the Efficiency Ratio, H. L. Doolittle. Power, vol. 50, no. 4, July 22, 1919, pp. 140-141, 1 fig. Chart, consisting of portion of total-heat-entropy chart with curves superimposed thereon indicating steam consumption per kilowatt-hour.

Stokers

Sudden Peak Loads on Chain-Grate Stokers, H. F. Gauss. Power, vol. 50, no. 1, July 1, 1919, pp. 20-22, 1 fig. Chart for finding air-space area for a given boiler output.

Testing, Boiler and Furnace

Boiler and Furnace Testing, Rufus Strohm. Steam, vol. 23, no. 1, July 1919, pp. 11-15, 2 figs. How to make tests and interpret their results.

U. S. Nitrate Plant No. 2

U. S. Nitrate Plant No. 2, Edward R. Welles and W. A. Shoudy. Power Plant, Eng., vol. 23, no. 14 & 15, July 15, & Aug. 1, 1919, pp. 617-622, & 671-675, 12 figs. Power received from 10,000-kw. steam-generating station. Article deals particularly with efficiency features of steam plant. Turbines and condensing equipment.

Waste Wood, Steam Generation

Electrical Equipment of Clear Lake Lumber Mills, W. A. Scott. Elec. Rev., vol. 74, no. 26, June 28, 1919, pp. 1065-1068, 6 figs. Refuse furnishes steam for dry kilns and turbo-generators.

Water Softening

Water Softening and Purifying Processes, C. E. Stromeyer. Power House, vol. 12, no. 11, July 19, 1919, pp. 300-302, 2 figs. Description of purifying processes used.

POWER TRANSMISSION

Belting

Scientific Methods to Prolong Life of Belting, vs. Careless Methods That Destroy, Edward E. Marbaker. Belting, vol. 15, no. 2, July 20, 1919, pp. 17-20. Tallow-cod oil recommended as best belt lubricant.

Steel-Mill Auxiliaries, Drives for

Hydraulic vs. Electric Drive for Steel Mill Auxiliaries, R. B. Gerhardt. Jl. Engrs. Club of Philadelphia, vol. 36, no. 177, August 1919,

pp. 303-308, 5 figs. Also Blast Furnace & Steel Plant, vol. 7, no. 7, July 1919, pp. 330-334. Comparison between hydraulic and electric drive for door hoists, furnace covers, elevators, manipulators, lifting tables, middle roll balance, shears and intensifiers. Paper read before Assn. Iron & Steel Elec. Engrs.

PRODUCER GAS

Tar Disposal

Tar Disposal in Ford Producer-Gas Plants. Power, vol. 50, no. 2, July 8, 1919, pp. 66-67, 1 fig. Method for returning tar to, and vaporizing it in producer.

PUMPS

Air-Lift Pumping

Air-Lift Pumping. John Oliphant. Can Engr., vol. 37, no. 2, July 10, 1919, pp. 121-124, 8 figs. Compressor handling single well pumping at rate of 400 gal. per min. with lift of over 300 ft. Details of operation.

Centrifugal Pumps

Rees Roturbo Centrifugal Pumps. Can Manufacturer, vol. 39, no. 7, July 1919, pp. 33-38, 10 figs. Single- and multiple stage-types illustrated. Venturi principle embodied in shaped contraction in water pipe having abrupt nozzle where water enters contraction, and gradually expanding taper piece after water has passed contraction.

Costs

Calculating Oil Conduits. Zentralblatt der Bauverwaltung, vol. 39, no. 19, Mar. 1, 1919, pp. 101-102, 1 fig. Cost of pumping plant, maintenance, fuel.

Pumping Engine Tests

Pumping Engine Tests. Fire and Water Eng., vol. 66, no. 2, July 9, 1919, pp. 66-69, 7 figs. Record of tests at Electric Park, Kansas City, Mo., during convention of International Assn. of Fire Engrs.

REFRACTORIES

Cements

Patching Oven Jamb Leaks. R. L. Fletcher. Gas Rec., vol. 15, no. 12, June 25, 1919, pp. 401-402, 4 figs. Closing cracks between fire-clay jamb bricks and silica shapes by means of Hytempite dissolved in warm water.

Firebrick

Constitution and Microstructure of Silica Brick and Changes Involved Through Repeated Burnings at High Temperatures. Herbert Insley and A. A. Klein. Techn. Papers Bur. Stand., no. 124, July 11, 1919, 31 pp., 20 figs. Petrographic microscopic examinations of commercial silica brick and those which have received repeated burnings by use in kilns, alleged to show three main constituents—quartz, cristobalite, and tridymite. In addition, small amounts of pseudowollastonite and glass are said to be present.

See also Refractory Material Committee Report.

Refractory Material Committee Report

Report of the Refractory Material Committee on the Crushing Strength of Firebricks. W. Emery and J. W. Mellor. Gas Jl., vol. 146, no. 2925, June 3, 1919, pp. 619-620, 3 figs. Results interpreted as having indicated that present strength is reduced by increasing grain size of grog when proportion of grog is constant; and also by increasing proportion of grog when grain size is constant. Presented before Instn. of Gas Engrs.

REFRIGERATION

Ammonia Receivers

Watch the Ammonia Receiver. John E. Starr. Power, vol. 50, no. 4, July 22, 1919, pp. 142-143, 2 figs. Advises feeding only liquid to expansion coils, and warns against estimating conditions of feeding by sound made in expansion valve.

Brewery

Remodeling Suction Gas Mains Anheuser Busch Brewery. Robert H. Karl. Power, vol. 50, no. 2, July 8, 1919; pp. 48-54, 13 figs. Refrigerating system of brewery occupies 70 city blocks. During growth multiplicity of ammonia-compressor piping demanded remodeling so as to provide means to facilitate operation and to effect greater economy especially by better insulating the piping. Arti-

Carbon-Dioxide Machines

The design of CO_2 machines. John E. Starr. Refrigerating World, vol. 54, no. 7, July 1919, pp. 11-12 & 20, 1 fig. Plate illustrating what writer terms disagreement on data of chief properties of carbonic acid gas as given by different authorities.

Code

Code for the Regulation of Refrigerating Machines and Refrigerants. Ice & Refrigeration, vol. 57, no. 1, July 1919, pp. 6-8, 2 figs. Prepared by Commission on Municipal and State Regulations of Am. Soc. of Refrigerating Engrs.

Ice Plants

Re-Modeled Ice Plant, Columbus, Ohio. Ice & Refrigeration, vol. 57, no. 1, July 1919, pp. 10-15, 11 figs. Rated capacity is 250 tons daily, all distilled-water ice. In the transformation effected, about 20 steam-driven pumps and small steam engines have been replaced by electric-motor-driven apparatus.

Largest Ice Plant in the West. Victor J. Azbe. Power, vol. 50, no. 5, July 29, 1919, pp. 168-170, 5 figs. Plant of 350 ton capacity. Features are drum-type copper steam condensers, ammonia condensers made up of 8-in pipe and ice-making system employing 800-lb. cans.

Shipboard Installations

Refrigerating Installations on Board Large Steamships (Les installations frigorifiques à bords des grands paquebots). Génie Civil, vol. 74, no. 26, June 28, 1919, pp. 521-525, 1 fig. Assembly plan of installations as laid out in French steamer of 15,000 tons.

Storage, Cold

Cold Storage Accommodation. Surveyor, vol. 55, no. 1432, June 27, 1919, pp. 479-480, 6 figs. Design for building of 120-ton capacity.

RESEARCH

Forest Products Laboratory

Production in Industrial Research. Samuel Morell. Indus. Management, vol. 58, no. 2, Aug. 1919, pp. 95-99, 5 figs. Management methods applied to Forest Products Laboratory to increase output of results.

Industrial Laboratories

The Organization of an Industrial Laboratory. A. D. Little and H. E. Howe. Mech. Eng., vol. 41, no. 8, August 1919, pp. 663-666, 3 figs. Divisions of laboratory are enumerated and discussed, laboratories of A. D. Little being taken as type. Methods of management, rating or reports and commercial organization are also discussed.

Industrial Research Laboratory Organization. K. C. Mees. Mech. Eng., vol. 41, no. 8, August 1919, pp. 667-668, 4 figs. Diagrams illustrating functions of industrial research laboratory.

The Scope of the Works Laboratory. Eng. & Indus. Management, vol. 1, no. 19, June 19, 1919, pp. 581-582. Success of a laboratory said to depend on (1) possession of proper equipment which includes ample number of properly trained scientific workers, (2) mutual existence of right attitude of mind between works and the laboratory, (3) complete confidence and sympathetic assistance of management.

Industrial Research

Industrial Research and National Progress. Frank D. Adams. Min. & Eng. Rec., vol. 24, no. 10 & 11, June 1919, pp. 142-146. With notes on the work being done by governments of United States and Great Britain.

Lausanne University Laboratory

Mechanical, Physical and Chemical Laboratory of the Engineering School of Lausanne University (Le laboratoire d'essais mécaniques, physiques et chimiques de l'école d'ingénieurs de l'Université à Lausanne). Bulletin Technique de la Suisse Romande, vol. 45, nos. 11, 12 & 13, May 31, June 14, and June 28, 1919, pp. 99-102, 114-116, and 127-129, 13 figs. Martens apparatus for measuring small elastic deformations; machine used to measure tensile and compressive strength of wires, sheets, springs, etc. Charpy apparatus for measuring resilience.

Lynite Laboratories

Evolution of the Lynite Laboratories. Iron Age, vol. 104, no. 3, July 17, 1919, pp. 149-154, 9 figs. General organization of laboratories is laid out to include research along purely scientific lines in the arts of alloying and fabricating non-ferrous metals, the adaptation of this scientific knowledge by means of experiments and development methods and scientific control of foundry practice to secure

National Physical Laboratory

The National Physical Laboratory. Engineering, vol. 107, no. 2791, June 27, 1919, pp. 846-848, 2 figs. Worm-gear testing machine. (To be continued).

Research Outlook

The Outlook for Research. Nevil Monroe Hopkins. Jl. Engrs. Club of Philadelphia, vol. 36, no. 177, August 1919, pp. 309-316. Present status and economic possibilities of research in America and in European countries.

The Condition of Research in the United States. Arthur H. Green. Mech. Eng., vol. 41, no. 7, July 1919, pp. 587-592, 13 figs. Writer discusses research in its relation to technical schools and engineering experiment stations, its value when comparatively conducted and as undertaken by various government activities.

Works Laboratory

See Industrial Laboratories.

SPECIFICATIONS

Malleable Castings

Technical Specification for the Delivery of Malleable Castings (Spécification technique pour la fourniture des pièces en fonte malléable). Fonderie Moderne, no. 2, Feb. 1919, pp. 43-45. Concerning malleable castings as adopted by railroad companies.

Motor Trucks

Motor Truck Specifications. Power Wagon, no. 176, July 1919, pp. 49-64. List of major specifications of internal-combustion and electric trucks, grouped according to load rating and arranged alphabetically by brand name.

STANDARDS AND STANDARDIZATION

Enamels

See Lacquers.

Engineering Standards Committee

American Engineering Standards Committee. C. B. LePage. Jl. Engrs. Club of Philadelphia, vol. 36, no. 177, August 1919, pp. 321-322. Statement of reorganization activities during period January 1 to June 1, 1919.

Holland

Standardization in Holland (Ontwerp-Standaardvormen der Hoofdcommissie voor de Normalisatie in Nederland). Ingenieur, vol. 34, no. 25, June 21, 1919, pp. 476-479. New standardization rules of Standardization Committee of the Netherlands.

Japans

See Lacquers.

Lacquers

Lacquers, Shellacs, Enamels and Japans. Safety Eng., vol. 38, no. 1, July 1919, pp. 15-22, 2 figs. Tentative safety standards prepared by the State of New Jersey.

Pumps, Liquid Measuring

Specifications and Tolerances for Liquid Measuring Pumps, Tentatively Adopted by the Twelfth Annual Conference of Weights and Measures, May, 1919. Scale Jl., vol. 5, no. 10, July 10, 1919, pp. 11-12. Covering definition of liquid-measuring pump, permanence, constancy of delivery, position of stop mechanism, etc.

Shellacs

See Lacquers.

Wood Screws

New Standards for Wood Screws (Neue Einheitsmasse für Holzschrauben). Metall-Technik, vol. 45, no. 7/8, Feb. 22, 1919, p. 29. New uniform measures for wood screws issued by the Standardization Committee of German Industries.

STEAM ENGINEERING

Boilers

Standard Boilers, Gt. Western Railway. Ry. Engr., vol. 40, no. 474, July 1919, pp. 138-141, 4 figs. Leading particulars of four standard sizes having lengths of 14-ft. 10-in., 11-ft., 10-ft. 3-in., and 11-ft. Details of joints are particularly dealt with.

Design and Construction of Marine Boilers. A. E. Seaton. Mar. Engr. & Naval Architect, vol. 41, no. 502, July 1919, pp. 307-309. Work done by British Marine Eng. Design and Construction Committee. (Concluded). Paper read before Instn. Naval Architects.

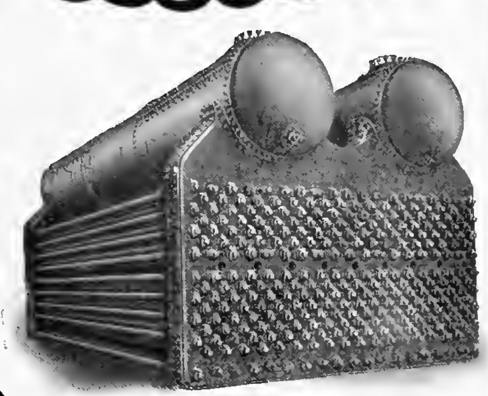
Water Power Can Not Take the Place of Coal

It is interesting to note that the maximum possible hydraulic energy of 230 million kilowatts is little more than the total energy which we can now produce from coal, and is about equal to the present total energy consumption of the country including *all* forms of energy.

This is rather startling. It means that the hope that when coal once begins to fail we may use the water powers of the country as source of energy is and must remain a dream; for if today all the potential water power of the country were developed and every rain drop used it would not supply our present energy demand.

Thus hydraulic power may and should supplement coal as a source of power, but can never replace it.—*Charles P. Steinmetz.*

WHEN STEINMETZ SAYS—"IT CAN'T"



you can be sure **"IT CAN'T"**

It behooves all users of coal, therefore, to burn coal ECONOMICALLY. Use the most efficient boiler you can get.

HEINE BOILERS

Heine Boilers are most efficient. They are famous for their quality, for their strength and for their excellent durability.

Visitors to St. Louis are invited to our Plant No. 1 to see the first Heine Boiler ever built. It was in continuous service for about 35 years. It is still serviceable. A very good record.

WRITE FOR "BOILER LOGIC"

HEINE SAFETY BOILER CO.

5321 MARCUS AVE. HELIOS ST. LOUIS, MO.

3

Tests of High Efficiency Pre-heater Type Boilers, Josiah H. Rohrer. Universal Engr., vol. 29, no. 7, July 1919, pp. 39-45, 2 figs. Experiences at Ford Motor Company.

Newcomen Engines

Two Newcomen Engines. Engr., vol. 127, no. 3313, June 27, 1919, pp. 621-623, and 632, 22 figs. Particulars regarding two engines, one dating back to 1787 and another to 1823, both of which are said to be still working satisfactorily.

Turbines, Blade Fastenings

Turbine Blade Fastenings—III. Mechanical World, vol. 65, no. 1694, June 20, 1919, p. 294, 8 figs. Methods used on running wheels of Westinghouse Rateau turbine. (Continuation of serial.)

Turbines, Bucket Efficiency

Bucket Efficiency of Impulse and Reaction Steam Turbines (Om Skövelverkningsgrader vid Aktions- och Reaktions-angturbiner), Tore G. E. Lindmark. Teknisk Tidskrift, Mekanik, vol. 49, no. 24/3, Mar. 12, 1919, pp. 37-41, 3 figs. Claims that it is frequently stated that the bucket efficiency in a reaction steam turbine must necessarily be lower than the corresponding efficiency in an impulse steam turbine, as long as the ratio between the peripheral velocity and heat drop for the reaction steam turbine does not exceed the most favorable values for the impulse steam turbine.

Turbines for Mechanical Drives

Turbines for Mechanical Drives, R. R. Lewis. General Elec. Rev., vol. 22, no. 6, June 1919, pp. 438-442, 12 figs. Illustrates selection of standard parts to produce turbine best adapted to conditions of particular application.

Turbo-Generator, 45,000-Kw.

The 45,000-Kw. Turbine-Generator set at Providence. Elec. Rev., vol. 75, no. 3, July 19, 1919, pp. 91-93. Cross-compound unit of Narragansett Electric Light Co. consisting of high- and low-pressure turbines, each connected with through flexible coupling to its own generator.

Turbo-Generator, 70,000-Kw.

Interborough Rapid Transit Company's 70,000-Kw. Turbo-generator. Elec. Rev., vol. 75, no. 1, July 5, 1919, pp. 4-6, 4 figs. Methods of operating three elements of triple cross-compound turbine.

Turbine Governing

Turbine Governing for Present Types of Steam Turbines (Zur Regelung der Steuerung der gegenwärtigen Bauarten von Dampfturbinen), Ernst Blau. Zeitschrift des österr. Ingenieur- und Architekten-Vereins, vol. 70, nos. 43 & 45, Oct. 25, and Nov. 8, 1918, pp. 465-466, and 484-487, 10 figs. Throttle governors of the Bergmann steam turbine, oil-pressure valve gears of the Brown Boveri & Co. turbines: Allgemeine Elektrizitäts-Gesellschaft system of automatic governing by cutting out nozzles. (To be concluded.)

THERMODYNAMICS

Equation of State for Fluids

Direct Determination of the Temperature Exponent in the Equation of State of Fluids (Détermination directe de l'exposant de la température dans l'équation d'état des fluides), E. Ariès. Comptes Rendus des Séances de l'Académie des Sciences, vol. 168, no. 19, May 12, 1919, pp. 930-933. Equation solved for exponent of temperature and substitution of values of quantities in second side of equation effected for seven substances.

Heat Conductivity

Heat Conductivity, C. Edwards, A. Rigby and J. W. Mellor. Gas World, vol. 70, no. 1819, May 31, 1919, pp. 448-450, 3 figs., and Gas Jl., vol. 146, no. 2925, June 3, 1919, pp. 620-622, 3 figs. Theoretical. In computation conductivity of air is neglected, and it is assumed that conductivity of solid does not vary with temperature and that no heat is conveyed across space by convection. Problem is taken up with reference to pore gap. Paper before Instn. of Gas Engrs.

Joule-Thomson Effect for Air

The Joule-Thomson Effect for Air at Moderate Temperatures and Pressures, L. G. Hoxton. Physical Rev., vol. 13, no. 6, June 1919, pp. 438-439, 8 figs. Joule-Thomson coefficient was found in experiments to have a decreasing linear variation with increasing line pressures.

VARIA

Astronomical Instruments

An Evening's Journey among the Stars, Frank C. Jordan. Jl. Engrs. Club of Philadelphia, vol. 36, no. 176, July 1919, pp. 253-258, 7 figs. Development of astronomical instruments together with some of records obtained through their use.

Chemical Associations

Part of Chemical Associations in International Documentation (L'organisation de la Documentation internationale et le rôle des associations de chimie), Paul Otlet. Chimie & Industrie, vol. 2, no. 5, May 1919, pp. 547-554. Proposes that an international federation of chemical societies should be entrusted with documentation of all chemical literature. Discourse pronounced before Interallied Conference.

Engineering Profession, Organization of

A National Organization of the Engineering Profession, F. R. Ewart. Elec. News, vol. 28, no. 10, May 15, 1919, pp. 23-26, 1 fig. Referring to example of Great Britain where with development of various engineering sciences a single society of engineers formerly existing separated in spite of strenuous opposition into present organizations, it appears to writer that best realization of single-society idea would be in developing systematic scheme of coöperation which would leave most complete autonomy for technical purposes to all existing organizations. A system of coördinating councils for this purpose is presented.

Engineers

The Engineer—His Opportunities and Responsibilities, John B. Fisken. Jl. of Electricity, vol. 43, no. 2, July 15, 1919, pp. 69-71. Calls attention to the fact that engineer is becoming a more and more important factor in modern world. Still, writer observes, in spite of vast opportunities for service which lie before him, his unnecessarily retiring temperament prevents him from taking the high place which is rightfully his.

Patent System

Proposed Changes in the American Patent System, Wesley G. Carr. Elec. Jl., vol. 16, no. 7, July 1919, pp. 299-300. Recommendations proposed by special committee appointed by Nat. Research Council.

Percentages

Checking Percentages by a Chart, William Wyer. Eng. & Contracting, vol. 52, no. 3, July 16, 1919, pp. 80-81, 1 fig. Methods of U. S. Railroad Administration.

WELDING

Acetylene Generating Plant

Acetylene Generating Plant for Large Welding Shops. Welding Engr., vol. 4, no. 7, July 1919, pp. 27-29, 3 figs. It consists of 7 generators, gas collector, moisture separator, 2 condensers, a gas-meter capable of storing 350 cu. ft. of gas, and 4 large purifiers provided with bypasses for working in pairs.

Acetylene Welding

Oxy-Acetylene Welding of Large Cylinders, L. M. Malcher. Min. & Sci. Press, vol. 119, no. 20, July 12, 1919, pp. 53 and 61-62. Repairing fractured left-hand low pressure steam-cylinder, 70 in. in inside diameter, of Allis-Chalmers twin-tandem compound-reversing engine.

Arc Welding

Electric Arc Welding in Mines, John G. Kjellgren. Coal Age, vol. 16, no. 2, July 10, 1919, pp. 52-53, 2 figs. Illustrating weld on cast iron hoisting sheave.

Blowpipes

Improvements in Blowpipes. Acetylene & Welding Jl., vol. 16, no. 189, June 1919, pp. 121-122, 1 fig. Invention relating to blowpipes in which extension piece can be readily attached between nozzle and handle. Extension piece arranged so as to establish communication between oxygen nozzle and injector, and also between passage for combustible gas and annular space between injector and rear portion of tip.

Concrete Construction

Autogenous Welding in Reinforced-Concrete Construction (Die Flammenverschmelzung im Eisenbetonbau). Autogene Metallbearbeitung, vol. 12, no. 3, Mar. 1919, pp. 38-40, 10 figs. Describes concrete tanks and pipes as made by the Metallindustrie G.m.b.H. at Buhl, Baden. (Concluded.)

Electric Welding

Development of Electric Welding, Howard C. Forbes. Elec. Eng., vol. 53, no. 5, May 1919, pp. 222-223. Emphasized by quoting its application in preparation of depth and gas bombs, construction of Liberty motor, attachment of Otto gear to hulls of ships to protect them from mines, etc.

See also Arc Welding, Spot Welding.

Electric Welding: Its Theory, Practice, Application and Economics, H. S. Marquand. Elecn., vol. 82 & 83, nos. 2144, 2146, and 2147, June 20, July 4 & 11, 1919, pp. 705-707, 17-18, and 40-41, 7 figs. Deals with preparation of welds and then passes on to certain properties of iron and mild steels which have a marked bearing on methods adopted. Examples of various types of welding. (Continuation of serial.)

Firebox Welding

Fire Box Welding, E. K. Smith. Welding Engr., vol. 4, no. 7, July 1919, pp. 42-44, 5 figs. Work done by U. S. Welding Co.

Gas Torch

Modern Welding and Cutting—XVI, Ethan Viall. Am. Mach., vol. 51, no. 3, July 17, 1919, pp. 117-122, 13 figs. Rules for welding with gas torch.

Modern Welding and Cutting—XV, Ethan Viall. Am. Mach., vol. 51, no. 2, July 10, 1919, pp. 61-65, 13 figs. Gas-torch welding and cutting outfits.

Jigs

Welding Jigs and Methods of Overcoming Distortion, C. S. Milne. Welding Engr., vol. 4, no. 7, July 1919, pp. 21-27, 23 figs. Illustrating repair work.

Welding and Cutting, B. S. Milne. Can. Machy., vol. 22, no. 3, July 17, 1919, pp. 48-51, 18 figs. Examples of welding and methods of overcoming distortion. Paper presented before British Acetylene and Welding Assn. (Continued.)

Various Jigs as Applied to the Welding Trade, B. S. Milne. Can. Machy., vol. 22, no. 1, July 3, 1919, pp. 13-15, 17 figs. Illustrating methods for overcoming distortion.

Repair Work

Rolling Mill Engine Repaired by Oxywelding, L. M. Malcher. Blast Furnace & Steel Plant, vol. 7, no. 7, July 1919, pp. 327-328, 5 figs. Repairing low-pressure steam-cylinder fracture on twin-tandem compound reversing engine at Farrell Works of Carnegie Steel Co.

Some Recent Striking Examples of Crankshaft Repairs. Reactions, 1919, vol. 12, no. 2, Second Quarter, pp. 31-36, 13 figs. Such as weld made on extension to 20-in. blooming mill crankshaft.

See also Jigs.

Seam Stress

How the Seam is Stressed in Autogenous Welding (Wie wird heim Autogenschweissen die Schweissnaht beansprucht). Autogene Metallbearbeitung, vol. 12, no. 3, Mar. 1919, pp. 31-36, 18 figs. Heat expansion and upsetting in autogenous welding of mild-steel plates; suggestions for preventing stresses; welding circular seams on cylindrical bodies. (To be continued.)

Spot Welding

A Large Spot-Welding Machine. Engr., vol. 127, no. 3311, June 13, 1919, pp. 588-589, 5 figs. Design for spot welding of tubes 5 ft. long made of ¼-in. steel plates and having an internal diameter of 8 in.

Tank Welding

Tank Welding by the Oxy-Acetylene Process, Charles C. Phelps. Machy. (N. Y.), vol. 25, no. 11, July 1919, pp. 1071-1072, 2 figs. Illustrating application of oxy-acetylene method of welding to duplicate work required in large quantities.

Thermit

Correct and Incorrect Methods of Lining up Broken Crankshafts for Thermit Welding, J. H. Deppeler. Reactions, vol. 12, no. 2, Second Quarter, 1919, pp. 37-38, 2 figs. Placing riser between slabs to prevent shrinkage of thin ribs between heavier parallel members.

Recent Thermit Technique at the Rocky Mount Shops of the Atlantic Coast Line Railroad, D. C. Lewis. Reactions, vol. 12, no. 2, Second Quarter, 1919, pp. 39-40, 5 figs. Welding of guide yoke, cast-iron driving wheel, and the like.

Truck Side Frames

Welding Truck Side Frames, Bolsters and Arch Bars. Welding Engr., vol. 4, no. 7, July 1919, pp. 48-50, and (discussion) pp. 50-52. Autogenous welding, limits and regulations recommended by Welding Committee of Am. R. R. Assn.

WOOD

Drying Wood

The Phenomena of Drying Wood, Harry D. Tiemann. Jl. Franklin Inst., vol. 188, no. 1, July 1919, pp. 27-50, 8 figs. Analysis of inter-

nal stresses which occur in wood during progress of drying, with discussion of physical properties which affect these stresses.

Kilndrying of Wood in the Airplane Industry, Myron A. Lee. Sibley Jl., vol. 33, no. 5, June 1919, pp. 66-67, 3 figs. Results obtained with kiln of hot-air-blast, bake-oven type.

Plywood

The General Properties and Uses of Plywood, B. C. Boulton. Aerial Age, vol. 9, no. 17, July 7, 1919, pp. 813-815, 2 figs. Plywood strength tables. (Continuation of serial.)

See also AERONAUTICS, Materials of Construction (Plywood).

Shrinkage

Shrinkage of Interior Trim: Its Cause and Prevention, Lawrence V. Teesdale. Am. Architect, vol. 116, no. 2275, July 30, 1919, pp. 143-145, 5 figs. Examples of shrinkage which occurs when insufficiently kiln-dried material is used. Writer advises obtaining material that has been kiln-dried to proper moisture content.

The Relation of the Shrinkage and Strength Properties of Wood to Its Specific Gravity, J. A. Newlin and T. R. Wilson. U. S. Dept. of Agriculture bul. no. 676, July 16, 1919, 35 pp., 9 figs, partly on supp. plates. Results of over 200,000 tests expressed in form to utilize them for estimating properties of any particular timber and for selecting timber for any given purpose.

Woodworking Industry

Installing Management Methods in the Wood working Industry, Carle M. Bigelow. Indus. Management, vol. 58, no. 2, Aug. 1919, pp. 124-133, 29 figs. Information in regard to handling lumber, drying lumber, construction and operation of kilns, purchasing and storing; also time study leading up to payment of bonus

Organization and Management

ACCOUNTING, FINANCE AND COSTS

Building Factors in Costs

Fixing Building Factors in Costs, M. H. Potter. Iron Trade Rev., vol. 65, no. 2, July 10, 1919, pp. 97-98. How building and associated factors are apportioned in fixing indirect costs. Fourth article.

Chemical Manufactures

Cost Analysis in Chemical Manufacture—II. Jl. Soc. Chem. Indust., vol. 38, no. 12, June 30, 1919, pp. 224R-226R. Costs and efficiencies of nitric and sulphuric acid production. Based on official reports of English foundries.

Coal-Production Costs

The Cost of Coal Production as Influenced by the Balancing of the Working Organization, F. W. Gray. Iron & Steel of Can., vol. 2, no. 7, July 1919, pp. 159-160. Cost increase since 1913. Unbalanced condition of working forces at collieries due to requirements of military service is quoted as prominent among reasons for increased expenditure required to produce coal.

Manufacturing Costs

A Graphical Analysis of Manufacturing Costs, E. L. Ackerman and L. F. Merritt. Am. Industries, vol. 19, no. 12, July 1919, pp. 20-21, 1 fig. Illustrates with hypothetical case graphical analysis of manufacturing costs of a given contract cancelled prior to completion.

Finding Costs of Manufacture, Clifford E. Lynn. Iron Trade Rev., vol. 65, no. 1, July 3, 1919, pp. 23-25, 5 figs. Recommended forms for keeping records. Fifth article.

Public Utilities

Organization and Methods of Public Utilities Accounting, C. P. Staal. Nat. Elec. Light Assn. bul., vol. 6, no. 7, July 1919, pp. 392-397, 2 figs. Diagrams showing accounting department organization of Southern California Edison Co.

EDUCATION

Accident Prevention

How to Give Illustrated Lectures on Accident Prevention to Workmen, Roy S. Bonsib. U. S. Dept. Labor, Working Conditions Service, 1919, 13 pp. Believes that most effective way to prevent accidents is through lectures with slides and moving pictures, showing results of accidents rather than how to avoid them.

Arc Welders

Training Operators for Arc Welding, E. Wanamaker and H. R. Pennington. Ry. Elec. Engr., vol. 10, no. 7, July 1919, pp. 226-231, 14 figs. Outlines methods said to have been used successfully.

See also Disabled Soldiers.

Colleges

See Engineering Students.

Disabled Soldiers

Electrical Occupations for Disabled Soldiers. Universal Engr., vol. 29, no. 6, June 1919, pp. 41-45. In construction, repair, and maintenance work.

Teaching Autogenous Welding to Disabled Soldiers (Lehrwerkstätte des Verbandes für autogene Metallbearbeitung an der staatlichen Maschinenbauschule zu Cöln). Acetylen in Wissenschaft und Industrie, vol. 22, nos. 3-4, Feb. 1919, pp. 15-18, 7 figs. Showing appliances used for various forms of disability.

Engineering Students

Broader Education for Engineers, George B. Pegram. Jl. Engrs. Club of Philadelphia, vol. 36, no. 176, July 1919, pp. 274-277. Preparing students to come into professional engineering course with fair general education on ordinary subjects and definite amount of preparation in fundamental sciences.

"Case System" Changes in Engineering Curricula, and Business Training for Engineers. Eng. News-Rec., vol. 83, no. 4, July 24, 1919, pp. 183-187. Results at Army Engineer School at Camp A. A. Humphreys in applying definite problem method. Radical reorganization in methods of instruction effected at Tufts College and Yale University.

Hawthorne Training Schools

Training Men and Women at Hawthorne, F. W. Willard. Western Elec. News, vol. 8, no. 5, July 1919, pp. 2-6. Theoretical as well as practical instruction.

Higher Positions

Choosing and Training the Man for the High Position, Julian McGill. Jl. Electricity, vol. 43, no. 1, July 1, 1919, pp. 11-12. Suggests rules governing training of men.

Miners

Educational Methods at the Copper Queen, Chas. F. Willis. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 151, July 1919, pp. 1099-1106, 1 fig. Course designed for education of miners to shift-boss position.

Upgrading in Training Department

Upgrading in the Training Department, M. R. Lott. Indus. Management, vol. 58, no. 2, Aug. 1919, pp. 100-104, 4 figs. Method of Sperry Gyroscope Co.

Tin-Plate Mills

Education a Plant Efficiency Factor, J. K. Lamoree. Iron Age, vol. 104, no. 5, July 31, 1919, pp. 296-297. Application in tin-plate mill.

Training

Preparing Industry for Reconstruction Demands, C. T. Clayton. Am. Mach., vol. 51, no. 1, July 3, 1919, pp. 19-22, 2 figs. Points out advantages of training men in manufacturing industry.

Vocational Education

Vocational Education Under the Smith-Hughes Act. Metal Trades, vol. 10, no. 7, July 1919, pp. 297-300. Provisions of the Act as far as industrial education is concerned.

FACTORY MANAGEMENT

Bonus Systems

Bonus System Reduces Coal Consumption at Denver, W. E. Casey and E. Weber. Power, vol. 50, no. 5, July 29, 1919, pp. 174-179, 7 figs. By installation of new turbine and introduction of bonus system, Denver tramway system claims to have reduced coal consumption to less than 2.5 lb. per kw-hr., with saving in operating expenses of about $150,000 per year.

Construction Records

Mastering Service Problems with a Master Sheet—II. Motor Age, vol. 36, no. 3, July 17, 1919, pp. 22-25, 7 figs. Service records for indicating repair jobs through shop proves a time saver.

Progressive Cards for Shipyards. Shipbuilding and Shipping Record, vol. 14, no. 2, July 10, 1919, pp. 41-42, 1 fig. Suggests system of checking progress of construction.

Drawing Office

The Principles of Drawing Office Organization, N. Gerard Smith. Eng. & Indus. Management, vol. 2, no. 1, July 3, 1919, pp. 13-15, 1 fig. Functions of office are believed to be (1) to design product and manufacturing plant and processes, (2) to collect ideas wherever they may be found, and to utilize them to best advantage, (3) to experiment with and demonstrate all new product and processes, (4) to deal with time study, (5) to record all data.

Employment Management

Employment Management, A. Rowland Entwistle. Eng. & Indus. Management, vol. 1, no. 19, vol. 2, nos. 1 and 2, June 19, July 3, and 10, 1919, pp. 590-593, 6-10, 38-41, 1 fig. June 19: Object, scope and functions of the employment manager. July 3: Constructional details of employment department. July 10: Qualifications of employment manager.

Physical Examination Previous to Employment, Chas. F. Willis. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 151, July 1919, pp. 1013-1020. Advocated not for the purpose of eliminating the unfit, but for measuring physical fitness and placing men where they can do the best for themselves, for their fellow-workers and the company.

Gage Making

See Management Methods.

Garment Trades

See Management Methods.

Industrial Cooperation

Anti-Social, Militant Methods Condemned, Walter Gordon Merritt. Iron Age, vol. 104, no. 1, July 3, 1919, pp. 9-12. Coöperation of different companies through representatives chosen by employer and employees suggested.

Industrial Democracy—The Leitch Plan. Min & Oil Bul., vol 5, no. 7, June 1919, pp. 395-396 and p. 411. Coöperation between executive and operating individuals by means of an industrial democracy house of representatives.

Successful Industrial Democracy, Dale Wolf. Indus. Management, vol. 58, no. 1, July 1919, pp. 67-71, 2 figs. Participation board plan of Miller Lock Company.

Industrial Co-operation, W. R. Ingalls. Min. & Sci. Press, vol. 118, no. 26, June 28, 1919, pp. 877-884. Economical aspect. Paper read before Can. Min. Inst.

Industrial Democracy in Operation, B. C. Forbes. Iron Age, vol. 104, no. 4, July 24, 1919, pp. 239-240. Representative plan which has been adopted by a number of companies.

Industrial Personnel Relations, Arthur H. Young. Mech. Eng., vol. 41, no. 7, July 1919, pp. 581-586. Human factor in organization systems intended to promote safety; also account of International Harvester Co.'s plan of employees' representation.

Interchangeable Manufacture

Principles of Interchangeable Manufacturing, Earl Buckingham. Machinery, vol. 25, no. 11, July 1919, pp. 1024-1029. Factors which make possible, or permanent, interchangeable manufacture of mechanical products.

Labor Labels

Organizing an Industrial Republic, A. J. Hain. Iron Trade Rev., vol. 65, no. 4, July 24, 1919, pp. 21-26. Commercial possibilities of label or trade-mark bearing words "Made in an Industrial Democracy," or similar phrase to denote that product originated in factory where labor is given voice in management.

Management Methods

Installing Management Methods in the Woodworking Industry, Carle M. Bigelow. Indus. Managament, vol. 58, no. 1, July 1919, pp. 1-8, 6 figs. Necessity of establishing engineering department in woodworking industry emphasized by reference to writer's experience in several of these plants where lack of this department permitted conditions which encouraged waste and inefficiency. Basis for organizing such department is suggested.

How We Increased Output 1000 Per Cent in an Already Crowded Plant. Factory, vol. 23, no. 1, July 1919, pp. 40-42. Improvements performed in various departments such as giving better tempering to cutting tool in screw machine that was found to dull quickly. From experiences of Gillette Safety Razor Co.

Efficiency in the Gage-Making Department, C. B. Cole. Machinery, vol. 25, no. 11, July 1919, pp. 1056-1057. Operation and management of gage-making department on time- and money-saving basis.

Scientific Management in Road Construction, A. W. Campbell. Contract Rec., vol. 33, no. 26, June 25, 1919, pp. 634-635. System of cost-keeping for securing greatest possible performance for given outlay.

Modern Management Methods, Applied to Construction, Mean Higher Efficiency, Daniel

J. Hauer. Contract Rec. vol. 33, no. 26, June 25, 1919, pp. 585-589. How scientific scheme of planning and organization opens way to greater and more certain profits.

Factory Management in Garment Trades, Mack Gordon. Indus. Management, vol. 58, no. 1 and 2, July and August 1919, pp. 12-16 and 140-145, 10 figs. July: Functions and methods of planning department. August: Time studies and instructions.

Managing for Maximum Production, L. V. Estes. Indus. Management, vol. 58, no. 1 and 2, July and August 1919, pp. 54-61 and 134-138, 10 figs. July: V—Use of standards and instructions. August: VI—Emphasis is laid upon needed fostering spirit of coöperation, training some one to perpetuate and carry forward betterment work and making an occasional management audit.

Organizing for Work, H. L. Gantt. Indus. Management, vol. 58, no. 2, Aug. 1919, pp. 89-93, 3 figs. Machine-record charts, progress charts and man-record charts.

Organization and Management of a Machine-Tool Plant—II. Machy. (Lond.), vol. 14, no. 353, July 3, 1919, pp. 408-411, 10 figs. Work of planning department in relation to time study and rate setting in medium-sized plant making single line of machines.

System in the Small Works. Eng. Rev., vol. 32, no. 12, June 16, 1919, pp. 340-341. Points out that general shops need have very little fear of total extinction.

Orders

The Production Planning System of Heald Machine Company, W. S. Pratt. Am. Mach., vol. 51, no. 5, July 31, 1919, pp. 203-208, 9 figs. General system and writing of orders. (First article.)

Payroll Computing

The Periodograph. A Decimal Time-Keeping Machine, J. Y. Hunter. Am. Mach., vol. 51, no. 2, July 10, 1919, pp. 49-54, 20 figs. Division of hour into ten parts for purpose of simplifying work of payroll computer. Manufacturing operations at Periodograph shop.

Periodograph

See Payroll Computing.

Planning Department

The Planning Department in Scientific Management—II, James F. Whiteford. Eng. & Indus. Management, vol. 1 & 2, no. 26 & 1, June 26 and July 3, 1919, pp. 632-636 and 23-24. Discussion following reading of paper of that title read before Indus. Reconstruction Council.

Plant Construction

Planning the Industrial Plant—II, Hugh M. Wharton. Indus. Management, vol. 58, no. 1, July 1919, pp. 47-50, 11 figs. Application for standard types of construction. (To be continued.)

Plant Layout

Doubles Steelmaking Capacity, G. H. Manlove. Iron Trade Rev., vol. 65, no. 2, July 10, 1919, pp. 87-95, 13 figs. Works of Inland Steel Co., with reference especially to mill equipment and layout for routing of material.

Planning a Progress Department.—III, W. J. Hiscox. Eng. & Indus. Management, vol. 1, no. 20, June 26, 1919, pp. 621-622, 3 figs. Suggestions in regard to selecting location so as to permit efficient handling of materials and to prevent confusion and overlapping.

Production

Increase Production to Reduce Prices. Contract Record, vol. 33, no. 30, July 23, 1919, pp. 713-715. Greater physical production considered as only solution of present industrial difficulties.

Rate Setting

Time Study and Rate Setting in a Machine Tool Plant, Erik Oberg. Machinery, vol. 25, no. 11, July 1919, pp. 1051-1055, 8 figs. System consists of determining, by actual experiments or performance of work in shop, accurate estimate of time in which it can be done. Bonus time is a certain amount less than "standard" time so determined.

Rating Workers

Dangers in Rating Employes, Roy Willmarth Kelly. Indus. Management, vol. 58, no. 1, July 1919, pp. 35-42, 13 figs. Methods used by representative American firms in rating workers for salary advances and promotions. It is recommended that rating divisions be few and questions to be answered precise.

Scientific Management

Scientific Management (Wissenschaftliche Betriebführung), Victor Frey. Schweizerische Bauzeitung, vol. 73, no. 21, May 24, 1919, pp. 237-240. With reference to systems of Taylor, Gilbreth-Ross and Gantt.

Shop Committees

Shop Committees as Lubricants in Management, William Leavitt Stoddard. Factory, vol. 23, no. 1, July 1919, pp. 37-40, 2 figs. System of representation ordered by War Labor Board at Lynn works of General Electric Co. following strike of workers during June-July 1918.

Representative Shop Committees, Willard G. Aborn and William L. Shafer. Indus. Management, vol. 58, no. 1, July 1919, pp. 29-32. Discusses basis of representation, method of election, election procedure, eligibility requirements, committee procedure, relations with labor unions and personnel of shop committees.

How Far Should Shop Committees Go? William Leavitt Stoddard. Indus. Management, vol. 58, no. 2, Aug. 1919, pp. 121-123. Observes that spirit of compromise must prevail else no good can be accomplished.

Small Shop

See Management Methods.

Symbolization, Mnemonic

Factory "Nicknames" That Save Time, Henry H. Farquhar. Factory, vol. 23, no. 1, July 1919, pp. 50-53. Basis of mnemonic symbolization.

Taylor System

An Object Lesson in Efficiency, Wilfred Lewis. Eng. & Indus. Management, vol. 1, no. 19, June 19, 1919, pp. 594-596. Illustration of what has been accomplished along lines laid down by F. W. Taylor by the Tabor Mfg. Co.

Tool Stores

The Model Tool Stores—II & III, Herbert C. Armitage. Eng. & Indus. Management, vol. 1 & 2, no. 20 & 2, June 26 & July 10, 1919, pp. 615-617 and 35-37, 8 figs. Their functions as independent stores investigated chiefly in regard to maintenance of effective stocks of all wearing tools. Arrangement, organization, construction and equipment. (Continuation of serial.)

Wage Systems

My Objection to the Piece Rate Method of Wage Payment—II, Harrington Emerson. Indus. Management, vol. 58, no. 1, July 1919, pp. 17-20. Lays down physiological laws of work, and discusses manner of estimating task and preparing standard schedule.

See also Bonus Systems, Rate Setting.

Welfare Buildings

Design and Construction of Factories—17, Arthur F. Wickenden. Eng. & Indus. Management, vol. 1, no. 20, June 26, 1919, pp. 618-619. Welfare buildings.

Welfare Work

Coöperation Between Management and Employes, E. O. Davis. Textile World Jl., vol. 56, no. 3, July 19, 1919, pp. 49-51, 5 figs. Emphasizes need of welfare and educational work as means of increasing production and improving quality of manufactured products.

Woodworking Industry

See Management Methods.

Work Records

Machine Repair Records, John A. Davenport. Machy., (Lond.), vol. 14, no. 352, June 26, 1919, pp. 365-367, 6 figs. Forms for keeping record of all repair work completed and in progress.

LABOR

Foremen

Who Make the Best Foremen? Factory, vol. 23, no. 1, July 1919, pp. 63-67, 5 figs. Personnel record forms of Service Motor Truck Co.

Great Britain

What I Found the British Employer Thinking About, Samuel Crowther. Factory, vol. 23, no. 1, July 1919, pp. 57-61. Position trade unions held at the beginning of the war; how women workers were affected by close of war.

Royal Commission on Industrial Relations Reports Its Findings on Labor Situation. Contract Rec., vol. 33, no. 28, July 9, 1919, pp. 667-668. Recommends, among other things, establishment by legislation of eight-hour day and recognition of greater rights of workers in control of industry.

Intelligence Tests

Intelligence Tests in Industry, J. P. Lamb. Indus. Management, vol. 58, no. 1, July 1919, pp. 21-23, 1 fig. Experience in industrial plant where such tests have been used for three years believed to indicate advisability of conducting them.

International Labor Standards

Enforcement in U. S. of International Labor Standards, George W. Wickersham. Am. Industries, vol. 19, no. 12, July 1919, pp. 11-16 and p. 42. Conclusion derived by writer from analysis of labor program as outlined in recent conferences in Europe and the U. S. A.

Labor Unrest

Prepare for Labor Unrest While Labor is Content, Harry Tipper. Automotive Indus., vol. 41, no. 2, July 10, 1919, pp. 77-79. Points out that even during prosperity and industrial peace and contentment radicals never let their printing presses or propaganda machine lie idle.

Living Conditions

Making the Workman's Dollar Bigger, Emerson P. Harris. Indus. Management, vol. 58, no. 2, Aug. 1919, pp. 111-112. By insuring economy and real competition in the purveying of household supplies.

Profit Sharing

Fallacy of the Employees' Profit-Sharing as a Reward for Labor, P. L. Burkhard. Indus. Management, vol. 58, no. 1, July 1919, pp. 42-45. It is emphasized as fundamental fact that no profit-sharing scheme can be substituted for a proper wage-payment system whereby adequate wages are paid to workers. It is pointed out that profit sharing must always be secondary to a fair, suitable reward for labor.

Women

Women's Work in Engineering and Shipbuilding During the War, Lady Parsons. Engineering, vol. 108, no. 2793, July 11, 1919, p. 62. Statistical data obtained from report of War Cabinet Committee on Women in Industry. Paper read before North-East Coast Inst. of Engrs. and Shipbuilders.

Women in Industry (Die weibliche Hilfskraft im Fabrikbetriebe), Karl Beneke. Dinglers polytechnisches Journal, vol. 334, no. 1, Jan. 11, 1919, pp. 4-6, 3 figs. Writer believes that when properly selected, the number of women suitable for ordinary factory work will be found larger than generally supposed. He also considers training course, as introduced by many large plants in Germany, as best method for selection.

LEGAL

Accident Legislation

Legislation and the Coal Trade, E. T. Good. Eng. & Indus. Management, vol. 2, no. 2, July 10, 1919, pp. 56-57. How accidents have been reduced.

Dependency

The Riddle of Dependency—II & III, Chesla C. Sherlock. Am. Mach., vol. 51, no. 1 & 2, July 3 & 10, 1919, pp. 10-12 and 70-72. Effects of desertion, bigamy, divorce and common-law marriages on the making of compensation awards. Question of disposing of compensation in case of death of workman's widow.

Disease and Accident Liability

Disease and Accident Liability, Chesla C Sherlock. Iron Trade Rev., vol. 65, no. 3, July 17, 1919, pp. 168-169. It is noted that courts hold employer must pay damages when disease results from injury and when injury hastens fatal consequence of disease.

Explosion of Chemicals

The Explosion of Chemicals—I, Common Law Liability, Chesla C. Sherlock. Chem. & Metallurgical Eng., vol. 21, no. 2, July 15, 1919, pp. 83-84. With reference to court decisions bearing on the subject.

RECONSTRUCTION

Reconstruction Problems, F. R. Todd. Gas Engine, vol. 21, no. 7, July 1919, pp. 213-216. Expresses optimism in viewing readjustment during period of reconstruction.

The Industrial Situation, E. Garcke. Eng. Rev., vol. 32, no. 12, June 16, 1919, pp. 337-339. Pleads for readjustment of economic system in order to repair ravages of war, to inaugurate industrial peace and to prevent famine of capital a few years hence.

Foreign Countries

Readjustment and Reconstruction Activities in Foreign Countries, Grosvenor B. Clarkson. U. S. Council of Nat. Defense, Reconstruction Research Division, Washington, D. C., May 1, 1919, 188 pp. Extracts from and digests of articles concerning readjustment and reconstruction activities in foreign countries, which have appeared in recent publications. Material selected consists of accounts of governmental activities in organization and administration of readjustment and reconstruction work, and

of similar activities of important national industrial, commercial, and welfare organizations.

Great Britain

British Engineers' Reconstruction Problems. E. J. Elford. Good Roads, vol. 56, no. 3, July 16, 1919, pp. 23-35. Development of labor-saving machinery and methods of dealing with labor situation considered as chief problem of municipal engineers. Paper prepared for meeting of Instn. of Mun. & County Engrs.

International Competition

Applying Industrial Efficiency to Readjustment, Charles E. Bedaux. Am. Contractor, vol. 40, no. 29, July 19, 1919, pp. 21-22. Forecasts that future competition will require at least 33 per cent reduction in production costs to meet foreign labor costs.

Machine-Tool Reappraisal

How War Department Will Revalue Used Machine Tools. Automotive Indus., vol. 41, no. 2, July 10, 1919, p. 67, 2 figs. Chart for use in appraisal of standard machine tools to determine service value.

Markets

Principle for Stabilizing Prosperity, G. Sumner Small. Indus. Management, vol. 58, no. 1, July 1919, pp. 24-28. Suggests utilization of reserve purchasing power of Government to sustain market, providing employment for idle labor on government work, and equalizing rate of purchase of materials with rate of consumption through governmental regulations.

SAFETY ENGINEERING

Acetylene Apparatus Explosions

Explosions in Acetylene Apparatus (Explosionen von Acetylen-Apparaten). Acetylen in Wissenschaft und Industrie, vol. 22, nos. 1-2, Jan. 1919, pp. 4-5. New regulations for cleaning and handling apparatus.

Apparatus Failure

Accidents Due to Structural Defects of Apparatus or Injury to Apparatus, D. Dale Logan. Iron & Coal Trades Rev., vol. 98, no. 2677, June 20, 1919, pp. 850-851. Details of two fatal accidents which happened during rescue operations in France. Paper read before Instn. of Mining Engrs.

Breathing Apparatus

Development and Improvement of Breathing Apparatus, H. H. Sanderson. Can. Min. Inst. Bul., no. 87, July 1919, pp. 730-736. Particularly Gibbs and Paul apparatus.

Electrical Apparatus

Safety Rules for Men Handling Electrical Circuits or Apparatus. General Elec. Rev., vol. 22, no. 6, June 1919, pp. 484-486. Based on experience acquired in electrical field by General Electric Co.

Gas Poisoning

Protection Afforded by Army Gas Masks Against Various Industrial Gases, A. C. Fieldner, M. C. Teague and J. H. Yoe. Jl. Indus. & Eng. Chem., vol. 11, no. 7, July 1, 1919, pp. 622-623. Results of tests against various gases.

Kerosene-Lamp Explosions

Kerosene Lamp Explosions, C. E. Worthington. Safety Eng., vol. 38, no. 1, July 1919, pp. 1-13, 9 figs. Lamp explosions are believed to be more properly termed flares. Conclusions are derived in regard to causes producing such explosions and remedies are suggested.

National Electric Safety Code

Is the National Electric Safety Code Suitable for California? Edward B. Rosa. Jl. of Electricity, vol. 43, no. 2, July 15, 1919, pp. 57-59. Standpoint of Bur. of Standards in regard to safety code and institution of code of ethics.

The National Electrical Safety Code, Geo. E. Quinan. Jl. of Electricity, vol. 43, no. 2, July 15, 1919, pp. 54-57. Discussion of problems, aims and the building up of present national code. Paper read before joint meeting of Am. Inst. Elec. Engrs. and Nat. Elec. Light Assn.

Safeguards

Industrial Safety—I, R. J. Young. Power Plant Eng., vol. 23, no. 15, August 1, 1919, pp. 689-690, 1 fig. Design and construction of safeguards. Lecture delivered before Schools for Safety Engr. conducted by Nat. Safety Council.

Safety-First Instructions

Safety First Instruction Through Moving Pictures, Ernest A. Dench. Jl. Electricity, vol. 43, no. 1, July 1, 1919, pp. 15-16. Pictures available and how to obtain them.

Sprinkler Protection

Automatic Sprinkler Protection a Necessity, C. G. Sherman. Contract Rec., vol. 33, no. 27, July 2, 1919, pp. 644-646. Claims that sprinklers have been proved 95 per cent efficient and that consequently they give a guarantee against fire loss that is needed when wastage is so high.

SALVAGE

Warring on Waste—XIII, Johnson Heywood. Factory, vol. 23, no. 1, July 1919, pp. 44-47, 2 figs. Instances showing how material has been saved in factories.

TRANSPORTATION

Industrial Electric Trucks

Use of Industrial Electric Trucks and Tractors by Railroads, Bernard J. Dillon. Elec. Rev., vol. 74, no. 26, June 28, 1919, pp. 1069-1073, 5 figs. Methods of application in handling of freight and baggage.

Motor Transportation

Motor Transportation, J. M. Ritchie. Jl. Engrs. Club of Philadelphia, vol. 36, no. 176, July 1919, pp. 281-282. Its relation to national highway development.

Hauling Over the Highways with Motor Trucks. Good Roads, vol. 18, no. 4, July 23, 1919, pp. 46-49, 14 figs. Examples of services performed by motor vehicles in rural motor express and intercity hauling. Cost data.

Rail and Truck Transportation Compared

The Relative Economy of Freight Transport by Railway and by Motor Truck, Charles Whiting Baker. Eng. News-Rec., vol. 83, no. 2, July 10, 1919, pp. 52-67. Based on figures compiled by Motor Truck Assn. of America and statistical data of railway companies having freight traffic less than 20,000 ton-miles per annum per mile of line.

Refuse Collection

Cost of Motor Truck Operation for Refuse Collection. Eng. & Contracting, vol. 52, no. 1, July 2, 1919, pp. 11-13. Data given by Rochester Bur. of Municipal Research.

Trailers

Trailers and Trucks for Highway Hauling, Harry Wilkin Perry. Good Roads, vol. 18, no. 4, July 23, 1919, pp. 41-44, 7 figs. How trailer solves special hauling problems, reduces road repair and maintenance costs and cuts down cost of highway transportation.

EXPORT

China

International Engineering Interests in China. Eng., vol. 108, no. 2792, July 4, 1919, pp. 827-829. Advocates reconstruction scheme which should include international supervision of all new loan expenditures and loan allotment and creation of an international railway service, which should control all railway policy.

See also Machine Tools in China.

Electrical Products

Export Conditions for Electrical Products. Elec. World, vol. 74, no. 2, July 12, 1919, pp. 64-65. Summary of information on South American countries emphasizes element of financing sales of manufactured materials for public-utility use and water-power possibilities.

Home Markets

The Future of Industry, F. J. Whiting. Stone & Webster Jl., vol. 24, no. 6, June 1919, pp. 474-484. Considerations on saturation of home markets in the face of present prospects of enlarging our foreign trade.

Internal-Combustion Engines

Where is the Foreign Market for Internal Combustion Engines, Lynn W. Meekins. Gas Engine, vol. 21, no. 8, August 1919, pp. 249-252. Possibilities of exporting internal-combustion engines. Paper read before Nat. Gas Engine Assn.

Latin America, Rolling Stock

Entering the Latin American Markets, Percy F. Martin. Eng. & Indus. Management, vol. 1 (New Series), no. 20, June 26, 1919, pp. 628 and 630. Opportunities for manufacture of rolling stock.

Machine Tools in China

The Machine Shops of China, Frank A. Foster. Am. Mach., vol. 51, no. 3, July 17, 1919, pp. 99-103, 12 figs. Opportunities of American machine-tool builder.

Electrical Engineering

ELECTROCHEMISTRY

Bleaching, Electrolytic

Electrolytic Bleach, Anson G. Betts. Paper, vol. 24, no. 18, July 9, 1919, pp. 15-16. Technical details of operation in electrolytic bleach plants.

ELECTRODEPOSITION

Electrochemical Industry

Utilization of Electrical Energy in Electrochemical and Electrometallurgical Industry (Consommation d'énergie électrique dans la fabrication de divers produits de l'électrochimie et de l'électrométallurgie), Revue Générale de l'Electricité, vol. 5, no. 26, June 28, 1919, pp. 913-923. Figures indicating kilowatts consumed in electrolytical processes.

ELECTROPHYSICS

Alternating-Current Circuits

Calculation of Alternating Current Circuits, Terrell Croft. Nat. Engr., vol. 23, no. 7, July 1919, pp. 338-342, 10 figs. Graphic method of computing wire sizes with Mershon diagram for two- and three-phase circuits. (Continuation of serial.)

Audion

See Vacuum Valve.

Cables, Heating of

Heating of Underground Cables, A. L. Freret. Jl. Engrs., Club of Philadelphia, vol. 36, no. 177, August 1919, pp. 301-303, 4 figs. Experiments to determine safe operating intermittent loads on underground cables.

Circuit Breakers

Calculation of Current Intensity Required to Operate a Circuit Breaker and Study of the Effects of a Short-Circuit (Calcul de l'intensité de déclanchement d'un disjoncteur et recherche d'un court-circuit), B. Guerschinovitch. Industrie Electrique, vol. 28, no. 648, June 25, 1919, pp. 224-227, 3 figs. Application of previously derived formula to various examples. (Concluded.)

Electromagnetic Waves

Electromagnetic Waves, T. J. I. Bromwich. Lond., Edinburgh, and Dublin Phil. Mag., vol. 38, no. 223, July 1919, pp. 143-164. General solution of electromagnetic equations of wave propagation.

The Production and Measurement of Short Continuous Electromagnetic Waves, Balth. van der Pol. Lond., Edinburgh, and Dublin Phil. Mag., vol. 38, no. 223, July 1919, pp. 90-97, 4 figs. By means of three-electrode thermionic tube with suitable circuits.

Gyro Compass

The Electrical Gyro Compass, O. B. Whittaker. Elec. Rev., vol. 74, no. 26, June 28, 1919, pp. 1078-1081, 7 figs. Principle upon which it operates is said to be a combination of laws of gravity and of rotation of the earth and the two characteristics of the gyroscope. Lecture delivered before Am. Soc. Mech. Inspectors.

Inductances

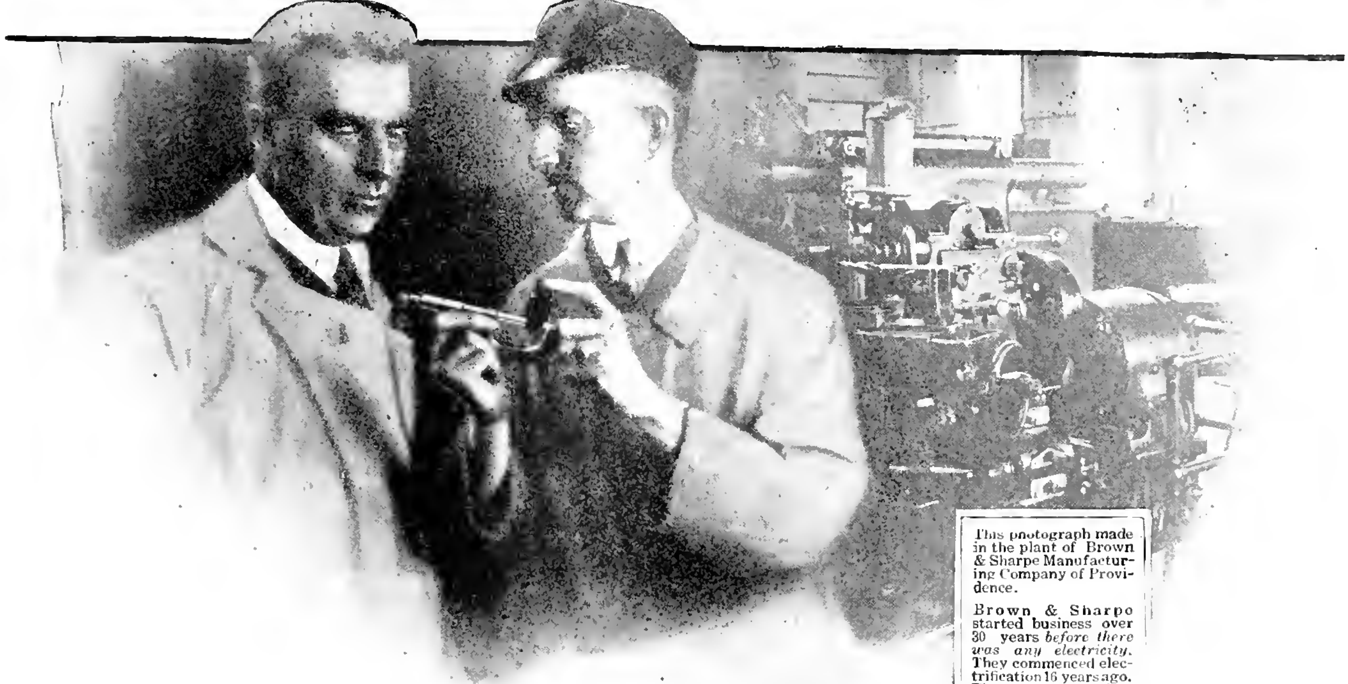
Calculating Growth of Current in an Inductance, Carl Hering. Elec. World, vol. 74, no. 4, July 26, 1919, p. 75. Method offered for simplifying computations when plotting curves showing rise in current in induction coils.

Simplified Inductance Calculations, with Special Reference to Thick Coils, Philip R. Coursey. Phys. Soc. of London, vol. 31, no. 4, June 15, 1919, pp. 155-167, 8 figs. Method based on extension of Nagaoka's formula for single-layer coils, to include as well all ordinary forms of thick coils. Rosa's formula for thick coils is put into the same form as Nagaoka's and by it a series of correction factors is calculated for various coil thicknesses.

Kenotron

Thermoelectric Emission and Its Applications: The Kenotron (L'émission thermo-électrique et ses applications: Le kénotron), G. Johannès. Revue Génerale de l'Electricité, vol. 5, no. 24, June 14, 1919, pp. 857-864, 5 figs. Technical study of rectifiers operating by electronic discharges. (To be continued.)

The wide use of General Electric Motors—precision instruments themselves—has helped make "American standardization" an example of efficiency for the whole world.



This photograph made in the plant of Brown & Sharpe Manufacturing Company of Providence.

Brown & Sharpe started business over 30 years *before there was any electricity.* They commenced electrification 16 years ago. Three years ago electrification was completed—with 90% of all the power applied *through G-E motors.* G-E Motor Equipment is also standard on the machine tools Brown & Sharpe manufacture.

Accuracy—
an American characteristic

ACCURACY finds its highest expression in what the world calls *American Standardization.*

It is attained by the accuracy of the men and tools which produce it.

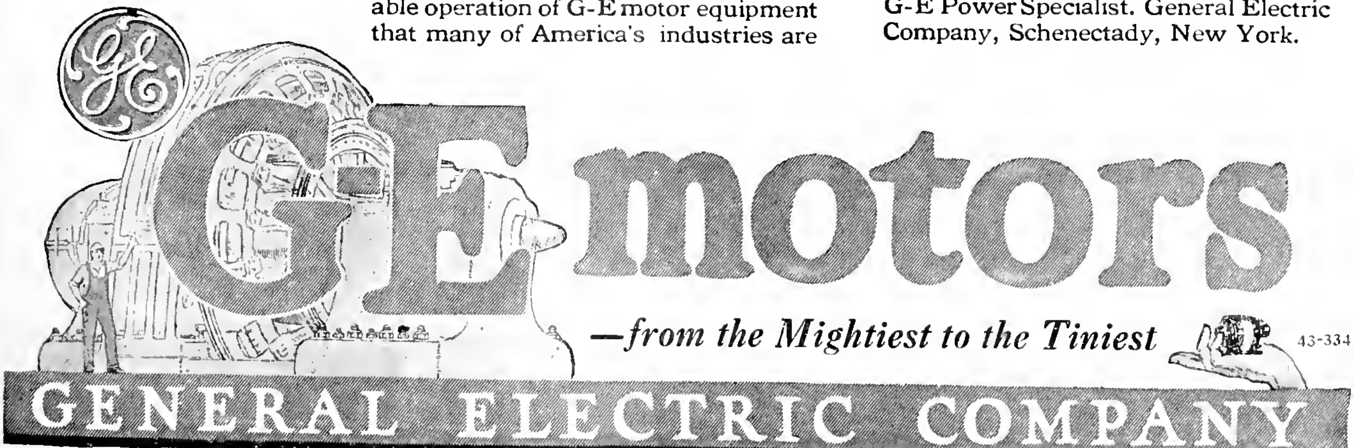
The highest accuracy in men and tools depends a good deal on the way power is applied and *controlled.*

And it is much because of the dependable operation of G-E motor equipment that many of America's industries are achieving fame for accuracy, efficiency and quality.

Accuracy is the element that makes watches "keep time"; makes automobiles save "gas"; makes cooking a science. Accuracy determines efficiency. Accuracy, plus speed, does America's work

To get accuracy and its by-products—dependability and efficiency—call in a G-E Power Specialist. General Electric Company, Schenectady, New York.

*Look for it—
the mark of leadership in electrical development and manufacture*



Nitrogen Electrode

The Potential of a Nitrogen Electrode, Francis Lawry Usher and Ramavenkatasubbier Venkateswaran. Jl. Chem. Soc., vol. 115 & 116, no. 680, June 1919, pp. 613-618, 1 fig. Evidence in support of assertion that during electrolysis of acid solution substance set free at anode is active form of ordinary nitrogen.

Power Flow

The Flow of Power in Electrical Machines, J. Slepian. Elec. Jl., vol. 16, no. 7, July 1919, pp. 303-311, 23 figs. Definitions and properties of Poynting vector and illustration of its application for picturing power flow in reactor, transformer, direct-current generator, alternator, synchronous condenser and induction motor.

Spark Potential

Influence of a Transverse Magnetic Field on the Spark Potential (Ueber die Beeinflussung des Funkenpotentials durch ein transversales Magnetfeld), Edgar Meyer. Annalen der Physik, vol. 58, no. 4, 1919, pp. 297-332, 10 figs. Theory of influence of magnetic field. Dependence from cross-section of spark gap.

Thermionic and Photo-Electric Phenomena at the Lowest Obtainable Pressure, C. F Hagenow. Physical Rev., vol. 13, no. 6, June 1919, pp. 415-433, 5 figs. Studied specially after illuminated plate had been denuded of occluded gases by continued electric bombardment.

Thermoelectric Equations

The Thermoelectric Equation $P = TdV/dT$ Once More, Edwin H. Hall. Proc. Nat. Acad. Sciences, vol. 5, no. 6, June 15, 1919, pp. 197-198. Questions validity of equation as commonly understood, P being taken as ordinary Peltier effect, and V the Volta effect between any two metals.

Three-Electrode Lamp

Maintenance of Mechanical Oscillations by Means of Three-Electrode Lamp (Sur l'entretien des oscillations mécaniques au moyen des lampes à trois électrodes), Henri Abraham and Eugéne Bloch. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 24, June 16, 1919, pp. 1197-1198. Based on property of audions which permits introducing in electrical circuit an inductive resistance.

Vacuum Valves

Maintaining Electrical Oscillations by Means of a Three-electrode Valve (Entretien des oscillations électriques par une lampe-valve à trois électrodes), G. Gutton. Revue Générale de l'Electricité, vol. 6, no. 1, July 5, 1919, pp. 14-24, 10 figs. Scheme developed by the division of military radiotelegraphy of the French army for the purpose of maintaining oscillations of antennæ. A suggested theory of phenomenon involved is presented. (Properties of valves were treated in R.G.E., April 26, 1919, p. 629.)

The Audion as a Circuit Element, H. W. Nichols. Physical Rev., vol. 13, no. 6, June 1919, pp. 404-414, 5 figs. Functional equations for three-element audion used to deduce actions taking place in any circuit containing the audion.

The Theory of Valve Rectification, W. S. Barrell. Wireless World, vol. 7, no. 76, July 1919, pp. 181-186, 6 figs. Outlines elementary theory of thermionic valve in its application to (1) two-electrode or Fleming valve, and (2) three-electrode valve. (To be continued.)

FURNACES

Bailey Furnace

Electric Furnace Progress, L. F. Bailey. Metal Indus., vol. 17, no. 7, July 1919, pp. 316-317, 2 figs. Bailey furnace.

Booth-Hall

The Booth-Hall Electric Furnace, W. K. Booth. Foundry Trade Jl., vol. 21, no. 209, May 1919, pp. 301-302, 4 figs. Vertical-arc type with conducting hearth.

Brass Furnace

Utilization of Electric Brass Furnaces, H. W. Gillett. Jl. Indus. & Eng. Chem., vol. 11, no. 7, July 1, 1919, pp. 664-668. Development and growth of electric brass furnace applications, and table giving performance of various types of electric brass furnaces.

Design

See Requirements.

Great Britain

Electric Furnaces in the United Kingdom, 1918, R. G. Mercer. Foundry Trade Jl., vol. 21, no. 209, May 1919, pp. 295-301. Elecn. vol. 82, no. 25, June 20, 1919, pp. 694-695. Figures quoted indicate that there are installed or being installed 142 electric furnaces with a total capacity of 112,000 kva. Of these, 117 are electric steel furnaces.

Metal-Melting Furnaces

Application of Electrical Energy to the Melting of Metals, H. A. Greaves. Engineering, vol. 108, no. 2793, July 11, 1919, pp. 42-43, 8 figs. Suggested connections to enable three-phase or two-phase current to be applied to furnace with an unequal resistance in one of the phases and still maintain balance load as regards both power and power factor on primary phases. Paper read at joint meeting of Instn. of Elec. Engrs. and Iron and Steel Inst.

Moffat Steel Furnace

The New Moffat Electric Steel Furnace, W. F. Sutherland. Can. Machy., vol. 22, no. 4, July 24, 1919, pp. 69-70, 3 figs. Designed, it is said, to overcome troubles frequently encountered by reason of crescent-shaped masses of partially fused raw material found clinging to walls between electrodes. This is claimed to have been accomplished by shaping body to conform to lines of current flow in bath of molten metal.

Morgan Crucibles

Electric Furnace Developments for Non-Ferrous Metals. Metal Industry, vol. 14, no. 22, May 30, 1919, pp. 444-447, 6 figs. Morgan crucibles. New feature said to be that crucible is container and also conductor to be heated.

Records

Operating Records of Electric Steel Furnaces. Elec. World, vol. 74, no. 3, July 19, 1919, pp. 125-127, 2 figs. Characteristics, 1918 energy consumption, maximum demand and steel output of eighteen arc-type furnaces in Milwaukee district, with experience of some users in operating them.

Requirements

Large Electric Steel-Melting Furnaces, Victor Stobie. Foundry Trade Jl., vol. 21, no. 209, May 1919, pp. 304-311, 8 figs. Technical requirements formulated from experiments and observations.

Developments in Electric Iron and Steel Furnaces, J. Birby. Foundry Trade Jl., vol. 21, no. 209, May 1919, pp. 311-323, 24 figs. Urges that engineers designing electric furnaces for use in manufacture of iron and steel fully grasp requirements of metallurgists and be fully acquainted with working conditions of blast furnaces and with steel foundries.

Sahlin Furnace

A New Type of Electric Furnace, Axel Sahlin. Foundry Trade Jl., vol. 21, no. 209, May 1919, pp. 302-304, 2 figs. Sahlin Furnace. Said to have been designed with a view to embodying advantages of both the direct-arc and the free-burning arc furnaces, at the same time avoiding as far as possible the disadvantages of both. Built as circular ladle with contracted top and dished bottom.

Steel Making

Electric Furnaces in Steel Making, Victor Stobie. Jl. of West of Scotland Iron & Steel Inst., vol. 26, no. 7, Mar. 1919, pp. 90-94 and (discussion) pp. 94-103, 9 figs. on 4 supp. plates. Claims following improvements for thorough sealing up of furnace roof: (1) no cold air is drawn into furnace; (2) no flames or highly heated air burn away the electrodes above roof; (3) electrodes can be of smaller diameter for a given current supply. Also other economic advantages and conveniences in manufacture of various alloys.

Temperature Regulation

A Furnace Temperature Regulator, Walter P. White and Leason H. Adams. Physical Rev., vol. 14, no. 1, July 1919, pp. 44-48, 1 fig. By making heating coil of an electric furnace one arm of a wheatstone bridge and combining this with galvanometer regulator, thus keeping resistance of coil constant, writers assert it is possible, regardless of variations in current supply, and with no attention, to maintain constant temperature of furnace not too directly influenced by temperature of room.

Automatic Temperature Control. Automotive Indus., vol. 41, no. 3, July 17, 1919, pp. 118-119, 2 figs. Thermo-couple of nickel-chromium alloy installed in electric furnace actuates high tension millivoltmeter; arm depressor depresses pointer at regular time intervals and in doing so pointer forces two contact pieces carried by table.

GENERATING STATIONS

Buenos Aires

New Generating and Distributing Electrical Installations of Buenos Aires (Les nouvelles installations de production et de distribution d'électricité de Buenos Aires), Bulletin Technique de la Suisse Romande, vol. 45, no. 11, May 31, 1919, pp. 97-99, 3 figs. Sub-stations where alternating current is transformed into direct current. (Concluded.)

Busbar, Emergency

New Emergency Bus Feature in Brantford Hydro-Electric Station. Elec. News, vol. 28, no. 9, May 1, 1919, pp. 29-30, 3 figs. Scheme contemplates use of double-throw single-pole disconnecting switches, three disconnecting switches being used to each circuit.

Lima

Notes on the Installations of the Associated Electric Enterprises of Lima (Algunas informaciones sobre las instalaciones de las Empresas Electricas Asociadas de Lima), Boletin de Minas, vol. 11, nos. 1-3, March 31, 1919, pp. 32-45. Characteristics of turbine alternators and transformers.

Load Dispatching

Central Station Load Dispatching, P. B. Juhnke. Power Plant Eng., vol. 23, no. 15, August 1, 1919, pp. 661-666, 6 figs. Methods employed to carry load most efficiently and precautions adopted to safeguard workmen.

Load Distribution

Station Load and Economy, Ths. Norberg Schulz. Elecn., vol. 82, no. 25, June 20, 1919, pp. 700-701, 4 figs. Results obtained by studying distribution of load when several machines or stations are working in parallel.

Operation, Combined

Advantages of Combined Operation of Water and Electric Utilities and Selling Electric Current for Private Use in Springfield, Ill., Willis J. Spaulding. Mun & County Eng., vol. 56, no. 6, June 1919, pp. 229-230. Net earnings said to have been over $92,000 for fiscal year ending Feb. 28, 1919.

Overload Protection

Overload Protection for Electric Motors, O. C. Callow. Power, vol. 50, no. 2, July 8, 1919, pp. 60-62, 3 figs. Discusses various types of overload protection for motors, and suggests arrangements to suit special conditions.

Oxygen and Hydrogen Manufacture

Oxygen and Hydrogen—A New Source of Revenue for the Central Station, F. G. Clark. Elec. News, vol. 28, no. 14, July 15, 1919, pp. 30-32, 1 fig. Electrolytic cell suggested as means of smoothing out rough curve of variable load.

Rates

Central Station Rates in Theory and Practice—I, II & III, H. E. Eisenmenger. Elec. Rev., vol. 75, nos. 2, 3 & 4, July 12, 19, and 26, 1919, pp. 47-51, 94-97, and 138-143, 7 figs. General principles by which service costs can be determined. Cost analysis; energy cost and demand cost; load curve and load factor. Capital charges of central stations and how they affect the demand cost.

Rotherham

The New Power Station at Rotherham. Elecn., vol. 82, no. 26, June 27, 1919, pp. 750-760 and vol. 83, no. 1, July 4, 1919, pp. 6-11, 20 figs. June 27: Total generating capacity has increased from 4500 kw. in 1914 to 70,500 at present time. July 4: Switch-gear and accessories; diagram of connection of synchronizing arrangement.

Selection of Electric System

Selection of an Electric System, Terrell Croft. Coal Age, vol. 16, no. 5, July 31, 1919, pp. 178-184, 5 figs. Formulæ and examples of application as applied to electrical problems incident to mine installations are given.

Shanghai

Shanghai Municipal Electricity Undertaking. Elec. Times, vol. 56, no. 1446, July 3, 1919, pp. 3-4, 2 figs. With reference to economical aspect.

Electricity Supply at Shanghai. Electrical Rev., vol. 84, no. 2170, June 27, 1919, pp. 747-749, 5 figs. Turbo-generator installation.

Switzerland

The Massaboden Electric Power Plant (near Brig) of the Swiss State Railroads (Das Elektrizitätswerk Massaboden bei Brig der Schweiz. Bundesbahnen). H. Eggenberger and J. Dänzer. Schweizerische Bauzeitung, vol. 73, no. 24, June 14, pp. 275-278 and vol. 74, no. 1, July 5, 1919, pp. 301-307, 24 figs. June 14: Reservoir holds 8000 cu. m., thus allowing for considerable height of peak loads. Power is transmitted partly by aerial line and partly by underground cable. July 5: Plant has three 3500 hp. double turbines of Francis

Announcement

We are prepared to demonstrate that the Fay Automatic Lathe offers the best known means for performing certain operations on the following automobile, truck, tractor and internal combustion engine parts:

Tractor belt pulleys
Cam shafts
Steering knuckles
Ring bevel gears
Pistons
Transmission Gears
Hubs
Stem pinions, both spur and bevel.

Our practice in machining these parts has been developed by specialized study, experiment and actual experience in the shops of our customers.

The advantages gained relate to labor cost, initial investment, ease of set up and cost of maintenance.

In each case the reasons for superiority are simple and definite, and will be immediately appreciated by the experienced mechanic.

If you are preparing to increase your output of any of the above parts you will find it to your advantage to consult with us.

JONES & LAMSON MACHINE COMPANY

SPRINGFIELD, VERMONT, U. S. A.

109 Queen Victoria Street, London, E. C.

France, Spain and Belgium: F. Auberty & Co., 91 Rue de Maubeuge, Paris
Holland: Spliethoff, Beeuwkes & Co., Rotterdam

SEE OUR DATA IN 1919 A.S.M.E. CONDENSED CATALOGUES OF MECHANICAL EQUIPMENT

type; two of the turbines are coupled with 3300-volt alternator generators; the two sets of transformers consist each of a synchronous motor of 240 hp. and 4000-volt generator.

GENERATORS AND MOTORS

Alternator Characteristics

Experimental Determination of Alternator Characteristics (Méthode d'analyse expérimentale des propriétés des alternateurs), A. Blondel and F. Carbenay. Revue Générale de l'Electricité, vol. 5, no. 24, June 14, 1919, pp. 843-855, 12 figs. Illustrating applications to special cases of methods of analyses described in preceding article. (Concluded.)

Armature Conductors, Current Distribution in

Current Distribution in Armature Conductors, Waldo V. Lyon. Elec. World, vol. 74, no. 2, July 12, 1919, pp. 66-68, 3 figs. Equations are derived showing how alternating current resistance depends upon depth of slot.

Commutator Motors

Graphs of Single-Phase Commutator Motors (Constructions graphiques élémentaires relatives aux moteurs à Collecteur monophasés) Osc. Colard. Société Belge des Électriciens, vol. 33, April-June 1919, pp. 133-145, 5 figs. Based on writer's analytical theory developed in Soc. Belge des Elec., issue Aug. 1906, p. 357.

Mill Motors

A 3000 HP. Mill Motor by the G. E. C. Elecn., vol. 82, no. 25, June 20, 1919, pp. 696-698, 6 figs. Motor is for driving a three-high, non-reversing plate mill and is believed to be the largest non-reversing motor driving a rolling mill in England.

IGNITION APPARATUS

Spark Discharge

Some Characteristics of the Spark Discharge and Its Effect in Igniting Explosive Mixtures, Clifford C. Paterson and Norman Campbell. Phys. Soc. of London, vol. 31, no. 4, June 15, 1919, pp. 168-228, 12 figs. Research to determine relation between electric characteristics of a spark discharge and its power of igniting explosive mixture. Main experiments of ignition of mixtures of petrol and air are described.

LIGHTING AND LAMP MANUFACTURE

Churches

Lighting Installation for a Church Auditorium, H. O. Stewart. Elec. Rev., vol. 75, no. 1, July 5, 1919, pp. 1-3, 5 figs. Indirect lighting with luminous bowl and urn fixtures.

Gases, Residual

Residual Gases and Vapors in Highly Exhausted Glass Bulbs, J. E. Sharder. Physical Rev., vol. 13, no. 6, June 1919, pp. 434-437, 2 figs. Investigation reported to show that vacuum in sealed vessels deteriorates with time, rapidly at first and then more slowly and that subsequent heating even at temperatures lower than the heat treating temperature results in increase of pressure due to further liberation of gases and vapors from glass.

Industrial Lighting

Industrial Lighting, C. E. Clewell. Jl. Franklin Inst., vol. 188, no. 1, July 1919, pp. 51-90, 18 figs. Engineering details of factory lighting and economical advantages derived from efficient illumination of industrial establishments.

Design of Industrial Lighting System, Ward Harrison and H. H. Magdsick. Elec. World, vol. 74, no. 1 and 4, July 5 and 26, 1919, pp. 7-11 and 184-187, 13 figs. July 5: Analysis of deflecting and diffusing units for lighting industrial plants, giving advantages and limitations of each. Data concerning distribution curves, efficiency and mounting heights. July 26: Table giving present intensity standards in industrial lighting and coefficient of utilization.

Inverted Burners

The Regenerative Effect as Influencing Lighting Efficiency of the Inverted Incandescence Burner, J. S. G. Thomas. Jl. Soc. Chem. Indus., vol. 38, no. 12, June 30, 1919, pp. 168T-171T, 3 figs. Concluded from experimental research that efficiency is increased when gaseous mixture of coal gas and primary air is preheated.

Lenses

Luminous Power of Lighthouse Lenses (Studio sulla potenza luminosa delle ottiche dei fari), A. Coacci. Rivista Marittima, vol. 52, no. 5, May 1919, pp. 195-208, 7 figs. Lambert law considered as giving close approximation. Analytical formula offered for what is be-

Motion-Picture Projection

Mazda Lamps for Motion Picture Projection, L. C. Porter. Gen. Elec. Rev., vol. 22, no. 7, July 1919, pp. 556-559, 11 figs. It is reported that lamp wattage has been increased to 900 and a tubular bulb used in place of spherical bulb, for the purpose of adapting Mazda lamps for motion picture projection.

Searchlights

The Development of Anti-Aircraft Searchlights, James B. Cross. Prof. Memoirs, Corps Engrs. U. S. Army & Engr. Dep., vol. 11, no. 56, Mar.-Apr. 1919, pp. 139-149, 6 figs. Types used (1) for seacoast defense, and (2) battlefield illumination.

Street Lighting

Street-Lighting Reconstruction Problems, L. Gaster. Gas Jl., vol. 147, no. 2929, July 1, pp. 29-30. Experiences in London during war.

Wartime

Lighting in Wartime, Preston S. Millar. Jl. Engrs. Club of Philadelphia, vol. 36, no. 176, July 1919, pp. 259-265, 2 figs. Work done by Illuminating Society and Lighting Industry in coöperating with government in promoting industrial production, preventing accidents and saving fuel. Paper presented at joint meeting of Phila. section of Am. Inst. Elec. Engrs. and Illuminating Eng. Soc.

MEASUREMENTS, ELECTRICAL

Asynchronous Machines

New Method for Indirect Testing of Asynchronous Machines (Sur une nouvelle méthode d'essai indirecte des machines asynchrones), J. Le Monnier. Revue Générale de l'Electricité, vol. 6, no. 2, July 12, 1919, pp. 35-40, 6 figs. Method of commuting coefficients necessary for constructing diagram.

Electrodynamometer

An Electrodynamometer Using the Vibration Telescope, Carl Barus. Proc. Nat. Acad. Sciences, vol. 5, no. 6, June 15, 1919, pp. 211-217, 2 figs. Its possible use for finding magnetic field within helix of unknown constants pointed out.

Magnetic Materials, Testing

Rapid Testing of Magnetic Materials, Thomas Spooner. Elec. World, vol. 74, no. 1, July 5, 1919, pp. 4-6, 5 figs. Use of small ring samples and ballistic method of testing.

Meters

Service Tests of Small Capacity Meters, Arthur Horace Bryant. Elec. Rev., vol. 75, no. 4, July 26, 1919, pp. 155-157. Recommends that thorough inspection be made in place of usual 36 months' test and that where inspection raises no question as to accuracy of any given meter, its test be set at 60 months (24 months after inspection.)

Potentiometers

A Rectangular-Component Two-Dimensional Alternating-Current Potentiometer, A. E. Kennelly. Jl. Franklin Inst., vol. 188, no. 1, July 1919, pp. 1-26, 20 figs. Form adapted for telephonic-frequency measurements. Readings are given in two rectangular components of the voltage measured.

Transformers, Instrument

Field Testing of Instrument Transformers — H. H. M. Crothers. Elec. World, vol. 74, no. 3, July 19, 1919, pp. 119-121, 5 figs. Experience with differential methods as applied to voltage and current transformers and to acceptance testing of series transformers for street lighting circuits. Possible simplifications are suggested.

Voltameters

A Note on the Accuracy of Copper Voltameter, J. Obata (in Japanese.) Denki Gakkwai Zasshi, no. 371, June 10, 1919.

POWER APPLICATIONS

Conference Grounds

Electricity at Summer Conference Grounds. Jl. Electricity, vol. 43, no. 1, July 1, 1919, pp. 6-8, 5 figs. Electrical equipment at Y. W. C. A. Conference Grounds.

Heating

High Frequency Induction Heating Today, E. F. Northrup. Chem. Engr., vol. 27, no. 7, July 1919, pp. 167-168 & 171. Recent developments. Paper read before Convention of Am. Inst. of Chem. Engrs.

High Power Factor Induction Heaters, C. Edward Magnusson. Jl. Electricity, vol. 43, no. 1, July 1, 1919, pp. 17-18, 5 figs. Design

Hotels

Electricity in the World's Largest Hotel, Wm. H. Easton. Elec. Jl., vol. 16, no. 7, July 1919, pp. 288-294, 18 figs. Pennsylvania Hotel, New York City. Distributing system divided into two separate parts; (1) direct current system for motors driving elevators, ventilating fans, and other machinery requiring speed control, and (2) alternating current for lighting, cooking and miscellaneous applications.

Sugar (Beet) Factories

Electricity in Beet Sugar Factories, Joseph P. Collopy. Elec. World, vol. 74, no. 4, July 26, 1919, pp. 178-181, 3 figs. Consideration of manufacturing process in its relation to load characteristics and some suggestions on the choice of electrical equipment.

Textile Mills

Canadian Textile Mill Operated by Central-Station Service, V. K. Stafford. Elec. Rev., vol. 75, no. 4, July 26, 1919, pp. 135-137, 7 figs. Remote control and other features of motor service.

STANDARDS

Generators for Electrotyping

Standardization of Generators for Electrotyping, Floyd T. Taylor. Metal Indus., vol. 17, no. 7, July 1919, pp. 323-325, 4 figs. Suggestion in regard to selecting standard.

Polyphase Currents

Two Suggestions to the International Electric Committee (Deux propositions au comité électrotechnique international), E. Pierard. Société Belge des Électriciens, vol. 33, April-June, 1919, pp. 146-151, 3 figs. With reference to a general formula for determining polyphase currents and a symbol for weakening of transmission in long lines.

Transformers

Standardization of Transformers in Germany (Erläuterungen zu den Normen für Einheitstransformatoren), G. Stern. Elektrotechnische Zeitschrift, vol. 40, no. 3, Jan. 16, 1919, pp. 33-34. Rules for constructing transformers with aluminum windings, issued by German Standardization Committee. Capacities, voltages, percentage of short-circuit voltages, temperature rise, overload capacity, and structural data are laid down.

STORAGE BATTERIES

Efficiency

On the Efficiency of Storage Batteries, K. Kimura. (In Japanese.) Denki Gakkwai Zasshi, no. 371, June 10, 1919.

TELEGRAPHY AND TELEPHONY

Antenna

Radio Transmission Formulas for Antenna and Coil Aerials, J. H. Dellinger. Jl. Franklin Inst., vol. 188, no. 1, July 1919, pp. 95-96. Derived from electromagnetic theory.

Baudot Quadruplex

Italian Submarine Cables Operated by Quadruplex Baudot (Le baudot quadruple sur les cables sous-marins Italiens), M. Cesare Albanese. Annales des Postes, Télégraphes et Téléphones, vol. 8, no. 2, June 1919, pp. 228-238, 6 figs. Scheme of arrangement and account of tests performed.

Direction Finders

Aircraft Radio Direction Finding Equipment Developed by the Navy Department, Edgar H. Felix. Aerial Age, vol. 9, no. 13, July 14, 1919, pp. 852-855, 4 figs. Designed by Bur. of Steam Eng., Navy Dept.

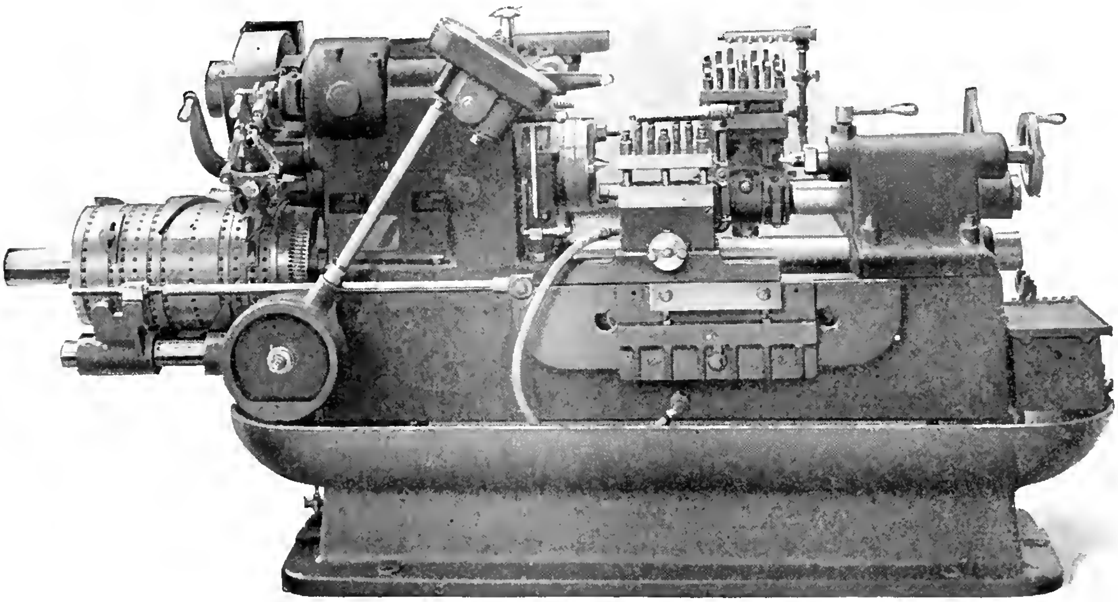
Multiplex Operation

High Frequency Currents on Wires, J. O. Mauborgne. Jl. Franklin Inst., vol. 188, no. 1, July 1919, pp. 91-93. Experiments undertaken to examine possibility of adapting existing types of radio-telephone and telegraphic apparatus to multiplex operation.

Perforators, Keyboard

The Story of the Keyboard Perforator, H. H. Harrison. Instn. Post Office Elec. Engrs., no. 71, January 8, 1917, 40 pp., 18 figs. Varieties in design occurring in respect to (1) selection from a gang assembly of punches corresponding to character key operated, (2) propulsion of punches through paper and their retraction to normal, and (3) feed forward of paper by amount in accordance with length of letter plus space element, these three conditions being quoted as essential in constructing an au-

The Fay Automatic Lathe



An automatic machine for simultaneous turning, facing and shouldering cuts on bar stock and centered forgings, such as pinion shafts, steering knuckles, cam shafts, etc.

An automatie machine for second operations on work held on centered arbors, such as spur and bevel gear blanks, hubs, pulleys, etc.

Designed with strength and driving power to carry all the tools, speed, and feed the work will stand under balanced cuts.

Jones & Lamson Machine Company

SPRINGFIELD, VERMONT, U. S. A.

France, Spain and Belgium: F. Auberty & Co., 91 Rue de Maubeuge, Paris
Holland: Spliethoff, Beeuwkes & Co., Rotterdam

SEE OUR DATA IN 1918 A.S.M.E. CONDENSED CATALOGUES OF MECHANICAL EQUIPMENT

Photographs

The Electrical Transmission of Photographs. Marcus J. Martin. Model Engr. & Elecn., vol. 41, no. 949, July 3, 1919, pp. 13-17, 5 figs. Historical account of work done by various experimenters. (To be continued.)

Pupinization

Effect of Pupinization of Short Telephone Lines (Wirksamkeit der Pupinisierung kurzer Fernsprechleitungen), Ludwig Schultheiss Telegraphen-u. Fernsprech-Technik, vol. 7, no. 21-22, Feb. 15, 1919, pp. 81-83, 1 fig. Tables showing results of tests. (Concluded.)

Relays

The Oscillatory Valve Relay: A Thermionic Trigger Device, L. B. Turner. Elecn., vol. 83, no. 2147 and 2148, July 4 and 11, 1919, pp. 4-5 and 34-35, and (discussion) pp. 35-36, 9 figs. July 4: Distinguishes between relays and amplifiers and explains operation of triode. July 11: Analysis is made of sensitivity and selectivity of the tuned high-frequency valve relay and general limitations on sensitivity and speed of working are discussed.

Static Interference

See Weagant Static Prevention.

Telephones, Automatic

The Western Electric Company's Automatic Telephone System, B. O. Anson. Instn. Post Office Elec. Engrs., no. 72, Dec. 4, 1916, 62 pp., 22 figs., partly on supp. plate. Including enumeration of requirements writer considers as essential to a mechanical switching system.

Telephone, Wireless

Wireless Telephone Transmitter for Seaplanes. Telegraph & Telephone Age, no. 14, July 16, 1919, pp. 342-346, 4 figs. Marconi type S. E. 1100 set.

Field Wireless Telephony and Direction-Finding. Wireless World, vol. 7, no. 76, July 1919, pp. 199-205, 7 figs. Account of demonstration.

Wireless Telephony and Directional Wireless. Aeronautics, vol. 16, no. 294, June 5, 1919, pp. 586-588, 2 figs. Features for military and commercial purposes. (Continued.)

Radio Transmitting Sets on the NC Type Seaplanes. Telegraph and Telephone Age, no. 13, July 1, 1919, pp. 330-331, 2 figs. Diagram showing connections and arrangement.

Telephony, Secret

Secret Telephony (Procédé de téléphone secrete), M. Poirson. Annales des Postes, Télégraphes et Téléphones, vol. 8, no. 2, June 1919, pp. 239-248, 5 figs. Periodic inversion of currents (without superposition of external current) at starting point and their rectification at receiving point. Scheme evolved by Service d'Etudes des Postes et Télégraphes of France.

Weagant Static Prevention

The Weagant "X-Stopper." Wireless World, vol. 7, no. 76, July 1919, pp. 209-211, 5 figs. Diagrammatic exposition of necessity for spacing two loop aerials comprising this type of receiver. (Concluded.)

TRANSFORMERS, CONVERTERS, FREQUENCY CHANGERS

Converters, Rotary

Pulsation of the D.C. Terminal Voltage in Rotary Converters, J. K. Kostko. Elecn., vol. 83, no. 2147, July 11, 1919, pp. 37-39. Diagrams and formulæ. (To be continued.)

Design

On the Most Economical Design of Transformers, T. Hayakawa. (In Japanese.) Denki Gakkwai Zasshi, no. 371, June 10, 1919.

Dessauer Transformer

Dessauer's High-Tension Transformer, E. Walter. Elecn., vol. 83, no. 2146, July 4, 1919, pp. 12-13, 2 figs. Scheme by which high-tension stresses are so controlled that they are removed to position where they can be safely dealt with.

Frequency Amplifier

Theory of Stationary Frequency Doublers (Beitrag zur Theorie und Wirkungsweise des stationären Frequenzverdopplers), M. Osnos. Elektrotechnik u. Maschinenbau, vol. 37, no. 5, Feb. 2, 1919, pp. 45-48, 7 figs. Argument to demonstrate Epstein frequency doubler is equivalent to two transformers with their primary windings in series and their secondary windings in opposition.

Rectifiers

The Tungar Rectifier—Its Theory, Characteristics and Application—II, F. Keith d'Alton. Elec. News, vol. 28, no. 10, May 15, 1919, pp. 30-35, 26 figs. Performance of simple single-phase rectifier is outlined and claimed advantages of different possible combinations of two or more single-phase rectifiers are presented and discussed.

The Use of Mercury Rectifiers at Hirschberg, Silesia, J. Obach. Elecn., vol. 82, no. 25, June 20, 1919, pp. 698-699. Three rectifying cylinders mounted side by side on wrought-iron frame work; together with the vaccum pump they occupy as much floor space as a rotary converter, giving 100 kw., whereas they themselves have a capacity of 750 kw. From Elektrotechnische Zeitschrift, no. 42, 1918.

Transformer Practice

Essentials of Transformer Practice—XXIV. E. G. Reed. Elec. Jl., vol. 16, no. 7, July 1919, pp. 301-303, 8 figs. Polarity.

Operation at Holtwood, Charles H. Bromley. Power, vol. 50, no. 1, July 1, 1919, pp. 8-9, 4 figs. How transformers are cleaned and inspected.

Transformers, Power

Power Transformers, A. F. Berry. Elecn., vol. 82, no. 26, June 27, 1919, pp. 736-739, 8 figs. Variety in requirements that must be met in transformer design. Points in design of building of sub-stations, such as desirability of being able to run a crocodile truck into building and the need for ample head room.

TRANSMISSION, DISTRIBUTION, CONTROL

Aluminum Conductors

Aluminum Conductors for Overhead Power Transmission Lines, Arthur Jacob. Elecn., vol. 82, no. 26, June 27, 1919, pp. 743-748, 7 figs. Conductivity of aluminum and copper, their relative densities, tensile strength and other qualities are discussed.

Cables

Varnished Cambric Cable for Underground Service, W. E. Hazeltine. General Elec. Rev., vol. 22, no. 6, June 1919, pp. 442-444. Describes structure of varnished cambric cable and points out features wherein this cable is superior to those of paper or rubber insulated type.

Grounding

Grounding (Erdung), Karl Michalke. Dinglers Polytechnisches Journal, vol. 6, no. 334, Mar. 22, 1919, pp. 57-60, 2 figs. Discusses various points which have to be considered in grounding.

High Potential Systems

Distribution of Current Intensity and Potential in line of High Tension System (Etude de la répartition de l'intensité et du potential le long d'une ligne de distribution à très haute tension), Léon Drin. Revue Générale de l'Electricité, vol. 6, no. 1, July 5, 1919, pp. 3-12, 14 figs. Graphical study by means of characteristics which are defined as geometrical loci of points corresponding to extremities of vectors of tensions and intensities of each element of network.

The Practicability of Transmission Lines at Highest Voltages in This Country, G. V. Twiss. Elecn., vol. 82, no. 26, June 27, 1919, pp. 732-736, 4 figs. Considerations alleged to have militated against use of overhead lines in England found exaggerated.

Insulators

Notes on Suspension Insulator Design, H. L. Garbutt. Jl. Electricity, vol. 43, no. 1, July 1, 1919, pp. 19-21, 4 figs. Theories accounting for deterioration of cap-and-pin type suspension insulator.

Overhead Lines

Overhead Net Works (Canalisations aériennes), Ch. Vallet. Industrie Eléctrique, vol. 28, no. 648, June 25, 1919, pp. 232-236. Formula for determining maximum safe distance between consecutive poles. (Continuation of serial.)

Power Factor Correction

Power Factor Correction. Power Plant Eng., vol. 23, no. 14, July 15, 1919, pp. 635-639, 8 figs. From report of sub-committee on power factor correction presented at Convention of Nat. Elec. Light Assn.

Power Transmission

On the Limits of Power Transmission by Alternating Currents (Ueber die Grenzen der Kraftübertragung durch Wechselströme), M. Dolivo-Dobrowolsky. Elektrotechnische Zeitschrift, vol. 40, no. 1, Jan. 2, 1919, pp. 1-4, 1 fig. Discusses question whether system of high-tension a.c. will be given preference, as now, for future power transmissions; writer comes to the conclusion that, since the underground cable will be the future means of transmission, high-tension d.c. will be used for future power transmission.

Relay Protection

Transmission Line Relay Protection, D. W. Roper, H. R. Woodrow, O. C. Traver and P. Mac Gahan. Elec. Rev., vol. 75, no. 1, July 5, 1919, pp. 13-18, 15 figs. Typical application of current and directional relays.

Relays, Reverse-Current

Reverse-Current Relays-Principles of Operation, Victor H. Todd. Power, vol. 50, no. 3, July 15, 1919, pp. 96-99, 15 figs. Schematic diagrams. Construction of features of various types.

Substations

Railway Converter Substations—I, C. F. Lloyd. Power House, vol. 12, no. 11, July 19, 1919, pp. 303-307, 10 figs. Concerning class of equipment to be used and its arrangement in substation buildings.

Canal Substation at Columbus, E. W. Clark Elec. Eng., vol. 53, no. 5, May 1919, pp. 204-205, 3 figs. Transformers, lightning arresters and other high tension equipment located out-of-doors; oil switches, buses, switchboard and auxiliary equipment placed in small building.

Substations for Y-connected Systems, A. V. Taylor. Elec. World, vol. 74, no. 4, July 26, 1919, pp. 172-175, 7 figs. As standardized by company operating in Northwest States, where light loads and long distances prevail.

Switchboards

Developments in Switchboard Apparatus. Gen. Elec. Rev., vol. 22, no. 7, July 1919, pp. 535-537, 8 figs. Plunger type for overload protection.

Three-Phase Current Transmission

Comparative Technical and Economical Study of an Overhead Line and an Underground Line to transmit Three-phase Current at 50,000 volt and 50 Cycles (Etude comparative, technique et économique, d'une ligne aérienne et d'une ligne souterraine à courant triphasé 50,000 volts 50), P. Yersin. Bulletin Association Suisse des Electriciens, vol. 10, no. 5, May 1919, pp. 141-149, 10 figs. Although in various respects underground lines are found more advantageous, the cost of aerial line is estimated to be less than one-half of that of underground.

Transmission at 220 Kilovolts

Problems of Power Transmission at 220 Kilovolts, A. E. Silver. Elec. Rev., vol. 75, no. 2, July 12, 1919, pp. 52-55, 4 figs. Design features of line and apparatus. Paper read before A. I. E. E.

Transmission Circuits

Electrical Characteristics of Transmission Circuits—I, Wm. Nesbit. Elec. Jl., vol. 16, no. 7, July 1919, pp. 279-287, 6 figs. Approximate methods including Mershon and Dwight charts. Resistance of conductors.

Transmission Costs

Transmitting Electric Power at Mines—II S. W. Farnham. Coal Industry, vol. 2, no. 7, July 1919, pp. 275-279. Computing and comparing cost of a. c. and d. c. and efficiency of locomotives. Paper presented before Ill. Coal Min. Inst.

Transmission-Line Computation

An Extension of the Step-by-Step Method of Transmission Line Computation, Frederick Eugene Pernot. University of Cal. Pub. in Eng., vol. 2, no. 4, pp. 131-138, 2 figs. Based on assuming one-sixth of total line admittance at each end of line and the remaining two-thirds in the middle.

Transmission Routes

Selection of Economical Transmission Route, P. O. Reyneau. Elec. World, vol. 74, no. 4, July 26, 1919, pp. 176-178, 1 fig. Equations and curves which are said to simplify choice between several available routes.

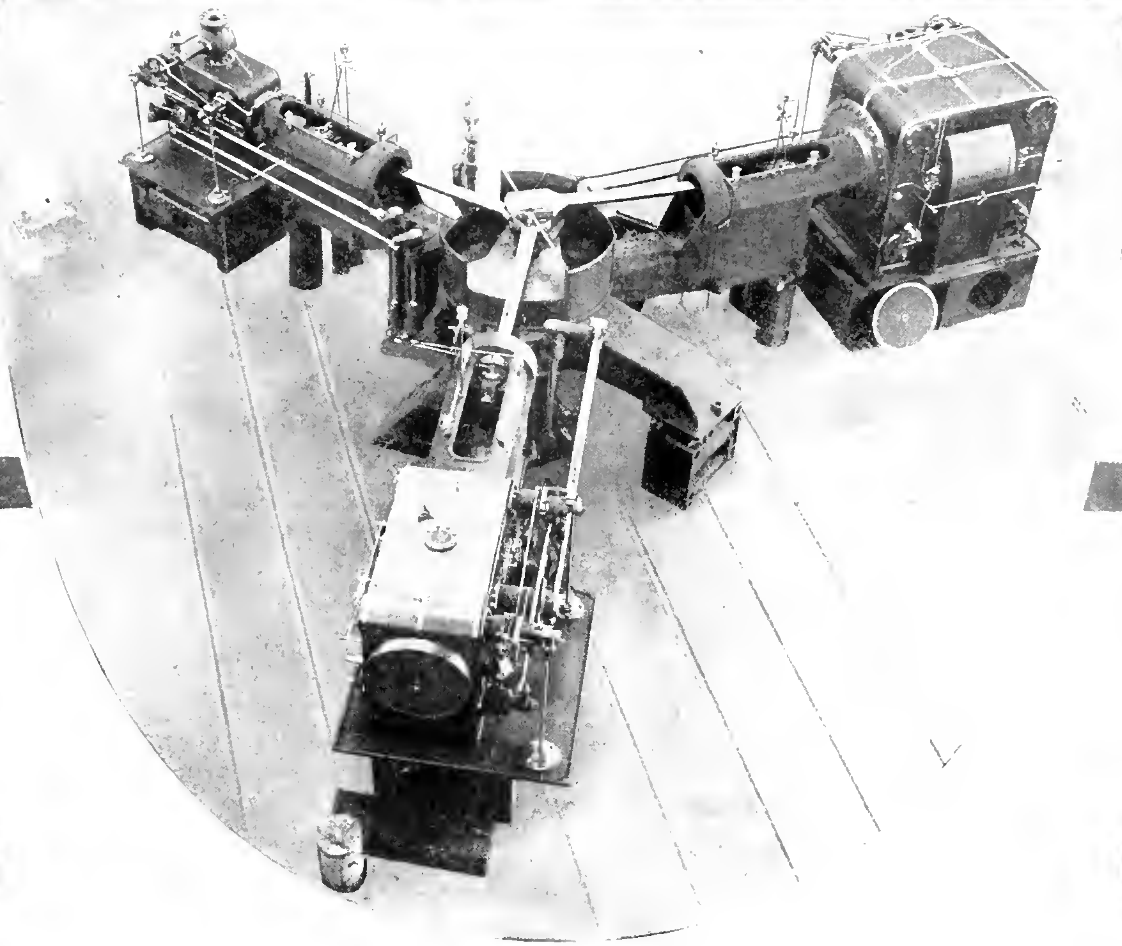
Voltage Regulation of Feeders

Voltage Regulation of Distributing Feeders as a Means of Improving Central Station Efficiency, Frank Hershey. Gen. Elec. Rev., vol. 22, no. 7, July 1919, pp. 544-551, 6 figs. With notes on control of distributing feeders. Paper read before Ohio Elec. Light Assn.

VARIA

Holland

Some Particulars Regarding Inventors in the Electrical Field and Holland's Part in the Development of Electrotechnics (Eenige bijzon-



Solving Power Problems

The illustration herewith tells a very definite, concrete story of the resources of this organization to solve power problems. A "HAMILTON" triple expansion horizontal engine, with vertical shaft extending downward to a centrifugal pump, is used with the elements set at angles of 120 degrees—to secure a continuous flow of power and the highest economy.

This is an extraordinary arrangement—and highly successful—the direct outgrowth of our 74 years of engine-building experience—and our contact with every manufacturing center and industry the world over.

These same resources—the resources which built four complete 2800 horsepower, triple expansion MARINE ENGINES per week for the U. S. Shipping Board—is available and keen to solve your power problem.

Whatever it is—we are building the exactly right unit for the purpose—in its highest and best expression—in its most scientific form, as applied to steam.

Let us demonstrate our solution of your problem. Offices in all large cities

The Hooven, Owens, Rentschler Company

Producers of Prime-Movers for All Industries

Hamilton, Ohio

H.O.R.CO.
HAMILTON
POWER EQUIPMENT

derheden over uitvinders op het gebied der electriciteit en het aandeel dat Nederlanders in de ontwikkeling van de electrotechniek hebben gehad). E. J. F. Thierens. Ingenieur, vol. 34, no. 24, June 14, 1919, pp. 446-453, 4 figs. Historical account.

Lightning Arresters

Records and Maintenance of Aluminum-Cell Lightning Arresters. F. S. Piper. General Elec. Rev., vol. 22, no. 6, June 1919, pp. 475-478, 8 figs. Method followed by Manchester Traction, Light & Power Co.

Soda (Caustic)-Chlorine Cells

Electrolytic Caustic Soda-Chlorine Cells. Karl Horine. Chem. & Metallurgical Eng., vol. 21, no. 2, July 15, 1919, pp. 69-72, 1 fig. Four classes of cells defined after reviewing patent situation—Diaphragm, mercury, Bell and fused electrolyte. An electrolytic caustic of soda-chlorine cell chart is presented.

Wire Pulling

Pulling in Conductors with a Crane. Terrell Croft. Power, vol. 50, no. 4, July 22, 1919, pp. 136-137, 7 figs. Suggestions on how to use traveling crane to pull large electrical conductors into conduits.

Civil Engineering

BRIDGES

Chicago

Problems Encountered in the Design of 12th Street Bridge. Hugh E. Young. Eng. World, vol. 15, no. 1, July 1, 1919, pp. 17-26, 15 figs. Plans for bridge improvement, both involving straightening of Chicago river. Completion will give west side of city a 118-ft. thoroughfare to Lake Michigan.

Concrete Bridge

Calculation of Arched Reinforced-Concrete Bridge of 30 Meters Span (Berekening van een vlakke gewelfbrug van gewapend beton van 30 M. spanning). W. J. Wisselink. Ingenieur, vol. 34, no. 27, July 5, 1919, pp. 496-503, 6 figs. Vertical section of bridge; determination of total constant load per meter; distribution of load.

Foundations

Test of Sandy Foundations at Arch Bridge Pier. Arthur Richards. Eng. News-Rec., vol. 83, no. 5, July 31, 1919, pp. 208-209, 2 figs. Settlement measured by gage at top of timber mast passing through completed concrete base. Stone blocks for load.

Inspection

Points Requiring Special Observation and Investigation in Bridge Inspection. Herbert C. Keith. Can. Engr., vol. 37, no. 3, July 17, 1919, pp. 145-147. Concerning reduction of vibration, investigation of compressing members, preventing decay of timber stringers and similar points. From paper presented before Brooklyn Engrs. Club.

Kansas City

Central Avenue Bridge and Viaduct in Kansas City. Elec. Traction, vol. 15, no. 7, July 1919, pp. 411-416, 14 figs. Design to accommodate both street railway and roadway traffic between Kansas City, Missouri and Kansas City, Kansas.

Pontoon Bridges

The Coblenz Pontoon Bridge. J. W. Skelly. Prof. Memoirs, Corps Engrs. U. S. Army & Engr. Dept., vol. 11, no. 56, March-April 1919, pp. 217-228, 13 figs. Bridge is about 1,050 ft long and is composed of 14 sections—two draw sections, 98 ft and 81 ft. in length, eight fixed sections 81 ft. long and at each end two short ramp sections about 50 ft. long. Other sections are held in reserve for use as required.

Railway Bridge Specifications

Comparison of Five Railway Bridge Specifications. Eng. News-Rec., vol. 83, no. 1, July 3, 1919, pp. 33-36. Proposed revised A.R.E.A. specifications compared with Southern Pacific, Pennsylvania, and New York Central accepted practice.

Reinforcement

Historic Shropshire Bridges Strengthened with Ferro-Concrete. A. T. Davis. Ferro-Concrete, vol. 10, no. 9, March 1919, pp. 249-262, 21 figs. Bridges in question were constructed with cast-iron arches on masonry abutments about a century ago.

How an Old Masonry Arch Bridge Was Rebuilt. Ry. Maintenance Engr., vol. 15, no. 7, July 1919, pp. 228-230, 5 figs. Bridge consisted of five semi-circular arches of 40 ft. span, having a total length of 260 ft. and total height above bottom of footings of 60 ft.

Sectional Bridges

Types of Truss Bridges (Neue Bauarten zerlegbarer Brücken). Rudolf Bernhard. Zentralblatt der Bauverwaltung, vol. 39, no. 15, Feb. 15, 1919, pp. 80-83, 24 figs. Reconstruction of bridges destroyed during war and types developed.

Substructure

Substructure of Michigan Avenue Bascule Bridge, Chicago. Hugh E. Young and William A. Mulcahey. Eng. News-Rec., vol. 83, no. 5, July 31, 1919, pp. 210-213, 4 figs. Cylinder piers sunk to rock and hardpan carry concrete tailpits for double-deck bridge. Steel columns embedded in walls support girders for trunnions and uplift anchorage.

Suspension Bridges

Special Design Features and Erection Methods for 540-Foot Suspension Bridge. William G. Grove. Eng. News-Rec., vol. 83, no. 1, July 3, 1919, pp. 4-8, 8 figs. Designed with varying cable inclinations at towers.

Suspension Bridge and Suspension Ferry in Rio de Janeiro (Hängebrucke und Schwebefähre in Rio de Janeiro). Zentralblatt der Bauverwaltung, vol. 39, no. 28, April 2, 1919, pp. 145-146, 4 figs. Bridge spans branch of the sea 150 meters wide.

Suspension Bridge of Gotteron, Fribourg (Le pont suspendu du Gotteron, à Fribourg). Bulletin Technique de la Suisse Romande, vol. 45, no. 12, June 14, 1919, pp. 112-114, 5 figs. Placing additional cable units so as to reduce maximum working stress to 18 kg per sq. mm.

Widening

Widening Existing Bridges. Ferro-Concrete, vol. 10, no. 9, March 1919, pp. 268-271, 7 figs. By means of reinforced concrete. Reference is made to actual work.

BUILDING AND CONSTRUCTION

Apartment Houses

Million Dollar Apartment House in Montreal. Contract Rec., vol. 33, no. 27, July 2, 1919, pp. 650-653, 6 figs. Eight-story building on site 253 ft. x 75 ft.; to contain eighty apartments.

Army Supply Base

Building the New Orleans Army Supply Base. Eng. News-Rec., vol. 83, no. 3, July 17, 1919, pp. 122-125, 4 figs. Concentration of equipment, use of 7 miles of temporary railway track, and rapid construction of project, mentioned as notable features.

Concrete-Block Construction

Houses for Halifax Reconstruction Built of Granite-Face Concrete Blocks. Contract Rec., vol. 33, no. 26, June 25, 1919, pp. 603-606, 6 figs. Building hollow walls with hydro-stone units presenting natural stone appearance.

Concrete Floor Surfaces

Concrete Floor Surfaces. W. P. Anderson. Ferro-Concrete, vol. 10, no. 11, May 1919, pp. 322-324. It is stated that in putting down concrete floors satisfactory results can be obtained either by using a top dressing or by finishing the structural concrete itself.

Concrete Substructure

The Construction of a Pumping Station for the Schenectady Works, General Electric Company. Keith O. Guthrie. Gen. Elec. Rev., vol. 22, no. 7, July 1919, pp. 538-544, 10 figs. Indicating method of pouring concrete substructure and lowering it into position.

Constructional Elements

Planning the Industrial Plant—III. Hugh M. Wharton. Indus. Management, vol. 58, no. 2, Aug. 1919, pp. 113-117, 12 figs. Practice in roofs, floors, stairways, windows. (To be continued.)

Cribbing

Sectional Concrete Cribbing Displaces Retaining Walls at Embankments. Coal Age, vol. 16, no. 4, July 24, 1919, pp. 141-143, 4 figs. Details of pillow blocks and fillers used in sectional concrete retaining wall.

Concrete Buildings

Concrete Building Addition Made at Reasonable Cost. Eng. News-Rec., vol. 83, no. 2, July 10, 1919, pp. 75-76, 3 figs. Cost per cu. ft., 15.4 cents. Work done in Boston district during war.

Designs

Cutting Down the Cost of Engineering in Building Design and Construction. E. H. Darling. Contract Rec., vol. 33, no. 26, June 25, 1919, pp. 597-599. Fallacy of free engineering and free designs.

Flagpole Erection

Seventy-Foot Concrete Flagpole Poured Erect in Place. R. C. Hardman. Eng. News-Rec., vol. 83, no. 4, July 24, 1919, p. 173. Construction effected by means of a light tower, similar to a hoisting tower.

Framing

Steel and Concrete Framing Combined for Economy. Eng. News-Rec., vol. 83, no. 4, July 24, 1919, pp. 178-182, 5 figs. Cost and space both saved in Chicago 12-story office building carried over theater auditorium. Design includes special heavy trusses, girders and cantilevers.

Garages

Curved Drive for Automobiles in Six-Story Garage. Eng. News-Rec., vol. 83, no. 4, July 24, 1919, pp. 188-189, 2 figs. Incline between floors claimed to give better facilities than elevators.

Hotels

Palmers' New Hotel and Canteen. Eng. & Indus. Management, vol. 1 (New Series), no. 20, June 26, 1919, pp. 619-620, 2 figs. Hotel composed of three large, three-story buildings. Canteen consists of large dining hall, kitchen, stores, offices and staff quarters.

Housing

A Solution of the Housing Problem in the United States. Robert Anderson Pope. Jl. Am. Inst. Architects, vol. 7, no. 7, July 1919, pp. 305-314, 2 figs. Proposal is made that each head of family and individual worker be provided with enough garden space immediately contiguous to his dwelling to enable him to produce, with intelligent direction and co-operation of an agricultural corps of community workers, the larger part of vegetables and small fruits which he and his family consume within the course of a year.

The Plumbing Standards for the Housing Projects of the Emergency Fleet Corporation. William G. Tucker. Architectural Rec., vol. 46, no. 1, July 1919, pp. 47-56, 6 figs. As adopted for various types of housing projects, which are divided into three general classes—(1) bungalows, (2) two-story dwellings, detached, semi-detached or in groups, apartments, and (3) dormitories, hotels, mess halls, kitchens and cafeterias.

The Engineering Aspect of the Housing Problem. Eng. Rev., vol. 32, no. 12, June 16, 1919, pp. 342-344, 2 figs. Alternative method of utilizing bricks with economy of materials in walls to the brick on edge construction. (Second article.)

A Model Housing Plan for Reclaiming a St. Louis District. Am. Architect, vol. 116, no. 2271, July 2, 1919, pp. 8-13, 6 figs. Removing existing buildings in slum sections to make way for more attractive and equitable government housing project.

Inspection

Testing and Inspection as a Means of Safeguarding Construction. R. Robertson Deans. Contract Rec., vol. 33, no. 26, June 25, 1919, pp. 624-626. Duty of testing engineer in detecting faulty materials. Concrete and steel.

Purifiers

The Application of Reinforced Concrete to Purifier Construction. A. E. Broadberry. Gas World, vol. 70, no. 1819, May 31, 1919, pp. 459-462, and (discussion) pp. 462-463, 14 figs., and Gas Jl., vol. 146, no. 2925, June 3, 1919, pp. 601-603, and (discussion) pp. 604-605, 14 figs. Plan and details of construction. Maximum pressure was assumed to be 48 in.

Reservoirs

Storage and Service Reservoirs in British Waterworks Engineering. Ferro-Concrete, vol. 10, no. 10, April 1919, pp. 297-301, 5 figs. Illustrating construction of reinforced-concrete reservoirs.

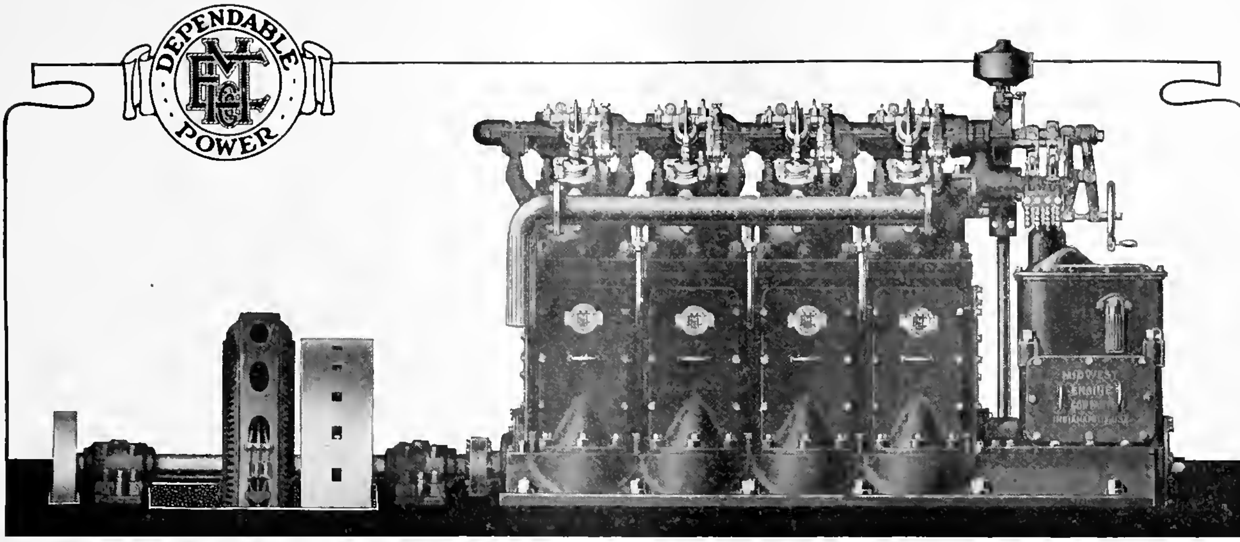
Retaining Walls

The Stability of Reinforced Concrete Retaining Walls. F. Zimmerman. Eng. & Contracting, vol. 52, no. 4, July 23, 1919, pp. 94-96, 4 figs. Diagram for solving design equations graphically.

See also Cribbing.

Silos

Grain Silos of Reinforced Concrete (Getreidesilos in Eisenbeton). G. Escher. Beton & Eisen, vol. 18, nos. 2-3, Feb. 5, 1919, pp. 17-20, 10 figs. Type built on Bank system, which aims at cooling grain by propelling air currents through silo walls into it. (To be concluded.)



MIDWEST
Dependable Power

HERE is power equipment that answers completely and adequately the modern need for more power at lower cost.

It converts the cheapest of crude and fuel oils into the highest known efficiency—does it without break or interruption.

This particular Midwest-Diesel Oil Engine is arranged for direct-connected electrical service. It comes in four standard sizes: 75 B. H. P.—100 B.H.P.—190 B.H.P.—250 B.H.P. Fuel consumption less than 1/10 gallon per K.W. Hour.

You are interested in creating power for your industry at a low cost. Ask for further information—based upon your conditions and requirements.

Midwest Standard Products

For Stationary Service—Midwest-Hvid Oil Engines, Horizontal—20, 25, 30 and 35 B. H. P.; Vertical—50 B. H. P.; Midwest-Diesel Oil Engines, Vertical—75, 100, 190, 250, 333, 500 and 666 B.H.P. units. Midwest-Wait Steam Turbines in units from 25 to 1500 K.W. capacity.

Also centrifugal and reciprocating pumps in a wide range of sizes.

MIDWEST ENGINE COMPANY
INDIANAPOLIS, U. S. A.

Stacks

Solving a Stack-Raising Problem, Martin Fishback. Eng. & Min. Jl., vol. 108, no. 3, July 19, 1919, pp. 95-96, 5 figs. Work done in replacing stack 6 ft. in diameter and 75 ft. long.

Steel Mill Buildings

An Investigation of the Stresses in the Transverse Bent for Steel Mill Buildings, C. S. Sperry. Proc. Colorado Sci. Soc., vol. 11, June 1919, pp. 253-268, 5 figs., partly on supp. plates. Accuracy of stresses obtained by various approximate solutions.

Tanks

Tank Construction—XXIX, Ernest G. Beck. Mech. World, vol. 65, no. 1695, June 27, 1919, pp. 306-307, 7 figs. Side walls of rectangular tanks. (Continuation of serial.)

Theaters

Engineering Features of the Modern Theater—I & II. Am. Architect, vol. 116, no. 2273 and 2274, July 16 and 23, 1919, pp. 91-98 and 123-129, 26 figs. partly on supp. plate. Study of Sam Shubert Theater at Philadelphia, notable feature of which is entire absence of obstructing columns, and of State-Lake Theater in Chicago.

See also Framing.

CEMENT AND CONCRETE

Calcium Chloride in Concrete Mixtures

Construction Work in New York Last Year. Good Roads, vol. 18 (new series), no. 2, July 9, 1919, pp. 14-15 and 22, 1 fig. From report of First Deputy Commissioner on work of Construction Department of State Commission of Highways during 1918. A graphical description of results of tests with calcium chloride in concrete mixtures is presented.

Cement Gun

Lining a Reservoir with Concrete by the Cement Gun, E. Court Eaton. Eng. News-Rec., vol. 83, no. 4, July 24, 1919, pp. 167-168, 2 figs. Costs and progress made. Given for operations in irrigation district during current high-price period.

Compressing Concrete

Compressing Concrete Increases Its Strength, Frank P. McKibben. Cement & Eng. News, vol. 31, no. 7, July 1919, pp. 22-23, 2 figs. Plain columns of successive layers pressed down said to have averaged half again as strong as these poured for full length.

Concrete

Concrete in Roads, Bridges and Culverts, H. Eltinge Breed. Mun. & County Eng., vol. 56, no. 6, June 1919, pp. 222-225, 1 fig. Concluded from tests that crushed-stone concrete resists impact better than gravel concrete, and that large-sized material is more durable than the small sizes.

Concrete Blocks

Making Concrete Blocks for Toronto Breakwater, Frederick Phillips. Can. Engr., vol. 37, no. 2, July 10, 1919, pp. 119-120, 3 figs. Collapsible wooden forms for making concrete blocks weighing 10 and 18 tons.

Plant Lay-Out for Making Concrete Blocks. Contract Rec., vol. 33, no. 28, July 9, 1919, pp. 665-666, 2 figs. Large units for breakwater construction cast at plant arranged to facilitate handling of raw materials and product.

Concrete Pipe Manufacture

Speeding up the Manufacture of Concrete Pipe with Compressed Air, F. A. McLean. Contract Rec., vol. 33, no. 29, July 16, 1919, pp. 694-695, 3 figs. Results obtained by installation of compressors and pneumatic rammers.

Cracking in Reinforced Concrete

Crack and Rust Formation in Reinforced-Concrete Constructions (Riss- und Rostbildungen an Tragwerken aus Eisenbeton). Zeitschrift des österr. Ingenieur-und-Architekten-Vereins, vol. 71, no. 1, Jan. 3, 1919, pp. 8-9, 1 fig. Caused by faulty design and construction. (To be concluded.)

Curing Concrete

Curing Concrete. Mun. Jl. & Public Works, vol. 47, no. 3, July 19, 1919, pp. 34-35, 2 figs. Results of tests made to determine effect of curing conditions on strength of concrete and wear from abrasion.

Gravel, Grading of

Proportioning of Pit-Run Gravel for Concrete, R. W. Crum. Can. Engr., vol. 37, no. 4, July 24, 1919, pp. 165-170, 8 figs. Also Concrete, vol. 15, no. 1, July 1919, pp. 3-8, 8 figs. Conclusion resulting from investigation is that grading of pit-run gravel may be measured by percentage of fine aggregate to total aggregate and by weight per cu. ft. measured loose.

Gunite

New Concrete Terminals at Norfolk. Cement & Eng. News, vol. 31, no. 7, July 1919, pp. 28-33, 5 figs. With reference to method of attaching wire and method of forming gunite wall.

See also Cement Gun.

India

Ferro-Concrete in India. Ry. Engr., vol. 40, no. 474, July 1919, pp. 154-156. Practice follows British Standard Specification. From technical paper no. 191 of Public Works Dept., Government of India.

Mixing Methods, Concrete

Bettering Concrete by a New Mixing Method, Nathan C. Johnson. Eng. News-Rec., vol. 82, no. 26, June 26, 1919, pp. 1266-1270, 7 figs. Using as basis motion-picture studies of concrete in mixing. Mixer has been developed in which, it is claimed, cement gets necessary thorough contact with aggregate.

See also Mix Water Removal.

Concrete Mixtures for Ferro-Concrete Work. With Special Reference to the Influence of Voids in the Aggregate, T. J. Gueritte. Ferro-Concrete, vol. 10, no. 2, August 1919, pp. 42-52, 6 figs. Comparison of specifications issued by Joint Committee on Reinforced Concrete of Roy. Inst. of British Architects, the regulations drawn up by London County Council, and the Mouchel-Hennebique standards.

Studies in Surface Area Proportionate Method, R. B. Young. Can. Engr., vol. 36, no. 26, June 26, 1919, pp. 563-566, 6 figs. Surface-area method of proportioning materials of mortars and concretes tested and approved by Ont. Hydroelectric Power Commission.

Tests Do Not Bear Out Surface Area Method, Duff A. Abrams. Can. Engr., vol. 36, no. 26, June 26, 1919, pp. 566-569. Comparison of surface area and fineness-modulus methods. Writer prefers latter method.

The "Sand" Method of Proportioning Pit Run Gravel for Concrete. Eng. & Contracting, vol. 52, no. 1, July 2, 1919, pp. 18-20, 5 figs. Investigation to establish engineering methods for proper use of such material, conducted by Engineering Experiment Station of Iowa State College. Paper read before Am. Soc. for Testing Materials.

Mix-Water Removal

Pressing Out Mix Water Adds to Cement Mortar Strength, C. T. Wiskocil. Eng. News-Rec., vol. 83, no. 3, July 17, 1919, pp. 130-132, 3 figs. Tests at University of California with apparatus which permitted pressures up to 30,000-lb. per sq. in. reported as giving very high compressive values.

Quick-Hardening Concrete

Cements Producing Quick-Hardening Concrete, P. H. Bates. Can. Engr., vol. 37, no. 1, July 3, 1919, pp. 113-115, and 117. Data obtained with "Sorel cement" in course of investigations conducted by Pittsburgh Branch of Bureau of Standards and dealing with various problems relating to portland cement.

Proportioning Concrete

See Mixing Methods.

Reinforced-Concrete Tests

Some Tests on the Properties of Reinforced Concrete, W. A. Slater. Eng. News-Rec., vol. 83, no. 5, July 31, 1919, pp. 217-220, 6 figs. Effect of protecting metal, lapping reinforcing bars and of reversing stress in beams as well as action of diagonally placed rods in slab spans studied for concrete ship. Research of Emergency Fleet Corporation.

Reinforcing Elements

High Tensile v. Mild Steel for Reinforcing Concrete, Arthur W. C. Shelf. Surveyor, vol. 55, no. 1432, June 27, 1919, pp. 495-496, 5 figs. Tests interpreted as proving that ordinary plain mild-steel bars of 28 to 32 tons breaking strain are best to employ for reinforced concrete.

EARTHWORK, ROCK EXCAVATION, ETC.

Canals

Enlargement of the Yakima-Tieton Main Canal, G. C. Finley. Eng. News-Rec., vol. 82, no. 26, June 26, 1919, pp. 1255-1258, 7 figs. Half circular section of reinforced concrete increased in height. Bonus system said to have proved successful in overcoming great scarcity of labor at favorable cost.

Chippewa Power Development in all Phases is a Higher Efficiency Enterprise. Contract Rec., vol. 33, no. 26, June 25, 1919, pp. 590-596, 18 figs. Building 12¾-mile canal.

Dams

Dam Foundation Placed by Suspended Pneumatic Caissons. Eng. News-Rec., vol. 83, no. 3, July 17, 1919, pp. 108-110, 8 figs. Difficulties encountered in getting footing in deep and swift water in narrow gorge of Spanish River at High Falls in northern Ontario.

Dam Supported by Bascule Bridge Closes Canal Lock. Eng. News-Rec., vol. 83, no. 3, July 17, 1919, pp. 116-118, 4 figs. Steel beams and panels placed from bridge form temporary dam permitting repair work in Trolhättan Canal.

Forms and Dimensions of Large Masonry Dams (Formes et dimensions des grands barrages en maçonnerie), M. Résal. Annales des Ponts et Chaussées, vol. 2, Mar-Apr. 1919, pp. 165-221, 34 figs. Mechanical discussion of stresses and illustration of method of computing them in various practical cases.

The Tata Hydro-Electric Power Plant, Bombay. Indian & Eastern Engr., vol. 44, no. 5, May 1919, pp. 151-154, 6 figs. Dams are 1200, 1500 and 2700 yards long. They were built with lime mortar. (To be continued.)

Drydocks

Carron Dry Docks at Grangemouth. Eng., vol. 107, no. 2789, June 13, 1919, pp. 762-763 & 774, 15 figs. Utilization of disused junction lock for wet dock.

Excavation Methods

Excavation Methods on the Miami Conservancy Project, G. L. Teeple. Eng. & Contracting, vol. 52, no. 3, July 16, 1919, pp. 61-63, 4 figs. Flood-prevention project which involves construction of five large earth dams.

Grading

How to Get Clean-Cut Grading Jobs, F. F. Mengel. Good Roads, vol. 18, no. 5, July 30, 1919, pp. 68-69. Suggestions in regard to methods in light and heavy work.

Percussion Drilling

Percussion Plant for Oil-Well Drilling. Engineering, vol. 107, no. 2791, June 27, 1919, pp. 830-833, 15 figs. Points out differences of rigs in three systems: American, Standard or Californian, and Canadian.

Sewers

Sewer-Construction Records Used at Scarsdale, New York, Perry Thompson. Eng. News-Rec., vol. 83, no. 3, July 17, 1919, pp. 111-112, 3 figs. Daily record blank, rock book and sample headings from final estimate book used on 2½ miles of sewers.

Shaft Sinking

Sinking and Concreting Mine Shaft 936 Feet Deep, Richard L. Russell. Eng. News-Rec., vol. 82, no. 26, June 26, 1919, pp. 1259-1262, 5 figs. Simultaneous concreting and excavating operations.

Tunnels

Backfilling Tunnel Through Holes Bored from Surface, J. Armstrong. Eng. News-Rec., vol. 93, no. 4, July 24, 1919, pp 174-175, 2 figs. Concrete poured around 60-in. cast-iron pipe in 10 by 10 ft. rock bore by dropping it 70 ft. from trestle across river.

Pittsburgh South Hills Tunnel and Earlier Projects. Eng. News-Rec., vol. 83, no. 4, July 24, 1919, pp. 166-167, 1 fig. Project for 5500-ft. tunnel.

Conduit Construction Work in Tunnels. Bell Telephone News, vol. 8, no. 12, July 1919, pp. 18-19, 7 figs. Formation of conduit under Chicago River consisting of single-duct tile laid three wide and 8 to 10 ft. high with complete encasement of concrete.

Construction Details on the Marin Water and Power Project, H. M. Bowers. Jl. Electricity, vol. 43, no. 1, July 1, 1919, pp. 22-23. Cost and construction data and description of 8700-ft. tunnel.

Tunnel Construction under Water (Tunnelbau unter Wasser), A. Haag. Zentralblatt der Bauverwaltung, vol. 39, no. 11, Feb. 1, 1919, pp. 57-59, 10 figs. With special reference to tunnels under the rivers Spree and Elbe and under the Kiel canal.

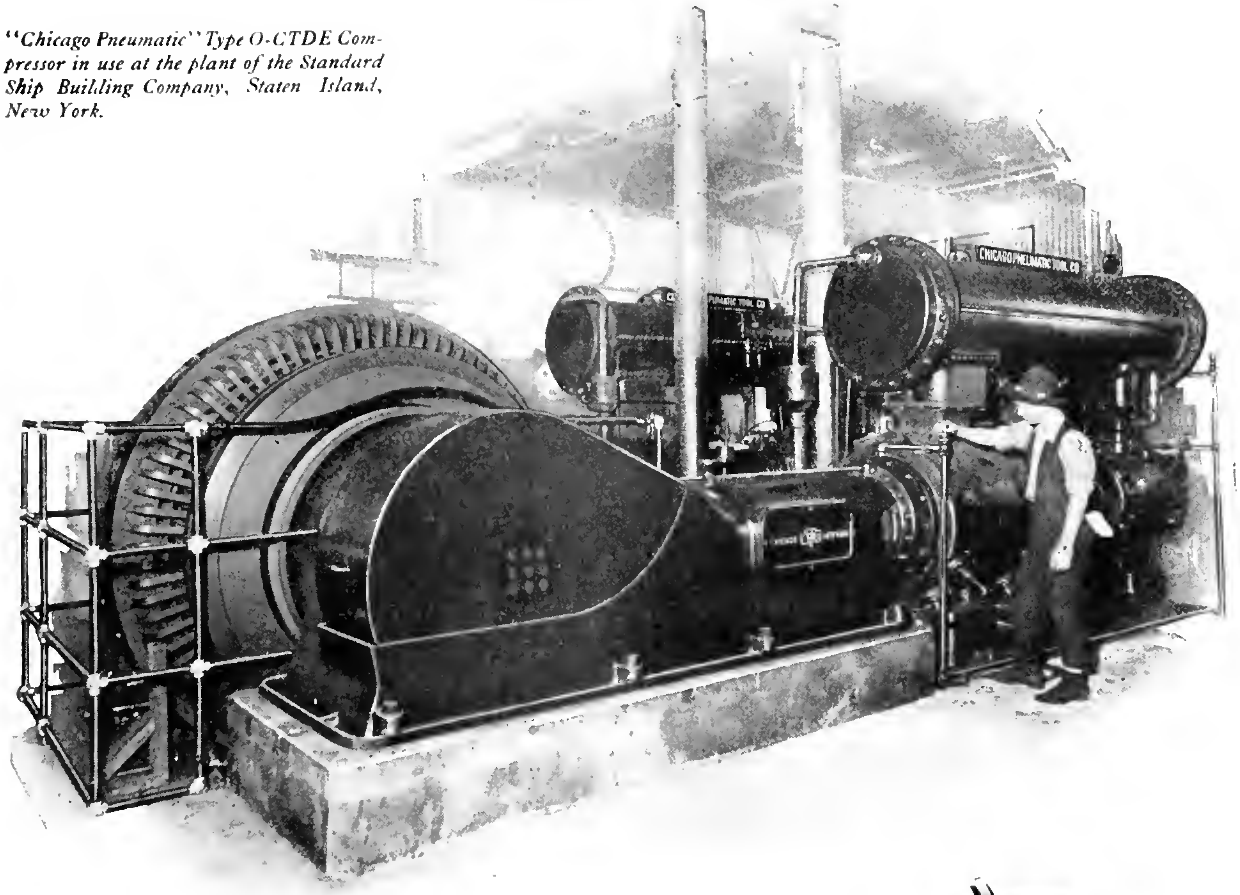
The Catskill Tunnels—IV. Ry. Engr., vol. 40, no. 474, July 1919, pp. 143-147, 4 figs. Alteration of heading during construction of Hunter's Brook Tunnel. (Continuation of serial.)

HARBORS

Docks

Reinforced-Concrete Dock (Travaux-Publics), A. Goupil. Génie Civil, vol. 75, no. 1, July 5, 1919, pp. 7-10, 8 figs. Work done at Dutch Indies, notably extension of ports of Soerabaja and Semarang. From De Ingenieur, Feb. 22, 1919.

"Chicago Pneumatic" Type O-CTDE Compressor in use at the plant of the Standard Ship Building Company, Staten Island, New York.



The Compressor with the "Simplate  *Valve"*

Every "Chicago Pneumatic" Air Compressor is equipped with the patented "Simplate" Flat Disc Valves. These valves require no lubrication and are practically indestructible. Operating silently and efficiently, they automatically adjust themselves to all load demands, increase mechanical and volumetric efficiencies, and simplify the whole problem of compressor operation and maintenance.

The "Chicago Pneumatic" line of air compressors comprises over 300 distinct sizes and types. Any compressor need is met by at least one. All are characterized by exceptionally large bearing surfaces, automatic lubrication, simple, sturdy construction and automatic regulation, which insures operating economy under variable load conditions. "Chicago Pneumatic" Air Compressors are, in every detail, thoroughly modern machines, the result of over 20 years' experience in building compressors for every conceivable need

Singapore Harbour Works. Ferro-Concrete, vol. 10, no. 8, Feb. 1919, pp. 220-28, 11 figs. Refers especially to reinforced-concrete construction.

Suez

Extensions of the Port at Suez (Les travaux d'extension du port de Suez). Génie Civil, vol. 74, no. 26, June 28, 1919, pp. 525-529, 2 figs. Involving extension of docks.

MATERIALS OF CONSTRUCTION

Asphalt

Melting Point of Asphalts, Leland M. Proctor. Chem. & Metallurgical Eng., vol. 21, no. 2, July 15, 1919, pp. 81-83, 1 fig. Comparison of data obtained by various processes for determining melting point.

Road Materials

Proposed Tests and Specifications for Road Building Materials. Good Roads, vol. 18, no. 1 & 2, July 2 & 9, 1919, pp. 3-4 and 13 & 18-19, 3 figs. Recommendations of Committee D-4 on road materials of Am. Soc. for Testing Materials.

Instructions for Field Inspection of Road Materials. Eng. & Contracting, vol. 52, no. 1, July 2, 1919, pp. 16-18. Issued by New Jersey State Highway Dept. for guidance of inspectors.

Stone, Crushed

Commercial Sizes of Crushed Stone. Eng. & Contracting, vol. 52, no. 3, July 16, 1919, pp. 72-73. Results of survey of Ohio, Kentucky, Tennessee, North Carolina and Georgia, undertaken by Bureau of Public Roads, for securing data to be used in developing of system of standard sizes and uniform nomenclature for crushed-stone products. From Public Roads.

ROADS AND PAVEMENTS

American Society of Civil Engineers

Highways and Their Construction (Carreteras y su construcción). Ingeniería Internacional, vol. 1, no. 3, June, 1919, pp. 131-140, 8 figs. Final report of special committee on materials for road construction and standards for their test and use, of Am. Soc. Civil Engrs.

Asphalt Pavement

Asphalt-Covered Napped-Block Pavement. Mun. Jl. & Public Works, vol. 47, no. 3, July 19, 1919, pp. 32-34. Pavement is constructed of old granite block napped and reclipped and laid with a filler of sand and asphalt mixed, novel feature consisting in addition of covering of same sand-asphalt mixture over entire pavement to depth of about ½ in.

Association of Dominion Land Surveyors

Roads, A. H. Hawkins. Annual Report of Assn. of Dominion Land Surveyors, Jan. 29, 30 and 31, 1919, pp. 91-97. Building of permanent roads is advocated.

Bituminous Mats

Bituminous Mat Protects Texas Roads, James P. Nash. Am. City, Town & County Ed., vol. 21, no. 1, July 1919, pp. 1-5, 2 figs. Process claimed to work satisfactorily in dry climate.

Bituminous Roads

Bituminous Roads in Great Britain and the United States (Les chaussées bitumineuses en Grande-Brétagne et aux Etats-Unis), R. Feret. Annales des Ponts de Chaussées, vol. 2, Mar-Apr. 1919, pp. 222-244. Gives particulars regarding work done and practices adopted in these countries.

The Design and Construction of Bituminous Macadam Roads and Pavements, A. W. Dean. Mun. & County Eng., vol. 56, no. 6, June 1919, pp. 206-208. Best and most lasting results believed to be obtained with sizes of stone in second course varying from ¾ in. to 2½ in., with larger sizes predominating.

Brick Pavements

A Review of Recent Progress in Brick Pavement Design and Construction, Clark R. Mandigo. Mun. & County Eng., vol. 57, no. 1, July 1919, pp. 9-11, 2 figs. Includes notes on advantages claimed for asphalt filler.

Concrete-Road Specifications

Chartered Summary of State Concrete Road Specifications, A. N. Johnson. Eng. News-Rec., vol. 83, no. 4, July 24, 1919, pp. 160-162, 1 fig. Arrangement in chart form.

Constructing Concrete Pavements. Mun. Jl. & Public Works, vol. 47, no. 2, July 12, 1919, pp. 22-23. Standard practice as recommended by Mississippi Valley Assn. of State Highway Departments.

Concrete-Road Stresses

Stresses in Concrete Roads. Mun. Jl. & Public Works, vol. 46, no. 26, June 28, 1919, pp. 466-467. Experiments made by Bur. of Public Roads believed to have shown that concrete road under action of traffic or perhaps under influence of frost and different percentages of moisture in subgrades is continually bending so that reaction pressures between subgrade and slab are neither constant nor uniform in intensity.

Costs

The Cost of a Mile of Road, George A. Duren. Can. Engr., vol. 37, no. 4, July 24, 1919, pp. 161-163, 3 figs. Tabulation of figures compiled by State Highway Engineer of Texas. From paper presented at Eng. & Road Builders' Congress.

Character and Cost of Highways for Motor Truck Use, S. Whinery. Eng. News-Rec., vol. 83, no. 2, July 10, 1919, pp. 77-78. Estimates they will have concrete foundations, will be not less than 20-ft. wide and will cost from $35,000 to $40,000 per mile.

Drainage

See Subsoil.

Granite-Block Pavements

The Design and Construction of Granite Block Pavements in Cincinnati, H. F. Shipley. Mun. & County Eng., vol. 57, no. 1, July 1919, pp. 19-21, 6 figs. Presents specifications.

The Design and Construction of Modern Granite Block Pavements with Special Reference to Practice in Borough of Manhattan, C. M. Pinckney. Mun. & County Eng., vol. 56, no. 6, June 1919, pp. 199-202, 11 figs. Specifications and requirements.

Iowa State Road Law

The New State Road Law of Iowa. Good Roads, vol. 56, no. 3, July 16, 1919, pp. 25-26. Measure provides for improvement of 6000-mile system of primary highways.

Labor

Convict Labor on Highways Good Business. Good Roads, vol. 18, no. 5, July 30, 1919, pp. 65-67, 4 figs. Experiences of highway officials in various states claimed to demonstrate efficiency and economy of prison labor on roads, and physical, mental and moral benefits accruing to convicts.

Maintenance

Macadam and Gravel Road Maintenance, R. C. Heath. Good Roads, vol. 18, no. 2, July 9, 1919, pp. 16 and 22. Practice followed by Kentucky Dept. Public Works.

Night Work

Road Building Twenty-four Hours a Day, William Ord. Contract Rec., vol. 33, no. 30, July 23, 1919, pp. 709-711, 2 figs. Examples quoted where it is said to have been found that night work effected economies and required less labor.

Pipe Lines, Subsurface

Location of Subsurface Pipe Lines to Conserve Street Pavements, Harry M. Adams. Mun. & County Eng., vol. 56, no. 6, June 1919, pp. 225-226. Policies suggested from conditions in New York City.

Road Design for Motor Traffic

Influence of Motor Traffic on Road Design, Arthur H. Blanchard. Good Roads, vol. 18, no. 4, July 23, 1919, pp. 50-52. Transportation surveys, laws and regulations, widths, grades, curves, bridges, drainage and foundations, wearing surfaces, detours and other considerations.

Highways and the Duty of Their Builders, S. M. Williams. Good Roads, vol. 18, no. 4, July 23, 1919, pp. 35-37, 5 figs. Observes that modern motor-truck transportation demands durable all-year roads that will make profits.

Highway Requirements for Twentieth Century Transportation, with Special Reference to New Jersey Practice, Wm. G. Thompson. Mun. & County Eng., vol. 56, no. 6, June 1919, pp. 208-210. Address delivered to Nat. Highway Traffic Assn.

Rubber Pavements

Rubber Pavements: A Historical Résumé. India Rubber World, vol. 60, no. 4, July 1, 1919, pp. 548-550. Although cost of rubber pavement is estimated at about $25 per sq. yd. it is alleged that experience has shown that it will last much longer than any other and will be less expensive in the long run. Pioneer work in England is quoted.

Sidewalk Specifications

Some Suggested Changes in Concrete Sidewalk Specifications, Chas. E. de Leuw. Mun. & County Eng., vol. 57, no. 1, July 1919, pp. 16-17. Recommends elimination of cinder foundation unless soil is impervious.

Subsoil

Comparison of Road Subgrade and Air Temperatures, C. C. Wiley. Eng. News-Rec., vol. 83, no. 3, July 17, 1919, pp. 128-129, 2 figs. Experiments at University of Illinois claimed to have shown that changes in air temperatures are slow to affect subsoil.

Notes on Road Foundations, Drainage and Culverts, U. W. Christie. Mun. & County Eng., vol. 57, no. 1, July 1919, pp. 17-18. Including table showing height to which capillary water rises in certain soils in 24 hours.

Cleveland Underdrains All New Pavements, Fred R. Williams. Am. City, City Ed., vol. 21, no. 1, July 1919, pp. 9-11, 3 figs. Methods and advantages of artificially draining subsoil.

SANITARY ENGINEERING

Air Diffusers for Activated Sludge Process

Test of Air Diffusers for Activated Sludge Process. Eng. & Contracting, vol. 52, no. 2, July 9, 1919, pp. 41-42. "Filtros" plates said to have proved more effective under test than perforated pipe and basswood blocks.

Factory Sanitation

Design and Construction of Factories—VI. Eng. & Indus. Management, vol. 1, no. 19, June 19, 1919, pp. 588-589. Sanitation.

Garbage Disposal

Garbage Disposal by Feeding Successfully Practiced at Lansing, Mich. Mun. & County Eng., vol. 57, no. 1, July 1919, pp. 23-25. Comparison of garbage-fed with grain-fed hogs.

Industrial Wastes

The Disposal of Industrial Wastes, Jacob L. Crane, Jr. Am. Industries, vol. 19, no. 12, July 1919, pp. 22-24. Fundamentals in solution of problem and remarks on attitude of law and recent developments in this direction.

Refuse Collection

Organization for Refuse Collection. Mun. Jl. & Public Works, vol. 47, no. 2 & 3, July 12 & 19, 1919, pp. 16-19 & 35-37, 4 figs. Study of operation and efficiency of existing plant at Rochester and recommended organization of Bureau of Sanitation. (Continued.)

Refuse Collection in Rochester. Mun. Jl. & Public Works, vol. 46, no. 26, June 28, 1919, pp. 464-466, 2 figs. Report of Bureau of Municipal Research. (To be continued.)

Sanitation and Mortality Rates

Reducing the Mortality Rate by Sanitation (Diminución de la mortalidad por el saneamiento), George A. Soper. Ingeniería Internacional, vol. 2, no. 1, July 1919, pp. 29-32, 4 figs. Illustrating sanitary measures conducted in representative European cities.

Sewage

Indianapolis Sewage Purification Plant, Edwin C. Hurd. Fire & Water Eng., vol. 66, no. 5, July 30, 1919, pp. 250-251, 1 fig. Inverted siphon used to convey sewage under river.

The Utilization of Sewage Sludge, John D. Watson. Surveyor, vol. 56, no. 1433, July 4, 1919, pp. 5-8, 1 fig. Diagram illustrating method of purifying sewage at Birmingham. Paper presented at annual meeting of Instn. of Municipal and County Engrs.

Some Unusual Sewerage Problems and How They Were Solved at Ocean Beach, New York, Andrew J. Provost, Jr. Mun. & County Eng., vol. 56, no. 6, June 1919, pp. 203-205, 7 figs. Precautions taken to prevent excessive infiltration of ground water into sewers through joints and at manholes.

SURVEYING

Classification of Lands

Classification of Lands, L. Brenot. Annual Report of Assn. of Dominion Land Surveyors, January 29, 30 and 31, 1919, pp. 51-56. Methods of classifying land for soldiers' settlement.

Highway Surveying

Surveying for Highway Improvement, F. G. Phillips. Good Roads, vol. 18 (new series), no. 2, July 9, 1919, pp. 11-12, 1 fig. Advises making thorough survey of road that is to be rebuilt and resurfaced.

Maps, Military

The Military Mapping Problem in the United States, R. C. Kuldell. Prof. Memoirs, Corps Engrs. U. S. Army & Engr. Dept., vol. 11, no. 56, Mar-Apr. 1919, pp. 229-244, 2 figs. Advocates making all military maps of the U. S. as complete as A. E. F. found available in France. System of scales for both metric and English systems is suggested.

Photographic Surveying

New Method in Photogrammetry, Robert Heindl. Sci. Am. Supp., vol. 88, no. 2272, July 19, 1919, pp. 44-47, 21 figs. Offered as accurate and convenient method for photographic surveying with any camera. Translated from Archive für Kriminal-Antropol. u. Kriminalistik, 1916.

Rod for Triangular Work

Topographical Surveying on Atacama Desert in Chile, B. L. G. Rees. Eng. News-Rec., vol. 83, no. 5, July 31, 1919, pp. 224-226, 2 figs. Special rod designed for triangulation work.

WATER SUPPLY

Artesian Wells

Artesian Well Supply at Baton Rouge, La., L. R. Howson. Eng. & Contracting, vol. 52, no. 2, July 9, 1919, pp. 40-41, 2 figs. Consists of 915 ft. of 12-in., 934 ft. of 10-in., 44 ft. of 8-in. casing, and a 70-ft. strainer. Paper read before Am Water Works Assn.

Chlorination

Chlorination in West Virginia. Mun. Jl. & Public Works, vol. 47, no. 2, July 12, 1919, pp. 20-22. Reported results of disinfection in lowering typhoid rates.

See also Filtration Plants.

Contamination

Contamination of Bello Springs of Matanzas Aqueduct (La contaminación de los manantiales de Bello del Acueducto de Matanzas), Jose M. Cadenas. Revista de la Sociedad Cubana de Ingenieros, vol. 11, no. 6, June 1919, pp. 259-270. Survey undertaken to determine cause of contamination.

Corrosion, Elimination of

The Chemical Treatment of Corrosive Cooling Water. W. O. Andrews. Jl. of South African Instn. of Engrs, vol. 17, no. 11, June 1919, pp. 239-244 and (discussion) pp. 244-246, 5 figs. Forms of rapid corrosion observed by Victoria Falls and Transvaal Power Co. and causes to which they attribute them.

Covering Water Basins

The Need and Cost of Covering the Clear Water Basins of the St. Louis, Missouri Water Works, Cornelius M. Daily. Mun. & County Eng., vol. 57, no. 1, July 1919, pp. 42-44, 1 fig. Typical sections of proposed cover.

Filtration Plants

The Design and Operation of the Water Filtration Plant at Camp Meade, Maryland, C. R. Potteiger. Mun. & County Eng., vol. 57, no. 1, July 1919, pp. 33-38. Design of rapid sand-filter plant.

Point St. Charles Filtration Works, Montreal. Can. Engr., vol. 37, no. 4, July 24, 1919, pp. 155-160, 8 figs. Efficiencies during last nine months claimed to be from 96.2 per cent to 99.1 per cent without chlorination and from 98.1 per cent to 99.8 per cent with chlorination.

Army Water Purification Units, William J. Orchard. Fire & Water Eng., vol. 66. no. 4, July 23, 1919, pp. 185-187, 4 figs. Motor-driven water trucks for chlorinating and filtering supply for A. E. F.

Gallery Collection System

The Gallery Collecting System of the Des Moines (Ia.) Water Co. Eng. & Contracting, vol. 52, no. 2, July 9, 1919, pp. 32-34, 7 figs. Water is obtained primarily from Raccoon River. Drainage area 3677 sq. miles above city.

Madison Water Works

The New Madison Water Works. Power, vol. 50, no. 4, July 22, 1919, pp. 128-133, 8 figs. Building new plant over old one while maintaining service. Choice of artesian or lake water and comparative costs.

Metering

Water Waste Control by House Inspections with District Metering, E. D. Case. Can. Engr., vol. 37, no. 4, July 24, 1919, pp. 163-165. Results obtained by pitometer at various cities. Paper read before Southwestern Water Works Assn.

Pitometer Surveys

Reduction of Water Consumption by Means of Pitometer Survey and Constant Inspection at Buffalo, N. Y., George C. Andrews. Mun. & County Eng., vol. 56, no. 6, June 1919, pp. 236-240.

See also Metering.

Purification of Water

See Filtration Plants.

Water Softeners

English and American Water Softeners. Power House, vol. 12, no. 10, July 5, 1919, pp. 278-280, 5 figs. Description of various types.

Water Testing

Water Testing Stations, W. T. McClenahan and R. S. Rankin. Fire and Water Eng., vol. 66, no. 2, July 9, 1919, pp. 63-65, 1 fig. Result of tests at Whiting Testing Station. Paper read before Am. Water Works Assn.

HYDRAULIC ENGINEERING

Spillways

Spillway Capacities Required for Reservoirs in Western United States, John T. Whistler. Eng. News-Rec., vol. 83, no. 1, July 3, 1919, pp. 28-32, 1 fig. Said to be based on a study of the flood discharges of 402 North American and 60 European and Indian records, with curves of probable flood discharges for far-western streams.

Thunderstorms and Storm Sewers

Some Broader Aspects of Rain Intensities in Relation to Storm Sewer Design, Robert E. Horton. Mun. & County Eng., vol. 56 & 57, no. 6 & 1, June and July 1919, pp. 218-222 & 3-9, 16 figs. Comparative study of rain-intensity formulæ with a view to determining what, if any, general relations exist between rain intensity and the various meteorological factors to which it is related. Simpson's theory of thunderstorm.

MUNICIPAL ENGINEERING

City Planning

Actual Accomplishments in City Planning in America, Andrew Wright Crawford. Jl. Engrs. Club of Philadelphia, vol. 36, no. 177, August 1919, pp. 291-299, 11 figs. Examples of improvements at various cities.

Town-Planning and Tramways. Tramway & Railway World, vol. 45, no. 30, June 19, 1919, pp. 309-311, 3 figs. Tramways on special track in parkway free from obstruction, as proposed at Dundee.

Bolton's Housing Problems—Past, Present and Future, E. Morgan. Surveyor, vol. 55, no. 1431, June 20, 1919, pp. 462-464, 4 figs. Bolton Corporation Act gives powers to insist upon intersecting street at every 200 ft. and forbids construction of blocks of buildings exceeding this length.

VARIA

Architects, Registration of

Model Form of Law for the Registration of Architects. Jl. Am. Inst. Architects, vol. 7, no. 7, July 1919, pp. 335-338. Regulation by State legislation of practice of architecture is proposed at annual convention of Am. Inst. of Architects.

Contract Work, Methods of Letting

Advantages and Disadvantages of Various Methods of Letting Contract Work, J. A. L. Waddell. Eng. & Contracting, vol. 52, no. 4, July 23, 1919, pp. 89-90, 1 fig. Diagram Indicating basis for division of profits between contractor and client.

Storage Tanks, Moving

Moving 60-Ft. Oil Storage Tanks 150 Miles by Water, A. J. J. Taylor. Can. Engr., vol. 37, no. 1, July 3, 1919, pp. 107-108, 7 figs. Each tank was moved in one piece.

Mining Engineering

BASE MATERIALS

Sands

The Texture of Sands. Nature vol. 103, no. 2590, June 19, 1919, pp. 315-317, 3 figs. Diameter obtained by plotting great sizes horizontally at distances proportional to their logarithms.

COAL AND COKE

Alaska

Methods for more efficiently utilizing our Fuel Resources—XXIX. The Coal Resources and Transportation Facilities in Alaska, F. P. Coffin. Gen. Elec. Rev., vol. 22, no. 7, July 1919, pp. 517-535, 7 figs. Alaskan coal fields contain the only accessible deposits of high-grade semi-bituminous coal on the shores of Pacific Ocean, as well as extensive deposits of lignite.

Bituminous Coal

A Chemical Investigation of Banded Bituminous Coal, Studies in the Composition of Coal, Frederick Vincent Tideswell and Richard Vernon Wheeler. Jl. Chem. Soc., vol. 115 and 116, no. 680, June 1919, pp. 619-636, 2 figs. In banded Hamstead coal investigated, it is claimed that ingredients show differences which grade them in fusain, durain, clarain and vitrain.

Preparation of Bituminous Coal—VII, Ernst Prochaska. Coal Age, vol. 16, no. 3, July 17, 1919, pp. 96-103, 7 figs. Considers advantageous to drive machines of washery in groups with larger units driven individually. It is noted that buildings should preferably be of steel, although wood and reinforced concrete are often employed.

Bunker Coal

A British System of Unloading, Stocking and Reclaiming Bunker Coal, H. Hubert. Coal Trade Jl., vol. 50, no. 29, July 16, 1919, pp. 865-866, 2 figs. System of bunkering with steam cranes described as being capable of handling 74 tons per hr.

Coal, Geology of

Résumé of Theories of the Origin of Coal, C. W. Hippard. Coal Age, vol. 16, no. 3, July 17, 1919, pp. 104-104. As some theories hold that beds now rest where vegetable matter from which they were formed originally grew, while others believe that beds are result of drift, writer, who finds arguments advanced in support of either hypothesis of value, concludes that it is quite probable that all coals were not formed by identical process.

Research on the Constitution and Origin of Coal, A. C. Fieldner. Gas Age, vol. 44, no. 2, July 15, 1919, pp. 45-49, 18 figs. Microphotographs taken at Pittsburgh Bur. of Mines Research Laboratory, with notes on practical investigation of microscopical examination.

The Formation of Coal, J. D. Kendall. Can. Min. Inst. Bul., no. 87, July 1919, pp. 761-778, 13 figs. Geology of English coal fields. (Continuation of serial.)

Coal Industry Commission

The Coal Industry Commission. Reports on Nationalism. Colliery Guardian, vol. 117, no. 3052, June 27, 1919, pp. 1541-1546. Quoting reasons for State ownership of coal royalties, suggested method of purchase and carrying account of coal mines, and proposed scheme for local administration.

Coal Mining and Rock Structure

The Effect of Coal Mining on the Overlying Rocks and on the Surface, W. D. Lloyd. Tran. Instn. Min Engrs., vol. 57, part 2, May 1919, pp. 74-95, and (discussion) pp. 95-100. Summary of theories which have been put forward and of opinions which have been expressed by various investigators.

Coke from Illinois Coal

Metallurgical Coke from Illinois Coal, R. S. McBride and W. A. Selvig. Iron Age, vol. 104, no. 5, July 31, 1919, pp. 283-286, 4 figs. Operating test at St. Paul plant of Minnesota By-Product Coke Co. conducted by Bureaus of Standards and Mines.

Coke Ovens

Coke Ovens (Koksöfen), E. Locoq and J. Pieters. Feuerungstechnik, vol. 7, no. 12-13, Mar. 15, April 1, 1919, pp. 95-96 & 101-104, 2 figs. Heat required for distillation; by-product yield; calculation of distribution of gases on walls of coke oven. The development of the coke oven. (Concluded.)

Coke-Plant Equipment

Clairton By-Product Coke Plant Equipment—II Frank F. Marquard. Blast Furnace & Steel Plant, vol. 7, no. 7, July 1919, pp. 340-342 & 358, 1 fig. Coal Industry, vol. 2, no. 7, July 1919, pp. 284-287, 1 fig, also chart showing operating organization of coke works.

Coking Capacity

The Coking Capacity of Coals, A. Meurice. Colliery Guardian, vol. 117, no. 3052, June 27, 1919, pp. 1559-1560, 1 fig. Practical commercial tests said to have proven that value of coking coals is directly proportional to their index limit of agglutination. From Annales des Mines de Belgique.

Depreciation

Depletion and Depreciation of Coal-Mining Properties. D. C. Burdick. Coal Age, vol. 16, no. 5, July 31, 1919, pp. 185-187. Writer's opinion is that charges should be graduated and of such amount that total investment may be extinguished when property is worked out.

France

The French Coke Problem, N. C. Berethelot. Colliery Guardian, vol. 117, no. 3050, June 13, 1919, pp. 1415-1416. Suggests as model specification for coking plant attached to works comprising blast furnaces, that surplus gas from the latter be used to heat the coke ovens, while coke-oven gas of 4000 calories be utilized in matallurgical furnaces. Translated from Chimie et Industrie.

Gas Exhausters

Gas Exhauster in Coke-Oven Plants (Gassauger in Koksofenanlagen). B. Schapira. Fenarungstechnik, vol. 7, no. 12, Mar. 15, 1919, pp. 93-94. Special reference is made to the Brown-Boveri and C. H. Jaeger types turbo-gas exhauster and also to the fan gas exhauster of the Berlin-Anhaltische Maschinenbau Gesellschaft.

Gas from Broken Coal

Effect of Breaking of Coal on the Emission of Gas, Robert Dunn. Coal Age, vol. 16, no. 1, July 3, 1919, p. 20. Daily sampling and analysis of mine air at Crow's Nest Pass Mine said to have shown that amount of gas in mine air changes but little and seems to bear no relation whatever to mining operations.

Impurities

Impurities in Raw Coal and Their Removal. Coal Age, vol. 16, no. 4, July 24, 1919, pp. 150-151. Limitations of three methods for removing impurities—hand-picking, mechanical shale pickers and coal washers.

Preparation

Preparation of Bituminous Coal—VI. Ernst Prochaska. Coal Age, vol. 16, no. 1, July 3, 1919, pp. 9-15, 5 figs. How, after coal has been washed, it must be freed from adhering moisture before it can be shipped. Draining bins, elevators, conveyors and centrifugal dryers as means for this purpose.

Pyrites

Valuable Pyrite in Illinois Coal Beds, G. H. Cady. Coal Age, vol. 16, no. 4, July 24, 1919, pp. 136-140, 9 figs. Defines various types of pyrite and their modes of occurrence, and shows in what beds and sections these types may be most generally found

Saar Basin

Problem of the Great Saar Coal Basin, Wilbur Greely Burroughs. Coal Industry, vol. 2, no. 7, July 1919, pp. 268-274, 1 fig. With reference to its political, economical and geological value.

Shaft Mine

Modern Shaft Mine at Amsterdam, Ohio. Jack L. Ball. Coal Age, vol. 10, no. 2, July 10, 1919, pp. 46-47, 2 figs. Coal mine. Capacity of mine is 800 tons a day.

Splitting of Coal Seams

On the Splitting of Coal-Seams by Partings of Dirt I, Percy Fry Kendall. Proc. Midland Inst., Min., Civil & Mech. Engrs., vol. 24, no. 4, 1918, pp. 104-119, and (discussion) pp. 119-123, 10 figs, partly on supp. plate. Evidence in support of theory that linear splits in coal-seams that rejoin are erosion phenomena and not, as Bowman supposed, tectonic in origin.

Stripping

Operating a Coal-Stripping Plant in Ohio. S. B. Creamer. Coal Age, vol. 16, no. 4, July 24, 1919, pp. 134-135, 3 figs. Overburden handled by shovel entirely. Suggestions are made for stripping by this method.

Thickener, Dorr

Use of the Dorr Thickener and Classifier in Coal Preparation, John Griffen. Coal Age, vol. 16, no. 4, July 24, 1919, pp. 146-148, 2 figs. Principles of construction and operation. Dorr continuous thickener is used for collection and dewatering of fine solids mixed or suspended in liquid.

Washing

The Examination of Coal in Relation to Coal Washing. M. Wynter Blyth and L. T. O'Shea. Iron & Coal Trades Rev., vol. 98, no. 2677, June 20, 1919, pp. 852-853. Suggests that purity of washed coal to be used for coking should be judged by its ash content as determined by incineration.

Washington (State)

The Coal Fields of Southwestern Washington, Harold E. Culver. Wash. Geol. Survey, bul. no. 19, Jan. 2, 1919, 155 pp., 36 figs., partly on supp. plates. General geological features; details of various areas and remarks on utilization of coals.

COPPER

Milling, Lake Superior

Developments in Lake Superior Milling, C. H. Benedict. Eng. & Min. Jl., vol. 108, no. 1, July 5, 1919, pp. 5-10, 8 figs. Two types of copper ore are mined in region—conglomeratic ore which is hard, close-grained rhyolite, characteristically composed of pebbles with copper as cementing material, and amygdaloidal ore, in which copper occurs in more massive form. Methods of dressing and leaching as required by these two types are described.

EXPLOSIVES

Blasting Equipment

Electric Blasting Equipment, L. D. Rowen. Eng. & Min. Jl., vol. 108, no. 2, July 12, 1919, pp. 45-46, 1 fig. Dependability and conditions under which electric detonating cap can be used.

Electric Priming in Mines (Note sur le tir électrique). MM. Taffanel, Dautriche, Durr and Perrin. Annales des Mines, vol. 7, no. 11, Apr. 1919, pp. 6-124, 13 figs. Composition and properties of powders used for inflammation and electrical features of inflammator. (To be continued.)

Permissible Explosives

Tests and Comparisons of Various Types of Permissible Explosives, Joseph C. Thompson. Coal Age, vol. 16, no. 3, July 17, 1919, pp. 94-95. Notes tests used by Bureau of Mines to establish permissible explosives. Comparison is made of black powder and some permissible explosives and several classes of permissibles are discussed.

Priming

See Blasting Equipment.

Storage

Regulations Governing Storage of Explosives. (Réglementation des dépots de substances explosives). Comité Central des Houillères de France et Chambre Syndicale Française des Mines Métalliques. Notes Techniques, no. 384, June 1, 1919, pp. 19-63. With provisions in regard to sales and importation of dynamite and other nitroglycerine explosives.

Storing and Handling High Explosives During the War, G. C. Munoz. Eng. News-Rec., vol. 82, no. 26, June 26, 1919, pp. 1242-1246, 9 figs. Methods developed by Ordnance Department.

TNT

TNT as a Blasting Explosive, Charles E. Munroe and Spencer P. Howell. Can. Engr., vol. 37, no. 4, July 24, 1919, pp. 170-172 and 174. Industrial use, general characteristics, solubility and hygroscopicity grade of determination, precaution in packing, and remarks on practical field demonstrations.

GEOLOGY AND MINES

Amber

Amber and Its Origin, George F. Black. Am. Mineralogist, vol. 4, no. 7, July 1919, pp. 83-85. Geology of Samland peninsula, East Prussia. (To be continued.)

Barite, Stalactitic

Stalactitic Barite from Madoc, Ontario, T. L. Walker. Am. Mineralogist, vol. 4, no. 7, July 1919, pp. 79-80, 1 fig. on supp. plate. Outer surface formed by projecting ends of small crystals arranged in radial fashion with macro-axis of tiny crystals approximately parallel to axis of aggregate.

Colorado Rockies

The Building of the Colorado Rockies—II. Rollin T. Chamberlin. Jl. Geology, vol. 27, no. 4, May-June 1919, pp. 225-251, 10 figs. System is characterized by open, gentle folding, moderate crystal shortening affecting a zone several scores of miles in depth in its deeper portions by strong uplifting and by extrusion of much lava.

Earthquakes

Surface Reflexion of Earthquake Waves, George W. Walker. Phil. Tran. Roy. Soc. Lond., Series A 567, vol. 218, June 12, 1919, pp. 373-393, 8 figs. partly on two supp. plates. Investigation undertaken to study sharp impulses noted on seismograms, which in Wichert's opinion represent arrival of waves that have undergone one or more reflexions at earth's surface.

Florida

Geology in Florida, E. H. Sellards. Jl. Geology, vol. 27, no. 4, May-June 1919, pp. 286-302, 3 figs. partly on supp. plate. General structural conditions.

Foliation and Metamorphism

Foliation and Metamorphism in Rocks, T. G. Bonney. Geological Mag., vol. 6, no. 6, June 1919, pp. 246-250. Pressure-modified gneisses and schists. (Concluded.)

Manganotantalite

Manganotantalite from Amelia, Virginia, O. Ivann Lee and Edgar T. Wherry. Am. Mineralogist, vol. 4, no. 7, July 1919, pp. 80-83, 1 fig. Physical properties of deep red columbite containing manganese in excess over iron and tantalum slightly in excess over columbium.

Metamorphism

See Foliation and Metamorphism.

Mud Volcanoes

Mud Volcanoes in Colombia, South America, Stanley C. Herold. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 151, July 1919, pp. 1025-1027, 2 figs. Their occurrence in faulted localities used as basis of explanation of their origin.

Pre-Cambrian

Some Stratigraphic and Structural Features of the Pre-Cambrian of Northern Quebec—III, H. C. Cooke. Jl. Geology, vol. 27, no. 4, May-June, 1919, pp. 263-275. Petrographical similarities, geological successions, deformations and relation to older and younger formations as criterion for correlation.

Some Problems of the Adirondack Precambrian, Harold L. Alling. Am. Jl. Sci., vol. 48, no. 283, July 1919, pp. 47-68, 3 figs. Following are some of points brought out as consequence of investigation: That Greuville strata have been extensively isoclinally folded; that individual phases of Saranac series may be some one or other of well recognized rock units, and establishment of metagabbro closely following intrusion of Laurentian granite.

Rock Composition Determination

A Planimeter Method for the Determination of the Percentage Compositions of Rocks, Albert Johannsen. Jl. Geology, vol. 27, no. 4, May-June 1919, pp. 276-285, 6 figs. Based on claimed proportionality of surface measurements to volumes in any uniform, non-banded rock, irrespective of shape of individual components.

IRON

Great Britain

Recent Iron-Ore Deevlopments in the United Kingdom, F. H. Hatch. Iron & Coal Trades Rev., vol. 98, no. 2676, June 13, 1919, pp. 795-796, 2 figs. Working of low-grade iron-ore deposits as influencing industrial recuperation. From lecture delivered at Roy. School of Mines.

Nova Scotia

The Iron and Coal Industry in Nova Scotia, F. W. Gray. Iron & Steel of Can., vol. 2, no. 7, July 1919, pp. 152-153. Economical conditions. Paper read before Montreal Metallurgical Assn.

LEAD, ZINC, TIN

Lead and Vanadium

Treatment of Vanadinite for the Recovery of Lead and Vanadium Metallurgically, J. E. Conley. Metal Industry, vol. 14, no. 26, June 27, 1919, pp. 521-524, 2 figs. Results of methods which are said to have proven successful in recovering lead from vanadinite and fusion with caustic soda and soda ash; recovery by solution.

Spelter

The Spelter Industry in Australia and Britain, F. A. Govett. Steel & Metal Digest, vol. 9, no. 7, July 1919, pp. 344-346. Statistics and account of projected increases of various plants.

Vanadium

See Lead and Vanadium.

Zinc

War's Influence on the Zinc Industry, Pope Yeatman. Eng. & Min. Jl., vol. 108, no. 1, July 5, 1919, pp. 19-21. Development of new uses of zinc; coöperation between miner and smelter. See also Spelter.

MAJOR INDUSTRIAL MATERIALS

Manganese

Manganese Deposits of the West Foot of the Blue Ridge, Virginia, G. W. Stone, H. D. Miser, F. J. Katz and D. F. Hewett. Virginia Geological Survey, Univ. of Va., Bul. no. 17, 1919, 166 pp., 38 figs. Based on examination of mines and prospects and studies of physiographic and stratigraphic conditions under which manganese deposits of region were formed, and of application of hypothesis proposed by D. F. Hewett for discovery of new ore deposits.

Preparation of Manganese Ore, W. R. Crane. Dept. Interior, Bur. of Mines, Minerals Investigations Series, no. 17, May 1919, 16 pp. Including summary of conditions affecting concentration.

Nickel

Treatment of Low-Grade Nickel Ores, C. W. Davis. Jl. Indus. & Eng. Chem., vol. 11, no. 7, July 1, 1919, pp. 644-648. No satisfactory concentration of ores was obtained by sizing tests, panning, tabling, magnetic concentration, or flotation. Magnetic treatment of reduced North Carolina ore brought concentration of nickel from 0.97 per cent to 3.6 per cent, recovery being 45 per cent.

MINES AND MINING

Apex Law

A Phase of the Apex Law, Chas. E. Dutton. Eng. & Min. Jl., vol. 108, no. 4, July 26, 1919, pp. 146-147. Examples quoted in support of contention that its application has operated to thwart development.

Concentration, Magnetic

Treatment of Low-Grade Iron Minerals by Magnetic Concentration (Le traitement des minérais de fer pauvres par concentration magnétique), Henry Louis. Chimie & Industrie, vol. 2, no. 5, May 1919, pp. 511-524, 20 figs. Description of process with illustration of machines employed and diagrammatic sketch indicating order of procedure in successive operations. Paper read before Interallied Conference of Chemistry.

Costs, Mining

Excerpts from Reports of Mineral Investigations of the Bureau of Mines for June, 1919. Dept. of Interior, Bur. of Mines, 1919, 50 pp., 1 fig. Covering production and cost data and mining situation in regard to labor and mining methods in various industries.

Diamond Drill Exploration

Progress in Methods of Exploration, Hugh M. Roberts. Min. & Sci. Press, vol. 119, no. 20, July 12, 1919, pp. 55-57. Tracing particular claim in increasing effectiveness of diamond-drill as exploring instrument.

France, Mining Law

New French Mining Law. Colliery Guardian, vol. 98, no. 3053, July 4, 1919, pp. 29. Provides profit-sharing scheme.

Hydraulic Mining

Hydraulic Mining in California With Special Reference to the You Bet Mine, F. A. Goodale. Colo. School Mines Mag., vol. 9, no. 7, July 1919, pp. 167-173, 2 figs. Including example of calculations involved in determining size and grade of sluice.

Mill, Ball and Tube Drives

Ball and Tube-Mill Drives at the Rochester Combined Mill, K. Freitag. Min. & Sci. Press, vol. 119, no. 1, July 5, 1919, pp. 7-8, 1 fig. Arrangement in two units, each composed of one 6 ft. by 4 ft. 6 in. ball mill and one 7 by 12 ft. tube mill.

Mine Examination

Proper and Lawful Examination of a Mine by the Mine Examiner, Steve Gosnell. Coal Age, vol. 16, no. 1, July 3, 1919, pp. 18-19. Calls attention to the fact that an inspection may be entirely legal but not adequate and recommends that examiner, while making his daily inspection, should not confine his activities to a perfunctory accomplishment of legal prescriptions.

Nevada Packard

Description of Nevada Packard Mine and Mill, Herbert C. Thomson. Salt Lake Min. Rev., vol. 21, no. 6, June 30, 1919, pp. 21-24, 4 figs. Said to consist of series of rhyolite flows, with several intercalated beds of rhyolite stuff, the latter deposited in water, and grading imperceptibly into true shales: they are probably of Jurassic age.

Power Transmission

Electrical Transmission of Power in and About Coal Mines, S. W. Farnham. Coal Age, vol. 16, no. 2, July 10, 1919, pp. 48-51. Types of mine loads to be considered and survey of practice in regard to methods of transmission. Paper read before Ill. Min. Inst.

Rock Drills

Pneumatic-Electric Rock Drill and Some of the Tools Used in Its Construction—I, Frank A. Stanley. Am. Mach., vol. 51, no. 3, July 17, 1919, pp. 107-110, 10 figs. Machine which is claimed to provide for air cushion for minimizing shock on electrical apparatus.

Sealing Up

Sealing Up Old or Abandoned Workings, Joseph C. Thompson. Coal Industry, vol. 2, no. 7, July 1919, pp. 259-260. Suggests method of procedure. Paper presented before annual meeting of Ill. Min. Inst.

Shaft Sinking

Sinking and Concreting Deep Mine Shaft. Contract Rec., vol. 33, no. 28, July 9, 1919, pp. 674-677, 4 figs. Lining and walls of four compartment shaft, 936 ft. deep, concreted simultaneously with excavation operations.

MINOR INDUSTRIAL MATERIALS

Graphite

The Graphite Situation, Hugh S. Spence. Can. Chem. Jl., vol. 3, no. 7, July 1919, pp. 213-216. Summary of situation as faced by Canadian producers with review of development of present process of recovery and discussion of market conditions.

Graphite Mining and Milling in Alabama, H. P. H. Brumell. Eng. & Min. Jl., vol. 108, no. 1, July 5, 1919, pp. 17-18. Flotation methods reported as successful.

Magnesium and Sodium Salts

Natural Deposits of Salts of Magnesium and Sodium Near Clinton, British Columbia, L. Reinecke. Can. Chem. Jl., vol. 3, no. 7, July 1919, pp. 209-213, 5 figs. Descriptive and historical. (Continued.)

Sodium

See Magnesium and Sodium.

OIL AND GAS

Appalachian

Depletion of Natural Gas in the Applachian Field, J. A. Bownocker. Gas Age, vol. 44, no. 2, July 15, 1919, pp. 57-60, 8 figs. Situation is seen fairly satisfactory for present but is considered as uncertain for future.

Conducting

Irvine Oil District, Kentucky, Stuart St. Clair. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 151, July 1919, pp. 1079-1089, 1 fig. Calls attention to probability that area of production from Irvine sand in eastern Kentucky is a function of the distance from the outcrop of the oil formation and from the major faults.

Drilling

Percussion Plant for Oil Well Drilling. Eng., vol. 108, no. 2792, July 4, 1919, pp. 830-833, 15 figs. Differences in various systems—American, standard or Californian and Canadian. Paper presented to Inst. of Petroleum Technologists.

Great Britain

The Search for Subterranean "Oil-pools" in the British Isles, V. C. Illing. Geological Mag., vol. 6, no. 7, July 1919, pp. 290-301, 1 fig on supplement plate. Evidence brought forward in favor of possible occurrence of oil pools in Great Britain studied in its geological aspect. Conclusions are generalized in regard to possibility of ascertaining existence of oil in a locality from knowledge of geological formation.

Sections of English Oil Wells. Petroleum World, vol. 16, no. 226, July 1919, pp. 293, 2 figs. Hardstoff where oil is flowing and Brimington where next strike for oil is expected.

Oil Accumulation

Notes on Principles of Oil Accumulation, Alex. W. McCoy. Jl. Geology, vol. 27, no. 4, May-June 1919, pp. 252-262, 6 figs. Experiments are offered to substantiate conclusion that bituminous shales are in close relationship with producing sand of oil field. It is asserted that this bituminous material is in solid form and is only changed to petroleum in local areas of differential movement, accumulation of oil in commercial pools being accomplished by capillary water after such a change is made.

Petroleum Refining

Petroleum Refining, R. W. Cunningham. Jl. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp. 78-82 and (discussion) pp. 82-84, 4 figs. Charts showing products obtained in running distillation of oil for petroleum coke and for cylinder stock with notes on oil testing instruments.

Water Sealing

Sealing Water in California Oil Fields, Seth S. Langley. Eng. & Min. Jl., vol. 108, no. 1, July 5, 1919, pp. 11-16, 4 figs. Formation and cement shut-off methods.

Water Separation

Separating Water from Petrol. Petroleum World, vol. 16, no. 226, July 1919, pp. 304-305, 2 figs. Device which is said to be more particularly applicable to (1) buried gasoline storage tanks, and (2) portable tanks.

PRECIOUS MINERALS

Cariboo

Cariboo Placers and Lodes, J. A. Macpherson. Min. & Eng. Rec., vol. 24, nos. 8 & 9, May 1919, pp. 125-129, 9 figs. Concerning conditions, ore treatment and transportation costs.

Gold

Operations of Round Mountain Mining Company, Charles F. Spilman. Salt Lake Min. Rev., vol. 21, no. 7, July 15, 1919, pp. 23-26, 5 figs. Gold deposits.

Oregon

Placer Mining in Oregon, A. E. Kellogg. Eng. & Min. Jl., vol. 108, no. 3, July 19, 1919, pp. 90-91, 1 fig. Geology of Waldo district.

Platinum

The Platinum Situation, James M. Hill. Eng. & Min. Jl., vol. 108, no. 4, July 26, 1919, pp. 131-137, 4 figs. Uses of platinum and possibilities for maintaining supplies. Shortage in platinum and platinum group of metals attributed to disturbances of normal production created by war.

Silver

Silver Spur Mine, Lionel C. Ball. Queensland Dept. of Mines, Geological Snvey. No. 264, 1918, 36 pp., 13 figs. Recent developments and future prospecting.

Silver Volatilization in Smelting, Frederic P. Dewey. Eng. & Min. Jl., vol. 108, no. 3, July 19, 1919, pp. 87-89. Distinguishes between volatilization and dusting and points out that mechanical loss due to ebullition has nothing to do with the vapor pressure, or true volatilization.

SAFETY ENGINEERING

Fires

Use of Inert Gas to Extinguish Mine Fire, Joseph J. Walsh. Coal Industry, vol. 2, no. 7, July 1919, pp. 266-267, 1 fig. Applicability in extinguishing crop fires or those at inaccessible points.

TRANSPORTATION

Belgium

Underground Transportation (Les transports souterrains), F. Defize. Revue Universelle des Mines & de la Métallurgie, vol. 1, no. 1, Jan. 1919, pp. 70-117, 6 figs. Comparative examination of various systems referring to conditions prevailing in Belgium mines.

Quarries

Transportation in Quarries, Daniel J. Hauer. Cement, Mill and Quarry, vol. 15, no. 2, July 20, 1919, pp. 19-20, 3 figs. Illustrating track layouts for inclines in pit quarries that are worked in two or more lifts.

Rails, Mine, Bonding of

Importance of Proper Bonding of Mine Rails, C. C. Beck. Coal Age, vol. 16, no. 3, July 17, 1919, pp. 90-93, 22 figs. Type of bond employing terminals welded to rail ends recommended.

VARIA

Germany

Economical Situation of the Basic Steel Works in Germany, Belgium and France (Situation économiques des aciéries au conver-

tisseur basique en Allemagne, en Belgique et en France), Fernand Tordeur. Revue Universelle des Mines & de la Métallurgie, vol. 1, no. 1, Jan. 1919, pp. 1-69. Discusses application of modern methods as economical factor for developing industry.

Public Control

State Versus Private Control of Mines and Minerals. Can. Min. Inst. Bul., no. 87, July 1919, pp. 697-701. Based on evidence before British Coal Industry Commission.

Metallurgy

ALUMINUM

Aluminum-Copper-Magnesium Alloys

Constitution and Metallography of Aluminum and Its Light Alloys with Copper and with Magnesium, P. D. Merica, R. G. Waltenberg and J. R. Freeman. Bul. Am. Inst. Min & Metallurgical Engrs., no. 151, July 1919, pp. 1031-1049, 28 figs. Temperature solubility curves of $CuAl_2$ and of Mg_4Al_3 in aluminum obtained by method of annealing and microscopic examination.

Lynite

Aluminum Alloy Combines Strength with Toughness. Automotive Indus., vol. 41, no. 3, July 17, 1919, pp. 108-109, 4 figs. Tests on lynite alloy said to have indicated that this material may be applied in parts subjected to shock, such as axle housings and differential carriers.

Mechanical Properties

Mechanical Properties and Resistance to Corrosion of Rolled Light Alloys of Aluminum and Magnesium with Copper, Nickel, and Manganese, P. D. Merica, R. G. Waltenberg and A. N. Finn. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 151, July 1919, pp. 1051-1062, 3 figs. Light aluminum alloys of several compositions belonging to each of three series—aluminum-magnesium-copper, aluminum-magnesium-manganese, and aluminum-magnesium-nickel—were rolled out into sheets and tested on tension as cold-rolled, after annealing and after heat treatment.

BEARING METALS

Researches on Bearing Metals. Antimony, Lead, Tin Alloys, E. Heyn and O. Bayer. Metal Industry, vol. 15, no. 1, July 4, 1919, pp. 1-7, 17 figs. Investigation covered (1) chemical analysis of raw materials for preparation of alloys, (2) behavior during solidification and fusion, (3) influence of rate of cooling and subsequent heat treatment on microstructure and ball hardness, (4) mechanical properties, (5) experiments on effect of additions of copper on microstructure and melting point.

BLAST FURNACES

Design

The Principal Changes in Blast Furnace Lines. Iron & Coal Trades Rev., vol. 99, no. 2679, July 4, 1919, pp. 6-7, 6 figs. Review of developments during past twelve years, especially in regard to capacity leads to conclusion that 1,000-ton furnace will be attained, either along present lines or completely revolutionizing useful designs.

Explosions

Blast-Furnace Explosions, B. B. Hood. Eng. & Min. Jl., vol. 108, no. 2, July 12, 1919, pp. 47-49, 2 figs. Disastrous accident occurred when blowing engine was shut down, believed to have been due to leaky jacket permitting contact of water and hot coke, and consequent generation of water gas.

Pulverized Coal

Application of Pulverized Coal in Blast Furnaces, E. P. Mathewson and W. L. Wotherspoon. Can. Min. Inst. Bul., no. 87, July 1919, pp. 737-760, 11 figs. Experiments by various plants, notably Tennessee Copper Co., and International Nickel Co. smelters.

Steel Turnings in Blast Furnace

On the Utilization of Steel Turnings in the Blast Furnace. Engineering, vol. 108, no. 2793, July 11, 1919, p. 58. Practice at iron works in North of France. Translated from Comptes rendus de la Société de l'Industrie Minérale.

COPPER AND NICKEL

Electric-Furnace Smelting of Speiss

Smelting Copper Speiss in the Electric Furnace, P. Papencordt. Metal Industry, vol. 14, no. 25, June 20, 1919, pp. 502-504, 2 figs. Experiments said to have yielded copper matte containing merely traces of arsenic, speiss high in antimony but free from arsenic, slag and sublimate. (From Metall und Erz.)

Monel Metal

Some Facts About Monel Metal, Hugh R. Williams. Power, vol. 50, no. 1, July 1, 1919, pp. 14-16, 3 figs. Charts comparing behavior of monel metal and nickel steel; also of monel and other metals of high temperature.

FLOTATION

Concentrate Treatment

Considerations on the Treatment of Flotation Concentrate, Oliver E. Jager. Min. & Sci. Press, vol. 119, no. 20, July 12, 1919, pp. 43-44. States what changes, if any, must be made in smelting process and equipment, and what differences are to be expected in results, when considerable proportion of material to be treated consists of flotation concentrate. The question is taken up by assuming the case of a smelting plant having a concentrator, the whole being in operation, and that the latter is about to install flotation.

Copper Ores

Flotation Concentration of Copper Ores. Chem. Eng. & Min. Rev., vol. 11, no. 123, Dec. 5, 1918, pp. 68-72, 5 figs. Device installed at Wallaroo, Australia, mines concentrating plant to deal with overflow from mine.

Physics of Concentration

Concentration by Flotation (Concentración por flotación), Federico C. Fuchs. Boletin Minero de la Sociedad Nacional Mineria, vol. 31, no. 239, Jan. 1919, pp. 37-49. Experiments said to have established that phenomena taking place in concentration by flotation are principally those of capillarity, surface tension and molecular cohesion.

Recent Progress

Recent Metallurgical Progress, Hugh K. Picard. Eng. & Min. Jl., vol. 108, no. 2, July 12, 1919, pp. 65-69. Following progress emphasized: That flotation has revolutionized concentration; that zinc metallurgy has slightly advanced in smelting: that in copper, reverberatory practice and ammonia leaching are chiefly to be noted.

FURNACES

Booth Electric Brass Furnace

The Booth Electric Rotating Brass Furnace, Carl H. Booth. Metal Indus., vol. 17, no. 7, July 1919, pp. 317-319, 2 figs. Modified by placing door in one end of furnace and having tapping hole in other end, in order to overcome difficulties that have been experienced in maintaining lining around former combination spout and door.

Crucible Furnace

Crucible Furnace with Blower and Detachable Preheater (Gebläse-Tiegel-Schmelzofen mit aufgesetztem und wegnehmbarem Vorschmelzer). Metall-Technik, vol. 45, no. 7-8, Feb. 22, 1919, p. 28, 4 figs. Special feature claimed is arrangement for exhaust gases to escape from side of preheater instead of from center.

Design

Metallurgical Furnaces, A. Bregman. Metal Industry, vol. 14, no. 25, June 20, 1919, pp. 507-509, 5 figs. Conditions that govern size, shape and type of metal-melting furnace. (Concluded.)

Detroit Rocking Furnace

The Detroit Rocking Furnace for Melting Brass and Bronze, H. M. St. John. Metal Indus., vol. 17, no. 7, July 1919, pp. 320-322, 3 figs. Consists essentially of cylindrical steel shell with refractories, and mounted on rollers and ring gears which permit it to be rocked through any desired arc of revolution up to maximum of 200 deg.

Furnace Selection

Melting Process Chosen Depends on Requirements, H. E. Diller. Foundry, vol. 47, no. 326, July 1, 1919, pp. 411-415, 9 figs. Acid open hearth and converter both operated by Detroit Steel Casting Co. Illustration of application.

Pulverized Coal

The Use of Pulverized Coal, L. C. Harvey. Engineering, vol. 108, no. 2793, July 11, 1919, pp. 62-67, 5 figs. With special reference to its application in metallurgy. (To be continued.)

Reveberatory Furnaces

Continuous Overflow and Its Effect on the Slag Loss of Reverberatory Furnaces, Oliver E. Jager. Min. & Sci. Press, vol. 118, no. 26, June 28, 1919, pp. 875-876. Continuous flow considered as most important factor in reduction of slag-loss (particularly when using pulverized coal as fuel), because, it is argued, there is a better opportunity for any entrained metal to settle out of slag blanket.

Prolonging the Life of the Roofs of Reverberatory Furnaces at Anaconda, Oliver E. Jager. Min. & Sci. Press, vol. 119, no. 3, July 19, 1919, pp. 85-86, 3 figs. Ribs are built on roof; when this is burnt in, space between ribs is filled with brickwork, thus forming new roof on top of old one.

Slag in Electric Furnace

How Slag Influences Electric Steel, J. L. Dixon. Foundry, vol. 47, no. 327, July 15, 1919, pp. 483-484. Removal of first slag and making of second not considered necessary. Superiority of acid steel questioned.

IRON AND STEEL

Differential Crystallization

Differential Crystalliation in a Cast-Steel Runner, Francis B. Foley. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 151, July 1919, pp. 1117-1121, 4 figs. Photomicrographs of open-hearth runner metal, 2 in. in diameter, that had been fractured, presented as sample of cast-steel structure.

German Industry

Light on the German Iron and Steel Industry. Iron Age, vol. 104, no. 4, July 24, 1919, pp. 246-247. German views of stipulations of peace terms; study of wartime conditions of iron and steel industry; labor an obstacle to quick resumption of peace-time operations. Discussed in report of May meeting of the Verein Deutscher Eisenhüttenleute.

Graphitization

Graphitization in Iron-Carbon Alloys, Kunlchi Tawara and Genshichi Asahara. Foundry Trade Jl., vol. 22, no. 210, June 1919, pp. 398-401, 2 figs. Report of experiments made at Tokio University.

Magnet Steel

Steel for Magnets—III. Carbon. Mech. World, vol. 65, no. 1694, June 20, 1919, pp. 292-293, 1 fig. Magnetic materials and their composition. (Continuation of serial.)

Malleable Iron

Research Work on Malleable Iron, Enrique Touceda. Mech. Eng., vol. 41, no. 7, July 1919, pp. 593-600, 17 figs. Account of work undertaken during four years for American Malleable Castings Assn.

Oxygen in Cast Iron

Oxygen in Cast-Iron and Its Applications, Wilford L. Stork. Metal Trades, vol. 10, no. 7, July 1919, pp. 295-296. Offers evidence in support of theory developed by J. E. Johnson in regard to good effect of oxygen on cast iron. To be presented at September meeting of Am. Inst. Min. & Metallurgical Engrs.

Slag

The Acid Hearth and Slag, J. H. Whiteley and A. F. Hallimond. Eng., vol. 108, no. 2792, July 4, 1919, pp. 852-860, 26 figs. Records of observations and experiments dealing with microstructure of slag, structure of hearth and reaction occurring in molten slag. Paper presented before Iron & Steel Inst.

Tool Steel

Making High-Grade Tool Steel, John D. Knox. Iron Trade Rev., vol. 65, no. 3, July 17, 1919, pp. 153-157, 7 figs. Care exercised in cooling ingots after they are stripped. Importance of annealing and hardening processes.

Vanadium

Manufacture of Modern High Speed Steel, John A. Mathews. Iron Age, vol. 104, no. 1, July 3, 1919, pp. 17-20. Use of vanadium found as most notable change in recent years. Paper read before Am. Soc. for Testing Materials.

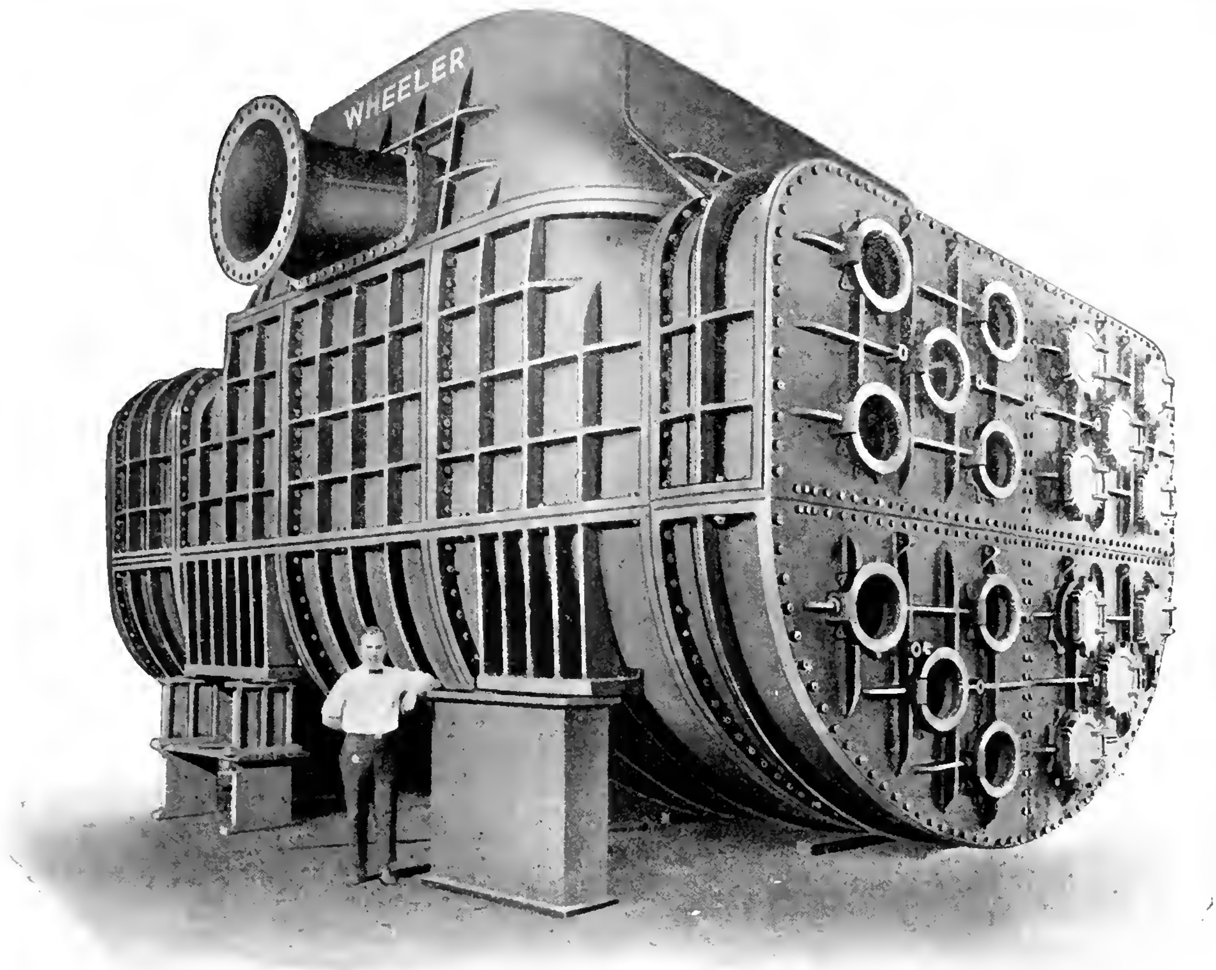
METALLOGRAPHY

Etching, Deep

Deep Etching and Rail and Forging Defects, F. M. Waring and K. E. Hofammann. Iron Age, vol. 104, no. 1, July 3, 1919, pp. 13-14 and (discussion) pp. 14-16, 7 figs. and Ry. Rev., vol. 65, no. 1, July 5, 1919, pp. 11-15, 10 figs. Investigation by means of deep etching with hot acid at Pa. R. R. laboratories said to have disclosed that interior defects appear to be more frequent in rails that had developed a number of transverse fissures than in others which had only a few or no such fissures. Paper read before Am. Soc. for Testing Materials.

Non-Ferrous Metals

Metallography Applied to Nonferrous Metals —VII, Ernest J. Davis. Foundry, vol. 47, no. 326, July 1, 1919, pp. 438-439, 3 figs. On deoxidation of metals and alloys by use of elements having strong affinity for oxygen.



We Are Now Building 16 Wheeler Condensers Like This

EACH CONDENSER CONTAINS APPROXIMATELY 50,000 Sq. Ft. OF SURFACE AND WEIGHS OVER 400,000 POUNDS

No condenser manufacturer has heretofore produced more than three or four units of this size in one year.

1000 MILES OF CONDENSER TUBING

For these 16 condensers 1000 miles or 1,700,000 lb. of Wheeler Crescent Brand tubing is required, an amount the large Wheeler tube mill easily produces in two months.

WHEELER CONDENSER & ENGINEERING CO.

CARTERET, N. J.

Aeronautics

AIRCRAFT (LIGHTER THAN AIR)

Airship Requirements

Lighter-than-Air Craft, T. R. Cave-Brown-Cave. Aviation, vol. 6, no. 11, July 1, 1919, pp. 585 & 588-591, 3 figs. Fabrics, engine requirements, useful carrying capacity, water recovery and use of hydrogen as fuel, mooring, towing and anchors. (Concluded.) Paper read before Roy. Aeronautical Soc.

R-9

The Evolution of the Airship—I. Aeronautics, vol. 16, no. 297, June 26, 1919, pp. 664-665, 3 figs. Construction of R-9.

R-34

British Airship R-34 Described. Aviation, vol. 6, no. 12, July 15, 1919, pp. 629-632, 6 figs.

Rigid Airship

The Tension in the Radial Wires of a Rigid Airship, E. H. Leavitt. Aeronautics, vol. 16, no. 295 and 297, June 12 and 26, 1919, pp. 617-618 and 675, 2 figs. Derivation of formulæ.

Vickers

The Evolution of the Airship—II. Aeronautics, vol. 17, no. 298, July 3, 1919, pp. 15-18, 8 figs. Vickers, Ltd. and their war productions.

APPLICATIONS

Commercial Applications

American Commercial, Tourist and Pleasure Aeroplanes. Aerial Age, vol. 9, no. 20, July 28, 1919, pp. 930-931, and p. 943, 10 figs. Aerial mapping and photopgraphy, express and mail delivery, passenger-carrying, fire and police patrol, advertising, exploring, reconnaissance, news distribution, and exhibitions. Details of ten types are briefly reported.

Mail Service

Aerial Mail Service (L'aviation et la poste), M. Delfieu. Annales des Postes, Télégraphes et Téléphones, vol. 8, no. 2, June 1919, pp. 216-227. Sees it handicapped at present by three essential deficiencies of aviation—irregularity, insecurity and excessive expense.

AUXILIARY SERVICES

Landing Fields

Municipal Landing Fields for Air Service. Am. City, City Ed., vol. 21, no. 1, July 1919, pp. 20-23, 2 figs. War Department's specifications.

Parachutes

The Sperry Parachute, H. E. Goodman. Aerial Age, vol. 9, no. 17, July 7, 1919, p. 812, 2 figs. Advantage said to be that aeronaut is able to get out of machine when it is in abnormal position.

The "Guardian Angel" Parachute. Indian Eng., vol. 65, no. 20, May 17, 1919, pp. 276-277, 2 figs. on supp. plate. Automatic and instantaneous opening said to be effected by enclosure in parachute body as it emerges from its case of cylindrical column of air, which under compression of fall is immediately converted into a cushion of air, extending in every direction to periphery. It can be used from height of 200 ft.

Wireless

Wireless Telegraphy Applied to Aviation, W. Knight. Aviation, vol. 6, no. 11, July 1, 1919, pp. 572-575, 7 figs. Principles of transmission and application of invention to air navigation, particularly with reference to its use for communication between airplanes and radio stations on the ground.

Development of Radio Equipment for Naval Aircraft, Edgar H. Felix. Flying, vol. 8, no. 6, July 1919, pp. 536-540, 11 figs. Installation on NC-3.

Wireless Telephone Transmitter for Seaplanes. Rudder, vol. 35, no. 7, July 1919, pp. 332-334, 4 figs. As designed for flying boats of H 16 class of U. S. navy.

DESIGN

Altitudes, Flight at Various

Theory of Airplane Flight at Various Altitudes. Predetermination of the Ceiling (Théorie du vol des aéroplanes aux diverses altitudes. Prédétermination de la hauteur du plafond), A. Rateau. Comptes Rendus des séances de l'Académie des Sciences, vol. 168, no. 23, June 10, 1919, pp. 1142-1147. Equations expressing angle of wings, speed of airplane, revolution per second of propeller, and slip of propeller with reference to "effective pitch."

Flying Boats

The Design and Construction of Flying Boats, David Nicolson. Aeronautics, vol. 16, no. 293 (New Series), May 29, 1919, pp. 562-565, 11 figs. For types known officially as F.2A, F.3, F.5, P.5, and N.4. Paper presented before Instn. Engrs. and Shipbuilders in Scotland. (To be continued.)

Loads and Stresses

The Loads and Stresses on Aeroplanes, John Case. Aeronautics, vol. 16, no. 293, 294, 295, 296 and 297, May 29, June 5, 12, 19 and 26, 1919, pp. 556-559, 589-592, 619-622, 644-647 and 671-673, 32 figs. May 29: Equations of equilibrium when flying and when alighting with engine shut off; approximate method of calculating loads when turning in horizontal position and when flattening out from vertical dive and looping. June 5: How flattening out of flight path is brought about. June 12: Loads caused by gusts, spiral glides and spinning. June 19: Distribution of load over the planes. June 26: Pressure distribution in spiral guide.

Metal Construction

Metal Construction of Aircraft, A. P. Thurston. Aeronautics, vol. 16, no. 293 (New Series), May 29, 1919, pp. 570-571. Methods of design and calculation of guide spars. Paper read before Royal Aeronautical Soc. (Concluded.)

Rigging

The Rigging of Aeroplanes, R. J. Goodman Crouch. Aeronautical Jl., vol. 23, no. 100, April 1919, pp. 143-178, 21 figs. Based on diagrams published by Roy. Air Force. Application of methods illustrated by various examples.

Struts

Strength of Two Combined Struts, K. Aichi. (In Japanese.) Jl. Soc. Mech. Engrs., Tokyo, Japan, vol. 22, no. 56, Feb. 1919.

Formula Giving the Ultimate Load for a Long Strut of Varying Cross-Section, K. Aichi. (In Japanese.) Jl. Soc. Mech. Engrs., Tokyo, Japan, vol. 22, no. 56, Feb. 1919.

Struts of Conical Taper, H. A. Webb and E. D. Lang. Aeronautical Journal, vol. 23, no. 100, April 1919, pp. 179-186, 3 figs. Strength of wooden struts consisting of parallel center portion with ends of conical taper is considered mathematically. Best results are obtained when parallel portion is half total length of strut, and when taper of ends is such that end of diameter is half of center diameter. Formula for design is offered.

War Developments

Some developments in Aircraft Design and Application During the War, Lord Weir. Engineering, vol. 108, no. 2793, July 11, 1919, pp. 59-61, 7 figs. Aerodynamical aspect of design and progress. Applicational aspect taken up in second part of paper. (To be continued.) Read before North-East Coast Instn. of Engrs. and Shipbuilders.

ENGINES

Altitudes, High

Operation of Airplane Motors at High Altitudes (Höhenregelung für Flugmotoren), R. Krüger. Motorwagen, vol. 22, no. 6, Feb. 28, 1919, pp. 103-104, 5 figs. Discusses French, American, Swiss and German inventions for insuring proper working conditions for motor even in thin air of high altitudes.

Cosmos

Cosmos "Jupiter" Aero Engine. Aeronautics, vol. 16, no. 297, June 26, 1919, pp. 666-668, 4 figs. Specifications and performance at demonstration flight at Filton.

The Cosmos Aero Engines. Flight, vol. 11, no. 27, July 3, 1919, pp. 869-871, 7 figs. Radial types constructed by Cosmos Engineering Co., Ltd.

Curtiss

The Curtiss Model K-6 Aero Engine. Aeronautics, vol. 16, no. 295, June 12, 1919, pp. 608-609, 1 fig. Six cylinders en bloc, 4-stroke cycle, rated horsepower 150 at 1700 r.p.m.

Design

The Design of Aeroplane Engines, pts. 22, 23 and 24, John Wallace. Aeronautics, vol. 16, no. 296 and 297, June 19 and 26, 1919, pp. 638-641 and 660-662 and vol. 17, no. 298, July 3, 1919, pp. 22-24, 9 figs. June 19: Stresses in crankshaft and crankpins; crankshaft bearings; ventilators; oil, water and air pumps. June 26: Requirements of satisfactory carburetor; venturi tube; principle of Zenith carburetor. July 3: Sources of poor efficiency; starting installations.

Hispano-Suiza

The Hispano-Suiza Airplane Engine—II. H. O. C. Isenberg. Am. Mach., vol. 51, no. 2, July 10, 1919, pp. 55-58, 13 figs. Foundry methods used for aluminum and bronze castings at works of Wright-Martin Aircraft Corporation.

Liberty

The Liberty 12A Aircraft Engine. Automobile Engr., vol. 9, no. 128, July 1919, pp. 213-221, 12 figs. Analysis of internal stresses, forces, and pressures on main members.

R-34 Motor Plant

A Technical Study of the R-34 Motor Plant. Automotive Indus., vol. 41, no. 2, July 10, 1919, pp. 81-83, 2 figs. With reference to operation of engines.

Salmson

France's Liberty Engine. The Amazing Salmson, W. F. Bradley. Automotive Indus., vol. 41, no. 2, July 10, 1919, pp. 59-66, 16 figs., partly on supp. plate. Engine is intermediate between rotary air-cooled aviation engine and fixed cylinder water-cooled star type. Outstanding features are nine steel cylinders mounted around circular crankcase, crankcase and cylinders being fixed and single-throw crankshaft revolving.

Supercharging

The Value of Supercharging. Aviation, vol. 6, no. 11, July 1, 1919, pp. 577-579, 5 figs. and Aerial Age, vol. 9, no. 19, July 21, 1919, pp. 892-893, 4 figs. Tests conducted at altitude laboratory of Bureau of Standards, said to indicate that net gain in hp. will result even if considerable power is needed to drive blower.

MATERIALS OF CONSTRUCTION

Balloon Fabrics

Notes on Balloon Fabrics, Junius David Edwards. Aviation, vol. 6, no. 12, July 15, 1919, pp. 626-627, 2 figs. Characteristics of fabrics in use and discussion of means along which future development may be expected to take place.

Duralumin

Duralumin in Aviation (Le duralumin en aviation). Aérophile, vol. 27, nos. 9-10, May 1 and 15, 1919, pp. 129-130, 1 fig. Advantages claimed over wood by reason of less sensitiveness to atmospheric changes.

Plywood

The General Properties and Uses of Plywood—III, B. C. Boulton. Aerial Age, vol. 9, no. 19, July 21, 1919, pp. 895-897, 4 figs. Monocoque type of fuselage. (Concluded.)

METEOROLOGY

Aerial Currents, Errors in Determination

Errors Arising from Insufficiency of Knowledge of Meteorological Variations of Aerial Navigation (Sur les erreurs d'estime que peut entrainer la connaissance incomplète du régime aérologique), L. Dunoyer. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 22, June 2, 1919, pp. 1102-1105. Probable errors in estimating effect of crossing on aerial current.

Anticyclones and Depressions

The Origin of Anticyclones and Depressions, John Logie. Proc. Roy. Soc. of Edinburgh, vol. 39, part 1, Session 1918-19, pp. 56-77, 8 figs. Theory based on two postulates—(1) when two portions of air differing slightly in density are adjacent and in the same level, they tend to mingle and so destroy the difference of density; (2) when changes of pressure occur at any level in an extensive layer of air, the surrounding air does not "immediately rush in," but only slowly intrudes into the region of diminished pressure.

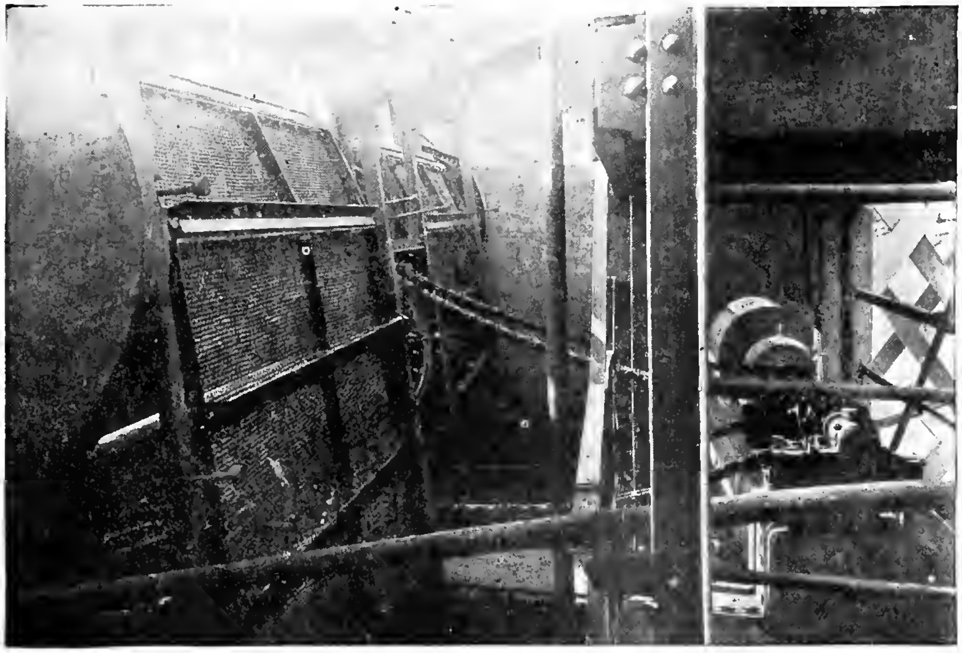
Storms

Storm Types and Peculiarities, George S. Bliss. Jl. Engrs. Club of Philadelphia, vol. 36, no. 176, July 1919, pp. 272-274, 8 figs. Bowie and Weightman map studies and summary of their conclusions. Paper read before Am. Soc. Heating & Ventilating Engrs.

See also Anticyclones.

Wind Velocities

Influence of the Vertical Distribution of the Temperature on the Wind Velocity Measured in the Vicinity of the Ground (Influence de la distribution verticale des temperatures sur les vitesses du vent mesurées au voisinage du sol), C. E. Brazier. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 23, June 10, 1919, pp. 1160-1161. Observations extending over period of ten years alleged to establish that considerable influence is exerted by temperature distribution on ratio of wind velocity



A close-up of the Rex Traveling Water Screens guarding the intake shown opposite

Operating Costs too Small to Figure

A steel company in Ohio uses two Rex Traveling Water Screens to protect the water supply.

When intake conditions are very good, they throw in the motor switch and turn the spray valve several times a day, letting the screens run for a few minutes each time.

Generally, however, they keep the screens running most of the time because the running costs, according to their estimates, are too small to take into account.

The water has a 4-foot minimum depth in the screen chamber and they pump 8,500 gallons per minute. With the Rex Traveling Water Screens there is practically no loss of head, so that they are always sure of adequate quantities of water.

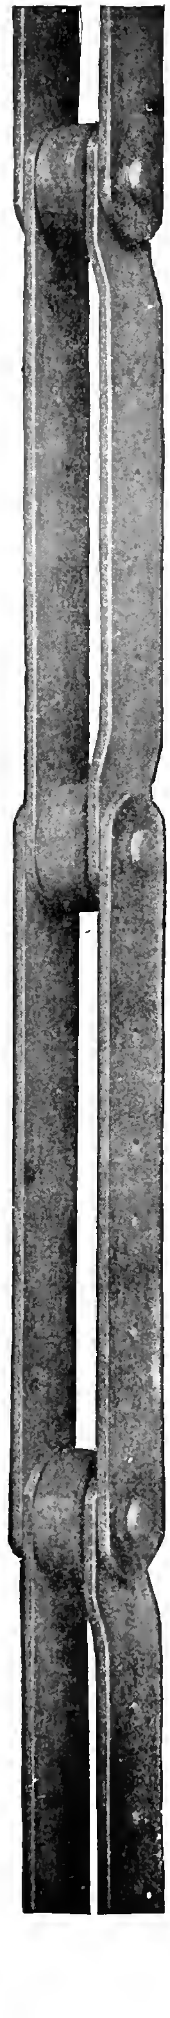
Send for Catalog No. 85 describing in detail the construction, operation and installation of Rex Traveling Water Screens.

REX TRAVELING WATER SCREENS

Rex Chains, Rex Concrete Mixers and Pavers,
Rex Sprockets, Rex Elevators and Conveyors

CHAIN BELT COMPANY, MILWAUKEE

Branch Offices and Representatives in Principal Cities in United States and Abroad



Rex Steel Roller Chain of the Chabelco type used for carrying the baskets of Rex Traveling Water Screens.

You can secure Standard Rex Sprocket Chain of any size or type, either through distributors or direct, for every transmission and conveyor need.

to gradient at altitudes at which anemometers are usually placed.

The Pilot Balloon Method of Determining the Direction and Speed of the Upper Winds, Ivan R. Tannehill. Jl. U. S. Artillery, vol. 51, no. 1, July 1919, pp. 1-16, 4 figs. One-theodolite method for sighting balloon compared with two-theodolite and other methods. Rapidity of calculations in one-theodolite method admitted to lead to small errors, but it is observed that atmospheric changes taking place during longer observations required by other methods lead also to errors.

Influence of Seasons and the Periodic Changes in Atmosphere on the Corresponding Variations in Atmospheric Pressure and Wind Intensity (Influence des saisons et des régimes aérologiques sur les variations corrélatives de la pression atmosphérique et de l'intensité du vent), G. Reboul and L. Dunoyer. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 19, May 12, 1919, pp. 947-950. As factor for determining coefficient of certitude of rules for forecasting weather conditions.

Various Cases of Diminution of Wind Velocity with Altitude (Sur certains cas de diminution de la vitesse du vent avec l'altitude), Albert Baldit. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 24, June 16, 1919, pp. 1211-1214. Instances are quoted to prove that established rule of increasing wind velocity with altitude represents merely average of a great number of cases, but not absolutely constant law.

PRODUCTION

Fittings

Making Aircraft Fittings with Temporary Tools, S. A. Hand. Am. Mach., vol. 51, no. 5, July 31, 1919, pp. 221-225, 22 figs. Tools developed to facilitate production in large quantities.

NC Boats

How the NC Boats were Built Under Pressure of War Need—II, J. C. Hunsaker. Automotive Indus., vol. 41, no. 3, July 17, 1919, pp. 120-123, 2 figs. Guarding against corrosion; glue for laminated construction; building of testing hangar.

MILITARY AIRCRAFT

Blackburd

See Torpedo-Carrying Aeroplanes.

British Airships

The Evolution of the British Naval Airship. Eng., vol. 107, no. 2789 and 2790, June 13 and 20, 1919, pp. 757-759 and 797-799, 46 figs., partly on supp. plates. Account of airship work of Vickers concern. Particulars of construction of R-80. (Concluded.)

Torpedo-Carrying Aeroplane

The "Blackburd" Torpedo-Carrying Aeroplane. Engineering, vol. 108, no. 2793, July 11, 1919, pp. 46-48, 5 figs. Weight with torpedo and full tanks, 5,800-lb.; engine, 350-hp. Rolls-Royce Eagle.

Naval Aircraft

Progress in Naval Aircraft, J. C. Hunsaker. Jl. Soc. Automotive Engrs., vol. 5, no. 1, July 1919, pp. 31-44, 10 figs. Notes on development of NC boats, notably manner of guarding against corrosion, protecting wooden and fabric parts and special equipment for transatlantic flight.

MODELS

Electrically Driven Models

Elementary Aeronautics and Model Notes, John F. McMahon. Aerial Age, vol. 9, no. 20, July 28, 1919, p. 941. On models driven by electricity.

Spar Forms

Model Aeroplanes—XXVII (New Series), F. J. Camm. Aeronautics, vol. 16, no. 295, June 12, 1919, pp. 623-624, 27 figs. Spar forms.

PLANES

Ansaldo

The Ansaldo 1 Biplane. Aerial Age, vol. 9, no. 19, July 21, 1919, pp. 890-891, 4 figs. General specifications are: Span, upper plane 25 ft., lower plane 21 ft. 8 in.; overall height 10 ft. 6 in.; engine, S. P. A. Ansaldo 220 hp.

Avro

The Avro "Baby" Sporting Biplane. Flight, vol. 11, no. 26, June 26, 1919, pp. 831-836, 12 figs. Fuselage is of rectangular section and conventional girder type. Machine is a single seater. Span 25 ft.; length overall 18 ft. 6 in.; height 7 ft. 6 in.; weight, loaded, 857 lb.

B. A. T.

B. A. T. 340 H.P. A. B. C. (Type F. K. 25—"Basilisk"). Aeronautics, vol. 16, no. 296 (New Series), June 19, 1919, p. 637, 1 fig. Fuselage follows system adopted in Bantam, but machine is somewhat larger.

See also Wasp.

Bristol

The Bristol Passenger Triplane. Aerial Age, vol. 9, no. 20, July 28, 1919, p. 932, 2 figs. Graph of performances of Bristol triplane cargo machine.

The Bristol Triplane Braemar. Aviation, vol. 6, no. 12, July 15, 1919, p. 639, 1 fig. Intended to be used for bombing of Berlin and other interior German towns. Driving power supplied by 400-hp. Liberty engines, fitted tandem, in pairs, on either side of fuselage.

Curtiss

The Curtiss Model 18-B Biplane. Flight, vol. 11, no. 28, July 10, 1919, pp. 902-904, 5 figs. Machine is built around same fuselage and power plant as the triplane, but has lesser over-all height.

Flying Boats

Design and Construction of Flying Boats, David Nicolson. Flight, vol. 11, no. 28, July 10, 1919, pp. 915-919, 7 figs. Hull construction of F. and N. types. (Concluded.)

Lawson

Lawson Aerial Transport. Aerial Age, vol. 9, no. 17, July 7, 1919, pp. 810-811, 3 figs. Fuselage built to accommodate 26 passengers. Designed from commercial point of view for transcontinental service between New York and San Francisco.

Navy Specifications

The New Navy General Specifications for Airplanes, Archibald Black. Aviation, vol. 6, no. 11, July 1, 1919, pp. 592-594, 1 fig. Comments on subject matter which has been added to or changed from that in previous issue. Addition referred to as new is no. 100-A.

Wasp

B. A. T.—170 H.P. Wasp (Type F.K. 23—"Bantam"). Aeronautics, vol. 16, no. 296 (New series), June 19, 1919, p. 636, 1 fig. Fuselage consists entirely of large sheets of three-ply birch, fixed on oval section formers which are supported on four ash longitudinals.

PROPELLERS

Moisture-Proofing

Moisture Proofing Airplane Propellers with Aluminum Leaf, M. E. Dunlap. Aviation, vol. 6, no. 12, July 15, 1919, pp. 636-638, 9 figs. Method of applying aluminum leaf. A diagram is presented showing comparative effectiveness of different coatings in moisture-proofing wood as determined by tests.

Wood Propellers

Wood Propeller Construction, Porter E. Stone. Aerial Age, vol. 9, no. 20, July 28, 1919, pp. 934-938, 12 figs. Suggestions in regard to their manufacture in quantity.

TRANSATLANTIC FLIGHT

NC Flight

Precautions That Spelled Success, James L. Breese, Jr. Sci. Am., vol. 121, no. 3, July 19, 1919, p. 55, 2 figs. Engineering features of flight of NC planes across ocean, notably arrangement for maintaining water in radiators and method of hooking up batteries.

R-34 Flight

Transatlantic Voyage of R-34. Aeronautics, vol. 17, no. 298, July 3, 1919, pp. 7-9, 1 fig. Plans considered by Admiralty and details of equipment.

VARIA

Altitude Errors

Altitude Errors in Aerial Navigation, J. G. Coffin. Aviation, vol. 6, no. 12, July 15, 1919, pp. 624-626, 5 figs. Form of pressure indicating device suggested for avoiding errors consists in placing instrument inside container, for instance, a sphere, with an opening to outside air and rotating or oscillating container so as to periodically cover the entire 360 deg.

British Regulations for Air Navigation

The British Regulations for Aerial Navigation, Henry Woodhouse. Flying, vol. 8, no. 6, July 1919, pp. 525-533. Governing civilian aeronautics.

Log Books

The New Air Navigation Directions. Aeronautics, vol. 16, no. 293 (New Series), May 29, 1919, pp. 567-569. Instructions for use of log books. (Continued.)

Physiology of High-Altitude Flight

Physiological Aspect of Travel at High Altitudes (Transports à haute altitude des voyageurs en cabine aérienne. Communication faite par le docteur Guglielminetti à la Commission scientifique de l'Aéro-Club de France, Séance du 30 avril 1919). Aérophile, vol. 27, nos. 9-10, May 1 and 15, 1919, pp. 132-135, 2 figs. Based on experiments and writer's experience during sojourn on top of Mont Blanc.

Wilbur Wright Lecture, 1919

The Wilbur Wright Lecture, 1919, Leonard Bairstow. Aeronautics, vol. 17, no. 298, July 3, 1919, pp. 12-14. Progress of aviation during period of war. (Concluded.) Paper read before Roy. Aeronautical Soc.

Marine Engineering

AUXILIARY MACHINERY

Compass

The Navigational Magnetic Compass Considered as an Instrument of Precision, M. B. Field. Jl. Instn. Elec. Engrs., vol. 57, no. 282, May 1919, pp. 349-386, 45 figs. Physico-mathematical study of forces entering in operation of various types, with reference to British Admiralty practice in regard to effecting corrections and recording measurements.

Electric Auxiliaries

First American Full-Powered Motorship Equipped with Electric Auxiliaries, H. W. C. Smith. Motorship, vol. 4, no. 8, August 1919, pp. 31-35, 16 figs. Machinery details of the "Benowa."

Hawthorne-Cockburn Valves

The Supply of Superheated Steam to Astern Turbines. Shipbuilding & Shipping Rec., vol. 13, no. 25, June 19, 1919, p. 775, 2 figs. Hawthorne-Cockburn patent valves for mixing of saturated and superheated steam.

Marine Two-Cylinder Engine Sets

Novel Features in a Two-Cylinder Marine Set. Automotive Industries, vol. 40, no. 26, June 26, 1919, pp. 1449-1451, 3 figs. Engine combined with reverse gear in single unit.

Turbine Drive for Auxiliaries

Turbine-driven Marine Auxiliaries. Eng., vol. 127, no. 3313, June 27, 1919, pp. 636-638, and 640, 10 figs. Equipments for merchant steamers, built by Franco Tosi Company of Legnano, Italy.

SHIPS

Concrete Ships

Auxiliary Motor Sailing Ship of Reinforced Concrete (Motosegler aus Beton). Beton & Eisen, vol. 18, nos. 2-3, Feb. 3, 1919, p. 32, 2 figs. Danish vessel 112 ft. long provided with screw propeller driven by 80-hp. oil engine.

Advantages, Progress and Permanence of Concrete Ships, Robert W. Lesley. Concrete Craft, vol. 1, no. 5, June 1919, pp. 119-122 and 126 and 132, 1 fig. Sees concrete ship, both large and small craft, better, cheaper and of lower upkeep and for many uses essentially superior to any other type of hull.

Barge Building in Scotland. Ferro-Concrete, vol. 10, no. 2, August 1919, pp. 35-38, 4 figs. Construction of 1,000-ton reinforced-concrete barges.

Concrete Coaling Barges. Colliery Guardian, vol. 117, no. 3050, June 13, 1919, p. 1413, 3 figs. Length, 185 ft.; beam, 35 ft.; depth, 18 ft.; hull is of straight-line type.

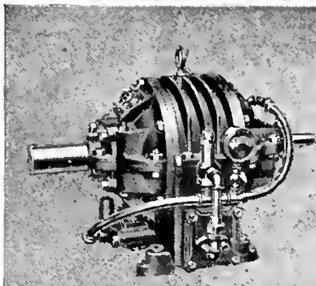
Concrete Merchant Ships. Concrete Craft, vol. 1, no. 5, June 1919, pp. 123-126, 5 figs. Their chance of development in time of peace.

Design

Suggestions for Increasing Revenue from Cargo Carriers, M. F. Carr. Shipping, vol. 8, no. 2, July 12, 1919, pp. 15-16, 2 figs. Concerning modifications in design of 8,800-deadweight-ton cargo carrier.

Diesel

The Diesel Engine in Great Lakes Freighters, R. D. Karr. Motorship, vol. 4, no. 8, August 1919, pp. 28-29, 2 figs. Recommends operating freighters with internal-combustion engine as economical measure and necessity because, "low price of coal hertofore prevailing in the Great Lakes trade will never be reached again."



The IDEAL DRIVE

TURBOGEAR

FAST PATENTS

The Modern Way to connect Driving and Driven Units

A Better Drive *for* Refrigerating and Ice Making Plants

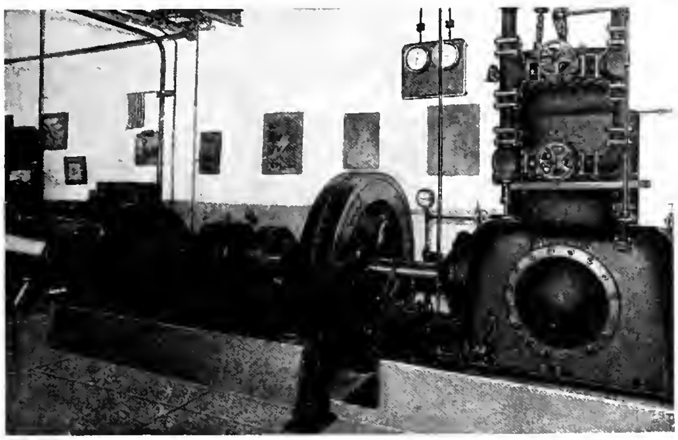
There are many advantages and economies of the Turbo-Gear for refrigerating drives.

Some of the advantages are:

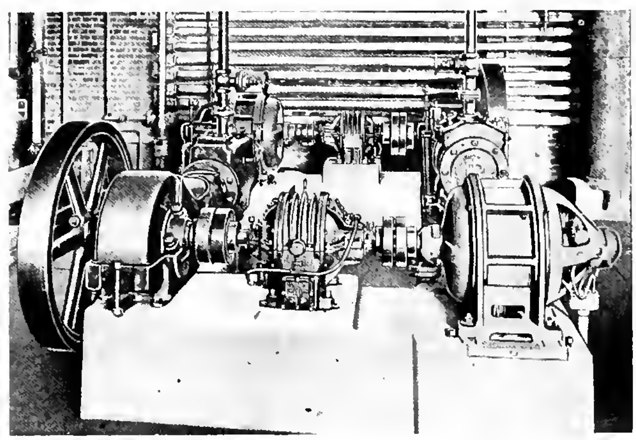
- Small floor space required.
- Higher speed; less expensive motors can be used.
- High and low speed shafts in the same straight line.
- Positive transmission of power—no slip.
- Continuous operation.

Some of the economies are:

- Low first cost.
- Low erection cost.
- Lower overhead.
- Practically no upkeep expense—simplicity of construction of Turbo-Gear economically abolishes the big item of repairing and replacing power transmission equipment.



75 HP. Turbo-Gear 1200 to 150 RPM.
Motor Ammonia Compressor Drive



One 25 HP. and one 50 HP. Turbo-Gear 1150 to 232 RPM.
Motor Air Compressor Drive

Economy and Sureness of Operation are of Primary Importance in all Drives.

Unless the drive is satisfactory, all else goes for naught. The merit of the driving unit is only proved by the performance of the drive. The drive must deliver uniform power at the right speed, and above all be dependable.

That is why the leading industries are installing Tubor-Gear, the modern drive—safe—certain—reliable.

Let us tell you about some of these installations—Let us solve your driving problems.

POOLE ENGINEERING and MACHINE COMPANY

Manufacturers of Gears and Power Transmission Machinery since 1843

BALTIMORE, MD., U.S.A.

General Sales Office: 50 Church St., New York, N.Y.

Electric Propulsion of Submarines

Electrical Equipment Used on Submarines, H. C. Coleman. Elec. Jl., vol. 16, no. 7, July 1919, pp. 295-299, 9 figs. General arrangement of propelling machinery. There are two main motors, each having its own shaft which is connected by heavy clutches to engine shaft at one end and to propeller shaft at the other.

Ljungstrom System

The Ljungstrom System Steam Turbo-electric Marine Propulsion. Pac. Mar. Rev., vol. 16, no. 7, July 1919, pp. 71-80, 10 figs. Plant consists of two turbo-generators of equal power, delivering their power electrically to two motors.

Motor Ships

Motor Ship Glenapp. Engr., vol. 127, no. 3312, June 20, 1919, pp. 612-613, 1 fig. Alteration as compared with "Selandia" referred to are cooling of piston with water instead of oil, and substitution of a battery of eight fuel pumps for the eight cylinders in each engine instead of a single pump for each set of four cylinders.

Propelling Machinery Type

Crude-Oil Motors vs. Steam Engines in Marine Practice, J. W. Morton. Mech. Eng., vol. 41, no. 7, July 1919, pp. 609-612, 1 fig. Discussion of various factors to be considered, also exposition of advantages and disadvantages, as compared to steam engines, of crude oil motors of constant pressure, constant-volume four-stroke cycle and two-stroke cycle types.

Specifications for Machinery

Specifications for Machinery for 8,100 Ton d.w. Steamships for Canadian Government Merchant Marine Ltd. Can. Ry. & Mar. World, no. 257, July 1919, pp. 394-399, 4 figs. Propelling machinery is to consist of one set of inverted, vertical, direct acting, triple expansion, surface condensing engines, having 3 cylinders working on separate cranks placed at angles of 120 deg. with each other, supplied with steam from 3 multitubular boilers at a working pressure of 180 lb. per sq. in.

YARDS

Concrete Shipbuilding

British Concrete Shipbuilding: Unit System Construction, W. Noble Twelvetrees. Eng., vol. 107, no. 2791, June 27, 1919, pp. 825-826, 17 figs., partly on supp. plates. Developed, it is said, with a view to reduce the absolute minimum amount of timber supports and shuttering required on building berth and arranging and spacing frame members in a manner similar to that generally specified for steel ships.

A New Irish Industry. Concrete Shipbuilding at Warrenpoint. Ferro-Concrete, vol. 10, no. 8, January 1919, pp. 177-187, 12 figs. Yard suitable for construction of concrete ships up to 10,000 tons capacity.

Costs

Shipyard Costs and Ship Wages—a Comparison, Winthrop L. Marvin. Pac. Mar. Rev., vol. 16, no. 7, July 1919, pp. 81-86. Comparison of American and British ship wages.

Fabricated Ships

The Fabricated Ship, Henry R. Sutphen. Universal Engr., vol. 29, no. 6, June 1919, pp. 21-27, 6 figs. Operations at Newark Bay shipyard.

Fabricated-Ship Plant Planned for Later General Use, M. E. Allen. Eng. News-Rec., vol. 83, no. 2, July 10, 1919, pp. 79-83, 5 figs. Mobile Shipbuilding Co. forced to revise steel design to make use of timber at Birmingham shop for fabricating ship material.

Ford Methods

Ford Methods in Ship Manufacture—VII, Fred E. Rogers. Indus. Management, vol. 58, no. 1, July 1919, pp. 8-11, 10 figs. Outfitting operations and power plant.

Fore River Yards

Shipbuilding Equipment and Methods at Fore River—I, Hull Construction Plant. Eng. News-Rec., vol. 83, no. 1, July 3, 1919, pp. 19-22, 5 figs. Single type of berth for various kinds of ships. Concrete substructure and bridge crane equipment.

Reconditioning War Service Vessels

Refitting War Fleet is Big Job, V. G. Iden. Mar. Rev., vol. 49, no. 8, August 1919, pp. 375-378, 5 figs. Reconditioning vessels used for war service is taxing capacity of repair yards.

Repairs

Repair of the "Curaca" a Triumph of Skill and Ingenuity. Shipping, vol. 8, no. 1, July 5, 1919, pp. 15-16, 4 figs. Straightening out bottom of ship sunk during explosion in Halifax Harbor.

See also Welding.

Welding

Some Experiences with Electric Welding in Warships, W. H. Gard. Eng., vol. 108, no. 2792, July 4, 1919, pp. 25-30, 12 figs. Sketches illustrating such repair work as required by broken cast steel stem of "P" boat, shaft bracket of a large 36-knot destroyer broken through, and lower portion of stern post of a Castle liner broken off, etc. Paper read before Instn. Naval Architects.

Repairing the Broken Stern-Post of the "Northern Pacific"—the Biggest Marine Weld in the World. Reactions, Vol. 12, no. 2, Second Quarter, 1919, pp. 23-31, 13 figs. Cast-steel stern post was cracked through just above uppermost gudgeon, cross-section of break forming roughly a triangle, each side of which was about two feet in length.

VARIA

Great-Circle Sailing

Great Circle Sailing—A Few "Wrinkles" to Save Time, H. G. S. Wallace. U. S. Naval Inst. Proc., vol. 45, no. 7, July 1919, pp. 1197-1199, 2 figs. Marcq Saint-Hilaire method.

Soundings

Sea Sounding on Board a Moving Vessel, Based on Propagation of Sound in Water (Sur un procédé de soudage en mer, à bord d'un bateau en marche, basé sur la propagation du son dans l'eau), M. Marti. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 22, June 2, 1919, pp. 1100-1102. Microphone fixed to vessel and immersed at convenient depth registers explosion on surface of water and its reflection from sea bottom.

Surveys

The Safeguarding of Our Seafarers, Robert G. Skerrett. Rudder, vol. 35, no. 7, July 1919, pp. 305-311, 19 figs. Work done by U. S. Coast and Geodetic Survey, including illustrations of corrections that have been made during a single year in chart of New York harbor.

Industrial Technology

Alcohol

Ethyl Alcohol from Waste Sulphite Liquor, E. C. Sherrard and Galo W. Blanco. Paper, vol. 24, no. 17, July 2, 1919, pp. 15-21, and 26. Experiments conducted both commercially and experimentally said to have shown production ranging from 0.70 to 1.15 per cent on a laboratory scale and from 0.53 to 0.79 per cent on a large scale production.

Ammonia

Manufacture of Ammonia by Means of Electric Arc. Study of the Influence of a Partial Vacuum (Formation de l'ammoniaque au moyen de l'arc électrique. Etude spéciale de l'influence de la dépression), E. Briner and A. Baerfuss. Jl. Chimie Physique, vol. 17, no. 1, March 31, 1919, pp. 71-140, 3 figs. Experiments at chemical laboratory of Geneva University. The best results obtained were mixture of one to three parts of nitrogen and hydrogen respectively.

The Manufacture of Ammonia and Ammonium Compounds, M. Rindl. South African Jl. of Industries, vol. 2, no. 5, May 1919, pp. 463-466. Sources of production and uses.

Benzene

Chlorination of Benzene. Analysis of Mixtures of Benzene, Chlorobenzene and Dichlorobenzene, etc., Percy F. Frankland, S. Raymond Carter and Dorothy Webster. Jl. Soc. Chem. Indus., vol. 38, no. 12, June 30, 1919, pp. 153T-155T, 1 fig. Three fractions obtained by interrupting distillation from Engler flask under uniform conditions at 122 deg. cent. and again at 142 deg. cent. Percentages of benzene and chlorobenzene obtained from graph constructed from experiments with mixtures of known composition.

Carbon, Artificial

The Manufacture of Artificial Carbon in Norway (Herstellung künstlicher Kohle in Norwegen), Sander. Dinglers Polytechnisches Journal, vol. 6, no. 334, Mar. 22, 1919, p. 63. The raw material used for this purpose is the lye drained off in the manufacture of cellulose, this lye being rich in organic matter. The product obtained can be used either wet or dried.

Caustic Soda

See Chlorine.

Chlorine-Caustic Soda

The United States Government Chlorine-Caustic Soda Plant at Edgewood Arsenal, Edgewood, Maryland, Samuel M. Green. Chem. & Metallurgical Eng., vol. 21, no. 1, July 1, 1919, pp. 17-24, 9 figs. Historical and descriptive account.

Clays

Some Properties of Bond Clays for Graphite Crucibles, M. C. Booze. Jl. Am. Ceramic Soc., vol. 2, no. 6, June 1919, pp. 461-476, 6 figs. Result of tests with nineteen domestic clays, one English, and one German clay.

Crucibles

The Effect of Electrolytes on the Properties of Graphite Crucible Bodies, H. G. Schurecht. Jl. Am. Ceramic Soc., vol. 2, no. 6, June 1919, pp. 443-450, 5 figs. Addition of NaOH to graphite-crucible bodies containing Dorset bond clay spoiled working properties of bodies, while effect of same electrolyte on bodies containing Mississippi bond clay was observed to be improvement of their moldability. HCl claimed to have opposite effect.

See also Clays.

Cyanamid

Warrior Extension Station for U. S. Nitrate Plant No. 2. Southern Engr., vol. 31, no. 5, July 1919, pp. 36-40, 7 figs. Plant uses cyanamid process.

Notes and Data on Fixed Nitrogen Plants. Chem. & Metallurgical Eng., vol. 21, no. 2, July 15, 1919, pp. 66-67. Cost figures obtained at Government's cyanamide process nitrate plant at Muscle Shoals as presented before Committee on Military Affairs of House of Representatives.

Dust Precipitation

Electrical Cleaning of Blast Furnace Gas, W. H. Gellert. Blast Furnace & Steel Plant, vol. 7, no. 7, July 1919, pp. 334-339, 2 figs. Data concerning electrical precipitation.

Dyes

Gas in the Dye Industry, Gilbert Colville Shadwell. Gas Rec., vol. 16, no. 2, July 23, 1919, pp. 17-21, 10 figs. Points out possible utilization. (To be concluded.)

Fertilizers

The World's Supply of Nitrogeneous Fertilizers, George W. Anderson. Gas Jl., vol. 146, no. 2926, June 10, 1919, pp. 695-696. As production of nitrogeneous products in Germany has been greatly promoted during the war, writer believes that a strong competition may be expected now that demand for munitions having ceased Germany will not be able to absorb total production herself.

Glass

Glass-Making Before and During the War, Harry J. Powell. Jl. Roy. Soc. Arts, vol. 67, no. 3473, June 13, 1919, pp. 485-493, and (discussion) pp. 493-495. Descriptive account of progress made by glass industry in England during the war.

Use of Optical Pyrometers for Control of Optical Glass Furnaces, Clarence N. Fenner. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 151, July 1919, pp. 1001-1011, 2 figs. Investigations at the Geophysical Laboratory, Carnegie Instn. of Washington, and account of results obtained in actual practice.

Glass, with Special Reference to Its Production in South Africa, Percy A. Wagner. South African Jl. of Industries, vol. 2, no. 5, May 1919, pp. 436-449, 2 figs. On selection of sands. (To be concluded.)

Procedures in the Manufacture of Optical Glass, W. S. Williams and C. C. Rand. Jl. Am. Ceramic Soc., vol. 2, no. 6, June 1919, pp. 422-442, 6 figs. Account of investigations made by Bur. of Standards.

Grease Extraction

Extraction of Grease from Sewage Sludge at Morley, F. Turner. Surveyor, vol. 55, no. 1428, May 30, 1919, pp. 401-403. Including cost of operation. Paper read before Instn. Mun. and County Engrs.

Helium

Bibliography of Helium Literature, E. R. Weaver. Jl. Indus. & Eng. Chem., vol. 11, no. 7, July 1, 1919, pp. 682-688. Articles published in scientific magazines up to January 1, 1919.

Hydrogen

See Oxygen.

Lime

Lime Calcination (Calcinacion de cal), W. D. Mount. Ingenieria Internacional, vol. 1, no. 3, June 1919, pp. 154-155, 1 fig. Sugges-

tions in regard to securing economy in production.

Oil, Linseed

Effect of Exposure on Raw Linseed Oil, E. J. Sheppard. Jl. Indus. & Eng. Chem., vol. 11, no. 7, July 1, 1919, pp. 637-639, 3 figs. Thickness of exposed layer thought to affect only rate of change in constants. For any gain in weight over range covered by experiments described, changes occurring in constants were found to be independent of rate of gain in weight.

Opacifiers

Note on the Use of Magnesia as an Opacifier, V. S. Schory. Jl. Am. Ceramic Soc., vol. 2, no. 6, June 1919, pp. 477-480. Experiments to determine whether additions of small amounts of barium and zinc would result in increased transparency of glaze.

Oxygen

Automatic Electrolytic-Oxy-Hydrogen Plant, Fred H. Woodhull. Jl. Engrs. Club of Philadelphia, vol. 36, no. 176, July 1919, pp. 271-274, 1 fig. Features in connection with electrical operation and control of compressor set. Paper read before Assn. Iron & Steel Elec. Engrs.

Paints

Paint Pigments Their History and Development, S. J. Cook Chem. Indus., vol. 38, no. 11, June 16, 1919, pp 137T-139T. With reference to Church's and Toch's methods of classification.

Paper

Waste Paper for Papermaking, Henry Aldous Bromley. Paper, vol. 24, no. 18, July 9, 1919, pp. 18-21. Researches on printing ink in relation to its destructibility.

Porcelain

An American Porcelain Containing no Free Silica, Arthur S. Watts. Jl. Am. Ceramic Soc., vol. 2, no. 6, June 1919, pp. 488-489. It is claimed that by calcining or semi-fusing fluxes and flint prior to incorporation in porcelain body maturing point can be lowered approximately two cones, color vastly improved, and resistance to sudden temperature changes improved approximately 200 per cent.

Potash

Non-German Sources of Potash, Arthur Holmes. Geological Mag., vol. 6, no. 6, June 1919, pp. 251-254, 1 fig. Deposits in Alsace, Spain, and Abyssinia, where beds of potassium are associated in workable quantities with saline formations. (To be continued.)

Rubber

Prices of Rubber Products, Isador Lubin. India Rubber World, vol. 60, no. 5, August 1, 1919, pp. 614-620, 7 figs. From War Industries Board, Press Bulletin no. 30.

Recent Improvements in Rubber Compounds for Solid and Pneumatic Tires. India-Rubber Jl., vol. 58, no. 1, July 5, 1919, pp. 1-2 & 5. Advantages claimed for using carbon gas black in rubber compounds

Soap

Colloid Chemical Studies of Soap I, Martin H. Fischer Chem. Engr., vol. 27, no. 7, July 1919, pp. 155-162, 8 figs Hydration capacity of some pure soaps.

Sugar

Better Results by Better Management, L. W. Alwyn Schmidt Sugar, vol 21, no. 7, July 1919, pp 350-353 Quotes instance in which it is said installation of suitable equipment in sugar factory increased amount of sugar obtained from same quantity of raw material.

The Color of Sugar Cane Products and Decolorization in Factory Practice, F. W. Zerban and E. C. Freeland. Sugar, vol. 21, no. 7, July 1919, pp. 354-359b, 2 figs. Results obtained in experiments at laboratory of Louisiana State University said to show that combination of ferric iron and polyphenols plays a very important part in the color of sugarhouse products.

Tellurium

A Study of the Preparation of Certain Organic Salts of Tellurium, Aaron M. Hageman. Jl. Am. Chem. Soc., vol. 41, no. 3, March, 1919, pp. 342-346. Method for the preparation of tellurium acid tartrate. Writer asserts that, contrary to the findings of Becker, this salt can not be separated from tartaric acid by crystalization.

A Contribution to the Chemistry of Tellurium Sulfide, Aaron M. Hageman. Jl. Am. Chem. Soc., vol. 41, no. 3, March, 1919, pp 329-341, 1 fig. Investigation concerning production and stability of a sulfide of tellurium.

Railroad Engineering

CONSTRUCTION

Gradient, Economical

Technical Study Preliminary to Projecting a Railway (El control técnico en los proyectos y obras ferroviarias), César A. Cipriani. Informaciones y Memorias de la Sociedad de Ingenieros del Perú, vol. 21, no. 5, May 1919, pp. 227-232. Formula for determining economical gradient.

Station Rebuilding

Union Station is Rebuilt Without Interrupting Traffic. Eng. News-Rec., vol. 83, no. 2, July 10, 1919, pp. 84-87, 6 figs. Erecting elevated trainshed and rearranging tracks while carrying 165 trains daily.

Track Construction

Constructing a Track Layout in Close Quarters, W. F. Rench. Ry. Maintenance Engr., vol. 15, no. 7, July 1919, pp. 232-234, 1 fig. Difficulties encountered especially because rail was of heaviest section and had to be unloaded and placed by hand.

ELECTRIC RAILROADS

Italy

Electric Traction in Italy (La grande trazione elettrica in Italia). Industria, vol. 33, no. 11, June 15, 1919, pp. 325-329, 3 figs. Features of installation in line of 50 miles.

ELECTRIFICATION

France and Belgium

Railway Electrification in France and Belgium, Robert E. Thayer. Ry. Age, vol. 67, no. 3, July 18, 1919, pp. 93-94. Plan under consideration involves electrification of 5,220 miles in France, and 147 miles in Belgium.

Main-Line Railroads

Electrification of Main-line Railroads, W. B. Potter. Street Ry. Bul. vol. 19, no. 7, July 1919, pp. 252-258, 7 figs. Statistical data on power demands for electrical operation of steam railroads in United States. Remarks on design of electric locomotives. Also abstracted in General Elec. Rev., June 1919, pp. 430-437.

Possibilities

Possibilities of Steam Railroad Electrification, Calvert Townley. Power Plant Eng., vol. 23, no. 14, July 15, 1919, pp. 639-642, 2 figs. Survey of electrified sections of railways, pointing out what are considered as advantages which had been realized in both freight and passenger service.

Single-Phase High-Tension Current

The Shortage of Coal and the Electrification of Railroads (Die Kohlennot und die Elektrisierung der Bahnen), Richard Baecker. Zeitschrift des österr. Ingenieur-und Architekten-Vereins, vol. 71, no. 1, Jan. 3, 1919, pp. 6-8. Writer considers high-tension single-phase alternating current as best suited for standard gage systems of European railroads.

Sweden

Extensive Electrification Proposed for Sweden. Ry. Age, vol. 67, no. 2, July 11, 1919, pp. 61-63, 5 figs. Findings of commission appointed to study question. Of estimated total of 5,000,000 water h.p. available, 1,000,000 has been developed

Switzerland

Electrification of Federal Railways (Electrification des chemins de fer fédéraux), Bulletin Technique de la Suisse Romande, vol. 45, no. 13, June 28, 1919, pp. 121-122, 2 figs. Hoeter reinforced-concrete piles. (To be continued.)

EQUIPMENT

Standardization

Standardization of Railway Equipment, Frank McManamy Ry. Rev., vol. 65, no. 1, July 5, 1919, pp. 7-9. What Railroad Administration planned and expected to accomplish.

FOREIGN

South America

Railways in the Americas (Ferrocarriles en las Américas), Percival Farquhar. Ingeniería Internacional, vol. 2, no. 1, July 1919, pp. 1-5, 1 fig. Points out advantages of building trunk lines with easy slopes in diminishing cost of freight and for developing uncultivated and slightly populated sections.

Necessity of Railways for the Development of South America (Ferrocarriles necesarios para la animación y desarrollo de la América del Sur), F. B. Morris. Ingeniería Internacional, vol. 2, no. 1, July 1919, pp. 7-8, 1 fig. Indicates three lines which writer believes are necessary for rapid development of South American continent.

Train Speeds

European Train Speeds. Ry. Gaz., vol. 30, no. 24, June 13, 1919, pp. 958-961, 1 fig. Germany and Scandinavia. Survey of highest, longest, and fastest non-stop runs, speed of trains between two places and geographical distribution of important services. (Continuation of serial.)

LABOR

Suitability Tests

Suitability Tests for Railway Men. Eng. & Indus. Management, vol. 2, no. 1, July 3, 1919, pp. 3-5, 5 figs. Illustrating what are believed to be imperfections in processes devised to test mechanically man's psychological conditions and activities.

LOCOMOTIVES

Design

Problems in the Construction and Operation of Locomotives (Probleme in Lokomotivbau und -betrieb), R. Sanzin. Zeitschrift des Osterr. Ingenieur-und Architekten-Vereins, vol. 70, no. 1, Jan. 4, 1918, pp. 1-5, 3 figs. Compares various types and discusses complete utilization of their power.

Engine Calibration

Engine Calibration as Adjunct to Efficient Operation, B. B. Milner. Ry. Rev., vol. 64, no. 26, June 28, 1919, pp. 1000-1004, 8 figs. Tests performed to determine maximum drawbar pull developed at various speeds and similar characteristics, for the purpose of gaining knowledge as to manner in which behavior of locomotives was effected through manipulation of reverse lever.

Fuel Economy

Locomotive Fuel Economy. Ry. Rev., vol. 65, no. 1, July 5, 1919, pp. 27-20, 2 figs. From report of committee on Fuel Economy and Smoke Prevention read at annual convention of Am. R. R. Assn.

Gasoline Locomotive

A New Petrol Shunting Locomotive. Ry. Gaz., vol. 31, no. 1, July 4, 1919, pp. 25-26, 1 fig. Engine is a 40-h. hp. internal-combustion motor having four water-jacketed cylinders working on 4-stroke principle.

Grand Trunk

Grand Trunk 0-3-0 Type Switching Locomotives. Ry. Age, vol. 67, no. 1, July 4, 1919, pp. 7-8. 1 fig. Tractive effort 36,700 lb; weight in working order 166,000 lb.

Mallet

Simple Mallet Locomotive Pennsylvania R. R. Ry. Rev., vol. 65, no. 3, July 19, 1919, pp. 81-89, 14 figs. Among special features to which particular attention is called are design of firebox and combustion chamber, superheater, float system for water-level indication and multiple stack and exhaust nozzle arrangement. Also in Ry. & Locomotive Eng., vol. 32, no. 7, July 1919, pp. 193-194, 2 figs.

Standard

Standard Light Mountain Type. Ry. Mech. Engr., vol. 93, no. 7, July 1919, pp. 431-437, 9 figs. Total weight, 327,000 lb.; tractive effort, 53,900 lb.

Standardization of Parts

The Standarization of Parts for Half-Inch Scale Model Locomotives, Henry Greenly. Model Engr. & Elecn., vol. 40, nos. 945, 946 and 948, June 5, 12 and 26, 1919, pp. 448-453, 470-473 and 519-522, 18 figs. June 5 and 12: Schemes for types writer classifies into outside-cylinder and inside-cylinder machines. June 26: Method of building up a machine.

Front Ends, Grates and Ash Pans. Ry. Jl., vol. 25, no. 7, July 1919, pp. 19-21. Committee report before International Ry. Fuel Assn.

Stoking, Mechanical

Mechanical Stoking of Locomotives an Economy, W. S. Bartholomew. Ry. Age, vol. 67, no. 4, July 25, 1919, pp. 163-167, 7 figs. Factors determining necessity of applying stokers; operating results secured by stoker firing. Paper presented before Western Ry. Club.

Switching

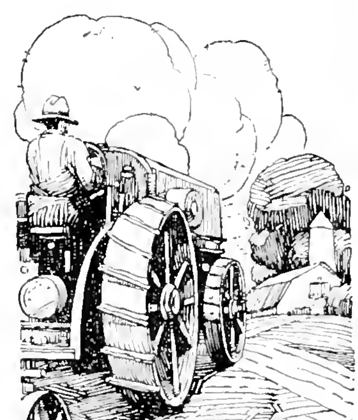
C.C.C. & St. L. 0-8-0 Switchers, R. W. Retterer. Ry. Mech. Engr., vol. 93, no. 7, July 1919, pp. 411-414, 5 figs. Consolidation type converted with special features to adapt engines for switching service.

The Carburizing Room

The Ten-Acre Plant of the New Process Gear Corporation

New Process Quality Counts

An automobile, truck or tractor is as good as its gears. New Process Differentials and Gears are designed and made by gear-specialists in a factory that is equipped to produce gears in quantity as well as quality. The product is uniformly good because of exceptional facilities and right inspection.



New Process Gear Corporation

Syracuse Member of the AGMA New York

New Process Gears

MAINTENANCE

Permanent Way

Maintenance of Permanent Way—I. Ry. Engr., vol. 40, no. 474, July 1919, pp. 141-143. Comparison of British and American methods of management. (To be continued.)

OPERATION AND MANAGEMENT

Accounting

Calculating Machine in Railroad Accounting, C. O. Price. Ry. Rev., vol. 64, no. 26, June 28, 1919, pp. 972-976, 5 figs. Contrasting present methods with those of ten years ago.

Allocation of Cars

Rolling Stock Distribution on the Midland Railway. Ry. Gaz., vol. 31, no. 1, July 4, 1919, pp. 9-16, 9 figs., partly on two supp. plates. Method of allocating vehicles which forms an essential part of the company's train control system.

France

Brief Survey of the Road Organization in France, A. Forbes. Surveyor, vol. 55, no. 1430, June 13, 1919, pp. 439-441, 4 figs. Work done by British army in order to fit French roads for war traffic. Paper road before Instn. Mun. & County Engrs.

Fuel Efficiency in Stationary Plants

Fuel Efficiency in Railroad Stationary Plants. Ry. Rev., vol. 65, no. 1, July 5, 1919, pp. 24-25, 1 fig. From report of committee on Fuel Economy and Smoke Prevention, read at annual convention of Am. R. R. Assn.

Interstate Commerce Law

A Comprehensive Revised Interstate Commerce Law. Ry. Age, vol. 67, no. 3, July 18, 1919, pp. 105-108. Suggestion for law which shall correlate laws passed since and including that of 1887.

Transfer Roads

How Operating Capacity Can Be Increased, E. H. Lee. Ry. Age, vol. 67, no. 1, July 4, 1919, pp. 34-36. Suggestions for improving intermediate transfer roads. From an appendix to preliminary report of Yards and Terminals Committee of Am. Ry. Eng. Assn.

PERMANENT WAY AND BUILDINGS

Grade-Separation Work

Extensive Grade Separation Work at Indianapolis. Ry. Age, vol. 67, no. 3, July 18, 1919, pp. 95-101, 16 figs. Improvements embrace a four-track high-level line and additional station facilities.

Track Support, Concrete

Concrete Railway Track Support. Eng. & Contracting, vol. 52, no. 3, July 16, 1919, pp. 65-67, 9 figs. Illustrating types constructed on various American railways. Paper read before Am. Concrete Inst. Also in Ry. Rev., vol. 65, no. 3, July 19, 1919, pp. 92-99, 20 figs.

Water Troughs

New Water Troughs at Langley, Great Northern Railway. Ry. Gaz., vol. 30, no. 25, June 20, 1919, pp. 997-999, 5 figs. Total length is 1,800 ft., of which 1,500 ft. is on level, the ramps at each end being 150 ft. long, graded to correspond with rails.

PUBLIC REGULATION

Government Operation

A New Advocate of Government Operation, Joseph B. Eastman. Ry. Age, vol. 67, no. 2, July 11, 1919, pp. 57-58. Letter to Congress suggesting that modifications proposed in the Cummins bill be continued "for an appropriate period of time," in order that uncertainty as to immediate future may be ended and sufficient time gained for deliberate and constructive consideration of entire problem.

RAILS

Electric-Railway Rails

Notes on the History and Development of Electric Railway Rails, R. C. Cram. Elec. Ry. Jl., vol. 54, no. 3, July 19, pp. 106-112, 11 figs. Takes up practical and theoretical considerations which are gradually leading to rail standardization and simplification.

ROLLING STOCK

Box Cars

Box Cars for Chilean Railway. Ry. Mech. Engr., vol. 93, no. 7, July 1919, pp. 417-420, 5 figs. Steel construction of American type for meter-gage line, including M.C.B. couplers and trucks.

See also Express Cars.

Express Cars

Utility Express Car of the Pennsylvania Railroad. Ry. Rev., vol. 65, no. 1, July 5, 1919, pp. 1-5, 6 figs. Box car fitted with heating and axle lighting equipment, and "semi-passenger" design of trucks to permit of its being run in fast trains.

Hopper and Gondola Cars

High Capacity Hopper and Gondola Cars, Pennsylvania Railroad. Ry. Rev., vol. 65, no. 2, July 12, 1919, pp. 45-50, 11 figs. Bodies are fabricated from plates and pressed-steel shapes. Underframe is composed of center sills, consisting of two 10-in. channels, weighing 30 lb. per ft. and two side sills, for which 4 x 6 x 3/4-in. angles are used.

Lighting

Report on Train Lighting and Equipment, Ry. Elec. Engr., vol. 10, no. 7, July 1919, pp. 233-240, 9 figs. Relating particularly work done by committee to develop standard ratings for axle generators. Paper presented at Ann. Conv. of Am. RR. Assn.

Vibration

On the Vibration of Railway Cars, N. Fukushima. (In Japanese.) Jl. Soc. Mech. Engrs., Tokyo, Japan, vol. 22, no. 56, Feb. 1919.

SAFETY AND SIGNALING SYSTEMS

Explosives, Transportation of

The Baltimore Tunnel Disaster, Frank H. Kneeland. Coal Age, vol. 16, no. 2, July 10, 1919, pp. 55-58, 3 figs. Judicial inquiry into causes which led to explosion of blasting powder which was being carried in same mined car with workmen.

Fire Prevention

Fire Prevention on Railroads, W. H. Hoyt. Bul. Affiliated Eng. Societies of Minnesota, vol. 4, no. 5, May 1919, pp. 89-94. Methods of reducing fire loss grouped under three heads—(1) fireproof construction, (2) fire-prevention and fire-fighting equipment, and (3) inspection and education. Applicability and value of each of these to fire prevention on railroads is discussed.

Locomotive Failures

Personal Injuries Due to Locomotive Failures, John L. Mohun. Ry. Age, vol. 67, no. 3, July 18, 1919, pp. 113-118, 2 figs. Suggestions for their reduction based on review of Interstate Commerce Commission locomotive inspection reports.

Safety-Signal Repetition

Safety in Operation of Railroads (La sécuritité de la circulation des trains de chemin de fer), J. Carlier. Société elge des Electriciens, vol. 33, April-June 1919, pp. 99-132, 3 figs. "Cesar" apparatus installed in locomotives for repeating safety signals.

Switch Machines

The Use of Low Voltage Switch Machines, A. R. Whitehorn. Ry. Signal Engr., vol. 12, no. 7, July 1919, pp. 241-242, 2 figs. Describing why such apparatus has been introduced and the main requirements to be met.

SHOPS

Chile

New Shops of the Chilean State Railways, Ernesto Gusman Donoso. Ry. Rev., vol. 64, no. 26, June 28, 1919, pp. 967-972, 8 figs. Reinforced-concrete sanitary repair plant.

Smoke Jack

An Unusual Form of Roundhouse Smoke Jack. Ry. Age, vol. 67, no. 4, July 25, 1919, pp. 155-157, 7 figs. Smoke jacks that cover entire length of stalls, special form of door construction and reinforced-gypsum roof mentioned as features in roundhouse of Pittsburgh & Lake Erie at Haselton, Ohio.

SPECIAL LINES

Light Railways

Light Railways (Ferrocarriles livianos), Charles F. Lang. Ingeniería Internacional, vol. 2, no. 1, July 1919, pp. 9-11, 5 figs. Economic advantages.

Construction and Operation of Light Railways in France, J. H. McKnight. Annual Report of Assn. of Dominion Land Surveyors, January 29, 30 and 31, 1919, pp. 136-139, 1 fig. Types used for military purpose.

A Technical Description of the British Light Railways in France, B. W. Guppy. Prof. Memoirs, Corps Engrs. U. S. Army & Engr. Dept., vol. 11, no. 56, March-April 1919, pp. 185-216. System was designed to connect broad-gage railways with front. Operating rules and signals are given.

STREET RAILWAYS

Cars

New Cars for Liverpool Corporation Tramways. Tramway & Railway World, vol. 45, no. 30, June 19, 1919, pp. 307-308, 4 figs. Single-truck car with reversed stairway and canopy top.

One-Man Car Operation, S. W. Greenland. Elec. Traction vol. 15, no. 7, July 1919, pp. 421-423. Types, service, and data secured from their operation. Paper read before Central Elec. Ry. Assn.

Cleveland

Cleveland Rapid Transit Report, Elec. Ry. Jl., vol. 54, no. 2, July 12, 1919, pp. 71-74, 5 figs. Report of Rapid Transit Commission of the city suggesting means of relief for present congestion and plans for development of rapid transit system.

Japan

Practices and Tendencies in Japanese Electric Railway Transportation, Shiro Sano. Elec. Ry. Jl., vol. 54, no. 1, July 5, 1919, pp. 4-6, 7 figs. Both double and single trolley are used, track gages are far from standard and people seem to lean toward public ownership.

Moving Platforms

Continuous Trains for Forty-Second Street Transit, Henry B. Seaman. Eng. News-Rec., vol. 82, no. 26, June 26, 1919, pp. 1248-1250, 3 figs. Moving platforms recommended. Operation illustrated.

Passenger Traffic, Analysis of

Methods of Observing and Analyzing Passenger Traffic, R. H. Horton. Elec. Ry. Jl., vol. 54, no. 2, July 12, 1919, pp. 75-78, 3 figs. Merits of various methods of obtaining data are pointed out and suggestions are offered in regard to using traffic study data.

Rail Hardening

The Sandberg "in Situ" Rail Hardening Process, Robt. B. Holt. Tramway & Railway World, vol. 45, no. 30, June 19, 1919, pp. 314-315, 1 fig. Experiments carried out by operating a car on an upgradient on a length of track a portion of which had been treated by the "in situ" process, with the front motor cut out and brakes applied to front wheels.

Track Construction

Latest British Street-Railway Track Construction. Eng. News-Rec., vol. 83, no. 2, July 10, 1919, p. 83, 2 figs. Ties generally omitted; bituminous granite chip packing under rails used; standard welding and rail hardening in place.

Bonds for Temporary and Permanent Track Construction, G. H. McKelway. Elec. Ry. Jl., vol. 54, no. 3, July 19, 1919, pp. 114-117, 14 figs. Advantages and disadvantages of various types are discussed from practical standpoint.

Zone Fares

The Zone Fare in Practice, Walter Jackson. Elec. Ry. Jl., vol. 54, nos. 1, 2 and 4, July 5, 12 and 26, 1919, pp. 7-12, 56-61 and 154-157, 27 figs. July 5: Comparative bus and trolley statistics obtained at Leeds, England. July 12: Despite higher fares and cut in service, traffic is said to have fallen off only 3.4 per cent and revenue increased 23.3 per cent. July 26: How British Elec. Traction Co. stimulated riding as close to destination as possible by introducing half-penny stages on top of maximum penny ride.

TERMINALS

Chicago

Proposed New Passenger Terminal in Chicago. Ry. Rev., vol. 65, no. 2, July 12, 1919, pp. 57-61, 6 figs. Plans of Illinois Central which also involve electrification for all types of service and lake-front developments.

Illinois Central Will Build New Chicago Terminal. Ry. Age, vol. 67, no. 2, July 11, 1919, pp. 51-54, 3 figs. Electrification project embracing terminal capable of development to accommodate all railroads at present entering passenger stations east of Chicago River.

Pennsylvania

Engine Terminal Improvements: Pennsylvania Lines West. Eng. News-Rec., vol. 83, no. 1, July 3, 1919, pp. 24-28, 5 figs. Heavy traveling crane, circular crane runway, parking tracks with transfer table and turntable and mechanical ashpits.

Northwest Pennsylvania's Newest Station, J. B. Scott. Elec. World, vol. 74, no. 2, July 12, 1919, pp. 60-63, 5 figs. Power house built on unit principle. It is expected that installation will eventually be rated at 120,000 kw.

Munitions and Military Engineering

Cables

Military Uses of Cables (Etude sur l'emploi des cables aux armées), G. Leinekugel le Cocq. Genie Civil, vol. 74, no. 24 & 25, June 14 & 21, 1919, pp. 477-481 and 497-504, 95 figs. partly on supp. plates. Mechanical details and technical study of semi-permanent Gisclard bridges; aerial transport cable and its use in rapid reconstruction of masonry piles and railroad beds. (Concluded.)

Camouflage

Memoranda on the Camouflage Service of the United States Army, Evarts Tracy. Prof. Memoirs, Corps Engrs. U. S. Army & Engr. Dept., vol. 11, no. 56, Mar-Apr. 1919, pp. 175-184. Including discussion of qualifications of a field camoufleur.

The Principles of Camouflage, M. Luckiesh. Tran. Illum. Eng. Soc., vol. 14, no. 5, July 21, 1919, pp. 234-255. Particularly in reference to marine practice and applicability of art to airplanes.

Camouflage, Harold Van Buskirk. Tran. Illum. Eng. Soc., vol. 14, no. 5, July 21, 1919, pp. 225-233, 8 figs. on six separate plates. Outline of progress made in United States before and after Navy Dept. took over and organized its camouflage section.

Painting Battleships for Low Visibility, Everett L. Warner. Tran. Illum. Eng. Soc., vol. 14, no. 5, July 21, 1919, pp. 220-224, 2 figs. on four supp. plates. Standard navy gray considered as most suitable shade.

The Science of Marine Camouflage Design, Everett L. Warner. Tran. Illum. Eng. Soc., vol. 14, no. 5, July 21, 1919, pp. 215-219, 10 figs. on four supp. plates. Showing various designs with reference to principles involved. Paper presented before N. Y. Section Illum. Eng. Soc.

Camps

Construction of Camp Meade, R. F. Proctor. Cornell Civil Engr., vol. 27, no. 5, June 1919, pp. 159-167. Camp provides housing for 41,500 men.

Construction Division, U. S. A.

Expediting the Engineering Work of the Construction Division of the Army, A. B. McDaniel. Eng. & Contracting, vol. 52, no. 3, July 16, 1919, pp. 77-79, 3 figs. Outlining method for routing work and coördination of various departments.

Destroyers

Notes on Handling Destroyers, C. C. Slayton. U. S. Naval Inst. Proc., vol. 45, no. 7, July 1919, pp. 1201-1219, 6 figs. Suggestions to captains.

Engineering in the Navy

The Importance of Engineering to the Navy, Josephus Daniels. Jl. Engrs. Club of Philadelphia, vol. 36, no. 177, August 1919, pp. 299-300. From address at opening exercises of Post-Graduate School at Annapolis.

German Fleet, Sinking of

The Sinking of the German Fleet at Scapa-Flow (Le coulage de la flotte allemande a Scapa-Flow), A. Poidlouë. Génie Civil, vol. 75, no. 1, July 5, 1919, pp. 1-7, 22 figs. Technical notes on relative values of British and German fleets. Structural features of ships which participated in Jutland battle.

Gun-Mount Construction

Building 5-inch Gun Mounts at Brantford, J. H. Moore. Can. Machy., vol. 22, no. 4, July 24, 1919, pp. 65-68, 9 figs. Dealing practically with machine-tool equipment. (To be concluded.)

Gun Mounts, Naval

Making Naval Gun Mounts. Machinery (Lond.), vol. 14, no. 351, June 19, 1919, pp. 349-353, 11 figs. Tools, gages and fixtures used in operations. (Continued.)

How the Navy Designed and Built the World's Heaviest Field Piece, C. L. McCrea. U. S. Naval Inst. Proc., vol. 45, no. 7, July 1919, pp. 1159-1169, 2 figs. Seven-inch caterpillar mount.

Mounts for Naval Anti-Aircraft Guns, Fred H. Colvin. Am. Mach., vol. 51, no. 2, July 10, 1919, pp. 79-83, 14 figs. Carriage and ball races. First article.

Mines

Bringing in the Sheaves, Clarence Nelson Hinkamp. U. S. Naval Inst. Proc., vol. 45, no. 7, July 1919, pp. 1117-1133, 11 figs. Structural details of German mines. Account of mine sweeping.

Ordnance Base

The Ordnance Base of the American Expeditionary Forces. Stone & Webster Jl., vol. 25, no. 1, July 1919, pp. 10-22, 14 figs., on supp. plates. Describes Mehun plant, which was laid out to serve army of two million men in France.

Ordnance Materials

The Manufacture of Steel for Ordnance Materials in England and in France, F. F. McIntosh. Proc. Engrs. Soc. Western Pa., vol. 35, no. 3, April 1919, pp. 140-163, and (discussion) pp. 164-170. Observation and impression obtained on inspection of steel mills through England and France. The method of etching for macrostructure of steel as developed by Mr. J. C. W. Humphreys, Chief Chemist in charge of Naval Inspector of Steels Laboratory at Sheffield, England, is presented.

Paravanes

Paravanes, George L. Catlin. U. S. Naval Inst. Proc., vol. 45, no. 7, July 1919, pp. 1135-1157, 8 figs. Types used, manner of applying them, and description of operation.

Zeebrugge Attack

Destruction of the Flanders Triangle. Z. W. Wicks. U. S. Naval Inst. Proc., vol. 45, no. 7, July 1919, pp. 1093-1116, 3 figs. Technical consideration involved in planning the Zeebrugge attack.

General Science

CHEMISTRY

Air Analysis

A Simple Form of Apparatus for Estimating the Oxygen Content of Air from the Upper Atmosphere, Francis William Aston. Jl. Chem. Soc., vols. 115-116, no. 679, May 1919, pp. 472-475, 1 fig. Watson apparatus modified by measuring difference only in oxygen content between sample and normal air.

Apparatus for the Rapid Analysis of Confined Air and Unhealthy Atmospheres (Appareil pour l'analyse rapide de l'air confiné et des atmosphères insalubres). Génie Civil, vol. 74, no. 24, June 14, 1919, p. 490, 1 fig. Air drawn in through independent Cloez flasks by running of water out of large zinc cylinder. Apparatus permits simultaneous examination of various atmospheres.

Allotropy

Theory of Allotropy; Allotropes and Allotropoids, Maurice Copisarow. Chem. News, vol. 118, no. 3086, June 6, 1919, pp. 265-266. Regards allotropy as function of valency and defines it as "capacity of an element to exist in forms, differing in the mode of their ultramolecular linkage."

Analysis, Electrochemical

New and Rapid Apparatus for Electrochemical Analyses, J. T. King. Chem. & Metallurgical Eng., vol. 21, no. 1, July 1, 1919, pp. 25-29, 7 figs. Stirring effected by rotating containing beaker. Table showing results of experiments on three different brasses, obtained by this and other methods of stirring and carried out by different operators, is included.

See also under names of materials analyzed.

Analysis, Nickel

Quantitative Analysis of Nickel in Ferro-Nickels and Steels (Dosage du nickel dans les ferro-nickels et les aciers), Paul Nicolardot and Georges Gourmain. Bul. Société Chimique de France, vol. 25-27, no. 6, June 1919, pp. 338-344. Preference is given to eletrolytic method, which is said to be most exact.

Asphalt Precipitation

Quick Method for Determination of Hard Asphalt (Schnellmethode zur Bestimmung von Hartasphalt), J. Tausz and A. Lüttgen. Petroleum, vol. 14, no. 14, Apr. 15, 1919, pp. 653-654, 1 fig. Principal features of method are: Hard asphalt is precipitated with benzine in special small centrifugal containers which may be weighed on the micro scale, and is immediately put into the centrifugal apparatus, where it is said to be completely separated within 10 min.

Calcium Determination

See Zinc and Calcium Determination.

Clay Analysis

A Simplified Apparatus for the Determination of Air in Clay. H. Spurrier. Jl. Am. Ceramic Soc., vol. 2, no. 6, June 1919 pp. 490-493, 2 figs. Disengaging gases occluded in clay by use of air-free and nearly boiling water, introduced as simplification in process given as accurate in connection with apparatus described in Jl. Am. Ceramic Soc., 1, 710-715, 1918.

Cyanide Reactions

The Sensitiveness of Some Cyanide Reactions, John B. Ekeley and Icie C. Macy. Proc. Colorado Sci. Soc., vol. 11, June 1919, pp. 269-274, 1 fig. Experiments lead to recommendation that Schonbein tests should be carried out in closed vessels in dark to get trustworthy results.

Distillation

New Laboratory Alembic and Measure of its Efficiency (Sur une nouvelle colonne à distiller, pour laboratoire, et sur la mesure de son éfficacité), M. H. Robert. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 20, May 19, 1919, pp. 998-1001, 2 figs. For fractional distillation.

Elements

New Periodic Classification of the Chemical Elements (Sur une nouvelle classification périodique des éléments chimiques), Marc Chauvierre. Bul. Société Chimique de France, vol. 25-26, no. 6, June 1919, pp. 297-305, 1 fig. Based on periodicity resulting from atomic weights and presented as applicable to theories of organic evolution and believed to suggest hypotheses explaining origin of radioactive phenomenon.

Explosive Reactions, Temperature

Temperatures Obtained in Explosive Reactions (Sur la détermination des températures atteintes dans les réactions explosives), Henri Muraour. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 20, May 19, 1919, pp. 995-997. Experiments are said to have proved that the greater part of methane contained in the products of combustion of powders is formed during period of cooling.

Gas Analysis

Computation Tables for Flue and Chimney Gas Analyses (Rechentafeln zur Rauchgas- und Auspuffanalyse), Wa. Ostwald. Feuerungstechnik, vol. 7, no. 7, Jan 1, 1919, pp. 53-57, 12 figs., partly on supp. plate. Endeavors to show the state of dependence to each other of the following variations: (1) proportion of mixture or surplus of air or air factor of exhaust mixture, (2) completeness of combustion or percentage of carbon monoxide, (3) percentage of carbonic acid in flue gases, (4) percentage of free oxygen in flue gases.

Lead Sulphide

The Chemical Equilibrium between Sulphide of Lead and Its Roasting Products (Ueber die chemischen Gleichgewichte zwischen Bleisulfid und seinen Röstprodukten), Rudolf Schenk and Agnes Albers. Zeitschrift für anorganische und allgemeine Chemie, vol. 105, no. 4, Apr. 3, 1919, pp. 145-146, 6 figs. Purpose of experiments was to determine nature of tension curves and to deduce from these the condition of existence of the various solid phases.

Petroleum Analysis

Estimation of Benzene and Toluene in Petroleum, F. B. Thole. Chem. Indus., vol. 38, no. 4, Feb. 28, 1919, pp. 39T-43T, 2 figs. Comparative examination of various methods.

Phosphates, Acid

On Various Properties of Acid Phosphates (Sur quelques propriétés des phosphates acides), A. Joannis. Comptes rendus des séances de l'Academie des Sciences, vol. 168, no. 24, June 16, 1919, pp. 1202-1203. Experiments said to confirm Berthelot's conclusions in regard to the different values he obtained for the three acid functions of phosphoric acid.

Rock Analysis

The Determination of Combustible Matter in Silicate and Carbonate Rocks, A. C. Fieldner, W. A. Selvig and G. B. Taylor. Bur. of Mines, technical paper no. 212, April 1919, 22 pp., 1 fig. Lissner's method of determining organic carbon and hydrogen found to give abnormally high results for organic hydrogen in rocks containing small amounts of combustible matter.

Schonbein Test

See Cyanide Reactions.

Soil Analysis

A Simplified Wet Combustion Method for the Determination of Carbon in Soils, D. D. Waynick. Jl. Indus. & Eng. Chem., vol. 11, no. 7, July 1, 1919, pp. 634-637, 1 fig. Said to require about 25 min. total time for determination.

Solubility

Solubility—III. Relative Values of Internal Pressures and their Practical Application, Joel H. Hildebrand. Jl. Am. Chem. Soc., vol. 41, no. 7, July 1919, pp. 1067-1080. Various methods for calculating solubility of liquids are reviewed, and though the values they yield differ considerably, argoments are presented to show that they are closely parallel.

Steel Analysis

The Determination of Vanadium in Steels by Electrometric Titration. The Selective Oxidation of Vanadyl Salts by Nitric Acid in the Presence of Chromic Salts, G. L. Kelley, J. A. Wiley, R. T. Bohn and W. C. Wright. Jl. Indus. & Eng. Chem., vol. 11, no. 7, July 1, 1919, pp. 632-634. With illustration of application of methods to analysis of synthetic steels.

Zinc and Calcium Determination

Determination of Zinc and Calcium in the Presence of Lead, Ernest Nyman. Can. Chem. Jl., vol. 3, no. 7, July 1919, pp. 217-218. Based on solubility of lead ferrocyanide and lead oxalate in amml acetate solution, and titration of zinc in ammoniacal solution by using uranylacetate weakly acidified with hydrochloric acid as outside inicator.

Zirconium Analysis

Analysis of Zirconium Ores and Alloys, A. Travers. Metal Industry, vol. 14, no. 22, May 30, 1919, pp. 441-444. Chancel's method of separating ZrO_2 and Fe_2O_3 by means of sodium hyposulphite considered as best.

MATHEMATICS

Determinants

Notes on the Determinant of the Primary Minors of Special Set of $(n-1)$ — by n Arrays, Thomas Muir. Proc. Roy. Soc. of Edinburgh, vol. 39, part 1, Session 1918-19, pp. 35-40. Cases in which determinant vanishes.

Equations

Two-dimensional Solutions of Poisson's and Laplace's Equations, Leonard Bairstow and Arthur Berry. Proc. Roy. Soc., Series A, vol. 95, no. A 672, June 4, 1919, pp. 457-475, 2 figs. Based on theorem stating that "any irrotational acyclic fluid motion can be reproduced by an appropriate choice of simple sources round the fixed boundaries." Strength of sources corresponding with given boundaries is determined by solution of an integral equation; in case of double boundaries simultaneous integral equations are solved.

Application of Gibbs-Helmholtz Equation to Monovariant Systems (Sur l'application de l'équation de Gibbs-Helmholtz, aux systèmes monovariants), A. Boutaric. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 19, May 12, 1919, pp. 939-942. Suggests modification in form adapted by Nernst for extending above equation to such systems.

Numerical Integration of Differential Equations, F. R. Moulton. Jl. U. S. Artillery, vol. 51, no. 1, July 1919, pp. 40-55, 1 fig. Examples illustrating application of Picard's method.

On the Numerical Integration of Differential Equations, H. T. H. Piaggio. Lond., Edinburgh and Dublin, Phil. Mag., vol. 37, no. 222, June, 1919, pp. 596-600, 1 fig. Formula for computing order of magnitude of error in final result when Runge's formula (Math. Ann., vol. 46, 1895) is used.

Isothermal Surfaces

On Isothermal Surfaces (Sur les surfaces isothermiques), C. Guichard. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 24, June 16, 1919, pp. 1185-1188. Solution of equation of system formed by lines of curvature, which is satisfied by the solutions of Laplace, of an equation having equal invariants such that the sum of their squares equals zero.

Polynomials

Development of Jacobi's Polynomials (Sur les développements de Jacobi), Erwand Kogbetliantz. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 20, May 19, 1919, pp. 992-994. Limiting cases of summation.

Series

Summation of Divergent Series (Sur la sommation des séries divergentes), Erwand Kogbetliantz. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 22, June 2, 1919, pp. 1090-1092. Theorem concerning application of method (R, λ, κ) by Riesz typical mean function.

Trigonometric Series

Trigonometric Series (Sur les séries trigonométriques), Erwand Kogbetliantz. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 24, June 16, 1919, pp. 1193-1194. Problem summation (C, $\delta < o$).

Vector Algebra

Further Contributions to Non-Metrical Vector Algebra, L. Silberstein. Lond., Edinburgh, and Dublin Phil. Mag., vol. 38, no. 223, July 1919, pp. 115-143, 6 figs. Theory of vector multiplication.

PHYSICS

Acoustics

The Resonance Theory of Audition subjected to Experiments, E. H. Barton and H. M. Browning. Lond., Edinburgh, and Dublin Phil. Mag., vol. 38, no. 223, July 1919, pp. 164-173, 1 fig. Reviewing position of resonance theory about audition, writer acknowledges subject to be controversial, but endeavors to throw sidelight upon it by trial of a graduated set of pendulums.

The Function of Phase Difference in the Binaural Location of Pure Tones, R. V. L. Hartley. Physical Rev., vol. 13, no. 6, June 1919, pp. 373-385, 5 figs. In expressing sound images observed when pure tones of same frequency and intensity but of different phase are applied to the two ears, use is made of theoretical curves calculated by Stewart and Fry, giving relation between the position of actual source and the resulting phase difference of sound at the two ears.

The Absolute Measurement of the Intensity of Sound, Arthur Gordon Webster. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 7, July 1919, pp. 889-900, 8 figs. on two supp. plates. Theory of operation of phone (used for measuring output of sound in watts of energy), phonometer (for measuring a sound in absolute units), and phonotrope (designed and used to find direction of a source of sound). A list of various technical papers on sound is appended.

Colors

The Persistence of Vision of Colours of Varying Intensity, Frank Allen. Lond., Edinburgh & Dublin Phil. Mag., vol. 38, no. 223, July 1919, pp. 81-89, 5 figs. Method of critical frequency of flicker applied to investigating phenomena of color vision.

Crystal Formation

A Method of Growing Large Perfect Crystals from Solution, R. W. More. Jl. Am. Chem. Soc., vol. 41, no. 7, July 1919, pp. 1060-1066, 3 figs. It consists of placing small seed crystals or several in nearly saturated solution of salt, cooling solution until it is very slightly supersaturated, and maintaining a state of slight supersaturation by slowly cooling solution, with the temperature regulated within very narrow limits.

Electron Discharges

Determining the Velocity of Electron Discharge (Ueber die Bestimmung von Elektronen-Austrittsgeschwindigkeiten), A. Becker. Annalen der Physik, vol. 58, no. 5, 1919, pp. 393-473. 17 figs. Theories: homogeneous field; cosine law of radiation; practical derivations; special applications.

Fluid Flow

Flow of Gasoline Vapor (Sur l'écoulement de la vapeur de pétrole), Jean Rey. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 22, June 2, 1919, pp. 1092-1095. Further discussion of equations presented in Comptes Rendus, vol. 168, 1919, p. 509.

Fluids

The Spreading of Fluids on Glass—III, W. B. Hardy. Lond., Edinburgh, and Dublin Phil. Mag., vol. 38, no. 223, July 1919, pp. 49-55. Evidence offered in confirmation of Lord Rayleigh's suggestion that complicated secondary changes in secondary composite surface are due to chemical heterogeneity of surface layer.

Heat Measurement

The Measurement of Heat and the Scope of Carnot's Principle, Arthur C. Lunn. Physical Rev., vol. 14, no. 1, July 1919, pp. 1-19. What is termed symmetric form of exposition of principle of thermodynamics is developed through recognizing on a parity from the outset the two kinds of conservation naturally called after Black and Carnot which lead to energy and entropy scales of measurement of heat.

Heat, Mechanical, Equivalent of

Value of the Mechanical Equivalent of Heat (Ueber den Wert des mechanischen Wärmeaquivalents), W. Jaeger and H. von Steinwehr. Annalen der Physik, vol. 58, no. 5, 1919, pp. 487-488. Discussion of value found by Carlton Sutton and table of equivalents obtained in research work of twelve other scientists, during period extending from 1843 to 1915.

Liquids

Vapor Pressure of Thin Liquid Films (Pression de vapeur des liquides en lames minces), Felix Michaud. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 23, June 10, 1919, pp. 1155-57. Concluded analytically that vapor from such films exerts pressure considerably below normal corresponding to conditions of saturation.

The Rotational Oscillation of a Cylinder in a Viscous Liquid, D. Coster. Lond., Edinburgh, and Dublin Phil. Mag., vol. 37, no. 222, June 1919, pp. 587-594, 1 fig. Following method used by Professor Verschaffelt in analogous case of sphere. (Comm. Leiden, p. 22.)

Michelson's Experiment

See Relativity.

Optics

Scattering of Light by Solid Substances, R. J. Strutt. Proc. Roy. Soc., Series A, vol. 95, no. A 672, June 4, 1919, pp. 476-479, 4 figs. on separate plate. Comparison between intensities of vibration, (1) parallel to direction of primary beam and (2) perpendicular to primary beam. Former is given as percentage of latter. Result for Chance's crown glass given as 8 per cent and for ordinary plate glass as 3 per cent.

Osmotic Pressures

On Osmotic Pressures Derived from Vapour-Pressure Measurements: Aqueous Solutions of Cane Sugar and Methyl Glucoside, E. G. J. Hartley and C. V. Burton. Phil. Tran. Roy. Soc., Lond., Series A 565, vol. 218, May 20, 1919, pp. 295-349, 6 figs. Investigations to determine best conditions for making method described in Roy. Soc. Proc., A, vol. 77, 1906, and in Phil. Trans., A, vol. 209, both accurate and of general applicability, and to obtain data for construction of suitable apparatus for determination of absolute vapour density of liquids in air or other gas.

Photographic Rendering of Contrast

The Fundamental Law for the True Photographic Rendering of Contrast, Alfred W. Porter and R. E. Slade. Lond., Edinburgh, and Dublin Phil. Mag., vol. 38, no. 223, July 1919, pp. 187-197, 9 figs. Examination of technical principles assumed in method of treating photographic plates devolved after researches of F. Hurter and V. C. Driffield. (See Jl. Sic. Chem. Industry, May 31, 1890.)

Radioactivity

On the Relation between the K Series and the L Series of X-Rays, William Duane and Takeo Shimizu. Physical Rev., vol. 14, no. 1, July 1919, pp. 67-73, 2 figs. Experiments with tungsten. Graphs are given representing ionization currents as functions of the crystal table angle.

Radioactive Bricks, H. J. Knollman. Jl. Am. Ceramic Soc., vol. 2, no. 6, June 1919, pp. 451-460. Method of manufacturing radioactive clay bricks.

Soap Films

Soap Bubbles and Films, J. Perrin. Sci. Am. Supp., vol. 88, no. 2273, July 26, 1919, pp. 50-51. Examination of black spots which appear just before rupture of bubbles or films of soap. Translated from the French.

Structure of Matter

The Langmuir Postulates, Ellwood Hendrick. Chem. & Metallurgical Eng., vol. 21, no. 2, July 15, 1919, pp. 73-81, 13 figs. Method of determining physical qualities of chemical compounds from their atomic, ionic and molecular struture. Presented as introduction to theory of chemical reactions developed by Dr. Irving Langmuir.

Sulphur Vapor

The Constitution of Sulphur Vapour, James J. Dobbie. Proc. Roy. Soc., Series A, vol. 95, no. A 672, June 4, 1919, pp. 484-492, 5 figs, partly on two separate plates. Experiment performed by enclosing quantity of metal in closed tube from which air was subsequently drawn out and nitrogen introduced. Sources of light employed were Nernst filament, ultra-violet, and cadmium arc.

Vortices

Vortices of a Fluid (Sur les tourbillons d'une veine fluide), L. Lecornu. Comptes Rendus des séances de l'Académie des Sciences, vol. 168, no. 19, May 12, 1919, pp. 923-926. On Beltrami's researches (Rendiconti del reale Istituto lombardo, 1889), as to whether in movement of fluid curves tangent to velocities coincide with lines of vortex.

X-Rays

See Radioactivity.

Centrifugal Compressors[1]

By GUSTAV FLUEGEL, D. ENG.

For a period of more than four years German engineering and scientific periodicals have been received in this country only to a very limited extent, and American engineers have been unable to follow the technical developments in Germany. Meanwhile the same urgent necessity which inspired the development of new ideas on the Allied and American side during the years of the war has existed also on the German side, with the result that many important and interesting inventions, improvements and researches have been carried out. The American Society of Mechanical Engineers has made a vigorous effort to collect copies of the German periodicals, particularly of the Zeitschrift des Verein Deutscher Ingenieure, and hopes within the limits of the available space to bring to the readers of Mechanical Engineering some of the more important of the German developments, either in the Engineering Survey section or as separate articles. The investigation of the characteristic curves of centrifugal compressors by Dr. Gustav Fluegel, printed below, is but the first installment of what is hoped will develop into a series of articles, abstracts, and translations.

I BASIC CHARACTERISTICS

THE characteristic curves of centrifugal pumps and water turbines may be derived in accordance with comparatively simple laws when certain data are available and certain conditions maintained, but the relations are far more complicated in the case of centrifugal machinery for handling elastic fluids. It is due to this fact, in the opinion of the author, that no general formulæ defining the behavior of multi-stage centrifugal compressors are available in technical literature, notwithstanding their great importance.

The characteristic curve of a compressor, that is, the curve which for the same speed of rotation n defines the rise of pressure as a function of the suction volume, can be considered as a result of superposition of the characteristics of all the single stages. If all such single-stage curves for the same speed of rotation and the same initial state be plotted in some system of coördinates, one obtains a group of curves such as shown in Fig. 1; and, as a rule, the nearer the stage is to the compressor end the smaller is the volume of fluid q flowing through it and the delivery head Δp. In a similar manner could be plotted the efficiency curves, which are different for every individual stage. The whole system of curves varies with the speed of the compressor and with the density of the fluid handled, but this variation of curves may be simplified in what the author calls an extraordinary manner, as will be shown later.

The delivery head Δp for a single stage can be expressed by the known formula

$$\Delta p = m \frac{\gamma}{2g} u^2$$

where m is the value of pressure rise which varies with the angle of blades and for the same angle may be considered as constant, though strictly it increases with the speed in revolutions (regarding which more will be said in another place), u is the peripheral velocity of the pumping wheel, γ the specific weight of fluid at entrance to the wheel and g the acceleration due to gravity.

The compressor is always built for a certain normal output at a normal speed in revolutions n_0 at which it should reach its maximum efficiency. In such a case the admissions of the single stages are equal to unity and the amount of fluid passing therethrough per second is Q_0. With the same speed in revolutions n_0 but with a different amount of fluid passing therethrough, the admission is

$$\varepsilon = \frac{Q}{Q_0}$$

When, however, the speed in revolutions varies also, the same magnitude is expressed by

$$\varepsilon = \frac{Q}{Q_0}\,\frac{n_0}{n}$$

With the same admission the entrance and exit triangles for the same stage are similar. Hence one may, instead of representing the delivery head Δp as a function of the amount of fluid flow Q, represent the magnitude of the delivery head m of each individual stage as a function of its admission ε, Fig. 2, in which case the curves $A_1 B_1$, $A_2 B_2$, etc., are obtained, and all of them differ but

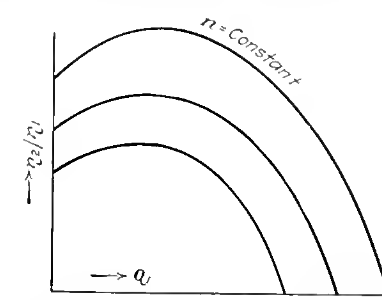


FIG. 1 CHARACTERISTIC CURVES OF A COMPRESSOR (AS A WHOLE)

little from each other because of the fact that all stages in a compressor are usually built very similar to each other. It is therefore natural to plot in their stead an average curve AB, derived from the following point of view. If, at a certain speed in revolutions n of the compressor and peripheral velocity of a wheel u, the value of $S = \Sigma u^2$, then for the stages under consideration can be calculated and for each of the curves A_1B_1, A_2B_2 can be found the corresponding value

$$\gamma_1 = \frac{u_1^2}{S}, \quad \gamma_2 = \frac{u_2^2}{S}$$

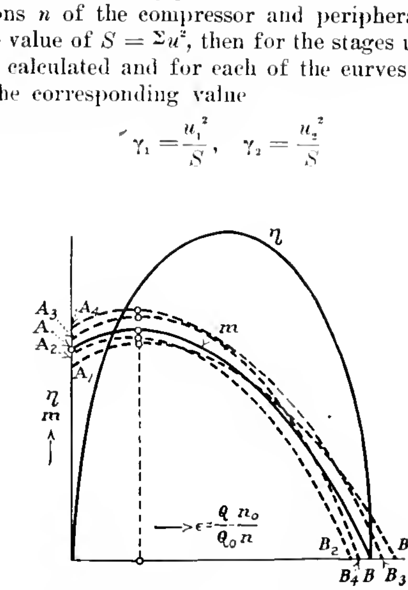

FIG. 2 DELIVERY-HEAD ADMISSION AND DELIVERY-HEAD EFFICIENCY CURVES

If now m_1, m_2, etc., be the numerical values of the pressure head with certain admission ε^1, the average value for the whole group is found to be

$$m = \Sigma \gamma m^1$$

By repeating such determinations as above for a number of admissions, one finds the average curve AB. In a similar manner may be determined as a function of ε the average curve of efficiency η for the single stages.

These two average curves of m and η derived of functions of ε the author calls the *basic characteristic* of a multi-stage compressor group. They are independent of the speed of rotation in revolu-

[1] From *Zeitschrift des Vereines deutscher Ingenieure*, no. 20, vol. 63, May 17, 1919, pp. 455-460.

tions, or the amount of fluid flowing per unit of time, of the density of the medium handled and of the location of each individual stage, and therefore may be used as a starting point for determining the general behavior of turbo-compressors. Since the individual stages of all centrifugal compressors are built in a manner very similar to each other and since in practice the variation in the speed of rotation, velocity of flow, and delivery head of a compressor is comparatively small, a single basic characteristic ought to be sufficient as a foundation for all calculations, at least when applying to machines of similar design.

II COMPRESSOR WITH UNCOOLED CASING

(a) Compression in a Single Multi-Stage Group

When a considerable rise of pressure is desired, compressors without external cooling are always divided into several groups of stages with intercooling of air between the groups. It is therefore only necessary to investigate the behavior of a single group of stages due to variation of the speed of rotation in revolutions, the amount of fluid flowing through and the initial state of the air. With normal load the admission in all stages is $\varepsilon = 1$, and without impairing materially the precision of results one may consider the magnitude of the pressure head m and the efficiency η_i of all stages of the group as constant. Under different conditions of operation, however, the values of ε, m and η_i may vary from stage to stage. From

$$\Delta p = m \frac{\gamma}{2g} u^2$$

we find with sufficient precision for our purposes the following expression for the work consumed in compressing the air in each stage.

$$\Delta E = A \frac{V \Delta p}{\eta_i} = \frac{A G}{2g} \frac{m}{\eta_i} u^2$$

where A is the mechanical equivalent of heat; V the amount of air flowing per second and $G = V\gamma$ the weight of air flowing per second. Since, further,

$$\Delta E = G c_p \Delta T$$

when ΔT is the rise of temperature in the stage and c_p the specific heat of the gas, it follows that

$$\Delta T = \frac{A}{2g\, c_p} \frac{m}{\eta_i} \Delta s$$

where $\Delta s = u^2$. Further, it has been shown (*Zeitschrift des Vereines deutscher Ingenieure* 1918, p. 662), that

$$\Delta T = \frac{k-1}{k\eta_i} \frac{\Delta p}{p} T$$

when p is the absolute pressure, T the absolute temperature at the entrance to the stage and k the exponent in the adiabatic equation. This equation was derived by considering the compression as if it were occurring not in a finite number of stages but in an infinite number of very small stages. Because of this the above two relations may be expressed in the form of differential equations

$$\frac{d\,T}{T} = \frac{k-1}{k\,\eta_i} \frac{d\,p}{p}$$

$$d\,T = \frac{A}{2\,g\,c_p} \frac{m}{\eta_i} ds$$

If great precision in calculation is desired it is necessary in the integration of these equations to consider only the variation of m and η_i under normal load by assuming that

$$\eta_i = \eta_{i1} = k_1 T$$

$$\frac{m}{\eta_i} = \left(\frac{m}{\eta_i}\right)_1 - k_2 s$$

where k_1 and k_2 are constants and $s = \Sigma u^2$ from the first stage to the stage under consideration. The integration gives then the following solutions for the entire group of stages

$$\frac{T_2}{T_1} = \frac{(1+a)\left(\frac{p_2}{p_1}\right)^c}{1 + a\left(\frac{p_2}{p_1}\right)^c}$$

$$T_2 - T_1 = \frac{A\,S}{4\,g\,c_p}\left[\left(\frac{m}{\eta_i}\right)_1 + \left(\frac{m}{\eta_i}\right)_2\right]$$

provided the following substitutions are made

$$a = \frac{\eta_{i2} - \eta_{i1}}{2} \frac{T_1}{T_2}$$

$$c = \frac{k-1}{k\,\eta_{i1}}$$

and $S = \Sigma u^2$ for all stages of the group. The subscript 1 denotes the values for the entrance to the group and the subscript 2, exit from the group.

Since, however, no especially great precision is necessary for purposes of general calculation in practice, approximations may be sufficient and it is permissible to substitute in the integration for m and η_i constant average values m_m and η_{im}. This gives

$$\frac{T_2}{T_1} = \left(\frac{p_2}{p_1}\right)^c \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad [1]$$

where

$$c = \frac{k-1}{k\,\eta_{im}}$$

and

$$\frac{A\,S}{2\,g\,c_p\,T_1}\left(\frac{m}{\eta_i}\right)_m = \frac{T_2}{T_1} - 1 \ldots\ldots\ldots\ldots\ldots [2]$$

The value of S is to the value of S_0 at the normal speed in revolutions n_0 in the ratio of $\frac{S}{S_0} = \left(\frac{n}{n_0}\right)^2$. With the aid of Equation [2] may be found for various values of m_m and η_{im} the corresponding temperature ratios T_2/T_1 for constant value of S and hence, in accordance with Equation [1], the ratios of compression p_1/p_2, or, inversely, with the constant compression ratio the respective values of S, that is, speeds in revolutions. The average values of m_m and η_{im} can be derived from the fundamental characteristic curves, Fig. 3, in accordance with the following procedure. If ε_1 denotes the admission of the first and ε_2 of the last stage, then the average admission of the group is

$$\varepsilon_m = \frac{\varepsilon_1 + \varepsilon_2}{2}$$

The values corresponding to m_m and η_{im} corresponding to ε_m are next inserted in Equation [2]. Attention is called here to the fact that the actual average values of m and η_i lying between ε_1, and ε_2 differ somewhat from m_m and η_{im} because of the curvature of the curves, the more so the more there is difference between ε_1 and ε_2. This circumstance may, however, be taken into consideration in inserting these values into Equation [2], and estimated variations in the values made.

Let subscript o denote the relations existing at normal load, subscript 1 the entrance to the compressor group and subscript 2 the exit therefrom. Further, let G be the weight of air flowing through the unit per second. Then the following values obtain for ε_1 and ε_2

$$\varepsilon_1 = \left(\frac{Q}{Q_0}\right)_1 \frac{n_0}{n} = \frac{G}{G_0}\left(\frac{p_0}{p} \frac{T}{T_0}\right) \frac{n_0}{n},$$

$$\varepsilon_2 = \left(\frac{Q}{Q_1}\right)_2 \frac{n_0}{n} = \frac{G}{G_0}\left(\frac{p_0}{p} \frac{T}{T_0}\right)_0 \frac{n_0}{n}.$$

Hence

$$2\varepsilon_m = \varepsilon_1 + \varepsilon_2 = \varepsilon_1\left[1 + \left(\frac{p_2}{p_1} \frac{T_1}{T_2}\right)\frac{p_1}{p_2} \frac{T_2}{T_1}\right],$$

$$\varepsilon_1 = \frac{2\varepsilon_m}{1 + \left(\frac{p_2}{p_1} \frac{T_1}{T_2}\right)_0 \frac{p_1}{p_2} \frac{T_2}{T_1}}.$$

The volume of air taken in by suction is then

$$Q_1 = \varepsilon_1 Q_{01} \frac{n}{n_0}$$

or

$$Q_1 = Q_{01}\,\frac{2\varepsilon_m \dfrac{n}{n_0}}{1+\left(\dfrac{p_2}{p_1}\dfrac{T_1}{T_2}\right)\dfrac{p_1}{p_2}\dfrac{T_2}{T_1}}\ \ldots\ldots\ldots\ldots\ [3]$$

The work of compression consumed by the group is

$$E = G\,c_p\,(T_2 - T_1)\ \ldots\ldots\ldots\ldots\ [4a]$$

and it has been shown in a previous paragraph that

$$\Delta E = \frac{A\,G}{2g}\,\frac{m}{\eta}\,u^2.$$

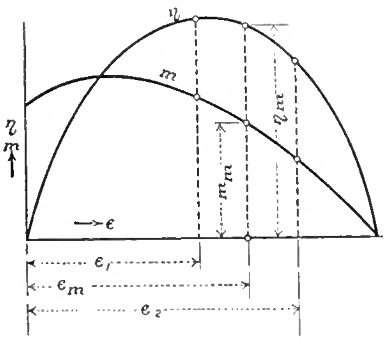

FIG. 3 BASIC CHARACTERISTIC CURVES, COMPRESSOR WITH UNCOOLED CASING

From these the following further equation is obtained, namely,

$$E = \frac{A\,G\,S}{2g}\left(\frac{m}{\eta}\right)_m\ \ldots\ldots\ldots\ldots\ [4b]$$

which must give for E the same value as Equation [4a]. In order to evaluate the main equations more uniformly the temperature relation

$$\frac{T_1}{T_2} = \left(\frac{p_2}{p_1}\right)^{\varepsilon} = \frac{E}{G\,c_p\,T_1} + 1$$

can be expressed as a function of the pressure ratio p_2/p_1 for the various values of ε, that is, of η_m = constant. In this way Equation [1] will be graphically reproduced. The characteristic curve of the group is then determined in a simple manner, as follows:

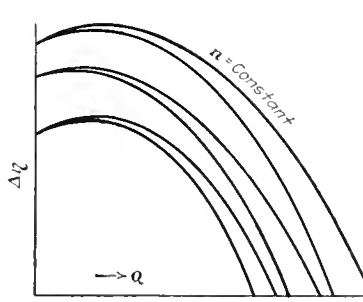

FIG. 4 CHARACTERISTIC CURVES FOR THE FIRST GROUP OF STAGES OF A COMPRESSOR

In Equation [2] are inserted the values of $\left(\frac{m}{\eta}\right)_m$ corresponding to the various values of Σ_m for the same value of n, (that is, for S = constant). Thereby may be determined the corresponding values of T_2/T_1 and hence the values of p_2/p_1. In this manner all the magnitudes on the right side of equation 3 are determined and the volume of the air taken in by suction Q_1 may be calculated. When this is done the compression ratios p_2/p_1 may be plotted as a function of Q_1, as in Fig. 4, which determines the first group characteristic curves. In a similar manner the other group characteristic curves may be computed for other speeds in revolutions n.

The problem may be therefore considered as solved for multistage compressors without intercoolers.

(b) TOTAL COMPRESSION OF COMPRESSOR

If a group of stages is followed by an intercooler, the amount of heat taken away from the flowing air can be in the first approximation expressed by

$$W = Gc_p(t_2 - t_1) \cong kF\frac{t_2 - t_k}{2}$$

where t_2 is the entrance temperature and t_1 the temperature at the exit from the cooler and t_k the average temperature of the cooling water, k the coefficient of heat transmission and F the area of the cooler. Since, in intercoolers, by far the greatest resistance to heat flow from air occurs at the tube wall and since practically all factors except the velocity of flow c and the density γ are constant, k can be expressed as follows:

$$k = k^1(c\gamma)^q$$

where k^1 and q are constants. Because of the constant magnitude of the cross-section of flow of air, $c\gamma$ is proportional to the weight of the flowing air G and therefore

$$k = k_0\left(\frac{G}{G_0}\right)^q$$

where k_0 is the coefficient of heat transmission at normal load.

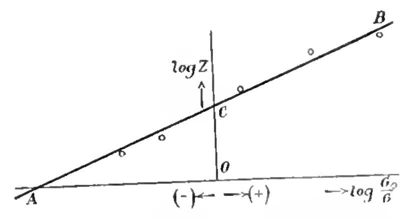

FIG. 5 GRAPHIC REFERRING TO EQUATION [18]

If K be used to denote all the constants, the above heat equation can be written as follows:

$$G_0(t_2 - t_1)_0 = KG_0{}^q(t_2 - t_k)_0 \text{ at normal load}$$
$$G(t_2 - t_1) = KG^q(t_2 - t_k) \text{ at any load}$$

From these two equations it is found that

$$t_1 = t_2 - \left(\frac{G_0}{G}\right)^q\left(\frac{t_2 - t_1}{t_2 - t_k}\right)_0 (t_2 - t_k)\ \ldots\ldots\ldots\ [5]$$

This determines the absolute temperature $T_1 = 273 + t_1$ at the entrance to the next group of stages. As regards q, in well-designed coolers one can use with fair approximation the value 0.78, which has been found by Nusselt to be good under different circumstances. The fall of pressure Δp in the intercooler varies in proportion to the average density γ and also in proportion to the square of the amount of air flowing per second Q

$$\frac{\Delta p}{\Delta p_0} = \left(\frac{Q}{Q_0}\right)^2\frac{\gamma}{\gamma_0}\ \ldots\ldots\ldots\ldots\ [6]$$

This establishes all the factors necessary for the calculation of the characteristics of compressors which may be determined in the following manner:

(1) It is necessary to determine for each group of stages a set of group characteristic curves in accordance with Fig. 4.

(2) For a given speed of rotation and volume of flow the state of the air at the exit from the first group of stages can be determined from the corresponding group characteristic curve which permits to determine the state of air at the entrance to the second group by the application of Equations [5] and [6]. In this manner Q_1 for the second group becomes known.

(3) Next, the same process as in (2) is applied to the second group with the intercooler following it and so on until the last group, which permits the determination of the final state of air for a given speed of rotation and amount of flow of air.

(4) The final state of air may be determined in the same manner for the same speed of rotation and different amounts of air flowing, which gives the first characteristic curve of the compressor. In a similar manner other characteristic curves for different speeds

of rotation may be determined. The total work of compression is then

$$E_s = Gc\,\Sigma(T_2 - T_1) = \frac{AG}{2g}\,\Sigma\left[S\left(\frac{m}{\eta}\right)_m\right] \ldots\ldots\ldots [7]$$

Instead of this rather complicated process there is a simpler way to secure the same results with sufficient approximation. Since it is desirable to have the same work of compression in all groups of stages of a compressor, and in practice an effort is always made to secure it, it may be assumed that this actually takes place and that further all the groups have the same air temperature at the entrance and the same conditions of compression. If then,

T_1 = average absolute air temperature at the entrance (arithmetic average of the actual temperatures at the entrance to each individual group of stages), which, with constant cooling-water temperature, varies only very little with the load, and may be estimated

T_2 = absolute average temperature at exit from the groups of stages

T = average absolute temperature at the entrance to the first group of stages

T_{II} = average absolute temperature at the exit from the last group of stages

$\frac{p_2}{p_1}$ = average compression ratio of a single group

p_I = absolute pressure ahead of the first group of stages

p_{II} = absolute pressure behind the last group of stages

i = number of groups of stages

Then the total compression ratio is in the usual manner found to be

$$\frac{p_{II}}{p_I} = \left(\frac{p_2}{p_1}\right)^i$$

The actual end temperature is found from

$$\frac{T_{II} - T_I}{T_2 - T_1} \cong \left(\frac{T_{II} - T_I}{T_2 - T_1}\right)_0$$

and proves to be

$$T_{II} = T_I + (T_2 - T_1)\left(\frac{T_{II} - T}{T_2 - T_1}\right)_0$$

According to the above assumption all the groups of stages are to be considered as equivalent. Because of this, Equation [2] may be applied to the case of one group in the following manner

$$\frac{AS_s}{2igc_pT_1}\left(\frac{m}{\eta}\right)_m = \frac{T_2}{T_1} - 1 \ldots\ldots\ldots\ldots\ldots\ldots [8]$$

but in this case $S_s = \Sigma u^2$ applies to the entire compressor. If we assume various values for the average admission, this equation by means of Equation [1] may be evaluated in exactly the same manner as Equation [2]. It must be observed in this connection that here the average admission ε_m is the average of the admissions ε_I of the first stage of the first group and ε_I of the last stage of the last group, these two magnitudes being determined from the following equations:

$$\varepsilon_I = \left(\frac{Q}{Q_0}\right)_I \frac{n_0}{n} = \frac{G}{G_0}\left(\frac{p_0}{p}\frac{T}{T_0}\right)_I \frac{n_0}{n}$$

$$\varepsilon_{II} = \left(\frac{Q}{Q_0}\right)_{II} \frac{n_0}{n} = \frac{G}{G_0}\left(\frac{p_0}{p}\frac{T}{T_0}\right)_{II} \frac{n_0}{n}$$

where the subscript 0 corresponds again to the conditions existing with normal loading.

From these equations is derived the following equation, which takes the place of Equation [3]

$$Q_1 = Q_{0I}\,\frac{2\varepsilon_m\dfrac{n}{n_0}}{1 + \left(\dfrac{p_{II}}{p_I}\dfrac{T_I}{T_{II}}\right)_0 \dfrac{p_I}{p_{II}}\dfrac{T_{II}}{T_I}} \ldots\ldots\ldots [9]$$

Just as in the preceding case, from Equations [8] and [9] may be derived the compressor characteristics instead of the group characteristics. Equation [5] may be used to check the assumed value of T_1 since $t_2 - t_1 = T_2 - T_1$.

The total work of compression is

$$E_s = G\,c_p\,i\,(T_2 - T_1) = \frac{AGS_s}{2g}\left(\frac{m}{\eta}\right)_m \ldots\ldots [10]$$

To this should be added two small amounts to cover the losses through rotor friction and those due to leaks on the pressure side; these losses vary in accordance with laws of their own. Practice indicates that the work consumed in rotor friction of a stage is proportional to $\gamma\, n^3 D^5$, where D is the diameter of the rotor, while the loss due to leaks depends on the final state of the gas in accordance with well-known laws.

(c) Determination of the Basic Characteristic from a Given Compressor Characteristic

According to the reasoning given in Section I the basic characteristic can be determined when the characteristics of all single stages have been found. Since, however, this is never the case, another method may be resorted to, viz., reversing the problem solved in Section II(b), and determining the compressor characteristic from the basic characteristic. Since, for a given load, the entrance and exit temperatures for each group, and, as a rule, also the total work of compression E_s, may be measured with sufficient approximation, it is possible to calculate the average entrance temperature T_1, as well as the sum of all the raises in temperature $\tau = \Sigma\,(T_2 - T_1)$, and, hence, the average raise of temperature per group

$$T_2 - T_1 = \frac{\tau}{i} = \frac{E_s}{i\,G\,c_p}$$

The average compression ratio of a group is

$$\frac{p_2}{p_1} = \left(\frac{p_{II}}{p_I}\right)^{\frac{1}{i}}$$

And, hence, when the ratios T_2/T_1 and p_2/p_1 are known, the average efficiency η_m of a single stage may be determined from the relation

$$\frac{T_2}{T_1} = \left(\frac{p_2}{p_1}\right)^c$$

Equation [8] makes it possible to determine the magnitude of the pressure head m_m if S_s is given. If, further, a certain load be taken as a normal load so that with it the admission in all the stages is $\varepsilon = 1$ and all the corresponding magnitudes are indicated by a subscript 0, then the corresponding average admission ε_m may be calculated from Equation [9]. By this are determined the exact locations of the points ε_m, m_m and η_m of the basic characteristic. Similarly the corresponding basic characteristic can be determined from a group characteristic.

III COMPRESSOR WITH COOLED HOUSING

(a) Compression in One Group of Stages

As in the case of compression with uncooled housing, the writer uses an equation derived by him elsewhere (*Zeit. Ver. deut. Ing.*, 1918, p. 662) under the assumption of the presence of an infinite number of stages and in this way derives the following relation for the temperatures

$$T_2 = \frac{M}{1 + \dfrac{a}{b}\dfrac{T_1}{T_K}(M - 1)} \ldots\ldots\ldots\ldots [11]$$

wherein for the sake of simplicity is substituted

$$M = \left(\frac{p_2}{p_1}\right)^{bc}$$

and further, the following expressions are used in which minor members are neglected

$$a = \frac{kFT_k}{E}$$

$$b = 1 + a$$

$$c = \frac{\kappa - 1}{\kappa\,\eta_m}$$

Here $k = k_0\left(\dfrac{G}{G_0}\right)^q$, the average coefficient of heat trans-

mission k_0 having the value which it has at normal load; because of the greater resistance to heat flow q is here smaller than in the case of intercoolers with smooth thin brass tubes. Also F = cooling area of the group and T_k = average temperature of the cooling water.

In accordance with the previous derivation by the same author referred to at the beginning of this section, the work of compression of the group is

$$E = \frac{Gc_pT_K}{a}\log\left[1+\frac{a}{b}\frac{T_1}{T_K}(M-1)\right] \ldots\ldots\ldots [12]$$

Further, as in the case of compression in an uncooled cooler

$$E = \frac{AGS}{2g}\left(\frac{m}{\tau_1}\right)_m \ldots\ldots\ldots\ldots\ldots\ldots [4b]$$

By combining these two equations we get

$$V = \log\left[1+\frac{a}{b}\frac{T}{T_K}(M-1)\right]$$

where for simplicity sake is substituted

$$V = \frac{aAS}{2gc_pT_K}\left(\frac{m}{\tau_m}\right)$$

The equation can also be written in the form

$$\frac{b}{a}\frac{T_K}{T_1}\left[e^V-1\right] = M-1 \ldots\ldots\ldots\ldots\ldots [13]$$

If now in the expression $a = \frac{kFT_K}{E}$ be inserted the expression for the coefficient for heat transmission k as given by Equation [4b], we obtain

$$a = \frac{2gk_0FT_K}{AG_0S\left(\frac{m}{\tau_1}\right)_m}\left(\frac{G_0}{G}\right)^{1-q} \ldots\ldots\ldots\ldots [14]$$

Further, Equation [3] applies here without alterations, only instead of the volume of flow of air, the author uses in this case the weight of the flowing air which gives that equation the form

$$\frac{G}{G_0} = \frac{2\varepsilon_m\frac{n}{n_0}\left(\frac{p}{p_0}\ \frac{T_0}{T}\right)_1}{\left(\frac{p_2}{p_1}\frac{T_1}{T_2}\right)_0\ \frac{p_1}{p_2}\frac{T_2}{T_1}} \ldots\ldots\ldots\ldots\ldots [15]$$

These equations are sufficient for determining the usual characteristic from a given basic characteristic. Since, however, some of these equations appear in a transcendent form, the problem cannot be solved directly and to assist in this the author derives a very useful additional formula in the following manner:

The expression

$$\Delta p = m - \frac{\gamma}{2g}u^2$$

may be written in the form of a differential, as follows:

$$dp = \frac{m}{2g}\ \frac{p}{RT}ds,$$

when R is a gas constant and $ds = d(u^2)$. Its integration gives

$$\log\frac{p_2}{p_1} = \frac{m_mS}{2gRT_m} \ldots\ldots\ldots\ldots\ldots\ldots [16]$$

where $m = m_m$ = constant and likewise $T = T_m$ =constant. This simple relation applies, of course, to the case of compression in an uncooled casing also, but there is no need for making use of it there.

Given two of the values $\frac{p_2}{p_1}$, ε_m (that is, m_m) and H (that is, n), the third value can be easily plotted. With constant average admission ε_m of the group, the average temperature T_m increases somewhat with the speed of rotation and falls off with the decrease of the speed of rotation. Since, however, T_m may be calculated from a given characteristic corresponding to the speed of rotation in revolutions n_0 in accordance with an equation for the admission ε_m, T_m can be estimated with fairly close approximation for any other speed in revolutions.

Hence, from Equation [16] we may compute, for various values of the average admission ε_m, either the corresponding compression ratios p_2/p_1 for a constant speed of rotation in revolutions, or the corresponding speeds of rotation in revolutions for a constant compression ratio.

Equation [15] enables us to determine the relation G/G_p by using an estimated value of the end temperature T_2. The same rule applies to it as to T_m, namely, that for a constant admission ε_m it varies in the same sense as the speed of rotation in revolutions (with an uncooled casing $T_2 - T_1$ is proportional to S, that is, the square of the speed of rotation in revolutions; with the cooled casing $T_2 - T_1$ varies somewhat less). Since a given characteristic for n_0 and ε_m gives the end value T_2 it may be equally well estimated for any other speed of rotation in revolutions, and with this the value of a can be determined from Equation [14]. The values thus obtained must satisfy Equation [13] and it is well to compute from ε_m, S and a, also first M and then the compression ratio $\frac{p_2}{p_1}$, which should agree with that derived from Equation [16]. Finally, from Equation [11] can be computed the temperature relation T_2/T_1 which should agree within fairly close limits with that obtained by estimation from Equation [15]. Likewise one may plot, as has been done in the compression with an uncooled vessel, the function

$$M = \left(\frac{p_2}{p_1}\right)^{bc}$$

for various sufficiently closely located values of bc = Constant as a function of $\frac{p_2}{p_1}$. This gives for the case of a compressor with the cooled housing a solution of the problem of deriving the group characteristics of Fig. 4 from a given basic characteristic.

(b) TOTAL COMPRESSION IN A COMPRESSOR

If the compressor is divided into two or more groups of stages separated by intercoolers, then the computation may be carried on from group to group in the above described manner by determining the back cooling and the fall of pressure in the intercooler following each group of stages (by using Equations [5] and [6]; it must be noted however that the exponent q in the case of an intercooler is different than when used for housing of the condenser. There is, however, a shorter method for the computation of the characteristic curves of a compressor based on the assumption that all the groups of stages are equivalent to each other. The corresponding relations set forth in Section II (b) are applied in this also. Hence, here also the total ratio of compression is

$$\frac{p_{\mathrm{II}}}{p_{\mathrm{I}}} = \frac{p_2}{p_1}$$

and the end temperature

$$T_{\mathrm{II}} \cong T_{\mathrm{I}} + (T_2 - T_1)\left(\frac{T_{\mathrm{II}} - T_{\mathrm{I}}}{T_2 - T_1}\right)_0$$

Equations [11] to [16] apply here also, but the values

$$S = \frac{S_s}{i}$$

$$E = \frac{E_s}{i}$$

$$F = \frac{F_s}{i}$$

must be used, if $S_s = \Sigma u^2$ applies to the entire compressor and E_s represents the total work of compression while F_s represents the total cooling area of the compressor. Further, instead of the coefficient of heat transmission k_c there should be used here its average value for the entire compressor. Equation [15] is to be used here in the form

$$\frac{G}{G_0} = \frac{2\varepsilon_m\frac{n}{n_0}\left(\frac{p}{p_0}\ \frac{T_0}{T}\right)_{\mathrm{I}}}{1+\left(\frac{p_{\mathrm{II}}}{p_{\mathrm{I}}}\ \frac{T_{\mathrm{I}}}{T_{\mathrm{II}}}\right)_0\ \frac{p_{\mathrm{I}}}{p_{\mathrm{II}}}\ \frac{T_{\mathrm{II}}}{T_{\mathrm{I}}}} \ldots\ldots\ldots\ldots [17]$$

which corresponds to Equation [9] if the weight of the flowing air be used instead of the volume of said air. The method of computation is the same as in III-a.

Certification of Gages at Bureau of Standards

By H. L. VAN KEUREN,[1] WASHINGTON, D. C.

During the early stages of the preparation for war in this country the need of a central bureau for the test and certification of munitions gages was apparent. Action was taken by the Committee on Standardization of Gages of The American Society of Mechanical Engineers in recommending to various branches of the War and Navy Departments that there be a central place for the inspection of munitions gages and that inasmuch as the Bureau of Standards was already prepared for this work, it be the recognized institution for the inspection of all gages required by the Government in securing munitions. Since the signing of the armistice the Bureau has been continuing its work of gage certification for manufacturers in the production of their regular products and it has already become an important element in this country.[2] In the following contribution Mr. Van Keuren, Chief of Gage Section, Bureau of Standards, gives an account of the work and methods of this department.

THE war has changed in a radical way many of our ideas, habits, words and expressions, as well as many of our commercial and industrial methods. Today we speak of the certification of gages rather than the certification of standards. To the manufacturing public a gage is the usable thing; the standard is for reference. The time is long past when people need be inconvenieneed by carrying and using silver dollars as a measure for the value of their purchases but they use instead, as their working medium, the convenient paper bills or checks, which are directly or indirectly certified by a standard value in silver or gold money in the custody of one of our banks or the United States Treasury. In the same way it is not necessary for manufacturers of interchangeable work to be burdened with an elaborate system of measuring devices and a highly-trained scientific organization for originating and comparing precision length standards; but rather, for convenience and rapidity, they use gages for measuring their product and these gages may be authenticated by being referred directly or indirectly to suitable standards in the custody of the Bureau of Standards.

As a result of the war even our ideas of standards have been radically changed. We now use a standard of length which cannot change with time; one which can be duplicated anywhere in the world; one which cannot be stolen, lost or destroyed; and one which is susceptible to greater accuracy of measurement than the standard meters or yards deposited in goverenment institutions in this country or in foreign countries. I refer to the use of the length of a wave of light which makes length measurements to within a millionth of an inch an easy matter.

Organization and Facilities of the Gage Section, Bureau of Standards

On June 15, 1917, the Bureau of Standards was granted an appropriation by Congress for the purpose of standardizing and certifying gages for the War and Navy Departments and other branches of the Federal government. As early as July 8, 1917, apparatus and equipment was transferred to a special building for the testing of munition gages. The first lot of gages was submitted on June 16, 1917. In addition to the laboratory in Washington, Branch Gage Sections were inaugurated as rapidly as need became apparent. The Branch Gage Section in New York City was opened on April 15, 1918; the Branch Gage Section in Cleveland on July 1, 1918; and the Branch Gage Section in Bridgeport on August 20, 1918.

The gage laboratories at Washington, New York and Cleveland are completely equipped, and the facilities in the branch laboratories for the inspection of gages are practically the same as those available in Washington.

A general view of the Gage Laboratory at Washington, showing the testing of plain and profile gages, is shown in Fig. 1. The equipment includes various types of commercial measuring instruments, such as inside and outside micrometers; a number of sets of working standards of the flat-end type, cylindrical type and spherical-end type; and other devices and instruments designed and constructed at the Bureau for the measuring of complicated profile gages and thread gages.

Routine of Inspection Work

In the inspection of gages at the Bureau, the following procedure has been adopted:

- *a* Unpacking and checking with shipping memorandum
- *b* Marking with a lot number and serial number
- *c* Acknowledgment of receipt
- *d* Routing for test
- *e* Measurement
- *f* Tabulation of results and comparing results with specifications
- *g* Mailing report
- *h* Ship or stock gages.

Particular care is taken in the various operations in checking and measuring the gages and in writing the reports in order to prevent mistakes. During each test measurements are made on a gage by two inspectors who work independently. The results obtained by each inspector are entered on a suitable form and from the records of both inspectors the results of the test are compared with the specifications upon which the gage was purchased, or with which the gage is supposed to correspond. In case of tests for the War Department, gages which meet the specifications, are marked with a seal and date of approval. If rejected, they are returned to the manufacturer with a report stating the reasons for rejection, in order that corrections may be made or new gages submitted.

The importance of two inspections by different people, oftentimes employing different methods, cannot be over-estimated. Not only is it possible to avoid numerous errors of reading but differences in results are sometimes found to be due to actual variations in the apparatus, which results in the development of new and improved methods of measurement and new measuring appliances.

Methods of Test

The apparatus in use and the methods of test have been selected with the object of obtaining the required accuracy of test, and at the same time reducing to a minimum the time required in testing the gages. As an illustration of a simple, effective, accurate and quick device for testing snap gages, the apparatus shown in Fig. 2 has been used with excellent results. In carrying out this test, one or two standardized size blocks are selected to permit the insertion of a pair of accurately-ground and lapped wedges, which, when placed together, have their contact surfaces parallel. With a calibrated micrometer the thickness of the adjustable wedge is determined and then added to the size block selected, which results in the measurement of the gage being inspected.

To describe all of the devices, methods and apparatus in use is quite beyond the scope of the present paper. However, the following outline indicates the more important pieces of apparatus used for gage inspection:

---

[1] Chief of Gage Section, Bureau of Standards, Washington, D. C. Mem. Am.Soc.M.E.

[2] A detailed statement of the work of this committee and its recommendations can be found in THE JOURNAL, January 1918, p. 70. The extent to which the recommendations were carried out, the opportunities afforded and results accomplished by the Bureau of Standards is given in detail in THE JOURNAL for February, 1919, p. 185. This paper was presented at the meeting of the Washington Section of THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS, April 30, 1919.

A Plain gages, outside dimensions
1 Calibrated micrometer calipers
2 Special Anderson bench micrometer, accurate to 1/100,000 in.
3 Commercial fluid-gage comparator
4 Pratt & Whitney measuring machine
5 Brown & Sharpe measuring machine

B Plain gages, inside dimensions
1 Calibrated size blocks
2 Micrometer and taper wedges as shown in Fig. 2 for snap gages
3 Calibrated size blocks for snap gages and ring gages
4 Special device, using mechanical indicator, for ring gages

6 Use of thread plug check gages for determining effective diameter of ring thread gages.

Throughout all phases of the measuring work, apparatus and instruments are carefully calibrated against precision standards, which have been verified by the light-wave interference method in the Optical Laboratory of the Bureau of Standards. As far as possible measuring instruments are used as comparators, thus eliminating errors which might arise due to imperfection in measuring instruments.

Descriptions, drawings, and other information with reference to the design and construction of gage apparatus previously listed, may be secured from the Bureau without charge, and demonstrations of different pieces of apparatus and methods of test can best be realized by visiting one of the gage laboratories.

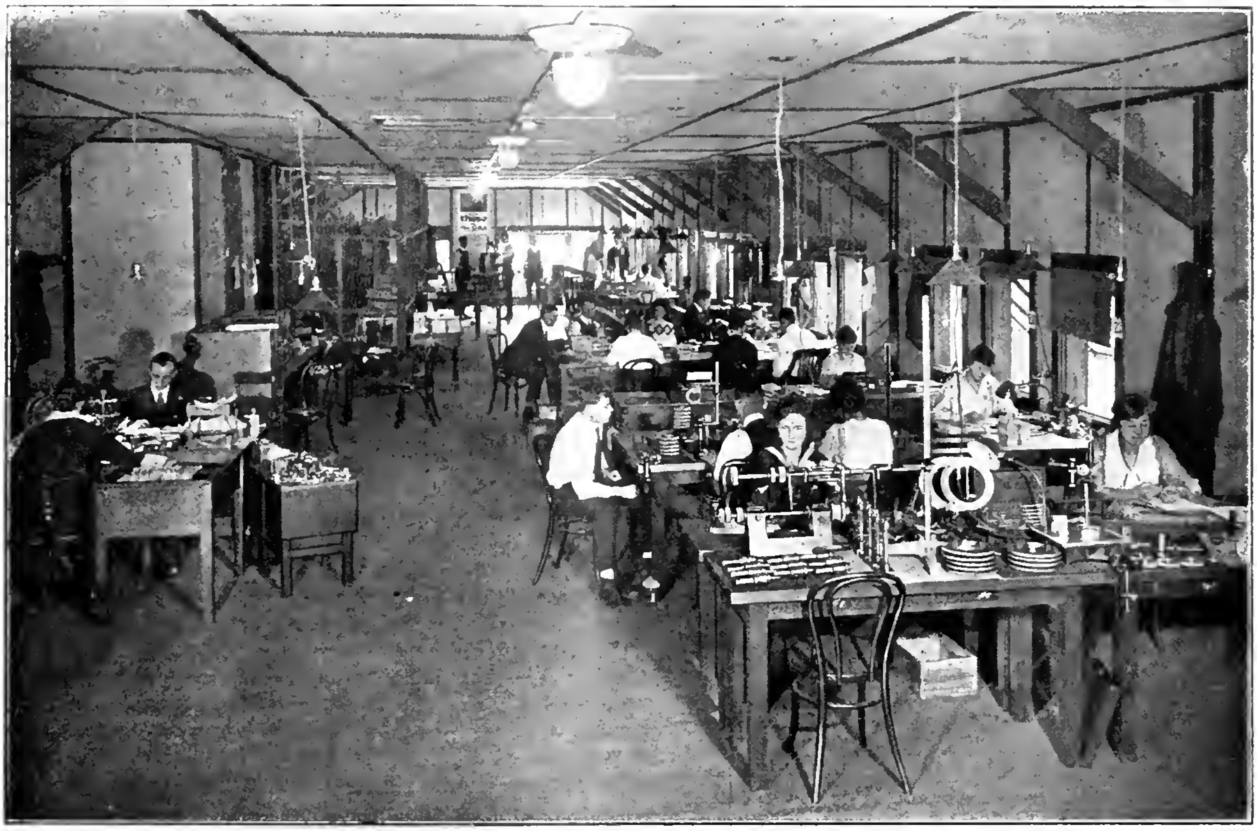

Fig. 1 Gage Laboratory, Bureau of Standards, Washington, D. C.

5 Inside micrometer, used as comparator only
6 Special forms of star gages
7 Use of standardized steel balls, size blocks and taper wedges

C Profile gages
1 Gaertner measuring machine
2 Projection lantern
3 Surface plate set-ups, employing sine bar, size blocks, mechanical indicators, calibrated steel balls, wires, plugs, etc.
4 Special applications for surface plate work of micrometer microscope.

D Thread gages
1 Special lead-testing machine for measuring pitch or lead of plug and ring thread gages
2 Projection lantern for examining form and angle of plug and ring thread gages
3 Calibrated micrometers and wires for measuring effective diameters by 3-wire method
4 Calibrated micrometer calipers and bench micrometers for plain diameters of thread gages
5 Three-ball method for measuring effective diameter of ring thread gages

Research and Experimental Work

Until recently the energy of the Gage Section has been devoted mainly to the test and certification of gages. However, in this work there has been accumulated a vast amount of information and data on the construction, measurement, and use of all kinds of gages, and it is planned to use the technical staff now available for the preparation of pamphlets, publications, and other literature in order to make this information accessible to American manufacturers. In addition, there are a great many problems upon which research and experimental work should result in improvement in the manufacture and use of tools and gages. Among the problems which are under investigation at the present time will be mentioned the following:

1 Experiments to determine the proper thread allowances and tolerances for wrench fits in cast-iron, aluminum and other materials
2 Compilation of formulae and description of methods of test of complicated profile gages and thread gages
3 Compilation of designs of gages found to be most practical for different classes of work
4 Investigation of the cutting properties of taps to determine the amount the tap cuts over-size when new

and when worn under different conditions of lubrication and with different materials

5 Investigation of suitable steels and their heat treatment, to determine the most suitable steel for a given type of gage

6 Life of different types of gages.

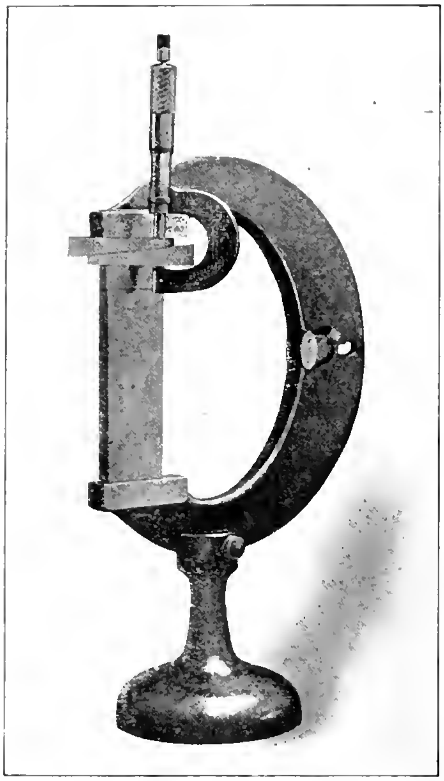

FIG. 2 METHOD USED IN TESTING SNAP GAGES

GAGE SHOP

The Bureau of Standards in Washington has, in addition to the Gage Laboratory, a shop which includes about 75 machine tools. This shop has been of great utility in the salvage of master gages purchased by the Ordnance Department and Motor Transport Corps and for the manufacture of gages needed in cases of exigency to prevent stoppage of production or to facilitate the shipment of munitions over-seas, which was being held up owing to lack of final inspection gages. The equipment of this shop is such as to permit the manufacture of practically any type of gage required for the manufacture of ordnance, aircraft, and motor trucks.

One of the important phases of the shop work was the development of a process of manufacturing precision gage blocks similar to the Swedish or Johansson gage blocks, described in MECHANICAL ENGINEERING for March, page 289, and for May, page 484. The manufacture of these blocks was undertaken about September 1, 1918. These gages are being produced to within an accuracy of five millionths of an inch for flatness and parallelism of faces and of absolute length.

It is not surprising that in some cases there has been a misunderstanding among manufacturers regarding the purpose and utility of the gage work at the Bureau of Standards. There have been instances where a manufacturer, not knowing the facts, has been under the impression that the chief cause of his rejected gages was the extremely close specifications and tolerances originated by the Bureau. There are other cases where manufacturers have imagined that the inspection methods of the Bureau were purely theoretical and, furthermore, that the chief aim of the Bureau was to find errors in gages by a minute examination with apparatus and devices suited only to the needs of precise scientific work.

The function of the Gage Section of the Bureau, during recent military preparations, has been to examine gages purchased by the War and Navy Departments and determine from a disinterested standpoint whether or not these gages corresponded to the specifications and tolerances laid down by the department for which the gages were purchased.

The Bureau of Standards is a government institution organized under the Department of Commerce for the development, construction, maintenance, custody, and use of standards of measurement, performance, and practice. It is by necessity a scientific institution and its relation to various branches of the federal government, to manufacturers and individuals, can be nothing but absolutely impartial. The policy of the Bureau is to extend to manufacturers every opportunity to secure information resulting from experimental and routine activities. In placing at the disposal of manufacturers the designs of apparatus, descriptions of methods of test and by demonstrating to gage manufacturers the advantages of better measuring facilities, many manufacturers have been able to improve their product and have realized the purpose and facilities available at the gage laboratories of the Bureau. During the war, courses of instruction were offered to gage makers and gage inspectors in the employ of the government or manufacturers having government contracts, and in this way further benefit and coöperation was secured.

FUTURE WORK

The results to be accomplished and the service to be rendered to American manufacturers during the reconstruction period will depend largely upon the demands made by manufacturers upon the facilities now available. The inspection laboratories at Washington, Cleveland, and New York can accommodate an appreciable amount of gage testing work and, in addition, can be used to good advantage for the demonstration of measuring apparatus, methods of test and for distributing technical information on gage problems. For routine work of the certification of gages, where the tests are of benefit to but one or two parties, a nominal fee is charged for the work done. However, where investigations and research are carried on, and where the results are of general utility to American manufacturers, no fee or charge is made for the resulting information or service rendered.

In the reconstruction of our industries, if we are to compete with foreign countries and not only share but lead in manufacturing progress, it will be necessary to secure a better quality of product at a minimum of cost, and in this problem the combined results of scientific, engineering, industrial, and commercial endeavor towards standardization is most essential. With this thought in mind, the facilities of the gage laboratories of the Bureau of Standards are available to American manufacturers.

The particulars of the thread-cutting mechanism of an engine lathe now manufactured by Brödrene Sundt, Christiania, Norway, are given in an article in the September issue of *Machinery*. The lathe is equipped with two lead-screws for cutting both inch and metric screw threads, and the gearing is so arranged that coarse threads, or helical grooves with leads up to 12 inches, may be cut, in addition to the usual range of pitches for threads. The headstock is so designed that its gear ratios may be utilized in connection with screw cutting. With this arrangement, the number of pitches ordinarily attained will be multiplied by the number of gear ratios in the headstock. There is one lead-screw for the inch pitches and one for the millimeter pitches. The metric lead-screw is practically a threaded feed-rod. By means of an additional screw on the feed-rod, metric threads can be cut without using translating gears and by employing the same gearing as for the inch pitches. The inch lead-screw is $\frac{1}{4}$ inch pitch, and the feed-rod 4 millimeters pitch; hence, when the lathe is geared for cutting 1/16-inch pitch, it is also geared for cutting a pitch of 1 millimeter with the metric lead-screw. The change-gear box in connection with one set of spur gears and the gear ratios of the headstock provide for cutting 342 different pitches: 167 inch pitches and 175 millimeter pitches. These different pitches are obtained by shifting handles or levers.

Gage Limits in Interchangeable Manufacture

By E. C. Peck,[1] Cleveland, Ohio

As indicated by the title, it is the purpose of the following paper to present modern gage practice as applied to interchangeable manufacture. As an introduction the author first discusses the merits of the English and metric systems, and suggests that a 10-in. meter would be a most desirable unit. Some interesting facts in the development of interchangeable manufacturing methods are next presented. The author also gives an explanation of the terms allowance and tolerance, and the method of using gages in strict interchangeable quantity production are outlined in some detail. The paper concludes with a discussion of the methods of interchangeable screw-thread manufacture.

The word gage is the name which has been given to a large number of instruments and appliances used in determining dimensions, capacities, quantities, forces, etc. Gages have been used since man first began to contrive conveniences for himself. The standards of weight, measure, and volume mentioned in the Bible are simply gages, and the instruments and appliances used in building the pyramids can be likewise so considered. In fact, it has been apparent from the beginning of time that standards for determining dimensions, capacities, quantities, forces, etc., are absolutely necessary in conducting all kinds of commerce and business.

In early times many tribes, states, and countries used gages originating with themselves, and in all probability the tribe or state which did the most trading succeeded in establishing their standards in other countries, and it is these standards that have been handed down to us. It would, however, have been much better for the present generation if there had been more coöperation among the ancients in regard to standardization, for then we would not have had our present heterogeneous collection of gages or units.

At the present time there is a consistent effort towards the establishment of international standards and there is no doubt but that the near future will see rapid strides in that direction. The World War has done more to help this movement than all the propaganda of the last decade, for it has shown in a very practical way the delay, trouble, and cost of production when a number of different standards are in use.

It would seem like a logical statement to say that some one system of standards ought to possess sufficient merits to win over the entire world by its greater utility, but this has not proved to be true. First, we have the natural pride of every country against giving up its own standard for that of another, and second, the objection of the industries themselves because of the cost involved in the necessary purchase of new gages and tools.

English vs. Metric System

The two systems which most concern this country are the English and metric. Both are used extensively, both are legal and both have warm advocates. It is obvious that the outstanding advantages of the metric system have not been sufficient to supplant the English in this country. Doubtless the chief advantage of the metric system is that all subdivisions are multiples of ten, and hence in calculation it is only necessary to move the decimal point in the reduction from unit to unit. Great advantage is also claimed in that the units of weight and volume are derived from the unit of measure, but to the writer this is of little account because for accurate work one does not want to originate his own standards but prefers to obtain them from a recognized bureau of standards.

One advantage claimed for the English system is that most sub-divisions are made by successively halving each unit. If these arguments are adhered to by the advocates of each side they both fail, because their methods result in units whose sizes are impracticable as has been found by experience.

In the English system, beginning with the inch and halving for each subdivision, we finally reach the units 1/64, 1/128, 1/256, 1/512, and 1/1024, all of which are awkward to handle and not readable on the well known micrometer without estimating. To obviate this difficulty, the inch is divided into tenths, hundredths, thousandths, and ten-thousandths, and all of these decimal units are practicable and usable units.

In the metric system the first subdivision of the meter is the decimeter, a unit 3.937 in. long, of no utility and rarely used. The next unit is the centimeter, a unit too large for good work and too small for use in distance measurements.

The next is the millimeter, 0.03937 in., the most widely used unit because of the adaptability of its size value. Many industrial enterprises require no greater accuracy than a millimeter, and, therefore, as this unit is about as fine as can be used on a steel scale it is sufficient for their needs.

For tools and fine accurate mechanisms the millimeter is too large, and so is the next subdivision, 1/10 millimeter, which is 0.0039 in. The great bulk of good work in our machine tool, automobile, and the tool making industries require units between 1/10 and the 1/100 millimeter, as one is too coarse, and the other too fine. Because of such fact there has resulted a halving and quartering of the millimeter and the 1/10 millimeter to obtain usable units approximating 1/100, 1/000 and 2/1000 of an inch. Thus it will be seen that the advocates of both systems use what the other claims as an inherent fundamental of his favorite system, and this, of course, proves the utility of it.

The impracticable size of the units of the metric system is, in the writer's judgment, the greatest stumbling block to its universal adoption, and if when the meter was adopted, all romance and sentiment had been left out of the question, and the meter made 10 English inches long, then the metric system would have been in universal use long ago.

If the meter were 10 English inches long, a decimeter would be the well-known standard inch, and the other decimal subdivisions the familiar decimals of an inch, all of which are thoroughly practical working units. The present 10-foot pole which is extensively used, would be 12 meters long, and 4 meters would easily have been substituted for the yard, as the error is only 1½ per cent. Furthermore 2 dekameters is within 2 inches of the English rod and as a unit would be satisfactory. The mile would be 6336 meters, just as easy to handle as 5280 feet.

The adoption of the 10-inch meter would have simplified at once the adoption of an International Standard Thread System, for the metric threads could have been expressed in whole numbers per decimeter, and this would not only agree with present practice, but would also fit in with the United States system.

Interchangeable Manufacture

The first interchangeable manufacture attempted was in France in the year 1717, and although it failed, another trial was made in 1785. This, however, also failed. In 1798 Eli Whitney of cotton-gin fame took and completed a contract to make ten thousand muskets for the United States Government. The parts of these guns were to be interchangeable.

English and French ordnance officers ridiculed and criticised Whitney's ideas to such an extent that Congress became alarmed and so Whitney went to Washington with ten guns and after distributing the parts on the floor assembled repeatedly from these parts ten guns that operated properly. This remarkable

[1] General Supt., Cleveland Twist Drill Co., formerly Lieut.-Col., Ordnance Dept., U. S. A. Mem.Am.Soc.M.E.

Abstract of a paper presented at a meeting of the Washington Section of The American Society of Mechanical Engineers, April 30, 1919.

achievement astonished everyone and it is believed to be the first successful interchangeable manufacture of accurate work. As nearly as can be determined from records available this occurred in 1800. In 1808 Simeon North accomplished a like feat on pistols for the Government and it is claimed by some that he was the first to introduce interchangeable manufacture.

While it is a matter of record that John George Bodmer began to manufacture guns at St. Blaise in the Black Forest about 1806 by a method which is believed to have been partly interchangeable, such methods of manufacture are conceded to be an American development, and are described by writers on the continent as an American method. In 1853 a British commission visited the United States to investigate the methods in use, and as a result ordered 20,000 Enfield rifles for the British Government, and later 157 machines for the Government arsenals. They also hired James H. Burton to install the machinery and methods.

From this small beginning the practice grew steadily in the armories and arsenals, and later, as the advantages became known, it spread to bicycles, typewriters, and various other articles, until now it is quite common to speak of interchangeable manufacture. There is no doubt, however, but there is some difference between the exact meaning of the term as used then and at present, just as there is also a great difference between manufacture at that time and the present.

There are several degrees of interchangeability, or at least several meanings to the exact interpretation of the term. Strict interchangeability consists in making the different parts of a mechanism so uniform in size and contour that each part will fit and properly function in any one of the whole number of mechanisms, no matter when or where it is made. It will be noted that this definition means that each part of the mechanism of a certain model will fit any of the mechanisms of the same model regardless of the lot to which it belongs or the year in which it was made. Some interchangeability consists in making each part fit any mechanism in a certain series, that is, the interchangeability exists only in the same series.

In the early days, before modern machinery came into use, it was necessary to finish work by hand, and to make it uniform, template filing and finishing was employed. For example, gun and pistol parts would have the holes drilled and reamed in a jig or fixture, and then the contour finishing done by putting these pieces into a template jig provided with pins to fit the holes. The outside of the jigs would be a duplicate of the shape and size of the model piece but hardened. The workman would then file down to the hardened template, which controlled the shape and size of the piece. Many ingenious devices and schemes were used to facilitate the duplication of parts, and great skill was developed by the workmen.

The great improvement in machine tools, especially as to accuracy of output, has been a very large factor in promoting interchangeability, and here again America has led the world. The refinements, accuracy, and efficiency of modern machine tools are strictly American, and are the outcome of the demands placed upon them by interchangeable manufacture at a low cost.

American labor costs so much more than foreign that to compete in the world markets we have been forced to obtain as much product for each dollar of labor as our competitors, and we therefore have been compelled to develop machinery to get more product for less labor. This, in turn, has developed skill in our mechanics and raised the standard of living of the American skilled workmen.

Allowances and Tolerances

It is a fundamental law that interchangeable manufacture is facilitated by the largest allowable freedom in the fit of mating parts without interfering with the proper functioning. This statement leads to the subject of allowances and tolerances, one of the simplest but least understood in the whole system of interchangeability. As these two words will be used repeatedly, it is well to point out the difference between them.

Allowance is a prescribed difference between the dimensions of two mating parts to produce a desired kind of fit. For example: a standard hole exactly 1 in. in diameter, contains a free running shaft, the journal diameter of which is 0.998 in. The difference between this hole and the journal prescribed for the oil film is 0.002 in., and this is the allowance.

Tolerance is the prescribed difference in the dimensions to tolerate the unavoidable errors or variations in manufacturing a large number of pieces. In the example just given, if a thousand running fits were to be made, the holes might be dimensioned $1.000 \text{ in.} {}^{+0.0005}_{-0.0000}$. This half thousandth permissible error is the tolerance. The shaft journal might be dimensioned 0.997 to 0.998 in., and this permissible error of 0.001 in. is the tolerance. Then the minimum allowance is 0.002 in. and the maximum looseness, or the sum of both tolerance and the minimum allowance, is 0.0035 in.

Thus the kind of fit is finally determined by the combination of the allowance and tolerance, and most engineers prefer to use allowance as a minimum value, which is never intentionally encroached upon, the tolerance providing for larger freedom of fits. The reason for this is that the data for minimum allowance are more reliable and has been more clearly demonstrated than the maximum allowance, and as it is vital it must be uneffected by tolerances. This is plainly evident in the case of free moving parts, as it is well understood that a space must be provided for an oil film, and this space must not be so small as to endanger failure by the parts seizing. Again, it has rarely been determined, except in individual cases, how loose moving parts can be before they are unsuitable. It must also be understood that the tendency of the engineer is in the direction of longer wearing life of the parts, hence the tendency to decrease maximum allowance or looseness.

There are many conditions in which maximum looseness determines the strength of the parts or the limits of engagement, and any more freedom of fit would make the parts unsatisfactory. When this is the case, maximum looseness must be the starting-point in the calculations, and must then be uneffected by tolerance. Then if minimum allowance can be determined, the difference between these two (maximum and minimum looseness) is the sum of the tolerances.

The tolerances are then divided between the mating parts according to the manufacturing ability to produce the parts to uniform size. That is, if the manufacturing ability is such that it is much easier to produce one member, to a uniform size, than another, the tolerance on the members is divided in direct proportion to this condition. When the dimensioning is finished, we will have the equation—maximum looseness equals minimum allowance plus the sum of the tolerance of both parts, and this equation will apply whatever the known factors are.

Very often the allowance has zero value, that is, there is no clearance whatever allowed for the fit, and in a single pair of mating parts they fit metal to metal. If a large number of such parts are to be made it must be determined whether this zero allowance is for the tightest or the loosest fit permissible, and then substitute the known values in the equation just mentioned.

The term "negative allowance" is often used to indicate that a certain prescribed amount is allowed so as to make a tight or force fit. This is very confusing because it implies being subtracted, whereas such is not the case. According to present usage, zero allowance indicates that there is no clearance or space allowed between the two mating parts. Positive allowance indicates that there is prescribed a space between the mating parts. Negative allowance indicates that there is less than a space provided for between the mating parts, or an imaginary space displaced by the flow of the metal to make a tight fit. Negative allowance should, therefore, be treated as a negative quantity in the formula above mentioned, and then the quantity resulting used for either greater or less looseness, according to whether the sign of the quantity is positive or negative.

The minimum allowance, or greatest tightness and maximum looseness, must be known when the tolerances have been set, and usually they are known at such time. There are, however, cases in which it is known that certain tolerances are the smallest that can be successfully used in manufacture, and then maximum

looseness and tightness must be adjusted to obtain the best functioning condition in conjunction with these tolerances. This occurs often in very close work.

After determining the maximum and minimum looseness of mating parts and setting the tolerances it becomes necessary to control the dimensions of the parts so that none of the dimensions will be outside of the limits established, and this is best done at this time for strictly interchangeable manufacture by the use of proper "go" and "no-go" gages. First-class gages are expensive and soon wear, so that strict interchangeability is sacrificed to keep down gage cost.

Past Methods of Using Gages

In times past it was common practice to use only "go" gages and limit the looseness of fit by the shake of the piece in the gage, or, where a little more refinement was practiced, a piece of newspaper was used on one side of the "go" gage, and if the piece which passed without the paper was tight with the paper it was accepted. A piece of newspaper used with each of a pair of mating "go" gages usually produced a freedom of fit of from 0.004 to 0.006 in., and with skilled help it produced satisfactory results.

For a strict interchangeable quantity production work of good character, a good gaging system will prove economical. Such a system comprises the minimum number of properly designed gages to control all the factors of the various parts of a mechanism so that they will assemble and function properly. As stated before, this assumes that proper allowances and tolerances have been established.

The designer should always remember that tolerances should be as large as proper functioning will permit, and he should be well informed as to what tolerances successful manufacturers actually work. He should take pains to inform himself how tight and how loose working parts can actually be and give satisfactory results.

Once these tolerances are set as large as the designer will risk, they should be rigidly adhered to, and considered a boundary line. The product should always be kept within these boundary lines, and this is best accomplished by making the component drawing dimensions the master gage dimensions. Then with all the working and inspection gages checked against the master gage, and never allowed to wear beyond master gage dimensions, the work is bound to be within component dimensions.

The procedure just outlined gives us the definition of master gage, namely; they are for reference only, and represent the extreme tolerance limits allowed on the parts being made. They are often the same design as inspection and working gages. In many cases, however, they are in the form of checks or master component parts for the purpose of checking the actual inspection or working gages. In all cases the dimensions are the exact physical standards and represent extremes of the component dimensions.

As exact duplicate master gages cannot be made except at a prohibitive cost, a master gage manufacturing tolerance is allowed. This tolerance is usually in good practice from 4 to 6 per cent of the component tolerance, and is applied in the direction to keep the work within the boundary line defined by component dimensions. This gage tolerance is treated as a wear limit, and robs the working tolerance by this 4 or 5 per cent.

Inspection gages are usually of the same design as the working gages, and often the same as the master gages, but they should have an additional allowance for wear. Inasmuch as the gages will wear, and as they are expensive, the exact amount to allow for wear is an economic point for each manufacturer to decide, keeping in mind that a small wear limit increases the gage cost, and a large wear limit requires closer attention and work at the machines.

Where experience is lacking, it is good practice to allow 10 per cent of the component tolerance for wear on the "go" gages, as the "no-go" gages wear but little, 5 per cent will be sufficient. The inspection gage can only represent extreme tolerance limits when worn to master gage size. The working gages are those used to check the work as it is machined, and should have liberal wear limits to insure the work being passed by the inspection gages.

Thus it will be seen that this system, if followed, will admit of the acceptance of work that will be interchangeable. It also emphasizes the fundamental that tolerance should be as large as will properly function, for if the tolerances are too small the work will be more costly, as better workmen will be required, and this always means higher wages. Better tools and machines to produce the close work, and more frequent adjustment and attention will be necessary also, and this will likewise increase costs.

Screw Thread Work

The examples and descriptions thus far given have applied to all kinds of interchangeable work, with no particular reference to screw thread work; and, while the principles and practice are the same, a great deal more care is required to produce strictly interchangeable screw thread work than plain work. The problem becomes more difficult because a larger number of factors make up a proper screw thread fit, and a large error in any one of them will prevent a proper fit. A comparison of these factors may help to make the solution more comprehensible. A cylindrical fit depends upon the size, rotundity, and parallelism of the mating parts. Rectangular and sliding fits depend upon size, contour, rotundity, and parallelism of the mating parts, and to a considerable extent upon the ability of the metal to flow under stress. Of course, all depend upon size, but in a screw thread fit size is effected by the errors of the lead in the mating parts and the errors in the angle of the thread. Thus the factor contour in a screw thread is made up of the factors of lead and form of thread.

Two mating parts with correct lead require no compensation in size for the lead factor. Two mating parts with an equal lead error in the same direction, either long or short, require no compensation in size for the lead error. Two mating parts with differing lead errors, or the equivalent, require a compensation in size for this lead difference to enable the mating parts to go together.

Two mating parts in which the contour of the thread is effected by having an error in the angle of the flanks of the thread must also have a compensation in the diameter to offset the angle error, or the metal must flow to make the fit. Thus it will be seen that strict interchangeable screw thread product is more difficult to produce than plain work, and if good fits are required close tolerances and good thread producing tools are necessary. There must also be a rigid inspection, and means of controlling all the factors which make a fit.

Where gages are used, as at the present time, they must be periodically checked against the master gages in order that boundary lines are not encroached upon. It is fundamental that the "go" gages should check all the factors simultaneously, and the "no-go" gages should check the factors separately. This must be obvious when it is remembered that lead and form errors are compensated for by increasing the diameter, and hence to be sure of the correct relation of all the factors to each other they must be gaged at once, and with a gage as long as the engagement of the ma g parts. The exception to this is the minor diameter of the nut and the major diameter of the screw. To include these two dimension factors in the "go" gages would make the cost of the gages prohibitive, and as these surfaces in the mating are intended to be cleared when assembled, it is practicable to gage them separately.

There has been considerable said about robbing the tolerances with the gages, especially where the fits are close and the tolerances small. As a matter of fact, if the master gages are exactly to the component dimensions they do not rob the tolerance at all. This can be demonstrated by gaging the mating parts of threaded work with a plug and ring thread gage which are correct form, lead, and diameter. If these gages fit snugly, requiring some hand pressure to screw them together, the work which they gage will go together at least as freely as the gages do, even if the lead is correct, or if there are errors in the opposite direction.

Refrigeration Requirements of Chemical Warfare

By MAJOR A. M. HERITAGE,[1] U. S. A.

Had the war continued, chemical warfare would have unquestionably assumed greater and greater importance, and even as it was it is common knowledge that the use of gases had no small part in the conduct of the war. The problems associated with the production of gases and gas-filled shells involved the creation of many plants and the undertaking of tremendous tasks. Such duties naturally fell to the lot of the chemist and engineer, and upon the mechanical engineer in particular, devolved the design and operation of the necessary refrigerating systems used in connection with chemical warfare. It is the purpose of this paper, as its title indicates, to discuss such a use of refrigeration, and the author first describes the properties and manufacture of many of the gases which were in general use during the war. He next outlines the method of manufacturing phosgene filled shells, and in conclusion discusses the need and uses of refrigeration and the type of equipment usually employed.

WHEN, on April 17, 1917, the United States Government declared war upon the Imperial German Government it became apparent that it would be necessary to fight the enemy with its own style of weapon. The Huns had been using gas in various forms since April 22, 1915, to fight the British and French, and commercial concerns in our country had engaged somewhat in furnishing the Allies with certain materials used to make toxic gas for filling shells. Up to this time, however, our Government had not engaged in the manufacture of toxic gases, and it, therefore, became necessary not only to immediately investigate and stimulate the manufacture of poison gases but also to devise a process for placing these gases into projectiles.

The initial step was taken by the Government on April 6, 1917, when a sub-committee of the National Research Council met and plans were made for extensive research in all matters pertaining to toxic gases. This sub-committee, under the chairmanship of the Director of The Bureau of Mines, was composed of representatives of the Army and Navy, and civilian chemists, gas experts and physiologists.

This enormous task, to be thus undertaken, was assigned to the Trench Warfare Section, Gun Division, of the Ordnance Department, and out of this small group of men grew a new corps known as the Chemical Warfare Service of the U. S. A. The Chemical Warfare Service, A. E. F. was formed independent of the Chemical Warfare Service, U. S. A.

Since no plan whatever was provided for chemical warfare when that service was organized in France, the Commander-in-Chief wisely permitted a wide latitude in its formation. Thus it was that the Chemical Warfare Service in France, as well as that organization nine months later in the United States, included research, development, production and supply, training in gas defense, chemical warfare intelligence, and the actual training, equipping, and operating of gas troops. These latter, of course, were handled in battle by the Chemical Warfare Service entirely in accord with and under orders of the commanding general of the armies, corps, and divisions with which they were operating.

This was a very fortunate organization. It permitted the widest latitude in using the personnel obtained to the best advantage, and in realizing very early the gas and gas defense needs of all other troops at the front. In fact, with its special knowledge of gases and gas warfare, the Chemical Warfare Service was enabled, in nearly every case, to realize the needs of the man at the front long before he realized them himself. It is believed that this is the soundest kind of organization, for the reason that it binds, into intimate contact, research, supply, experiment, intelligence, development, and actual fighting. The Chemical Warfare Service as organized in France had five subdivisions—Offense, Defense, Technical, Supply, and Intelligence. Experience indicated that Offense and Defense should be merged and that Training should be separate. These changes and other minor ones to adapt the organization to the regular General Staff organization appears to be the ideal, and was what the Chemical Warfare Service was working toward when the war closed.[1]

The gases experimented upon and used, some to a greater extent than others, were chlorpicrin, stannic chloride, phosgene, dichlorethyl sulphide (mustard gas), cyanogen chloride, chlorine, diphosgene, bromacetone, ethyl-iodoacetate, brombenzylcyanide, and diphenylchlorarsine. Of these gases phosgene requires the most refrigeration and the engineering problems solved in its manufacture were by far the greatest. Mustard oil also requires refrigeration in its manufacture but not during the process of the placing of the liquid into the projectiles.

The Properties and Manufacture of the Gases

A few words concerning the manufacture of the gases requiring refrigeration, although somewhat extraneous to the subject at hand, might nevertheless, prove of interest and for that purpose the writer quotes below from two recent articles, one by General A. A. Fries which was published in the *National Service Magazine* for June 1919, and the other by Major D. Domerest which appeared in *The Ohio State Engineer* for May 1919.

Chlorpicrin is a liquid boiling at about 115 deg. cent. and is made by reaction between bleaching powder and the high explosive picric acid. Picric acid is made by mixing phenol and sulphuric acid in sulphonators and allowing the mixture to age. This phenolsulphonic acid is added to nitric acid and water in nitrating pots, thus making picric acid. The spent acid is drawn off and the dry is mixed with water and calcium chloride, or lime, forming calcium picrate, and this is poured into a mechanical mixer together with calcium hypochloride, or bleach which has been creamed with water. The mixture is then pumped into stills where steam is introduced, as the reaction between the acid and bleach distills over into a water cooled condenser and the result is Cl_3NO_2, commonly called chlorpicrin which, being heavy, settles to the bottom and this allows any water carried over with it to be drawn off at the top.

Chlorpicrin was manufactured both at Edgewood Arsenal, Stamford, Conn., from which place there was shipped 111,853 lbs., and at Edgewood Arsenal, Edgewood, Md. This latter plant had an estimated capacity, January 1, 1919, of 3,000,000 lb. per month. This gas is highly lethal with low persistency and of it 3,806,000 lb. were shipped overseas.

Stannic chloride is a chemical made by passing chlorine gas over old tin cans. This gas when liberated in the presence of air produces a dense, white smoke cloud. It is also known as chloride of tin, and when added with chlorpicrin in gas shells, proved to be an excellent marker for the gunner.

Cyanogen-chloride, chlorine, diphosgene, and others of a similar nature are also highly lethal gases with low persistency. Bromacetone, ethyl-iodacetate, brombenzylcyanide, diphenylchlorarsine, or sneezing gas, and several other lachrymators are all highly irritating but not lethal except in extremely high concentrations. Lachrymators are highly economical in forcing the wearing of the gas masks and are used principally for that purpose.

Mustard gas, called yperite by the French, is the king of all gases. It is estimated that more than 80 per cent of all gas casualties among the English and Americans was caused by this gas. Technically it is dichlorethyl sulphide. This gas was discovered by a German chemist, Victor Mayer, in 1886. He pursued his experiments until he saw that the gas was having as serious an effect upon his experimenters as upon the animals experimented with. At that stage he stopped.

It is interesting to note that an English chemist recommended the use of this gas a year before the Germans began using it. But

[1] Chemical Warfare Service, Edgewood Arsenal, Baltimore, Md. Assoc.-Mem. Am. Soc. M. E.

The author desires to give credit to the American Society of Refrigerating Engineers for permission to publish the latter part of this paper, which was presented before the Sixth Western Meeting of that Society at Cincinnati, Ohio, during May 1919, and which appeared in their Journal of the same month.

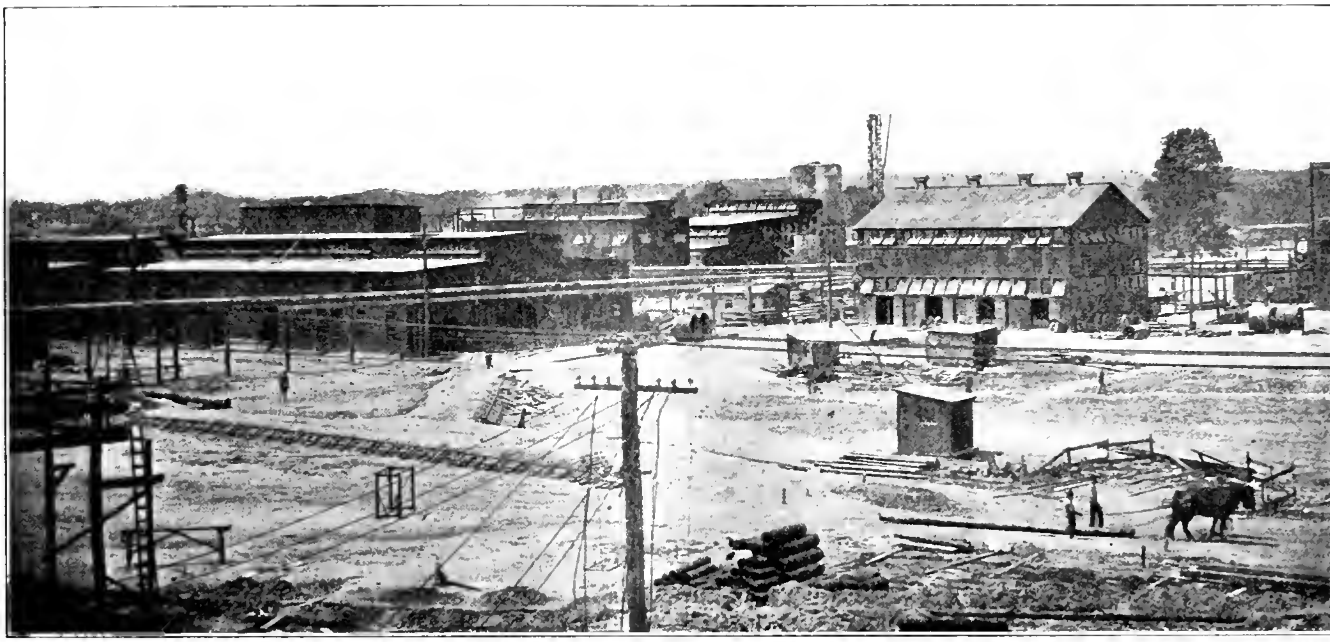
[1] These two paragraphs are quoted from an article by General A. A. Fries which appeared in the *National Service Magazine* for June, 1919.

here, as in the case of many other things, there was either too much fear, or hostility, or perhaps both, to new ideas, and once again the initiative was left to the Germans.

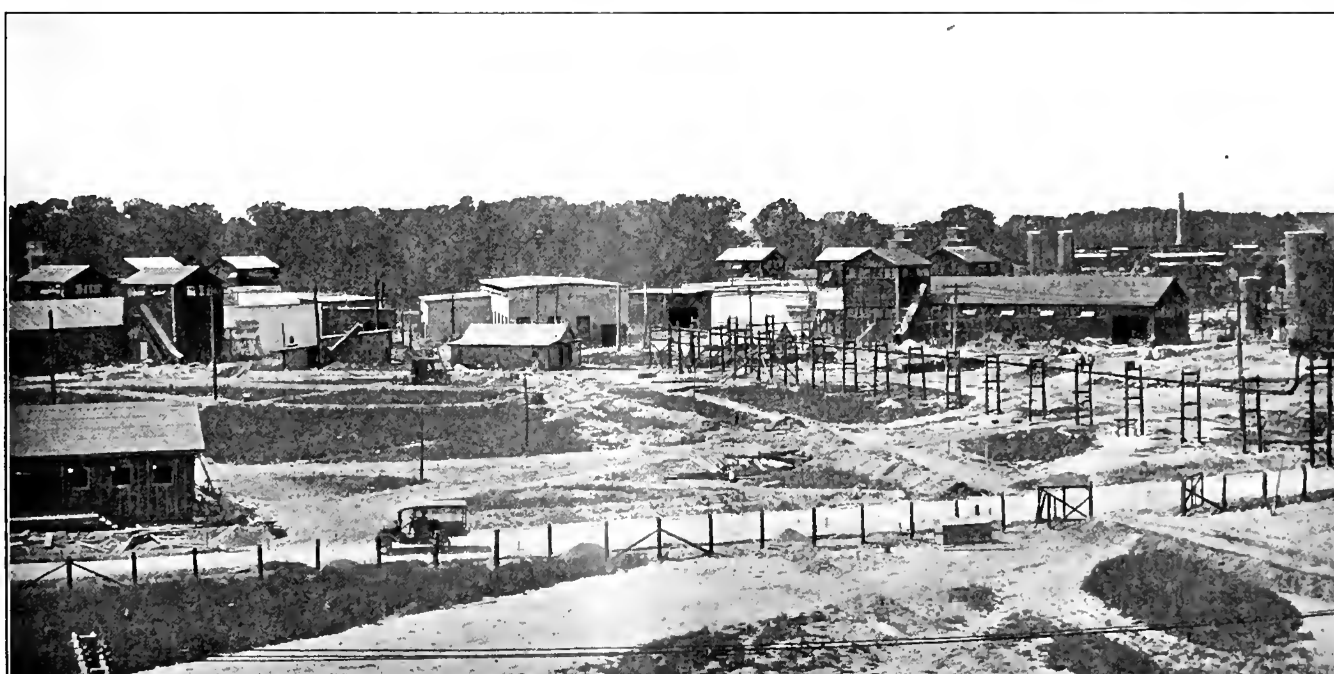
The gas is a yellowish oily fluid, freezing at about 50 deg. fahr. and boiling at about 422 deg. fahr. and its color varies with the impurities and solvents in it. It appears to combine to a certain extent with the iron or steel in shells, because the mustard gas as seen sprayed on vegetation from bursting shells appears to vary from fairly dark brown to almost tar black. The modern method of making it is to agitate sulphur-monochloride vigorously in the presence of ethylene vapor.

The gas is highly persistent—that sprayed on the ground being dangerous from a minimum of about two days in warm dry weather to a week or even longer in damp cold weather. It vaporizes very slowly. The idea will naturally occur that it must be effective in extremely low concentration or else its slow vaporization would make it useless, and that idea is correct. It is claimed that the highest concentration of the gas that can be obtained at 65 deg. fahr., is about one part in 30,000 of air. It has, moreover, the quality of cumulative effect to a very marked degree, being fully 50 per cent even for very low concentrations. For example; one part in 2,000,000, if breathed for 20 hr., will produce as serious a casualty as one part in 100,000 will produce in two hours; that is, if you multiply the time by 10 the concentration can be decreased to one-fifth and yet get the same result.

Mustard gas produces casualties almost wholly by burning. The theory is that the gas in the presence of moisture is broken up so as to liberate hydrochloric acid and that this acid produces the burn. The gas accordingly burns any soft moist tissue it reaches, whether inside or outside the body. Moreover, as it readily penetrates clothing, all soft parts of the skin are burned by the true gas, which is contrary to the original idea that burns were caused only by splashes of the liquid. The mustard gas of the Germans has an odor somewhat like mustard and that of the Allies exactly like garlic. Finally the gas has a pronounced delayed action, as its effects are not felt until 4 to 12 hr. after exposure, during which time the person breathing it experiences no discomfort. It should also be added that after breathing the gas for from thirty minutes to two hours, depending upon the person, one loses his sense of smell and can no longer detect the gas. As may be readily imagined these qualities make it highly valuable, or highly dangerous, depending upon which way you are looking at it. Indeed, as before said, it is the king of gases. It



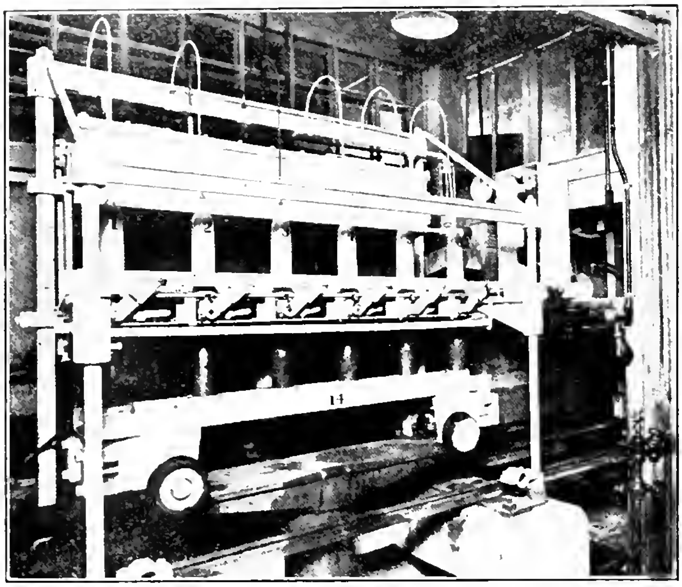
A GENERAL VIEW OF THE PHOSGENE MANUFACTURING PLANT



A GENERAL VIEW OF THE SHELL FILLING PLANT

changed not alone gas warfare, but to a considerable extent all warfare.

Mustard gas shells were picked up and opened after the first attack against the British in July, 1917. The English extracted the gas and within 48 hr. knew its composition. Within a week they had found, in German chemistries, Mayer's account of his discovery and the laboratory methods for making it. Notwithstanding an early realization of the importance of this gas and the determined efforts made to manufacture it on a large scale by the English, French, and Americans, it was almost eleven months after its first use by the Germans before the first Allied mustard gas attack took place. This was made by the French in the vicinity of Compiegne in June 1918. Thus for eleven months the German had a tremendous advantage over the Allies. That he did not make a greater use of it was



Shell Filling Machine

surprising to the Allies until just before the armistice, when it was learned that he had been making it by a cumbersome, slow, and expensive method, and that his total production was only about six tons per day. It is interesting to note that before the armistice was signed the Americans actually made 40 tons in one day and were equipped to make 80 tons but had not the shell in which to put it.

Mustard is a liquid boiling at 219 deg. cent., which gives out vapors highly destructive to the mucous linings of the body, and the liquid itself is terribly destructive to all living flesh that it touches, producing fearful burns. It is made by passing ethylene gas into liquid sulfur chloride reacting according to the following quotations:

$$2C_2H_4 + S_2Cl = (C_2H_4)_2SCl_2 + S$$

This reaction looks very simple but is exceedingly difficult to carry out practically. Sulfur chloride is a liquid easily handled and easily stored and obtainable in large quantities. Ethylene is a gas which had to be made in a plant on the grounds erected for that purpose.

To make ethylene 95 per cent ethyl alcohol is vaporized by steam and the vapors passed through 8-in. tubes filled with kaolin in the form of sphagetti and heated from the outside to a temperature of 550 deg. cent. Under these conditions the alcohol decomposes thus:

$$C_2H_5OH + heat = C_2H_4 + H_2O$$

About 80 per cent of the alcohol is thus decomposed and in the best practice yield 97 per cent ethylene gas, the undecomposed alcohol being condensed and recovered. It was necessary here to calculate the amount of steam necessary to vaporize the alcohol, and the amount of water and condensing surface required to condense the undecomposed alcohol and water vapor, and also to design an alcohol still to distill and recover the alcohol passing through the ethylene furnaces undecomposed. It was likewise necessary to operate a water gas plant for furnishing gas to heat the ethylene furnaces.

The ethylene, after leaving the condenser, was passed through a large scrubbing tower to remove the last traces of alcohol and ether remaining in the gas, then it was passed through especially designed sulphuric acid towers, built of lead and quartz pebbles, by which the ethylene was thoroughly dried, since moisture in the ethylene caused endless troubles in the mustard reaction. The ethylene gas was then compressed in reciprocating compressors, the size and power of which had, of course, to be previously calculated. From the compressors the ethylene was blown in the form of fine bubbles through the sulphur chloride in the reaction vessel.

Several varieties of reaction vessels were used and it was very difficult to secure a design whereby the difficulties resulting from the precipitation of sulphur set free in the reaction might be avoided. It must be remembered that this sulphur was mixed with "mustard" and was fearfully toxic. The reaction between ethylene and sulphur chloride is exothermic and since the temperature in the reactor must not be allowed to go over 38 deg. cent. owing to the precipitation of sulphur and decomposition of "mustard" in contact with iron at a higher temperature it was necessary to design the reactor with a sufficient amount of lead coil inside to keep the temperature of the liquid below 38 deg. cent. This was difficult owing to the tendency of sulphur to settle on the cooling pipes and make the cooling inefficient, notwithstanding that ice-cold brine was used. If the reaction can be carried out sufficiently rapidly below 38 deg. cent., the process is practical and the sulphur does not precipitate but remains in collodial suspension.

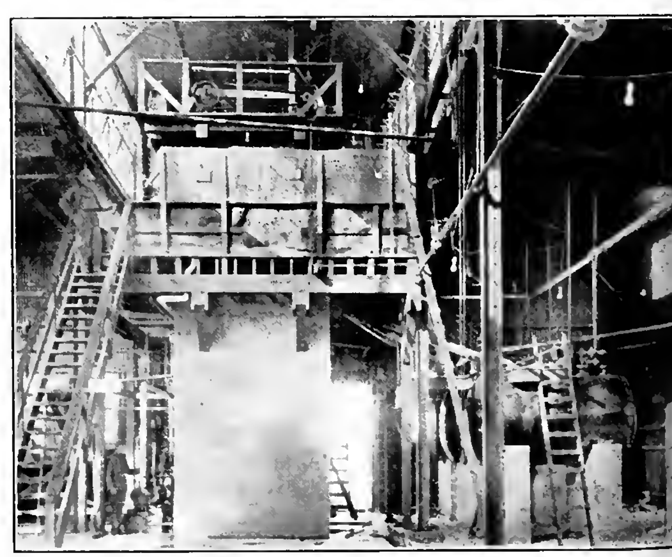
It was necessary to install blow cases for handling sulphur chloride and for pumping the "mustard" from the reaction vessel to storage tanks and from the storage tanks into drums for shipment across the seas or for transfer to the shell-filling plant. The chief difficulty at the "mustard plant," both in design and operation, arose from the necessity for taking care of occasional bad charges in which the sulphur precipitated badly and which resulted in stoppage of pipes. The most successful way to handle this difficulty was to dissolve out the sulphur mixed with "mustard" with an excess of sulphur chloride and pump the solution by means of a special pump built for pumping liquid sulphur through a steam jacketed pipe line into a large cistern in the swamp.

The day of the armistice the chemical plant was regularly and smoothly producing phosgene, chlorpicrin and mustard in quantities larger than shipping facilities could take it across the water and 1500 tons had accumulated stored in steel drums at the Chemical Plant.

Phosgene is a gas condensing at 8 deg. cent., and is made by a catlytic reaction between carbon monoxide and gaseous chlorine, extremely porous carbon being the catalyst. The product is $COCl_2$, and is extremely poisonous, consequently all pipes, valves, and fittings had to be extraordinarily tight. To make this substance it was of course necessary to handle large quantities of liquid chlorine, more in fact than was ever dreamed of before, and to gasify it and to transport the gas in pipes in such a way as to keep the liquid and gaseous chlorine under easy control. It was necessary to design and have built special tanks for the storage of liquid chlorine, vaporizers for vaporizing the chlorine and to install extra heavy pipe and special fittings to handle the liquid and gaseous chlorine. All this involved a good many calculations based on vapor pressure, latent heat of vaporization, and density of chlorine liquid and gas. The results were very satisfactory.

The production of reasonably pure carbon monoxide had never been a commercial process until this plant was built and after a great deal of thought on the subject it was finally decided that it would be necessary to make use of the two following reactions going on simultaneously:

$$2C + O_2 = 2CO + 58{,}000 \text{ calories}$$
$$C + CO_2 = 2CO - 39{,}000 \text{ calories}$$



Installation of a Mustard Oil Reactor

The first reaction could not be conveniently used alone on account of the enormous temperature produced by the reaction endangering the safety of the producer. The second reaction could not be conveniently used alone since it is endothermic and would soon smother the fire, requiring a frequently reversing procedure with resultant low purity of gas. Upon calculation it is found that when making

proper allowance for radiation heat-loss the above reactions when going on simultaneously should produce a state of fairly constant temperature when 30 cu. ft. of oxygen is used with 50 cu. ft. of carbon dioxide. It was expected that when using seventy-hour foundry coke as the source of carbon that a carbon monoxide gas of 98 per cent purity could be obtained.

The Manufacture of Phosgene Filled Shells

The preceding paragraphs give a general knowledge of the gases used and how manufactured and as phosgene is the principal gas requiring refrigeration, on account of its low vaporizing temperature, the writer will discuss at some length the subject of the handling of this gas, as it is placed in the various kinds of projectiles. It should first of all be stated that mustard oil and phosgene both require two tons of refrigeration for each ton of gas manufactured. This is due to the heat of reaction between the sulphur chloride and the ethylene gas.

Phosgene is made by bringing CO and Cl_2 together in equal volume in the presence of a catalytic agent where chemical reaction produces heat. This heat is partly counteracted by passing the mixed gases through a double-pipe water-cooler and the water used in steam boilers for general heating purposes. The mixed gases are then condensed in large spiral lead coils with a cold circulation of brine surrounding them. This phosgene, which condenses to a liquid at 40 deg. fahr. is then stored in either 300 lb. steel containers or in large steel drums of one-ton capacity made of ⅝-in. steel plate, the empty drum weighing approximately 1650 lb. These drums, before introducing the phosgene, are cooled to prevent the first phosgene entering the drum from again vaporizing and causing pressure, thereby preventing other liquid phosgene from running by gravity into the drum.

It might properly here be stated, that about 10 cc. of phosgene liberated in close proximity to a person, or 0.0003 gram taken into the lungs or even one part in 200 of air breathed for ten minutes, is sufficient to cause death. From this, one can easily see that in transferring the cold liquid phosgene from the phosgene condenser, or its supply tank, into the storage drums it is absolutely necessary to allow none to escape and this is best done by precooling the drums and preventing the first phosgene from gasifying upon entering the drum. These drums are tested to a pressure of 5,000 lb. per sq. in.

The next task requiring refrigeration is the transfer of the phosgene from the drums into the system for filling shells and other projectiles. This was accomplished by means of steel mixing bottles made of ¼-in. plate, welded, and containing floats for regulating levels and especially made distributing valves for the admission and eviction of the liquid "gas" in and out of the mixing bottles. Phosgene is sometimes mi ed with either chloropicrin or stannic chloride. The mixed gas, while probably not more toxic or poisonous than phosgene alone, is harder for the gas mask to hold against than the phosgene alone. The latter mixture, phosgene and stannic chloride, is made for the purpose of showing the artillerymen the point of explosion of the gas shell. This is accomplished by the fact that stannic chloride, upon coming in contact with air, produces a white smoke.

The Need and Use of Refrigeration

In order to fill shells or other projectiles with either straight phosgene or a mixture containing phosgene, it is necessary to cool the metal to a temperature below 32 deg. fahr, and as thousands of shells were filled per hour, and each shell weighed according to size from 10 to 90 lb., the amount of refrigeration required can be easily discerned. These shells and other projectiles, such as Stokes mortars and Livens projectors, were cooled by placing them on specially designed conveyors which traversed through rooms held at zero temperature. These rooms were designed with an anti-room at either end through which the conveyor carrying the shell travelled. The space necessitated by carrying three 75 mm. shell abreast on one conveyor, left open so far as cork insulation is concerned, was boxed in and hung full of felt strips which entirely covered and surrounded the shell and conveyor. The rooms were built with bunker lofts which contained, according to the size of the shell cooled, from 4,000 to 20,000 lineal feet of 2-in. direct expansion pipe and No. 5 ventura fans were used for circulating the heat given up by the metal of the shells over the direct expansion coils.

The program for filling gas shells at first being very uncertain on account of the lack of e perience, it was decided not to build a too permanent an installation to start with and accordingly the buildings were designed for wood construction and mill shavings as an insulation. Accordingly, four buildings, 77 ft. long and 8 ft. wide with 15 ft. ceiling, were first built and a 3 ft. mill shaving insulation installed. This type of construction and insulation proved extremely satisfactory and the only change made in it was that a curtain wall of 8-in. hollow tile was set up on account of fire risk.

Recording thermometers were installed with connections leading from every room, which thus made the control very easy. The machines used for filling gas shells with phosgene were designed and worked out, using the siphon principle. These machines were all insulated as were all pipes containing the liquid "gases." The large containers of phosgene were taken from the rooms where they were filled and transported to the filling buildings on industrial railways. Here they were moved into small chapels—each one just large enough to place the container for connection to the shell filling system.

These chapels were kept under negative pressure, being connected to large ventilating scrubbing systems. The chapels were situated eight in a row, each one containing a chlorine pressure gauge and special gas connection. The fronts of the chapels were made with two vertically sliding glass doors and each chapel being

Installation for Production of Chlorpicrin.

under negative pressure, immediately as the door was raised, air was drawn in from around the attendant which prevented him from being gassed.

Each chapel also contained a metal carriage made with ball-bearings and wheels which run on tracks set in the floor. These carriages were made with a revolving metal basket so that the large drum of phosgene could be placed in the basket and easily revolved for the purpose of bringing its outlet connection to the system's inlet connection. After a drum of phosgene was connected to the system, its pressure reading was taken to denote the presence or absence of ferric chloride and if satisfactory, it was allowed to run by gravity into a double pipe brine and gas cooler.

The brine used for circulation through these coolers was held at 15 deg. fahr. and the same brine was used for cooling the filling machines and the pipes carrying the gas from the double pipes of the brine and gas cooler to the filling machines. Experience taught many lessons and it was quickly discerned that it was necessary to have a drop leg in connection with the double pipe brine cooler for the purpose of collecting and removing ferric chloride, which precipitated out at low temperature. This ferric chloride is produced by water resulting from moisture in

the atmosphere coming in contact with the phosgene. It was also quickly learned that a large quantity of cold, dry air was necessary for the transferring of phosgene, for in this manner the liquid "gas" could be "shot" from one part of the system to another with little trouble.

Connections were made from the double pipe gas and brine cooler to the mixing bottles, which held 900 lb. of liquid "gas." Connections were also made whereby the liquid "gas" could be run from the mixing bottles back through the double pipe brine and gas cooler, thereby enabling the operator to mix cold phosgene with warm chlorpicrin and circulate the mixed gases back up through the double pipe brine cooler. The air used for the circulation of the liquid "gas" was produced by large air compressors run through dehumidifying systems. These systems proved very satisfactory although they required constant attention.

Each system was made of two banks of double pipes and a brine tank containing two sets of double pipes. The air coming from the compressors travelled through the double pipe air and brine color in the brine tank, which brine, in tank, was held at a temperature of 33 deg. fahr. From this cooler it traveled up through a double pipe brine and air-cooler above, which contained brine of a temperature of 15 deg. fahr. The brine cooler, located in the tank, had a pipe leading from the lowest air tube to a steam trap for the purpose of removing the humidity or moisture. The double pipe cooler above the brine tank was used for reducing the temperature of the air in the neighborhood which was approximately 32 deg. fahr. to –15 deg. fahr. Between the two sets of coolers, a large receiver was installed for the purpose of catching drops of moisture left in the air after passing through the first double pipe cooler.

Refrigeration Equipment

The machinery used was of the ammonia compression type and comprised various makes. Some were direct-connected engine driven and others were belt driven and used electric motors. The size of the machines varied from 12 tons to 120 tons refrigerating duty. Direct expansion piping was used entirely in the bunker lofts of the shell conveyor coolers and double pipe and shell type brine coolers used for the cooling and condensing of the phosgene.

All lead and steel pipes used for conveying the liquid "gas" were either burned or welded, or connected by means of flanged fittings welded on the pipes. No soldered joints could be used on account of the action of phosgene on tin. The phosgene showed little or no action on lead and on this account the phosgene condensers were made by wrapping 2-in. lead coils in special form around shell type brine coolers set vertically in large cylindrical steel tanks.

Several large installations at Edgewood, Md., due to a desire to keep the gas and ammonia lines short, were made by using a short belt drive with an idler. This short belt drive proved very successful and enabled the use of a narrow building. On either side of these ammonia compressor buildings were located the shell filling and phosgene cooling buildings,—two in number on each side. This lay-out made it possible for any one of four filling buildings or any one of four phosgene manufacturing buildings to be shut down, due to any cause such as bad gas leak, and the remainder left in operation without the operators being hindered in their duty. Inasmuch as each filling building and each phosgene gas manufacturing building required refrigeration which was produced at a central ammonia compression building, it became necessary to run liquid ammonia lines, cold brine lines, and cold dry air lines from the central buildings to each of these buildings. The idea of making the ammonia compressor buildings long and narrow made it possible for theses lines to be shorter than had long belt drives been used.

As stated before, the first unit of four shell filling buildings were insulated with three feet of mill shavings. The second unit of four shell filling buildings were insulated with sheet cork board set in plaster with a plastic cement on the outside for protection against the elements. The third unit of four buildings were insulated with sheet cork board plastered against an 8-in. hollow tile. The phosgene manufacturing unit of four buildings were insulated with sheet cork board and plastered. Various kinds of insulation were used for pipe covering and the kind which could be removed the more easily was the kind which seemed to be the most satisfactory,—especially on the cold phosgene pipes on account of speed being required to remove a pipe which developed a gas leak caused by the presence of ferric chloride. After removing many feet of covered pipe it was decided to build insulated box chambers around the cold pipes where they were located close together in connection with the gas mixing bottles. The double-pipe ammonia and, brine coolers and double-pipe gas and brine coolers were placed in insulated rooms with cold storage doors which made them accessible for changes or quick removal.

In conclusion, one statement should also be made which is that the handling of phosgene gas in a liquid form readily collects moisture from any source, air included, and this causes the formation of ferric chloride. This ferric chloride denotes that iron is being given up from some source and that source, be it a cold pipe, is quickly getting thinner and this deterioration will quickly produce a leak because of the fact not only of the wall of the pipe getting thinner, but also of the fact that ferric chloride denotes the presence of hydrochloric acid vapor which produces great pressure. Tests made on samples of phosgene containing ferric chloride showed a pressure on a standard gauge up to 500 lb. This means that either lead pipe or extra heavy pipe with strong fittings and welded joints must be used. Of the hundreds of tons of phosgene made and filled into containers by the Chemical War Service, at its various plants, only three fatal casualties resulted and two of these were caused by the explosion of a phosgene container in one shell filling wing which caught on fire from some unknown source.

A new design for rigid airships which seems to eliminate most of the drawbacks of the existing types forms the subject of a recent British patent which has been taken out by a well-known firm of English motorboat and yacht builders.

In this design the hull of the airship is formed by a gas-tight shell made of several thin layers of wood veneer with layers of fabric between them, the whole being cemented and stitched together with fine copper wire, and internally stiffened by longitudinal and transverse girders. Such a monocoque hull offers several advantages over the conventional fabric-covered girder type for the following reasons:

First, owing to the fact that the shell acts at the same time as framework, outer cover and gas container, the monocoque design is for the same size or for the same weight lighter than the Zeppelin type.

Second, the veneer shell eliminates the tedious adjustment of the wire stays which brace the girder type athwartship and longitudinally, the transverse bracing being insured by veneer bulkheads which subdivide the gas container into compartments.

Third, head resistance is reduced to a minimum because no external projections beside fins and rudders occur on the hull, the machinery and accommodations being situated inside. The latter are separated from the gas container by a double wall, the space between which is filled with an inert gas, such as nitrogen, to reduce the fire risk when hydrogen is employed as a lifting gas. With the use of helium—which is non-inflammable—this double wall could most likely be done with entirely. The reduction of head resistance effected by such a design, where the airship is a strictly streamlined body, must obviously result in a considerable increase of speed for the same power.

Fourth, the monocoque hull promises to solve the much tangled problem of conserving the lifting gas for continued use, that is, without losing it through leakage or having it deteriorate by air penetrating the gas container owing to the imperfect gas tightness of existing balloon fabrics and their gradual deterioration due to sunlight. It is believed that a veneer hull, suitably lined with gas impervious fabric, will insure an almost perfect gas tightness.—*Aviation*, August 1, 1919.

The Lubrication of Ball-Bearings

By H. R. TROTTER,[1] HARTFORD, CONN.

Ball-bearing lubrication is a subject of which little is known, and this is chiefly due to the fact, that there is no accepted method of determining the lubricating value of an oil or grease. As a step toward the development of a satisfactory method the author has devised an instrument for such a purpose, a brief description of which follows in this paper. The operating characteristics of a ball-bearing as related to the problem of lubrication are also discussed and the specifications for a satisfactory oil are given. The use of grease and graphite as a lubricant is next presented and the paper concludes with a suggested procedure for the analysis of lime-soap greases.

An investigation of existing literature on the subject of ball-bearing lubrication reveals the fact that up to date a comprehensive study of this particular phase of lubrication has not as yet been published. The efficient lubrication of the plain-sleeve type bearing presents, on the other hand, few difficulties, as the engineering world is in possession of an accumulation of data acquired during many years of patient study, experiment, and practice.

In 1885, Beauchamp Tower completed a series of experiments which he had made to obtain data regarding the behavior of a lubricant under various loads and speeds. These experiments were made at the request of the British Institute of Mechanical Engineers, and were later made the subject of a very thorough mathematical analysis by Prof. Osborne Reynolds. The outstanding feature of these experiments was the discovery of the wedge-shaped film of oil. Professor Reynolds later gave the rule for efficient lubrication which is that where two surfaces are in sliding contact a satisfactory film of oil cannot be maintained, unless the surfaces are at a slight inclination to each other.

The formation of such a wedge shaped film of oil can be described as follows: In Fig. 1 is shown a pan or tray (A) containing a small amount of oil. A flat plate (B) is loaded with weights (C). When in a stationary position, the surfaces of the plate and pan are parallel to each other, but if the plate is now pulled along the surface of the pan the leading edge will rise and the plate will float on an oil film with the surfaces at an inclination to each other. The oil film assumes the shape of a wedge as shown in Fig. 2.

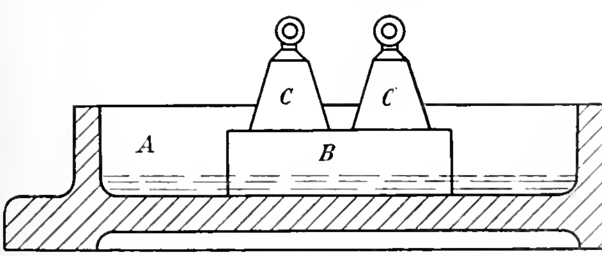


Fig. 1 Formation of Oil Film, Initial Stage

The Mitchell thrust-bearing, which is manufactured in Great Britain, and the Kingsbury thrust-bearing, made in this country, are designed to take advantage of this phenomenon and both have proven very successful.

Successful bearing operations is a problem that should be solved by the designer, and not by the lubrication engineer who acts in an advisory capacity after the bearing is in service. It must be admitted, however, that the average engineer is not in possession of the necessary data which would enable him to select the proper type of lubricant for his particular use. Nor has he the instruments or appliances to analyze a lubricant both physically and chemically.

The final choice of a lubricant is at best the result of a compromise between the engineer and the chemist. This compromise is very often unsatisfactory and due in part to the chemists' inability to thoroughly comprehend the engineer's problem and in part to the engineer's lack of chemical knowledge.

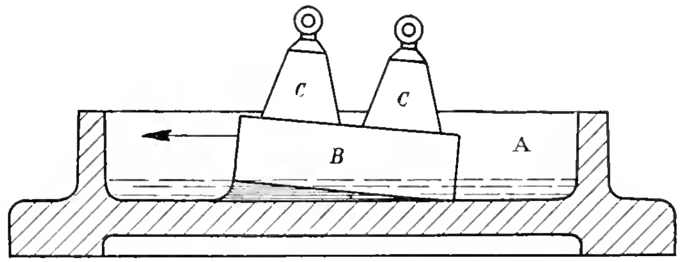

Fig. 2 Formation of Oil Film, Final Stage

The Testing of Lubricants

At the present time there is, unfortunately, no instrument which will accurately indicate the true lubricating value of an oil or grease, and until such an instrument is devised, the selection of a lubricant must be more or less a matter of guess work. A viscosimeter gives a comparative reading of the inertia of a liquid, but it does not indicate the value of a lubricant under working conditions. Furthermore, all authorities are not agreed on the desirable qualities of a lubricant. Many claim that a high surface tension is a requisite, and others lay great stress on adhesive qualities. All are agreed, however, that a lubricant should have the minimum of internal friction. Generally speaking, the requirements of a lubricant for the plain-sleeve type of bearing are a certain amount of adhesive quality to enable it to adhere to both the revolving and stationary surfaces. It should have sufficient body to withstand the pressures. The lubricant film will, therefore, consist of three layers, which in operation approximate the features of a ball-bearing in that one element is stationary, one rotating, and one an intermediate layer consisting of globules similar to the balls in a ball-bearing. From this description, the importance of body in a lubricant will be realized, and as the best and toughest material is required in the balls of a ball-bearing, so is body required in the intermediate layer of a lubricant.

Body in a lubricant cannot very well be defined. It seems certain that its effects are opposite to viscosity. Professor Kingsbury gives the following relations of viscosity and body. (Trans. A. S. M. E., 1903, page 147).

With increase of	Where the viscosity is effective the coefficient of friction	Where the body is effective the coefficient of friction
Pressure	Decreases	Increases
Speed	Increases	Decreases
Temperature	Decreases	Increases

The author has designed an instrument which may possibly be the means of obtaining data of value regarding lubricants. This instrument is shown diagrammatically in Fig. 3. The appliance consists of a revolving element driven by a small

[1] President Trotter-Patterson Corporation, Hartford, Conn. Assoc.-Mem. Am. Soc. M. E.

For presentation at the Annual Meeting, New York, December 2 to 5, 1919, of The American Society of Mechanical Engineers All papers are subject to revision.

motor and a stationary element similar to a block used in a Mitchell or Kingsbury bearing with suitable means of obtaining readings of the inclination angle of the block to the revolving element.

At one time it was considered necessary to support the blocks in a Mitchell or Kingsbury thrust-bearing at a point behind its center of figure in order to secure the wedge of oil between the opposing surfaces. Furthermore, it was assumed that if such a block was centrally supported, it would possess no load carrying capacity. Independent experiments by Professor Kingsbury and Sir Charles Parsons established the fact, however, that a centrally pivoted block could carry considerable load. This was an important discovery, as most of the applications of Mitchell and Kingsbury thrust-bearings have been on marine propeller shafts where reverse rotation is necessary. It was later found that with a centrally supported block, the wedge shaped film of oil was due to the change of viscosity of the lubricant when passing through the block. It will thus be seen that the angle, which the block assumes to the rotating member, gives an indication of the change of viscosity in a lubricating film when in operation.

Referring again to Fig. 3 (*A*) marks a casing consisting of an inner chamber which contains the lubricant to be tested and an outer chamber containing oil which is electrically heated and which transmits its heat to the inner chamber. At (*B*) is shown a small electric motor with a shaft extension on which is placed a flange, the face of which is highly polished. The motor swings on a pivot (*C*) which allows the flange to take various positions with relation to the block thus enabling readings to be taken at various rubbing velocities. By means of the lever (*D*) various pressures can be obtained. The movement of the block is magnified by minimeters and transmitted to the dial indicator. Holes are drilled in the block and can be connected to a monometer to obtain pressure readings, or as there is practically no pressure difference, the holes can be connected to each other in such a manner that there will be practically no velocity through them. Temperature may be obtained at the leading and trailing edges of the block. Readings can be taken at constant speed with varying loads or with constant load at varying speeds. While the author is not certain as to the practical value of such an instrument, it is at least a step in the right direction.

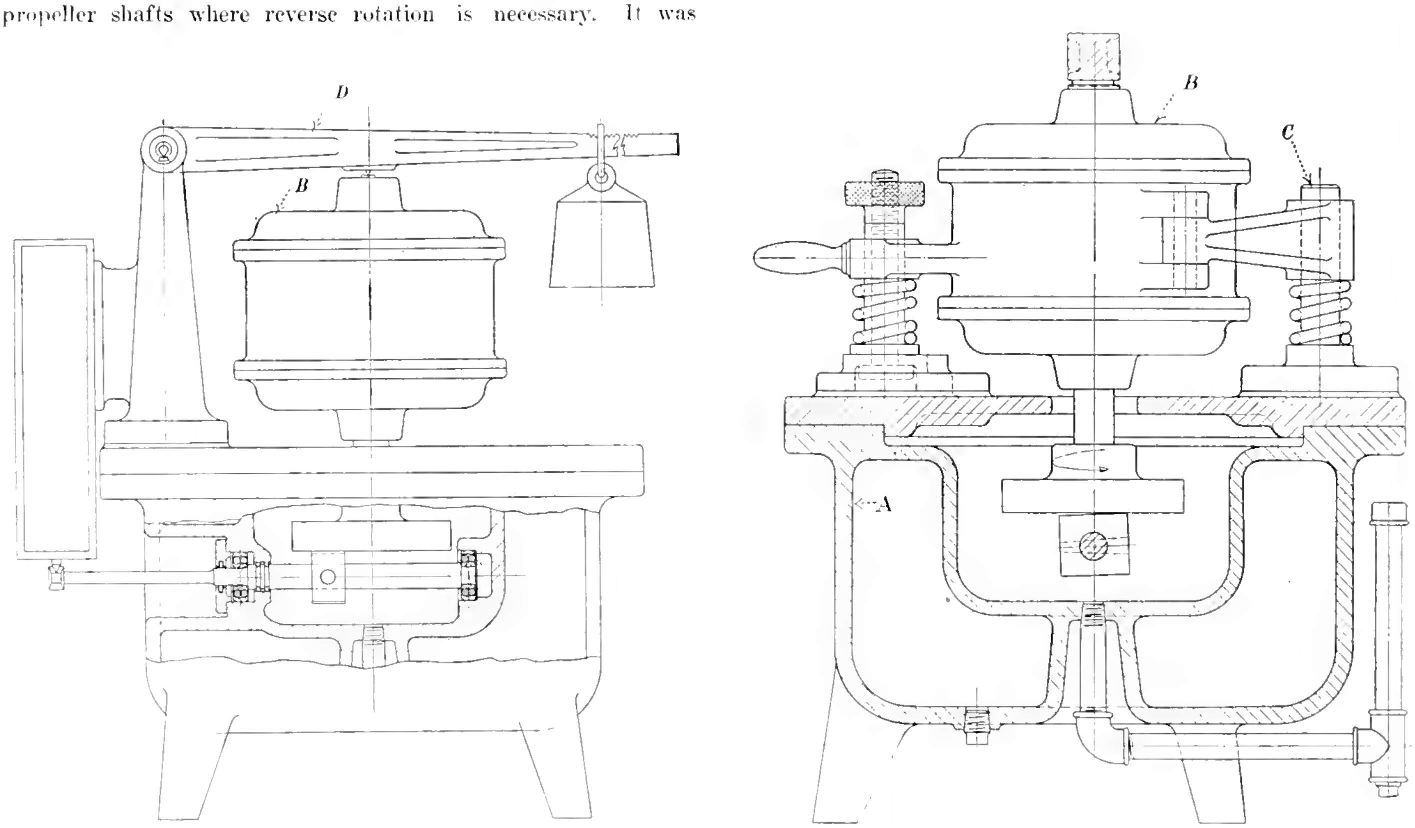

Fig. 3 Diagrammatic Sketch of Author's Device for Obtaining Data Concerning Lubricants

Operating Characteristics of Ball-Bearings

The two cardinal points of successful sleeve-bearing operation are:

1 A design of such a type as will permit of the formation and preservation of an oil film

2 Selection of a lubricant that will provide a film of maximum strength with a minimum of internal friction

With a ball-bearing, however, the problem is not so easily understood, but the important points to be remembered are:

1 The coefficient of friction is practically constant throughout wide ranges of loads and speeds

2 Metal to metal contact (an oil film only possible at very high speeds when slippage may take place)

3 The coefficient of friction is lower in an unlubricated ball-bearing (at light loads and moderate speeds).

The first point is, of course, generally known, but the conclusion to be derived from this point has not been stated before to the author's knowledge, namely, the impossibility of an oil film between balls and races.

In Fig. 4 curve *A* shows the change of friction coefficient of a plain-bearing under constant load and varying speed. This curve is self-explanatory and shows that a satisfactory oil film is not formed till a certain speed is reached. In the same figure curve *B* gives the friction coefficients of a well-made ball-bearing, and shows that the friction loss of a ball-bearing is practically constant throughout wide ranges of speed. If an oil film were formed between balls and races, curve *B* would possess the same general characteristics as curve *A*.

The difference between the friction coefficient of a lubricated and unlubricated ball bearing is shown in Fig. 5. This property of a ball-bearing is not generally known, and should not be used as an argument in favor of operating ball-bearings

without lubrication. From the foregoing statements it should be evident that plain-bearings and ball-bearings possess such radically different characteristics that a true comparison is impossible. It naturally follows, therefore, that practically all the accumulated experience of the lubricating engineer is of little value when analyzing ball-bearing operation.

Requirements of a Ball-Bearing Lubricant

The use of a lubricant with ball-bearings is necessary to protect the highly polished surfaces of the balls and raceways, and to minimize the slight friction between the balls and ball retainer. The small amount of friction between balls and retainer

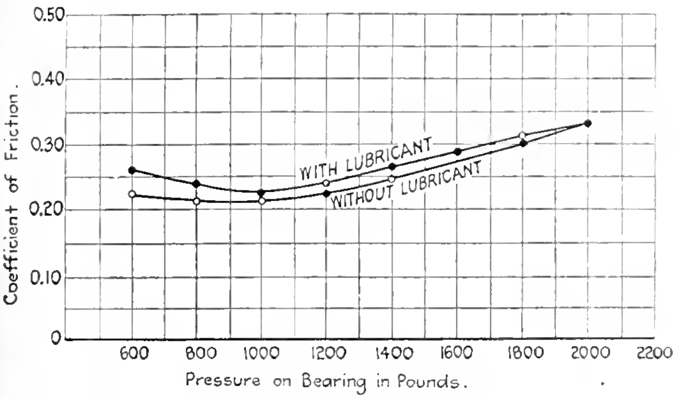

Fig. 4 Fiction Coefficient of a Plain-Bearing

can also be minimized by careful design. The principal requirement of a ball-bearing lubricant is chemical neutrality. The lubricant used must not contain over 0.10 per cent acid or alkali. There are many commercial lubricants on the market which come within this limit, but very few are acceptable because of their tendency to develop acid with age or when operating at high temperatures.

Most of the high grade oils can be used with safety, but many of the lubricating greases, while suitable for general purposes, are a positive menace to successful ball-bearing operation, not because of poor material used in the manufacture of greases, but because of the lack of scientific mixing methods. The manufacturer is in no way to blame for this condition, because he is making grease for general commercial use and not for ball-bearings. There are now on the market a few greases manufactured especially for ball-bearings, but, with one exception, all those tested by the author have proven worthless and clearly indicate the maker's ignorance of the requirements.

Experience shows that the most satisfactory lubricant for ball-bearings is a highly refined mineral oil having the proper viscosity and cold test for the installation. Greases should be used only where operating conditions require viscosities greater than can be obtained with a mineral oil.

Whenever a ball-bearing is operated at high speeds, it is not advisable to run it submerged in a lubricant, and provision should be made to supply the oil from a pressure system. If such a system is not available, good results may be obtained by a large-sight feed-oil cup. A few drops of oil per minute is all that is required.

At moderate speeds a heavy oil will generally give better results than a light oil. The substitution of a heavy oil for a light oil will generally result in a decreased operating temperature. This peculiarity may be explained by the fact that when the bearing is running at the actual operating speed, less opposition is offered to the rotation of the balls by the oil because of the inertia of the oil. In addition, there is less churning and frothing with its resultant air pockets. Air pockets in a lubricant act as insulators and prevent the transmission of the heat generated to the outer casing where it can readily be dissipated.

All mineral oils used on ball-bearings should be highly refined, filtered, and contain a minimum amount of acid, alkali or sulpho compounds, and in order to insure the use of such oils the following specifications are suggested:

Free acid (calc. as oleic acid), maximum, 0.10 per cent
Free alkali, absent
Ash, trace
Heat test (15 minutes at flash point), slight darkening, but no sediment
Flash point (Cleveland open cup), minimum, 300 deg. fahr.
Fire test, minimum, 350 deg. fahr.
Viscosity at 100 deg. fahr., Saybolt Universal

Light oil	100 to 200 sec.
Medium oil	200 to 300 sec.
Heavy oil	300 to 500 sec.
Extra heavy oil	More than 500 sec.

Free Acid Test. The test for free acid should be made in accordance with the method of the American Society for Testing Materials, which is as follows:

Accurately weigh 10 grams of the oil into a flask, add 50 cc. of 95 per cent alcohol which has been neutralized with weak caustic soda, and heat to the boiling point. Agitate the flask thoroughly in order to dissolve the free fatty acids as completely as possible. Titrate while hot with tenth-normal alkali, using phenolphthalein as indicator. Express results as percentage of oleic acid. 1 cc. N/10 alkali = 0.0282 gram of oleic acid.

Emulsion Test. This test gives a very definite indication of the presence of sulpho-compounds in an oil (sulphuric or sulphonic). There are several methods for carrying out this test, but for routine work, the following method for motor oil specified by the War Department in Specification No. 3502 issued April 24, 1918, should be followed:

One ounce of the oil shall be placed in a standard four-ounce bottle with one ounce of distilled water. The mixture shall be heated to a temperature of 180 deg. fahr. and then shaken vigorously for five minutes. After standing for one hour the oil must be clear and of the same color as before the test. All of the water must have settled and appear only slightly cloudy.

This method is simple and gives valuable indications as to degree of refinement of the oil. Highly refined oil shows a thin white line of demarcation between the oil and clear water below, thus indicating the absence of sulphuric acid compounds. Impure oil mixes permanently with water, appearing often as a curdled mass floating on milky water. The curdled portion contains what is frequently called a sulphuric acid soap and the extent to which it is present is an indication of the quantity of the "sulpho" compounds left in the oil, due to improper refinement. Oils containing appreciable amounts of these sulpho compounds are unsuitable for ball-bearings.

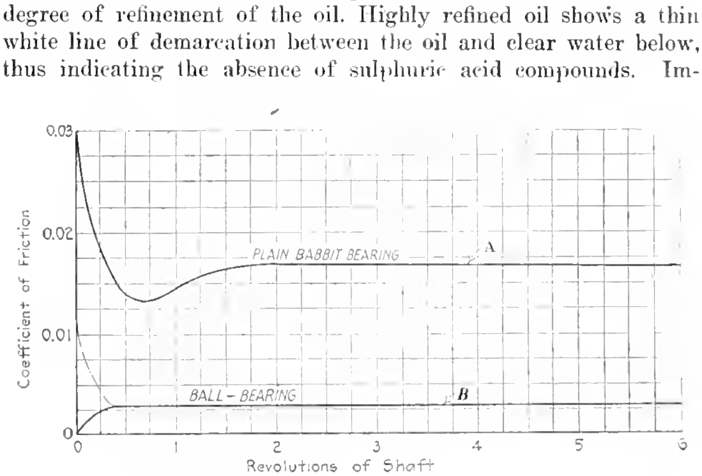

Fig. 5 Friction Coefficients of a Plain and a Ball-bearing

Heat Test. This test is conducted by heating a small portion of the oil in a flask or beaker up to the flash point and holding it at this temperature for fifteen minutes. A comparison is made between the heated and unheated oil. Highly refined oil darkens slightly but does not deposit sediment on standing twenty-four hours. Oils that contain sulphuric acid compounds turn black and deposit carbonlike substances. Such oils are not suitable for ball-bearings.

Inflammability Test. A flash point of 300 deg. fahr. (open cup) is the lowest limit considered safe for ordinary work and, on installations subject to high temperatures, oils having a flash point above 400 deg. fahr. should be used. The fire hazard is the factor to be considered in specifying the flash and fire tests.

Cold Test. For installations running at low temperatures asphaltic base or low pour-test oils are recommended as this type of oil shows pour tests of 5 deg. fahr. or below, while the paraffin base oils do not ordinarily run below 30 or 35 deg. fahr.

Lubricating Greases for Ball-Bearings

Most of the high-grade mineral oils conform quite closely to the above specifications. In connection with lubricating greases, however, the problem is more difficult. Many of the greases now on the market are entirely satisfactory for general purposes, but lack certain characteristics which experience shows to be highly important for successful ball-bearing lubrication. Tables 1, 2, and 3 show the variations to be found in a number of lubricants on the market, and it includes a sufficient number of analyses to show characteristic variations in the different types of greases available.

A large number of greases contain lime-soap as thickeners, a few are of the soda-soap type, while others are a combination of both. The lime greases are valuable in that they can be used without harmful results where moisture is present. Their consistency, however, is more easily changed by heat than greases of the soda type.

Using the tests previously mentioned as a basis, we can very easily arrive at a suitable specification which will ensure the production of lubricants suitable for ball-bearings without putting any undue burden on the lubricant manufacturer. The following specifications are accordingly suggested:

- Free acid (calc. as oleic acid), maximum, 0.10 per cent
- Free alkali (calc. as sodium hydroxide), maximum, 0.10 per cent
- Free lime (calc. as calcium oxide), maximum, 0.5 per cent
- Neutral saponifiable oil, maximum, 1.0 per cent
- Viscosity of mineral oil (minimum 200 sec. Saybolt Universal 100 deg. fahr.)
- Abrasive particles (sand, etc.), absent.

The determination of acidity in a grease containing lime-soap requires special treatment and the following modification of Marcusson's method is strongly recommended:

Ten grams of the grease are carefully weighed into an extraction flask and dissolved in 88 deg. gasoline by shaking cold (it is well to dissolve cold as by heating or boiling some of the free lime may combine with the free acid). Allow the soap to settle, and pour clear gasoline solution on medium large filter, without stirring the soap, treat the insoluble soap, lime, etc., again with gasoline thoroughly shake and allow to settle clear, pour on filter paper and when filtered wash soapy residue into filter paper and wash several times with gasoline until all soluble is washed out. Filtrate and washings are caught in Erlenmeyer flask of sufficient capacity, the gasoline solution is slowly distilled off on electric hot plate, being careful not to carry down too far so as to break up the oils.

The residue is washed into a stoppered bottle with a small amount of gasoline and 50 cc. of 50 per cent neutral alcohol added and titrated with standard N/100 sodium hydroxide solution, shaking the mixture thoroughly after each drop of solution is added, using phenolphthalein as an indicator. By this method, the acid content can be determined within 0.02 per cent, calculated as oleic acid.

Ball-bearing manufacturers are quite agreed that the limit of free acid in a grease should not exceed 0.10 per cent calculated as oleic acid, and from the Tables 1, 2, and 3 it is evident that there are plenty of greases available which meet this requirement.

It is essential that the grease be comparatively free from unsaponified fatty oil, or as expressed in the analyses, "neutral saponifiable oil." This specification is imposed because the unsaponified fatty oil has a tendency to become rancid or develop an acidity with age in service, particularly when operating at high temperatures. We have established a limit of 1.0 per cent, and the above tables show that this can be met in most of the compounds which are suitable in other respects.

One feature of grease lubrication which cannot be too highly emphasized is the importance of using a high-grade mineral oil conforming to the tests for purity as previously outlined. A grease may be perfect in every other respect, yet if a poor grade of mineral oil is used, the life of the bearing will be shortened.

Some manufacturers take advantage of the fact that a grease made with kerosene looks much the same as one containing high-grade oil and cheapen their product by using inferior light oils. It is desirable that a highly refined oil showing about 200 sec. viscosity Saybolt Universal at 100 deg. fahr. be used in the ordinary grease formula.

In view of the high polish necessary on ball-bearings, the elimination of abrasives such as sand particles, etc., is manifestly important.

At the present time, there is no generally accepted method for determining the consistency or melting point of a grease. Grease manufacturers have adopted systems of nomenclature peculiar

to their product, but not directly comparable to any other manufacturer's product. In the absence of a standard test, the adoption of the method for determining the melting point described by Gillett is urged. (See *Journal Industrial and Engineering Chemistry*, 1909, page 351.)

This method makes use of an open capillary tube 4 mm. inside diameter and about 8 cm. long, graduated at 1 cm. and 5 cm. from one end. The tube is stuck into the grease, and if necessary, suction is used at the same time to draw up a plug of grease 1 cm. into the tube. The tube is then attached, with a rubber band, to a thermometer so that the grease plug is beside the bulb. The thermometer and tube are immersed in a beaker of water so that the bottom of the tube is 5 cm. below the surface of the water, and the water is heated at a rate of 3 to 4 degrees per minute. When the melting point is reached, the plug which is under a pressure of 5 cm. of water, slides upward in the tube.

By itself, this test means very little, but when made in conjunction with a complete analysis of a grease, it enables one to check up the uniformity of the manufacturer's product on various lots of the same grade and gives some idea of the temperature under which the grease will operate. The melting point as determined above is dependent upon the nature and amount of soap, oil, and water in the grease as well as the processes used in combining the various constituents of the grease.

It is also desirable to keep the free lime content of the grease down to a minimum as any excess detracts from the lubricating qualities of the grease. Experience indicates that 0.5 per cent is a desirable limit. In some of the greases that the author has examined, small lumps of free lime were discovered to be distributed throughout the grease.

The highest grade ball-bearing greases are put through a milling process after compounding. This treatment insures very intimate mixing of all constituents and pulverizes any chance impurity to an impalpable powder. It is strongly recommended that all greases for ball-bearings be so treated.

Graphite as a Lubricant

Graphite, despite its unctious qualities, cannot be regarded as a true lubricant. It can, however, be used with success in plain bearings as it fills in the interstices in the bearing surfaces and allows the true lubricant to operate efficiently. A modern well-made ball-bearing with mirror-like finish has, however, practically no interstices in the balls and raceways. A perfectly finished ball shows no scratches when magnified 100 diameters and furthermore, were there irregularities present, graphite would not eliminate them as there is considerable difference between the sliding action of a plain-bearing and the rolling action of a ball-bearing.

Graphite, moreover, has a tendency to pack in the ball retainers and raceways, and a bearing which has been lubricated with graphite grease generally has a distinct wavy appearance in the ball paths. A recent brief test of a grease containing colloidal graphite revealed the fact that while the graphite did not pack in the raceways, and the wavy ball paths were absent, the complete raceway presented a burnished appearace quite different from that obtained by the use of ordinary greases. The graphite packed hard in the ball retainer and could not be removed by dipping in gasoline.

The use of graphite in ball-bearings cannot, therefore, be regarded as beneficial, and its application is purely a question of economics. Its use in ball-bearing automobile transmissions and rear axles is advisable only if the increased efficiency and life of the gears offsets any possible harmful effect on the bearings.

Analysis of Lime-Soap Greases

The procedure for analyzing lime greases is not a simple one and the following suggested form may prove of interest. The ordinary constituents of a lime-soap grease are:

$$\left.\begin{array}{l} a\ \text{Mineral oil} \\ b\ \text{Saponifiable oil} \\ c\ \text{Free lime} \\ d\ \text{Free fatty acid} \\ e\ \text{Moisture} \\ f\ \text{Soap.} \end{array}\right\}\ \text{Original State}$$

Determination of Total Fatty Matter. Weigh 10 grams of the grease into 250 cc. extraction flask, add 50 cc. water and 5 cc. of hydrochloric acid. Boil on hot-plate for one hour or until the soap is completely broken up. Make sulphuric ether extraction, leaving,

$$\left.\begin{array}{l} a\ \text{Mineral oil} \\ b\ \text{Neutral saponifiable oil} \\ d\ \text{Fatty acid.} \end{array}\right\}\ \text{Second stage}$$

Determination of Total Acidity. Add 50 cc. of neutral alcohol, heat under reflex condenser for fifteen minutes to dissolve fatty acids and titrate with standard alkali using phenolphthalein as indicated. The standard alkali used in the titration is calculated to oleic acid which gives a total of fatty acids combined as soap and free fatty acids existing in the grease, leaving

$$\left.\begin{array}{l} a\ \text{Mineral oil} \\ b\ \text{Neutral saponifiable oil} \end{array}\right\}\ \text{Third stage}$$

Determination of Neutral Saponifiable Oil. To the contents of the flask from the above determination, add 25 cc. of standard alcoholic caustic potash solution and boil under reflex condenser for two hours. Titrate the excess of caustic potash with standard hydrochloric acid and calculate the number of milligrams of caustic potash used up by the neutral saponifiable oil. The neutral saponifiable oil is then calculated from the saponification number, leaving

$$a\ \text{Mineral oil}\ \}\ \text{Fourth stage}$$

Determination of Mineral Oil. Add 10 cc. of standard alcoholic caustic potash solution to the contents of the flask used in the previous determination and boil under reflex condenser for one-half hour. Cool and make petrolic ether extraction. Ether extract contains the mineral oil.

Determination of Ash Content. Weigh 10 grams of grease in a platinum dish. Burn to ash over gas burner. Residue may contain lime, lead, sodium, sand, potassium, silicates, iron, aluminum, mica, talc, or mineral filler. Weigh residue and add hydrochloric acid. Heat and filter. Residue contains sand, silicates, mica, talc, etc.

The filtrate contains iron, aluminum, calcium, sodium, potassium, etc., and should be made alkaline with ammonia, then boiled and filtered. Residue is iron and aluminum. Filtrate contains calcium, sodium, and potassium. Add excess of ammonium oxalate to filtrate, and filter. Residue contains lime in form of calcium oxalate, filtrate contains sodium and potassium.

While the bases used in the soap may be determined by the usual chemical methods as indicated above, micro-chemical methods are quicker and more delicate for qualitative tests and in some instances the latter method represents the only practical means of determining very small amounts of the bases used. Chamot, in his book on Elementary Chemical Microscopy, gives a complete and detailed account of the methods to be used in microscopic analysis.

In conclusion, the author would like to point out the need for further investigations to obtain data so that lubricating grease specifications may be standardized. The lubrication problem is essentially a chemical problem and we should welcome the assistance of the chemical societies in this matter.

The railroads have at last shown a net gain to the government. The operating results for the month of July of practically all Class 1 railroads and terminal companies under federal operation indicate that this net gain will run to approximately $2,000,000. The net operating income for the month of July, 1919, was about $77,000,000. The indicated net gain to the government for July is obtained after allowing one-twelfth of the annual rental due the railroads. The net loss to July 31, 1919, was $290,526,307.

Mid-Continent Section Meeting of A. S. M. E.

A Group of Papers Relating Mainly to the Oil Industry, Presented at the First Meeting of the Mid-Continent Section of the Society at Tulsa, Okla.

One of the newest Sections of The American Society of Mechanical Engineers is located in the heart of the famous mid-continent oil fields, with headquarters at Tulsa, Okla. This Section covers the large territory included in Oklahoma, Kansas, Northern Texas, and a portion of Louisiana and Arkansas. While its meetings will be devoted to general engineering subjects, it is expected that many of the papers will relate to the betterment of the mechanical phases of the petroleum industry. On May 23, 1919, an all-day meeting was held, at which the group of papers here abstracted was presented. A feature was made of the inspection of airplanes which had been brought from the Air Service Center, No. 2, Romorantin, France, by Lieut. E. E. Ives, recently of the U. S. Air Service, who gave a brief paper, here included. The Mid-Continent Section is now planning a second meeting to be held the latter part of October, announcement of which is in this number.

THE EDUCATION OF A PETROLEUM ENGINEER

By J. H. FELGAR,[1] NORMAN, OKLA.

IN discussing this topic, the writer desires, first of all, to call attention to Dr. Mann's preliminary report on engineering education in which there was discussed the replies received from a questionnaire sent out to a large number of employers of technical men, and to technical men themselves. The replies indicated the rather startling conclusion that the factors which go to make up technically educated men, able to compete in their professions, are mainly personal qualifications and not technical knowledge as might have been supposed. This report has naturally led to a general consideration of the requisites of a technical education.

There are certain fundamental studies which form the backbone of any engineering course and these are mathematics through calculus, one year of college physics, a full treatment of applied and theoretical mechanics, a full course in strength of materials, and a carefully-given course in statics and dynamics. To these might be added a year in chemistry and a course in English composition and literature.

There should also be included in the curriculum a course in business law and contracts, elementary accounting, and the fundamentals of cost accounting. These three courses make a foundation upon which a knowledge of business administration could very well be built.

No engineering course is complete without a year of mechanical drawing, and in addition to this, a course in descriptive geometry develops constructive thought and imagination. Shop work and elementary surveying are also essential.

There are, of course, the subjects taken just for their educational value and the satisfaction in the knowledge gained, and there are few engineering educators who would not appreciate an opportunity for their students to take a course in history, political science, sociology, literature, and art.

Coming now more particularly to the subject of petroleum engineering from the production standpoint, this should include scientific work in locating new fields, location and drilling of wells, conservation of the product, whether oil or gas, the piping of oil to storage and gas to the consumption point. Following the year of fundamental chemistry, there should be a course in quantitative analysis and organic chemistry with special attention to the specific problems of oil and gas. This course is for the general education of the technical student entering this field and should, therefore, be included whether any application is made of it or not. In the second semester of the freshman year, a course in the elements of surveying should be started, continued through the more advanced subjects and concluded by a practical course in the field. In the sophomore year the student should begin the study of the elements of geology, and sufficient work in higher geology should also be given so as to permit of his entering the field and seeking employment in the geology department of any oil company.

The moment that one approaches the field of petroleum engineering he realizes that there is a demand for training in mechanical engineering, and such a training should comprise the fundamentals of steam machinery, including engines, pumps, compressors, etc., and also the fundamental principles of gas and gasoline engines. A course in the study of transmission of oil and gas through pipe-lines is also worthy of a hearing, and it would not be amiss to acquaint the student with classes, types and methods of drilling.

Electricity and electrical machinery are finding a place in the production of oil, and for this reason a petroleum engineer should be familiar with the fundamental principles of electricity as presented by a course in electricity and magnetism. He should also have a knowledge of the workings and principles of electrical machinery, gained through laboratory experiments. Such a course as this will be found in practically every non-electric course in any technical school throughout the country, and will fulfill the fundamental needs in a course in oil and gas production.

Turning to the refining standpoint, there is no doubt but that from the fundamental outline already discussed, the technical work could be filled in from the departments of chemistry and engineering. In mechanical engineering it would be necessary to begin with the fundamental course in steam engines and boilers, taking along with it some laboratory work in the operation and efficiency of steam machinery, together with the discussion of the transmission, metering and flow of fluids in pipes and a knowledge of the machinery necessary to produce this flow. It would be well to include a careful study of the economy of burning fuels under different types of boilers, including their cost and construction, and to obtain a knowledge of the fundamentals of heat transfer, a thorough course in thermodynamics should be included, which should take up in detail the different engine cycles, compressors, and the specific heat of different substances, taken separately, and a mixture of these substances; also a study of the saturation tables of different fluids at different temperatures and pressures, a study of the specific gravity, etc. This course can be made as comprehensive in the theory of heat as time will allow, and is, without doubt, a fundamental course. There could also be included a course in the principles and operation of oil and gas engines.

The foundation work in chemistry should be continued, including a course in quantitative analysis which follows the first year's work taken by all students. A fundamental course in organic chemistry and another in organic preparation could also be given. Qualitative analysis should likewise be more carefully studied, for no better course exists to develop insight into the scientific spirit than a study of physical chemistry and physical-chemical measurements. Along with all this material, the study of petroleum technology could be begun. The studies dealing more intimately with petroleum engineering could be given in as many subdivisions as there was time to devote to them, and would include lectures on theory and practice of petroleum refining, petroleum products, natural gas and natural-gas products, and the analysis of petroleum products, coal tar, oil shales, and natural gas. The details of petroleum refining could be taken up in a separate course, each followed with laboratory work to emphasize the theory. Research problems might

[1] Dean, College of Engineering, University of Oklahoma. Mem. Am. Soc. M. E.

also be given and inspection trips should be taken to study actual conditions. The laboratory work would also include the carrying out of the refining process in a small but complete refinery of about one to five barrels capacity.

Although such an undergraduate course is intended primarily to give a fundamental training in petroleum technology, nevertheless, the student would not find himself unnecessarily handicapped if an opportunity presented itself in other allied fields.

Even a brief study of this undergraduate course, by anyone interested in petroleum engineering, will immediately disclose the fact that many of the problems, which he had in mind for such a course, could not be considered by undergraduate students, but must be solved by the work of graduates. Each will realize also that any technical course is perfected through development, or through a process of evolution, as a biologist would call it, and if the engineering profession can come to some reasonable agreement as to what fundamental general training and professional work should be included in the undergraduate course, then such agreement will immediately eliminate the more advanced problems for graduate study. The problem of getting this material into the course can be attacked in two ways: first, by requiring a year of general training before entering the technical school, in which considerable of the preliminary work will be carried, leaving room at the end for these more advanced classes in technology; or second, by the addition of a stiff graduate year to the course already outlined, in which the advanced problems could be approached.

In conclusion the writer wishes to present the outlines of three courses, the first giving the essentials of any technical course, as combined with suggested professional work adapted to prepare for the petroleum field, the second, a suggested course in petroleum-production engineering and the third, a suggested course in petroleum-refining engineering.

THE TANK CAR MAINTENANCE PROBLEM

By PAUL BATEMAN,[1] COFFEYVILLE, KAN.

SINCE tank cars constitute a large item of initial expense to almost every producer and marketer of petroleum products, it is of some importance that they be maintained at a point of greatest efficiency with minimum up-keep expense.

As an engineer and designer for several years, in the employ of two of the largest car builders in the country, it was a matter of circumstance that one of the outstanding ideas of car builders was forcibly brought to my notice. That is, in substance, design *something different*. The best engineering practice is sometimes made subservient to the principle of designing something on which a claim for a patent may be made.

This practice has resulted in innumerable types of cars, each type with its own variations, and has greatly complicated the problem of maintenance of equipment. Repair shops have been called into existence by the impossibility of car owners carrying a sufficient variety of parts to repair their cars properly. Although there are some few concerns which employ experienced repair men, the owners of cars must in general trust to inefficient labor to perform work that requires specialized knowledge and experience.

Behind the experience, also, there must be knowledge, not only knowledge of how to make repairs, but of why the part requires repairs and of how to prevent a recurrence of the same trouble.

[1] Superintendent, Peoples Tank-Line Co. Assoc.-Mem. Am. Soc. M. E.

To make this clear we will refer to Fig. 1 showing the end of the underframe of a car. There are innumerable variations in the end structure, but the principle must remain the same in all.

Repair of Friction Draft Gear

The yoke, Fig. 1, is riveted to the butt end of the coupler and contains certain friction parts, which, in buffing, are compressed by the coupler against stops, or lugs, riveted to the longitudinal beams, or sills. In pulling, the yoke is brought into play and performs the same duty in a reverse direction, by compressing the friction parts against the front stops or lugs.

When originally installed the "friction draft gear" is provided with sufficient travel to enable the full capacity of the gear to be utilized. Any shock in excess of the capacity of the gear is absorbed by the horn of the coupler striking against the buffer

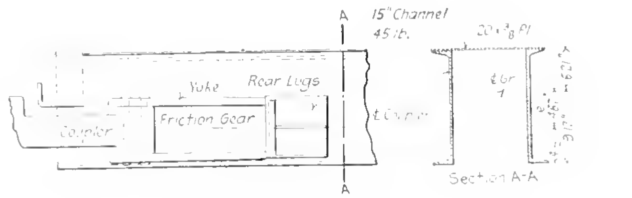

Fig. 1 End of the Underframe of a Car

on the end of the sills, after the gear is compressed to its full capacity.

The gear, as installed, is not at the center of the sills, due to details of construction based on truck clearances and the necessity of keeping the center of gravity of the loaded car as low as possible and there is approximately a 200,000-lb. shock on a 13 in. to 15 in. girder with an eccentricity of about 4 in. to 6 in. Any shock above the absorption capacity of the gear is absorbed by a direct blow against the fully-compressed gear which now

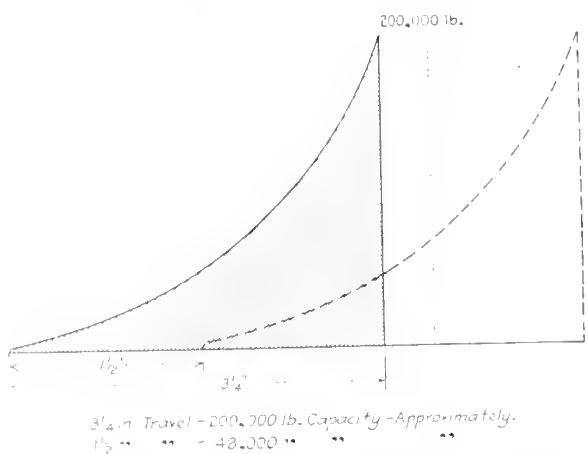

Fig. 2 Composite Compression Diagram of Draft Gears

acts as a rigid block. When wear on the friction elements develops, the end clearance betweene coupler and buffer block is eliminated and the impact load in excess of the gear capacity is received by the buffer. The gear, as originally installed, gives protection to the car, but when the friction parts wear, more and more of the impact load is directly transmitted to the buffer. As the latter has relatively little resiliency, it is only a question of a short time before it is broken, thus bringing the full load on the gear and thence directly to the sills. The obvious result is that the sills spread and buckle, or else the rivets on the rear draft lugs are sheared, sometimes both. The usual procedure has always been to say. "Oh, let it ride, the sills are all right, we'll fix it sometime." When it is finally released for repairs the first and only thing done is to put on a new buffer and let the worn-out gear alone.

If the gear has worn so that the first $1\frac{1}{2}$ in. of travel has become non-effective, there will be left only $1\frac{3}{4}$ in. of useful travel of the original $3\frac{1}{4}$ in., giving a retarding value of only about one-fourth of the capacity of the gear. (Fig. 2.) With the full load of a moving train, having a possible buffing shock up to 1,000,000 ft-lb., it is not hard to imagine the effect on the new buffer casting.

This is not an isolated case but is the usual procedure all over the country, not alone with the refiners, but also with the railroad companies and even some of the private repair shops.

As we are dealing with buffer forces, we have kinetic energy, which does not permit of the same assumption for fiber stresses as in the case of static loads. Under static loads we can figure a column at its full value, with each of the fibers bearing an equal portion of the load. Under our conditions, however, we have two variable forces, one along the center line of the coupler and the other along the center line of buffer impact, the latter after the frictional resistance of the gear has been absorbed. In addition we have the forces compounded by secondary forces which cause torsional stresses. These latter are caused by inequalities of tracks, different heights of couplers, impacts on curved track, couplers being off center, etc. We term them secondary forces,

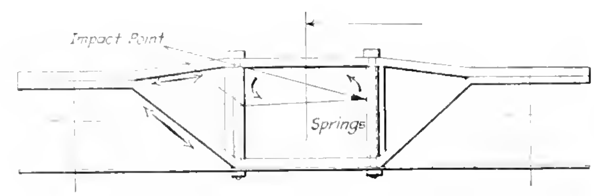

Fig. 3 Arch Bar Truck Construction

but they are really as much a part of the primary forces as are any others.

In tank car design, we do not have to consider the deflection due to loading on account of the loads usually being concentrated at the bolsters and thence transmitted directly to the truck, so all we have is the compound load due to conditions previously mentioned.

The above case, as illustrated, is indicative of the usual methods employed in making repairs. No thought is given to the cause. The best way to make repairs, of course, is to prevent the necessity. However, in conditions as they are, the best procedure is to remove the slack travel of the coupler by renewal of necessary parts and by placing shims between the gear and the lugs. After that, see that the correct position is maintained.

Truck Repairs

Reference to Fig. 3 shows the usual design of arch bar truck construction and the lines of force with their attendant results. We will suppose a loaded car to be in a rapidly-moving train, when an emergency application of the brakes is made.

The braking power is from 70 per cent to 90 per cent of the light weight of the car which, in a 38000-lb. car of 8000 gal. capacity, loaded with gasoline, is 30 per cent to 40 per cent of the total weight of the car. The result is that the trucks receive a direct load at the center plate due to the inertia of the entire loaded body of car at whatever speed it is traveling.

It has always seemed inconsistent that one part of the car—the sills, through the coupler—should be used to start the car, and another and much lighter part—the brakes operating on the trucks—should be used to stop it. The writer sees no way, at the present time, to improve the basic principle of this.

The resultant tendency in brake application is to transmit a load to *one* side of the center plate and generate torsional stresses tending to rotate the bolster. This load very naturally comes on only one side of the truck springs, which are intended always to act as a unit. The result is that the springs compress unequally and throw the bolster against the columns with unequal bearing. This causes failure in the columns by tearing the column bolt

through the wearing surface of the column. A condition of this kind is usually caused by neglect in allowing nuts of column bolts to become loose, thus permitting the arch bars to spread and allowing excess clearance. Quite frequently the cars, as originally built, have entirely too much clearance.

The material wear of columns and of the column guides on the bolster should be taken up by placing shims on one column or else on the column guide on the bolster. This is almost never done as it requires that the truck be practically dismantled.

Another cause of trouble is the rapid rounding of curves at which time the loaded car seeks a tangent and the trucks must follow the rails. That causes the bolsters to exert more pressure on one set of springs than on the other, thus allowing the springs to slip and quite frequently lose out. Improper side bearing spacing and clearance are very usual causes of truck failure and also cause derailment.

The principal instructions would seem to be to keep the truck tight and see that wooden shims, above or below springs, are renewed at sufficient intervals to insure that they are solid. The shims are made of seasoned oak but they decay very rapidly and allow the springs to settle into them, thus increasing clearances to an unsafe margin. Side bearing clearances must be kept at the proper point, 1/8 in. to 1/4 in. between top and bottom.

Repair of Tanks

Of the tanks proper little need be said except that all *indications* of leaks should be immediately looked into as stains on the *outside* usually mean that the caulking edge of the sheets and rivets on the *inside* has deteriorated. The tank should not only be caulked on the outside but more especially on the inside. It might be stated that caulking on the inside is almost never practiced except in the shop where its necessity is understood. The fact that inside caulking is obligatory, under Bureau of Explosives' Rules, seems to be overlooked. Leaks are quite commonly caused by deflection of the sheets of the unsupported end portion of the tank which causes distortion of the sheets at riveted joints.

The safety valves ordered to be used have always been a source of wonder to the writer, particularly as to why it seemed necessary to provide 40 sq.in. to safety valve outlet surface while the largest locomotive using superheated steam and a pressure of up to 250 lb. per sq. in. has only about 10 per cent of this area. The Master Car Builders Association has designed a device using a spring balance to determine the proper point at which to set the valve. Inequalities of bearing surface on the valve seats seem to be overlooked, consequently there is practically no guarantee that the valves will hold any pressure whatever.

All valves should be removed and ground in with emery in oil, then set to the proper point under a test by compressed air. The valve question is not only a maintenance problem but one in design, which we hope will have the attention of qualified engineers.

The advisability of keeping cars well protected by paint is too well known to require more than passing comment. That comment is mostly directed toward the policy of merely making the cars a good advertising sign board instead of seeing that the painting is properly done. Cars, particularly the tanks, should be thoroughly cleaned preparatory to painting as the improperly cleaned car will not hold the best paint made. My company has found it advisable to put the problems of painting up to the paint manufacturers, using their knowledge and experience in connection with our own.

One of the greatest causes of tank cars being neglected is the attitude of certain railroads, particularly at competitive points. When an inspector refuses a "Bad Order Car," a competing road's inspector will take it and so drum up business for his road. If it is impossible to run the car in its condition as accepted, temporary repairs are made. In fact, anything is done that will get it out of the yard at the point of origin. The owner is very grateful to the railroads accepting the car and consequently the accommodating railroad gets the future business.

This policy can have only one result, and that is evident when it is stated that the policy is pursued in endless chain fashion, the original road accepting cars that even the first offending road refused to handle.

INSPECTION OF AIRPLANES AT ROMORANTIN, FRANCE

By Lieut. Earl E. Ives,[1] Tulsa, Okla.

This paper relates to the inspection of airplanes at Air Service Production Center No. 2, Romorantin, France. All of the American-built planes which were used abroad were De Haviland-4s. They were shipped to Romorantin in a semi-assembled condition, there to be uncrated, set up, tested, and flown to the battle line. The plant in which this work was done had a floor capacity of 120 machines with wings on, and 75 to 100 machines without wings. In addition there was ample room for uncrating 50 machines a day and storage capacity for all this material. An airplane repair shop and a motor repair shop, each of the same size as the assembly plant, operated as auxiliaries to the assembly work.

When a machine was first uncrated an inspector was on the job with a handful of red rejection cards and repair shop cards. If defective material was found it was marked and the disposition to be made of it was indicated on the red card; that is, it was labeled "repair" or "salvage," as the case might be. If no trouble was found these first inspectors put a card on the machine which gave it the right to remain on the assembly floor.

Inspection in Fuselage Department

When the assembly work began the inspectors in the Fuselage Department went over every part of the machine. In checking up the machine for alignment the following rule was observed: "With the upper longerons level in the pilot's cock-pit, the motor bed should be level. A line parallel to and 16 7/8 in. below the top of the upper longerons, in the pilot's cock-pit, should bisect the sides of the tail. This line will be referred to as the line of flight of the machine. That is, it is a line parallel to the path of the machine when the machine is flying level and straight ahead at its rated speed. With the two upper longerons level with each other in the pilot's cock-pit, the rudder post in the tail of the machine should be in a vertical position, and the clips to which the main tail plane, or horizontal stabilizer, as it is called, is fastened, should be level. The motor should be level in the machine, and the center line of the crank shaft of the motor should be parallel with and directly under the center line of the machine. The axle in the landing gear should be at right angles to the center line of the machine, and should extend the same distance out on each side of the fuselage. The clips or hinges to which the wings are fastened must be uniformly located on the sides of the fuselage and in such a position that, when the wings are put on, the upper wing will be 12 in. ahead of the lower one. The center of the center section must be exactly above the center line of the machine."

It would be impossible to mention here all of the details watched by the inspectors as they looked over the fuselage, but a few will be interesting. "Make sure that the controls in the floor of the cock-pit are properly fastened. Be sure that the main stay-rods in the under side of the machine have not been cut by some Hun sympathizer. What is in the fire extinguisher, Pyrene or gasoline? Have all the internal brace wires in the fuselage been fastened so that the vibration of the motor will not loosen them? Are the brace wires that hold the motor in place damaged by corrosion?"

The controls to the motor, and instrument leads from the motor, were carefully examined, but in doing so the inspector knew that the man who tested the motor later on would find out whether every part of the power plant was functioning, so he looked the motor over more to help hasten the work than anything else. However, every defective instrument and damaged motor part was tagged as soon as it was found.

Before the machine could leave the assembly floor its propeller had to be properly installed. Before its installation the propeller was checked up by the following specifications: it must be in static balance, 3 in-oz. being the maximum error. The error in

[1] Recently of the U. S. Air Service.

track and length must not exceed 1/8 in., that is, ± 1/16 in. The error in pitch must not exceed 1 deg. at any point along the effective areas of the two blades, and the average error in pitch of the two blades must not exceed 20 min.

Every propeller was carefully watched for defective workmanship, and the writer has seen a great number of excellently finished oak and walnut blades uncrated in France with the hub hole bored through each at such an angle as to give the propeller a track error of half an inch. An Englishman in looking over the propellers said: "I say, why don't you fellows catch the Hun who is boring those holes for you?"

Motor and Propeller Inspection

The motor, of course, received a careful test. It was placed in a concrete stall where a free current of air could be obtained, and a bank of dirt received the bullets from the machine guns when their synchronizing mechanism was tested in connection with the propeller. The following requirements were rigidly demanded of every motor. After being warmed up it must run at 1600 r.p.m. without loading or choking; throttle to at least 300 r.p.m. without stopping; maintain an oil pressure of not over 30 lb. nor under 15 lb. in its range of speed; maintain a speed of 1500 r.p.m. without excessive vibration or over-heating; show that it is getting proper lubrication, that its ignition and throttling mechanisms are in first-class condition; and the sound of its exhaust must indicate that its valve openings are properly adjusted.

After this test a rigid inspection of all water, oil, and gasoline leads must prove that there are no leaks. A second check was made of the propeller alignment and general behavior of all motor control instruments. One instrument which was very carefully watched was the tachometer. It was very necessary to know that the motor actually developed its rated r.p.m., for with a standard propeller the motor speed was a direct check on the horsepower of the motor.

Final Inspection of Machine and Its Instruments

In the final inspection, after the machine was fully rigged and before its flight test, the following alignment specifications were followed. The angle of incidence measured with a straight edge rule and level must be 3 deg. The method of checking this was very simple. A straight edge touching the under side of the rear edge of the rear wing beam and held level must be 1 15/16 in. from the rear edge of the front wing beam when the machine was level in its line of flight. That is, the under side of the wing must cut the air stream at a positive or lifting angle of 3 deg. A simple jig reduced this check to the taking of one measurement, that is, the 1 15/16-in. measurement, with an over- and under-limit of 1/64 in. The dihedral angle of 3 deg. was even more easily checked. A string stretched across the top of the upper wings above the front wing beam must clear the center section 9⅛ in. when it touched the wing at the center strut fittings.

But the details which must be covered on an airplane before it can be OK'd as a perfect machine are an entirely different matter. For instance, to counteract the torque of the 400-hp. motor an extra amount of incidence must be put in the left wing. If this were not done the big bird would fly as though it had lost some of the feathers from its left wing. If the inter-plane struts are not all of proper length, the upper wing will not have the same angle of incidence as the lower one, and the pilot will say that the machine is heavy on one side, that it does not want to climb, or that it has a heavy tail. The angle of incidence is the all important factor in the final alignment of an airplane.

Then new wire, or cable, as it is referred to, will always stretch. The question of just how tight the machine can be set up and not endanger the strength of its own members and at the same time be sure of holding its alignment is one that the inspector must be able to answer without a second thought. With the check-up on equipment, and especially such special equipment as cameras, bomb-dropping sights, and machine guns, comes the necessity for an inspector with a ready mind. If he is not wide awake he will surely pass his machine with some of its vital parts missing.

The compass must be adjusted after all other apparatus has been installed. The residual magnetism of the motor has a tendency to throw the magnetic needle out of its proper course. When the motor is running, the magnetism of its rotating parts produces a still heavier effect on the compass needle. Before that instrument will function, the magnetic effect of the running motor must be counteracted. The inspector must make sure that the compass needle will point straight north when the machine is in the air, and he must, if possible, get all adjusting done before the flight test.

On the field the machine underwent a hasty inspection by the test pilot before flight. In the air it must fly level with a motor speed of 1350 to 1400 r.p.m. It must be easy enough on the controls to permit the pilot to release the stick and maintain his course and altitude with the use of his rudder alone. The motor must meet all the demands before mentioned, and in addition be able to maintain its r.p.m. in a steep climb. That is, a change of the level of gasoline in the float chamber of the carbureter must not affect the motor speed.

The card system mentioned earlier in this paper was a great aid in getting the excellent results obtained by the inspection department. When the assembly work was begun on the machine a card 5 in. by 8 in. was put in a holder on the outside of the machine. As one part of the work was completed or one alignment properly checked out the inspector on the job made record of the fact on the card. At the same time if he found some defect which must be remedied before the final OK he noted it on the back of the card. When the machine was ready to leave the first department all the assembly work assigned to that one floor had been passed on by the inspector and many of the defects remedied, which might have been overlooked later on, or if discovered would have delayed the machine in its schedule. The inspector who passed the machine to the next department removed the card and put on one which, it might be said, gave it the privilege of leaving the first assembly floor. Any defects still unattended to were carried forward to the new card and the old card was filed in the inspector's office as a part of the history of that plane. This process was repeated four different times, the plane receiving at last a final OK from the inspector. This OK was on a linen tag and remained on the machine when it was delivered to the front. If at any time a defect was found that would hold the machine in the department as much as two hours over its schedule, the inspector would remove the regular inspection card and put on a repair shop card which constituted a pass to the repair shop for that machine. When the repair shop card was properly signed, by the inspectors at the repair shop, the machine was placed back into the assembly process again and its old card was attached to it.

Personnel of Organization

A careful selection of the men available for inspection work revealed the fact that young men with some college training or at least high school education made the best inspectors. Men skilled in automobile repair work were the poorest. They wanted to do the job themselves. Jewelers were available for instrument inspection and cabinet makers for wood work. But men who could and would learn how to exercise good judgment along mechanical lines were hard to find. The best inspectors it was found could be more easily and quickly made out of young men who had not had a large amount of practical mechanical experience along any line.

The organization, which in November was capable of passing successfully on 50 complete airplanes a day, consisted of 75 non-commissioned officers and privates, and 10 commissioned officers. Five of the commissioned officers were test pilots. There were five distinct departments, first inspection, fuselage assembly inspection, motor inspection, final assembly inspection, and flight test. The daily and hourly reports came on the regular inspection cards to the inspection office from these different departments. The record of the work of the department is best told by saying that none of the 1400 machines passed by that organization, up to November 11, 1918, failed on the field because of some defect carelessly overlooked by an inspector.

INDUSTRIAL DEVELOPMENT IN THE TRANS-MISSOURI REGION

By P. F. Walker,[1] Lawrence, Kan.

By the Trans-Missouri region is meant the section of country west of the chain of towns on and in prolongation of the Missouri River, the prolongation referring to that part of the river north of Kansas City and extending westward into the intermountain region until the point is reached where Pacific coast shipping conditions are directly felt. This forms one of the zones recognized by the Interstate Commerce Commission in its railway-rate regulation measures. It is not the plan to include the whole of this zone, however, because vital factors other than railway rates tend to limit us in north and south directions, notably the influence of fuel supply. Our region then includes the entire states of Kansas, Oklahoma and Colorado, and parts of Texas, Arkansas, Missouri, Nebraska, and New Mexico. Gulf conditions cut off a considerable portion of Texas, as do Mississippi River conditions portions of Missouri and Arkansas. A strip of southern Nebraska and the northeastern portion of New Mexico come in to round out the circle of influence exercised by the oil field. It is worth noting that the geographical center of the United States lies due north of the center of this region and within the state of Kansas. It is, therefore, a section cut out of the heart of the country.

It is well to consider with care the natural resources of this region other than oil and gas. They are of significance on several bases: first, as raw or auxiliary material consumed in the production of finished goods; second, as indicative of the capacity of the region to support population in the direct matter of foodstuffs; and third, as an index of freight traffic on the railroads, and thus of the importance of the region in the transportation business of the country. The following figures are about ten years old and so are not to be taken to show accurate values for today, but are relative and so indicative of conditions in this group of states when compared with the United States as a whole. The figures are totaled for the states of Nebraska, Kansas, Oklahoma, Texas, Colorado, and New Mexico when available. It is to be borne in mind that the population of these states amounts to about 18.5 per cent of that of the United States and also that the center of population of the country has been moving westward gradually until now it is Indiana. This last point is of significance in the transportation of foodstuffs as well as in the location of the domestic market for manufactured goods.

Agricultural

Only approximate statements are given. In staple foodstuffs, wheat and meat products, the region produces about 40 per cent of the total for the country. This being four times the population ratio, three-fourths of the total product moves outside the region in either raw or manufactured form, representing an immense amount of through freight originating here. Other foodstuffs are more nearly balanced as regards shipment into or out of the region, with a difference in favor of the incoming in many of the more expensive varieties. In cotton and other fiber products the movement is outward, but not in notably large quantity. In general, the producing power of the region is far in excess of its population needs and creates outgoing traffic. It means a balance of credit in its favor, a not inconsiderable portion of the capital thus represented being invested in projects outside the

Mineral Products

The total value of the output of mines and quarries in this region amounted in 1909 to $123,214,000, which is 9.95 per cent of the total for the United States. This figure includes lead and zinc for Missouri because of the fact that in recent years this industry has moved almost wholly into Oklahoma and Kansas, and always has been identified in a distinctive way with these states. These mineral products are of special significance. It is to be noted that the percentage is essentially the same as that of population. Developments of recent years have made it slightly more. Outside of petroleum products, the most distinctive are lead and zinc, occurring and treated as one. The figures of ten years ago show this item as $23,196,000, 81.2 per cent of the total of the country. The figures are altered now, but possibly the older ones are fully as significant as are those resulting from the abnormal conditions of the last two years. The deposits are small in area, but of tremendous significance in the production of those metals on a world basis. Happening to occur at the junction of three states, the really small distribution appears in a large way in the published statistics. In this case concentration is a fortunate circumstance, especially as the field is close to the best coal and petroleum fields of the region.

Coal deposits occur in workable form in each state excepting Nebraska. The total product is about 27,000,000 tons, which is 7.1 per cent of the total of the country. The wide distribution is a fortunate element with reference to the general upbuilding of industrial enterprises, and an increased production would follow with the increasing demand. The western mines have been proven to produce coal yielding fair grades of metallurgical coke, a thing, by the way, which should be followed out and developed with care. Its association with the foundry and machine products business is apparent.

Gypsum is produced in nearly every part of the region, the total output amounting to $1,381,300, which is 23.8 per cent of the total of the country. This output can be readily increased and to advantage.

Limestone is abundant throughout and is produced as desired. The recorded output is 7.5 per cent of the total of the country and valued at $2,237,000. This is independent of that produced directly for cement manufacturing purposes.

Clays, shales, and limestones for the production of many varieties of clay products, including Portland cement, are abundant. Monetary or quantitative values are difficult to secure, and as records, would be of slight significance. There is no limit at all to possible developments in this line dependent upon quantities of material available. Cement manufactures are included in manufacturing statistics to be discussed later.

In the western portion of the region many of the finer metals are plentiful, notably copper, silver, and tungsten. They do not figure appreciably in respect to transportation considerations, however, and their development is dependent on conditions quite special and distinct from other economic relationships.

In general, the outstanding resources of the region which contribute to the enterprises of the country as a whole beyond the needs of the local population are the cereals and meat products in the food group; lead and zinc spelter and gypsum products in the metal group, together with the special rare metals of Colorado; salt in both raw and refined forms; and petroleum and its refined products in the fuel group. In large measure these commodities leave the region in raw or only partially manufactured form. Others of the list of resources are undeveloped because of the fact that their shipment in raw material form is impossible, and manufacturing enterprise has not yet brought the opportunity for full realization of the possibilities.

Accomplishments in Manufacturing

Only a brief summary will be given. Contrary to the popular impression, the number of kinds of manufacturing enterprises which have grown up in the region to an extent which makes them of real significance in supplying the markets is large, and to go into detail is beyond the scope of this paper.

In 1909 the value of the manufactured products in the six states was $988,642,000. This is 4.8 per cent of the total for the United States. Some advance has been made in the past ten years, although the percentage relationship may not be greatly increased because of the tremendous impetus which manufacturing has undergone everywhere. If we eliminate the meat-packing plants of Kansas City and Omaha, in order to get a closer comparison with respect to general diversified manufacturing, the percentage

[1] Dean of the School of Engineering, University of Kansas. Mem. Am. Soc. M. E.

drops to 3.6, or almost exactly one-third the amount which the local market demands on the basis of population. After making due allowance for manufactured goods going to export trade, it appears that our region is producing, in gross, slightly over 40 per cent of the value of articles needed in local markets. Probably the surprise is that the percentage is so high rather than so low, although it is to be borne in mind that the purchasing power of this western region is high compared with many blocks of population of similar size in the congested cities of the east, so that our actual market is not supplied up to this figure.

The lines of manufacturing in which a substantial development has taken place, arranged without reference to magnitude, are as follows:

Meat packing	$310,742,000
Flour and grist-mill products	146,271,000
Canning and preserving	2,793,000
Dairy products	17,902,000
Cotton goods	2,815,000
Men's clothing	3,933,000
Leather goods	8,746,000
Medicines and druggists' preparations	2,636,000
Tobacco goods	2,877,000
Lumber and timber products	48,252,000
Clay products (not including cement)	1,411,000
Portland cement	5,537,000
Glass	2,037,000
Salt, refined	1,513,000
Agricultural implements	521,000
Foundry and machine-shop products	24,807,000
Furniture and refrigerators	2,670,000
Sheet-metal manufactures	4,608,000
Paint and varnish	1,948,000
Wall plaster (gypsum)	884,000
Paper and paper goods	300,000
Railroad shop-repair work	39,706,000
Zinc smelting	13,859,000
Oil refining	......
Beet-sugar industry	......
Total	$646,768,000

Certain industries included in census reports under the heading of manufactures, such as printing and publishing, artificial ice, bakery products, etc., which are in themselves considerable items, are omitted from the list because they bear a somewhat different relationship to industrial development than do the others, which are forced to go to the market on a purely competitive basis. These listed industries, with values subject to great changes during the past ten years, but taken as they stand, involve the operation of equipment calling for 437,623 hp. They represent an invested capital of $310,255,000 and the employment of 135,044 persons.

It is significant that these enterprises are well distributed over the region, and that they embrace the nucleus of a mill population. This does not mean a mill population of the type found in manufacturing cities of the East, but it does mean that there is a group that is becoming skilled in shop and factory work. It is well known that the development of a population with a portion sufficiently large that is trained and acclimated to industrial-plant activities, so as to make the systematic development of manufactures possible, is a long process. Happily the progress made already in this region has carried us through the first difficult stages, and the curve of difficulties grows flatter and cause for concern on this score is rapidly growing less.

Transportation and Freight Adjustments

The one element in industry which must form the basis for gravest consideration in this Trans-Missouri region is that of transportation and freight adjustments. Freight rates make or break enterprises without number. This region has been peculiarly unfortunate during some periods in the past history of railroad manipulations and later adjustments, and anything that is done on a considerable scale very far west of the Missouri River must be prefaced by a very careful study of the rate situation. It is well understood that the river towns are basing points for through shipments and enjoy certain advantages on that account as compared with interior points which have to bear a local-rate addition. It results, therefore, that on commodities to and from the eastern markets the towns away from the river have a handicap that may be considerable, especially if some secondary material like fuel must be transported westward through a river point to the point of manufacture of the article in question.

We have a special interest, however, in the shipping conditions westward, now greater than ever with the striking possibilities before the Pacific coast towns. In the intervening country lies the natural home market for manufactured goods produced in the Trans-Missouri region. With the growth of that section of country should go the growth of industries in this section. The problem has been to reach it with our goods under conditions advantageous with reference to other more distant regions. Previous to the war, before the taking over of the railroads and the confusion resulting from unprecedented demands upon our entire transportation system, two steps had been taken in the adjustment of rates which reacted favorably for this region. The principles laid down in those decisions are practically sure to hold whatever the ultimate destiny of the railroads may be.

By the decision of the Interstate Commerce Commission in 1911, and upheld by decision of the Supreme Court in June, 1914, on traffic originating at the Missouri River and points west thereof, the rates to intermediate points should not be more than the rates through to the Pacific coast terminals. This region is designated as Zone 1. On traffic originating in Zone 2, which is the region east of the Missouri River as far as the Chicago territory, the rates to intermountain points should not exceed by more than 7 per cent the rates through to the coast terminals. Similar provisions with increasing percentages of excess are prescribed for zones in territory still farther east. This decision made the intermountain territory accessible to this Zone 1 region on terms slightly in our favor as compared with shipments made by way of the Pacific coast terminals.

The policy of blanketing the westbound rates over the eastern half of the United States gives another point that is favorable in a slightly more positive sense. By this plan of blanketing, the rate on a shipment westward is the same when starting from any point east of the Missouri River. Traffic originating west of the river for west coast or intermountain points may be given lower rates. This distinctly favors the establishment of enterprises in this district for the intermountain market.

With the opening of the Panama Canal a new condition was created. With the above conditions in force any lowering of rates to coast terminals to meet the new type of competition of the water routes would have carried like reductions to all intermountain points. It was clear that some adjustment was necessary in order to preserve for the railroads an amount of business that would enable them to serve the country. On January 29, 1915, the Interstate Commerce Commission rendered its decision, containing this provision: that from points on the Missouri River and in the territory west thereof carload rates to intermediate points are not to exceed those of Pacific coast terminal points.
points are not to exceed those of Pacific coast terminal points, except for a list of twenty-eight articles or commodity groups which consist, for the most part, of various kinds of iron and steel manufactures. The decision also contains the provision that for these excepted articles the rate to intermediate points east of the Missouri the rates to coast terminals may be less than for intermediate points on a much greater number of articles.

Under transportation conditions of the last two years many changes have taken place in rates but the above comparison as to the relative adjustments will remain as the substantial basis, with little question of doubt. That such adjustment constitutes any marked advantage for this Trans-Missouri region in shipping to western markets over eastern producing territory, is not claimed. It does, however, tend to remove the unfavorable conditions which previously existed, and serves to give a fair and

equal opportunity for manufacturers of this region to reach a market which is bound to be increasingly profitable.

RESULT OF PRESENT-DAY TRANSPORTATION DIFFICULTIES

A condition, more or less temporary, exists now in the transportation business of the country which in a very real way makes for the encouragement of industrial enterprises in the West. This is the fact that shipments of goods from the East are difficult to secure. Because of the need this has produced the Pacific coast business men have actually started manufacturing enterprises of considerable magnitude. A few years more of the present stringency in transportation facilities and the west coast region will have developed a manufacturing business which it would not have done, under more normal conditions, in as many decades. In only a small measure is the situation different in this mid-west region. All that is needed are progressive groups of men, business men and engineers, who are alive to the fact that permanent prosperity and the unchecked increase in the value of their securities depend upon the development of a well-rounded out group of producing industries, and who in their several communities will devote their influence and energies to the encouragement of prospective manufacturers. This transportation tie-up is not a simple matter of diversion of effort to moving war material nor an illustration of inefficient management. Serious as may have been these factors, there is another that is with us to stay. It is the greatly augmented foreign trade that is upon us as a nation and that is bound to be a dominating factor in many phases of our industrial life. All over the country there is being preached the doctrine of promotion of export trade, and it means a change in many of our practices and ideals. An opportunity is at the door of this country greater in its way than anything else that has come to us in history. In a dozen different corners of the globe there are markets waiting for intelligent development by this nation.

The export trade in manufactured commodities may be a matter somewhat remote from this section west of the Missouri River so far as direct participation in it goes, excepting for products in the lines of foodstuffs, petroleum, lead and zinc. Even in those lines, in which production is on such a large scale, it may be that a wiser course to pursue is to look a little less intently for the foreign market as a direct market, and give more attention to the development of the varied lines which will build up our own region and make the home markets a more complete absorbent for these dominating products. And in particular let it be observed that the diversion of so much product from the established manufacturing centers, from home to foreign markets, makes the creation of new industries in these regions more natural. Materials in place of manufactured goods in return for the immense quantities of freight taken out of the region in the form of cereal and meat products only partially manufactured will mean the development of our population in more systematic manner, and the substitution of intensive for extensive method on many wide expanses of the western plains. It will mean a more complete realization of the possibilities which lie in these sections of Texas, Oklahoma, and western Kansas which now yield so little.

REGIONAL FUEL SITUATION

There is one serious condition which remains to be satisfied in the full before such program can be carried out in full confidence. Reference more or less detailed has been made in four of the prime essentials for industrial development; namely, materials, labor, transportation, and markets. A factor of equal import is that of power, which means the regional fuel supply. Coal is well distributed over the region, but the deposits are not large. The Pacific coast states have at their north doors in the remarkable coal deposits of Alaska, a source of energy for industrial enterprises that is unmeasurable. All that is needed is a more enlightened policy on the part of the federal administration to make coal production from that field a sure and determining factor in our national progress. Before we are many years older Alaskan coal will be on its way in American ships through the Panama Canal up the Mississippi River for distribution in the Missouri Valley. But the Pacific coast states will have that coal first, and at low cost.

The fuel situation in this Trans-Missouri region calls for careful survey and analysis. The extent to which the unique petroleum resources will be available for local industry should be worked out by men who have the oil business at their fingers' ends. The full realization of possibilities in the lead and zinc field is waiting on the creation of a source of cheap power, making the electrolytic-zinc process feasible. The full utilization of paper pulp in the arts, with untold tons of the principal raw material going up in smoke on the Kansas wheat fields while the forests of the north are dwindling, is dependent upon the economical production of heat energy in the form of steam. The time is not far distant when fertilization of western soil will be demanded, for which nitrogen secured by the fixation process of electrical means is the direct response. It is the fuel that is to determine the future of the region and this Section of the Society can do no greater service to the people of the country than to produce the sound facts which will show where we stand. This can be done by well considered information which will show material facts regarding both petroleum and coal as the fuel supply on which the local industrial life of the region must depend for indefinite periods of time.

A VOLUMETRIC EFFICIENCY TEST OF A VACUUM PUMP

By GEORGE S. TAYMAN,[1] TULSA, OKLA.

IT was the purpose of this test to determine the volumetric efficiency and indicated horsepower of a Laidlaw-Dunn-Gordon Duplex dry vacuum pump, size 18 in. by 12 in., when operating under different intake and discharge pressures. Tests were made on April 10, 1919, at Station No. 28, Helen Hardridge Lease, for the Gypsy Oil Company, located at Tulsa, Okla.

The vacuum pump was belt-driven by a 2-cycle Bessemer gas engine rated 50 hp. at 180 r.p.m., and a 11 in. by 12 in. Ingersoll-Rand duplex booster was used to obtain a vacuum on the discharge side. The booster was also driven by a 2-cycle Bessemer gas engine, rated 50 hp. at 180 r.p.m.

The general arrangement of piping and connections for gages, orifice prover, and location of thermometer wells were as follows: The intake of the vacuum pump consisted of a 6-in. line with gate-valve near the pump for controlling the vacuum on the intake. Connections for manometer and thermometer wells were located between the gate-valve and vacuum pump.

The discharged air was led to a scrubber tank in order to eliminate the effect of the pulsations from the pump to the manometer, the latter being placed in the discharge line near the vacuum pump. The intake of the booster was connected to the scrubber tank, and the degree of vacuum or pressure on the discharge side of the vacuum pump was controlled by a gate-valve on the intake of the booster. The discharge line from the booster was connected to a second scrubber tank, and the orifice prover was connected to this tank by a 4-in. pipe. The function of this scrubber tank was to maintain a uniform pressure on the orifice prover during each test by reducing the pulsations from the discharge of the booster as far as possible.

Before starting the test the valves were removed from the vacuum and thoroughly cleaned and inspected. The packing glands were tightened on the piston rods of both vacuum pump and booster and tests were made for air leaks on all manometer connections. The intake valve of the vacuum pump was set so as to obtain a vacuum of 28 in. of mercury, and the intake valve on the booster was left wide open (this being the controling valve for discharge vacuum or pressure on vacuum pump) and under such conditions a maximum discharge of 24 in. of mercury was obtained.

It should be noted that the displacement of the booster per revolution was less than that of the vacuum pump, and that it was also driven at a lower speed, therefore, a high vacuum during

[1]Mechanical Engineer, Gypsy Oil Co., Tulsa, Okla., Jun. Am. Soc. M. E.

the discharge period of the vacuum pump could not be expected. When a vacuum of 20 in. of mercury was obtained during the intake of the vacuum pump, the booster had only sufficient capacity to reduces the discharge pressure to atmospheric. The intake vacuum was kept constant for each series of tests and the discharge vacuum varied from the highest value that it was possible to obtain by the use of the booster to the greatest discharge pressures.

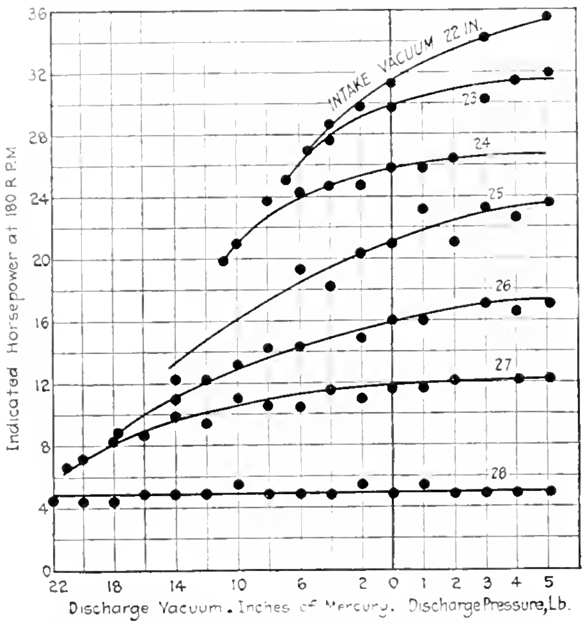

FIG. 1 INDICATED HORSEPOWER CURVES OF AN 18 X 12 IN. LAIDLAW-DUNN-GORDON PUMP

The following observations were taken for each test. Temperature of intake, temperature at orifice prover, vacuum on intake (constant for each series of tests), vacuum or pressure on discharge of vacuum pump, volume of air discharged through orifice prover per hour, barometer reading, and r.p.m. of vacuum pump.

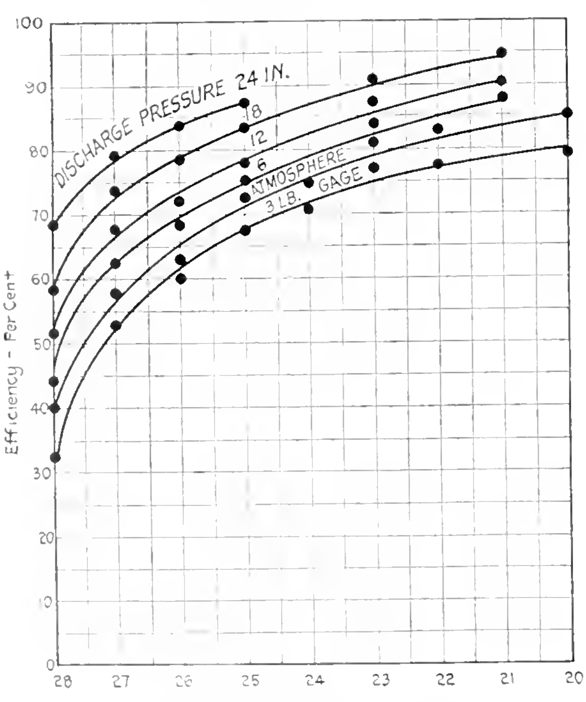

FIG. 2 VOLUMETRIC EFFICIENCY CURVES OF AN 18 X 12 IN. LAIDLAW-DUNN-GORDON PUMP

Three indicator cards were also taken for each test; one from each end of the cylinder and one including both ends. An American-Thompson indicator with 16-lb. spring was used for this purpose. From the cards thus secured the indicated horse-power was calculated, and curves plotted of indicated horse-power as the discharge vacuum or pressure, one curve being plotted for each intake vacuum from 22 to 28 in. inclusive, as shown in Fig. 1.

The primary object of this test, however, as previously stated, was to obtain a set of volumetric efficiency curves for constant discharge pressures with variable intake vacuum. Accordingly from the data secured, curves were plotted of volumetric efficiency vs. intake vacuums, one curve being plotted for each intake vacuum from 20 in. to 28 in. inclusive as shown by Fig. 2. The volumetric efficiency, in each case, was calculated by the following equation:

$$E_v = \frac{AT\sqrt{\frac{P}{P_1}}\left[\left(\frac{P}{13.6}\right)+B\right]}{DT_1\ P_2\ N}$$

When

E_v = volumetric efficiency

A = cu. ft. of air per min. through prover as shown by open holes

P = pressure on prover in inches of water

P_1 = correct pressure of orifice prover from tables

P_2 = absolute pressure on intake of vacuum pump in inches of mercury

B = barometer reading at time of test

T = absolute temperature of intake

T_1 = absolute temperature at orifice prover

D = displacement of vacuum pump, cu. ft. per revolution

N = revolutions per minute of vacuum pump.

Engineers in the Pan-American Financial Conference

Those in charge of the Second Pan-American Financial Conference state that the engineering profession will be well represented at the January conference to be held in Washington. Latin-American engineers are more closely connected with important industrial projects and have a greater command in matters pertaining to the developments on which they are working than is the case in the United States. Our own engineering profession may, therefore, do well to study the Latin-American plan of coöperation between capital and the engineers. The former Assistant Director of the Bureau of Foreign and Domestic Commerce has gone to Central America to obtain definite data on the credit and investment requirements of Latin-America, and these data are for the special use of the conference.

Experimental Work on Oil Shales

Because of the enormous amount of oil tied up in the great shale deposits of the United States it has been the opinion of many engineers that the recovery of the oil can be profitably undertaken. A bill has been introduced in the Senate proposing to provide the Bureau of Mines with $140,000 for experimental work on oil shales. The Secretary of the Interior has advised the Senate Committee on Mines and Mining that the plan for the proposed research work is necessary to ascertain the most profitable way of recovering the oil. The bill has his complete approval.

A large initial outlay of capital will be necessary in any projects organized to get commercial oil in this way because an extensive manufacturing process is involved. The importance of accurate and extensive preliminary research work is, therefore, apparent. This source of petroleum supply will be of added value to the country when the point is reached where oil wells do not produce sufficiently to meet all requirements. One item of great importance which must be looked to in the future is the increasing tendency to use oil in high-power naval craft.

ENGINEERING RESEARCH

A Department Conducted by the Research Committee of the A. S. M. E.

Industrial Research

IN an excellent paper on Industrial Research by Dr. Frank B. Jewett, read before the Royal Canadian Institute at Toronto on September 8, 1918, the great need for the training of research men is again clearly set forth, and the method of obtaining these men for this work is outlined. The concluding remarks of this paper are very significant, and are given here for the consideration of our members:

In conclusion I should like to present for your consideration a few points which I think are fundamental to the successful carrying out of any broad policy of industrial research growth within a nation and a few other points which my experience has taught me to look upon as beacons in the course of building up an effective and smooth-running industrial research organization. The points of the general problem which I would make are:

1 That no extensive and successful industrial research growth can be looked for unless provision is made for a continuous supply of competent men of broad general training and a specific and thorough training in the methods of scientific research.

2 That coincident with the growth of real industrial research there must be a corresponding and equal growth and development in the domain of fundamental scientific research which will broaden the bounds of knowledge and open up new avenues for the industrial research worker.

3 That there must be education to develop a full understanding of the material and economic advantages which will result from the supplanting of the purely cut-and-dry inventive type of growth by the application of scientific research methods and the further knowledge that a vigorous and healthy growth of fundamental scientific research is an integral and absolutely necessary part of the problem. In the one case this education must be directed toward the industrial interests for the purpose of indicating to them the advantages to be gained by an abandonment of methods which are not in accord with the present-day state of world-knowledge and the building up of a demand for the right type of men, and in the other case toward the population at large for the purpose of instilling an appreciation of the advantages which will accrue to the nation and attracting to the field of research, whether fundamental or industrial, a large proportion of qualified men; also for the purpose of having the people at large view with sympathy a reasonable allotment of general funds for the advancement of research activities.

4 That a realization of all of the foregoing can best be obtained by a close coöperation between the industrial and business interests of the country and the higher educational institutions, which are already looked upon with favor by educated and thinking people, and from which must come the men qualified to build up industrial research.

5 That whatever the scheme finally adopted to provide for an expansion in the domain of fundamental research and the development of competent industrial research workers, care must be taken to insure that pressure from the industries will never be so great as to withdraw those men who can render the greatest service by continuing as investigators in the field of pure research and the training of younger men. Such a course would be suicidal if long continued and I mention the point because of the fact that my experience indicates a considerable tendency on the part of industries which have benefited from industrial research to endeavor to attract into their service the best of the university research men. I confess that the temptation to do this is very great and that the monetary inducements which industry can offer to the individual are large and not easily to be withstood by a man whose normal human reaction is for the material welfare of his family.

Finally, as to those specific points which may be of interest to anyone endeavoring to build up an industrial organization:

1 The research department must be so organized, developed, and equipped with men and machinery that the net result, direct or indirect, will be of decided monetary value to the industry. Otherwise, it has no reason to be.

2 The present state of the art is such that a large number of the problems falling within the field of the industrial research laboratory are inherently expensive. For this reason, while enormous returns may be possible from the successful completion of any line of research, lack of success or an attempt to conduct it with inefficient help will mean the waste of much valuable time and money. For these reasons the choice of the staff and the careful consideration of all of the factors in any problem are of the utmost importance.

3 That successful industrial research under modern conditions is essentially one of organization and group working, as distinguished from the essentially individualistic work of fundamental research. For this reason extreme care must be taken to secure competent executives either from the ranks of those whose primary training has been along research lines and who have shown capacity for handling men and complicated problems, or from those of executive capacity and experience who have shown a proper sympathy for the requirements of research.

4 That all industry tends to be conservative and that great care must be taken not to attempt the forced growth of a broad industrial research development where a too rapid growth will engender the active opposition of those who have been educated in a different environment. My experience has indicated that there is never any trouble where the proper method is employed but that there is always trouble if the so-called practical man feels that the proposed new methods are essentially a reflection on his ability and that his point of view is not receiving sufficient consideration. As a matter of fact, the practical man's point of view and his knowledge, gained by long experience, will be found to be one of the chief assets of the successful industrial research worker.

5 That some industries are much more conservative in their attitude toward the adoption of modern research methods than others. In general, I think it will be found that the most conservative are the oldest and are those industries which existed long before the science of their art had been developed. Because of the fact that modern electrical and chemical industries have grown directly from pure scientific developments, I think they will be found to be easier fields for the cultivation of industrial research than older industries, such as those which were well developed in the earlier periods of human affairs.

6 Finally, a most important point, not to be lost sight of in the organization of a successful industrial research department, is the fact that many very capable men trained for industrial research are essentially devoid of certain commercial attributes. Many of them, for instance, fail to realize that on a large number of their problems time is an essential element in the work, while others fail to give due weight to that phase of the work which lies between the completion of the research activity and the introduction of the results into commercial manufacture or employment under modern conditions where the day-by-day control must, of necessity, be largely in the hands of those who are not highly-trained skilled workers. For this reason it is essential that whoever is responsible for the direction and success of the industrial research under-taking should be a man with a broad outlook, a full appreciation of all of the factors of the business problem and a man who can sympathize with and appreciate the varying points of view which he encounters and who can harmonize all of the activities into a smooth-working machine.

In closing, I wish merely to go on record with you by saying that after many years of experience, I now, as an executive in a large technical organization, am more than ever a firm believer in the benefits to be derived from a vigorous stimulation of both fundamental and industrial research, benefits which I believe will accrue not only to individual industries but to the people at large as well. It seems to me that, provided we have proper legislation to safeguard a just distribution of the benefits, we have in industrial research a most valuable means for ameliorating and bettering the conditions of mankind.

United States Bureau of Mines

The Bureau of Mines of the Department of the Interior has been recently reorganized under general order dated August 1, 1919. This general order describes the relation between the various branches of the Bureau and the duties and responsibilities of the various officers and employees of the Bureau. To give a brief statement of the plan of organization, the following statement and table have been taken from this general order:

The work entrusted to the Bureau involves matters both of business and of investigation. This necessitates that there shall be both administrative and technical control. In some matters there is necessity for only the minimum of technical control, since the work is either non-technical in character or follows established routine. In matters primarily investigative, it is desirable that the minimum of non-technical administrative control be exercised. For this reason the investigative work is set off as much as possible from the other work of the Bureau. The Bureau will, therefore, be organized with Investigations and Operations Branches with suitable subordinate divisions and sections, and so far as possible, work and personnel

will be assigned to one or the other. It will be necessary in certain instances that the work be co-operative as between sections, divisions, or branches, or that a member of the Bureau may work for a period or regularly for part time with more than one section or division. In all cases the officers of the Bureau are charged with the duty of marking out a clear line of responsibility in regard both to administration and technical control, subject to the authority and final approval of the Director. Allotments and transfers of funds will be made for the various divisions of the work only on authority of the Director.

The general plan of organization will, therefore, be as follows:

UNITED STATES BUREAU OF MINES
DIRECTOR

INVESTIGATIONS BRANCH ASSISTANT DIRECTOR	OPERATIONS BRANCH ASSISTANT TO THE DIRECTOR
1 Division of Mineral Technology	1 Office Administration
2 Division of Fuels	2 Division of Education and Information
3 Division of Mining	3 Government Fuel Yard
4 Division of Petroleum and Natural Gas	4 Mine Rescue Cars and Stations
5 Division of Experiment Stations:	
Pittsburgh, Urbana, Columbus, Bartlesville, Minneapolis, Fairbanks, Golden, Salt Lake City, Tucson, Seattle, Berkeley	

In connection with this attention should be called to the dedication of the new million dollar laboratories comprising the Bureau of Mines Experiment Station at Pittsburgh, Pa., in which the Pittsburgh Chamber of Commerce coöperates. The exercises will extend through three days, from September 29 to October 1.

ARTHUR M. GREENE, JR.,
Chairman of Research Committee.

A—RESEARCH RESULTS

The purpose of this Section of Engineering Research is to state the source of research information which has been completed, to give a resume of research results with formulae or curves where such may be readily given, and to report results of non-extensive researches which in the opinion of the investigator do not warrant a paper.

Aircraft A1-19 Wind Tunnel Investigations. The wind tunnel at the Bureau of Standards has been used for studies in connection with fall of aircraft bombs in rapidly moving air steams, and the effect on the position of the center pressure by displacement of the stabilizing finns forward and backward. Studies are being made on the manner of damping aircraft bombs which oscillate and of bringing them back to steady flight. Tests have been made on the aerodynamical characteristics of a model flying boat. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Aircraft A2-19 Angle-of-Attack Meter. Calibrations of pressure head used with angle-of-attack meter up to speeds of 120 miles an hour, Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Aircraft A3-19 Beams. Three-piece beams as strong as solid beam. Technical Notes, Feb. 15, 1919. Forest Products Laboratory, Madison, Wis. Address Director.

Automotive Vehicles & Equipment A1-19 Exhaust Gases. Vitiation of Garage Air by Automobile Exhaust Gases, by G. A. Burrell and A. W. Ganger. Technical Paper 216, Bureau of Mines. Address Van H. Manning, Director, Washington, D. C.

Concentration of Ores A1-19 Manganese Ore. Problems Involved in the Concentration and Utilization of Domestic Low-Grade Manganese Ore by Edmund Newton, War Minerals Investigations Series No. 9. Bureau of Mines, Address Van H. Manning, Director, Washington, D. C.

Concentration of Ores A2-19 Sulphur Ores. Concentration of Native Sulphur Ores by Flotation by James M. Hyde. Minerals Investigations Series No. 15, Bureau of Mines, Address Van H. Manning, Director, Washington, D. C.

Fuels, Gas, Tar & Coke A4-19 Coal Analysis. A Method of Least Squares Applied to Estimating Errors in Coal Analysis by J. D. Davis and J. G. Fairchild, Technical Paper, 171, Bureau of Mines, Address Van H. Manning, Director, Washington, D. C.

Fuels, Gas, Tar & Coke A5-19 Lignite. Combustion Experiments with North Dakota Lignite by Henry Kreisinger, C. E. Augustine and W. C. Harpster, Technical Paper 207, Bureau of Mines, Address, Van H. Manning, Director, Washington, D. C.

Heat A2-19 Solder of Intermediate Melting Point. In aircraft research work a solder melting at about 400 deg. cent. was needed. One of the following composition was found to be satisfactory: Silver 40 per cent, Tin 40 per cent, Copper 14 per cent, Zinc 6 per cent. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Leather & Glue A2-19 Comparison of Various Types of Glues. The Forest Products Laboratory of the United States Department of Agriculture at Madison, Wis., has issued a circular on the comparison of various kinds of glues: animal, casein, vegetable, blood and liquid. Animal glue has been used for a long time. It has great strength, a free flowing consistency and does not stain fancy veneers. Its price and the fact that it does not resist water to a high degree are the factors which limit its use.

Casein glue is made from casein obtained from milk. It has been used for a short time commercially and its possibilities and limitations are not well known. It can be spread with a brush when cold and has a good strength. Its special value lies in its high resistance to water. This glue stains through veneers. When hard it is difficult to machine.

Vegetable glues are made from starch and are quite cheap. They are used cold and remain in a good working condition for many days. They are very viscous and are difficult to spread by hand. They lack resistance to water.

Blood albumin glue is made of soluble dried blood and is of high water resistance. The formula for mixing may be changed to produce various properties. The great objection to the use of this glue is the expense of the apparatus required.

Liquid glues are usually made of skin and bones of fish or animals quite similar to animal glue. They are ready for immediate use, have little or no water resistance and the cost is high.

Leather & Glue A3-19 Animal Glues. The Forest Products Laboratory of the United States Agricultural Department at Madison, Wis., has issued a circular on animal glues, their manufacture, preparation and application. The stock of bone and skin is washed and treated to remove dirt and grease and then boiled to extract the glue forming substance. The solution is concentrated by evaporation until jelly forms on cooling. The jelly is cut into various forms and dried. Calcium salts are removed for higher quality of glue. Temperature and time are controlled as overcooking reduces strength. Stock may be boiled several times to obtain glue solution. Mineral matters such as barium sulphate, white lead, zinc oxide or whiting may be added to the concentrated solution before cooling to give color and make the glue opaque.

Nominal grades can be relied upon for high-grade work. It is necessary to specify requirements and then provide means to determine whether or not those requirements are fulfilled. A system of classification based on jelly strength was devised by Peter Cooper. These are designated A Extra, 1 Extra, 1, IX, 1¼, 1⅜, 1½, 1⅝, 1¾, 1⅞, 2. 1 Extra is the strongest glue. There are now glues stronger then 1 Extra and weaker than 2. This is little used today.

In using glues it is important to find the proper proportion of glue and water for the best results with the wood used and the conditions under which it is used. This should be determined by strength tests and then the proportion adhered to. Clean cold water should be used and the mixture thor-

oughly stirred to prevent lumps, allowing it to stand in a cool place until the glue is thoroughly water soaked and softened. This may take from one hour to ten hours. It should then be melted on a water bath of not more than 150 deg. fahr. as high temperature and long heating reduces strength. The pot should be kept covered to prevent the formation of skin or scum. The glue should be applied in a warm room free from drafts, and it is good practice to warm the wood without warping it before applying the glue. Clamps should be applied as quickly as consistent with good workmanship.

Clamping pressure should be evenly distributed over joints. The proper amount of pressure is not definitely known. In gluing veneers pressures as high as 150 lb. per sq. in. are sometimes used. Too much pressure may force glue completely from joint.

Strict cleanliness of pots, apparatus, floors and tables should be observed. Old glue becomes foul and breeds bacteria which decompose glue. Glue pots and brushes should be washed after every day's work. Keep brushes in weak solution of carbolic acid. Mix enough glue for one day's run only.

A strength of animal glue is greater than the wood upon which they are used. Certified glues give a shearing strength of from 2200 to 2400 lb. per sq. in. Address Director, Forest Products Laboratory, Madison, Wis.

Leather & Glue A4-19 Blood Albumin Glues, Their Manufacture, Preparation and Application. The Forest Products Laboratory of the United States Department of Agriculture of Madison, Wis., has prepared a circular on blood albumin glues. The use of blood albumin glue is comparatively new in this country. Previous to the entrance into war some plants had their own secret formulae. The demand for water resistant plywood caused increase in production of all kinds of water proof glue. The Forest Products Laboratory developed several formulae for blood albumin glues, and worked out method of gluing thin veneers with such. Prepared blood albumin glues are not offered on the market. Owing to decrease of solubility of albumin with age they are mixed at time of using. The glue is made from fresh blood of slaughtered animals or from black soluble blood albumin obtained by processing fresh blood. Unless fresh blood is utilized at once it must be treated with preservative or converted into dry soluble form by removing the fibrin and part of the red corpuscles and then evaporating to dryness at a temperature below the coagulating point of albumin which is 160 deg. The glue is prepared by the Forest Products Laboratory method according to the formula for which a patent has been applied for in the name of S. B. Henning. The dried albumin is allowed to soak for some time before stirring. The water added should be at room temperature and the soaking should take two hours. It is then agitated until it is of uniform consistency. If any of the material is insoluble the mixture should be strained through a thirty mesh sieve. This mixture makes a glue of considerable value but it is improved by adding ammonium hydroxide and hydrated lime. The formula for which the patent has been applied for is as follows:

Six parts of black soluble blood albumin, 90 per cent solubility. Eleven parts of water at about 80 deg. fahr. One-fourth part of ammonium hydroxide of specific gravity 0.90. One-eighth part of hydrated lime.

After the blood has been put in solution the ammonia is added while slowly stirring the mixture. Lime is then added in the form of a thick cream while slowly stirring. Care should be exercised in adding the lime as a small excess will cause the mixture to thicken. The glue should be of moderate consistency when mixed and should be suitable for use for several hours. The exact proportions of albumin and water may be varied to produce a glue of greater or less consistency.

The glue is applied with a bristle brush or glue spreader. The spreader should only be operated when actually coating the wood as its operation is apt to cause the glue to foam.

To set the glue a minimum temperature of 160 deg. fahr. is necessary. When thoroughly coagulated the glue cannot again be dissolved in water. Heat is conveniently applied by pressing between hot platens of hydraulic press. High temperatures to speed production are apt to cause steam pockets. A pressure of 50 to 100 lb. per sq. in. is desirable. With temperatures of 212 deg. three minutes are sufficient for three ply panel of 1/16 in. plies.

Blood glue is highly water resistant, retaining 50 to 75 per cent of dry strength after soaking or boiling.

Precautions: Weigh out constituents. Add cold water and do not heat. Do not stir until after soaking. Avoid stirring or agitation. Apply pressure before coagulation takes place. Be careful not to use excessive amount of lime. Do not use excessive temperatures. Address Director, Forest Products Laboratory, Madison, Wis.

Leather & Glue A5-19 Dry Glue Process for Thin Veneer. The Forest Products Laboratory of the United States Department of Agriculture at Madison, Wis., has issued a circular on blood albumin glues in which is described a dry glue process for thin veneers of 1/30 in. to 1/125 in. thickness. The previous troubles with thin veneers have been to prevent warping due to the water. The Forest Products Laboratory coöperating with the Bureau of Aircraft Production has developed a blood albumin glue which when dried was used successfully to glue thin veneers. A standard glue was mixed and then applied to tissue paper or cloth after which it was dried. The paper or cloth thus treated was placed between thicknesses of veneer which if too dry were sprinkled or sponged before placing in press where the pressure was from 150 to 200 lb. per sq. in. Address Director, Forest Products Laboratory, Madison, Wis.

Leather & Glue A6-19 Casein Glues, Their Manufacture, Preparation and Application. The Forest Products Laboratory of the United States Department of Agriculture at Madison, Wis., has issued a circular on this subject. Casein glues have been used in Europe to a limited extent in bookbinding and cabinet work, but their production on a large scale was unknown. In the United States the use of this glue is more recent, but there has been a more rapid development. This development was due to the great demand for water-proof plywood.

There are two types of casein glues, one in which the components are mixed dry, the other in which the components are added separately during preparation. Those on the market are of the first class.

The principal constituent of casein glue is casein, a product obtained from milk. This is the curd which precipitates when milk sours naturally. Hydrochloric and sulphuric acids and rennet are used to precipitate casein. Casein is produced by the removal of the butter fat by means of a separator, precipitation of the casein, washing to remove acid or other impurites, drying, finally grinding to a powder. To make it desirable for glue it should have only a small percentage of acids, moisture, fats or other impurities. It should be free from sour odors, clear and uniform in color, and should be in the form of a powder. The powder should pass through a 50 or 60 mesh sieve.

To produce glue, the casein is mixed with lime and water to increase the working life, the water resisting quality and to improve the glue. Caustic Soda, sodium fluoride and sodium silicate are used in patented formulae. They will lengthen the life of the glue, and sodium fluoride probably gives the glue antiseptic properties. Oils are added to dry mix glues to prevent dusting in handling the glue. Several formulae for mixing have been developed at the Forest Products Laboratory. One of these has been patented. U. S. Patent No. 1,291,396 granted to Samuel Butterman and assigned to the United States Government.

Glue 4-A Formula: 100 parts casein with 130-280 parts of water soaked for 15 minutes is mixed with a mixture of 15-22 parts of hydrated powdered lime and 90 parts water. To these add 70 parts of silicate of soda. After mixing, the mixer being turned at 50-60 r.p.m., add casein. Continue

until the casein passes into the form of a mush. After a period of about 15 minutes the soaking is considered complete and the mixing blade is started again. Then add lime water, and after two or three minutes add liquid silicate of soda. Mix for 20 or 30 minutes.

Casein glue is applied by hand or machine spreader, a wire brush or metal scraper used for hand work or a bristle brush. Enough glue should be spread so that a small amount is squeezed out when pressure is applied.

The working life of the glue is from four or five hours for moderate consistency to many hours for thinner consistency. The time that elapses between the spreading of the glue and the pressing depends on the moisture content of the wood, the consistency of the glue, the kind of wood, the quantity of the glue and the temperature of the wood and glue in general. The pressure should be applied while the glue is yet in a wet condition. The pressure used should be from 75 to 100 lb. per sq. in. Unless the surface is very irregular and the glue thick the pressure should be held for at least one-half hour, although longer periods are advisable.

After removal from press the stock should be allowed to condition before being finished. The time of conditioning depends on the nature of the material. Dry casein and casein glues will keep for a long time if stored under proper conditions. The place should be cool and dry as excessive moisture and high temperature causes deterioration. Casein glues have good strength and water resistant properties. After boiling for eight hours and soaking for ten days in cold water samples glued with this glue show no separation. Address Director, Forest Products Laboratory, Madison, Wis.

Metallurgy & Metallography A10-19 Manganese Alloys in Steel. The Use of Manganese Alloys in Open-Hearth Steel Practice by Samuel L. Hoyt, War Minerals Investigations Series No. 11, Bureau of Mines, Address Van H. Manning, Director, Washington, D. C.

Metallurgy & Metallography A11-19 Aluminum Alloys. Special and Commercial Light Aluminum Alloys by Robert J. Anderson. Minerals Investigations Series No. 14, Bureau of Mines, Address Van. H. Manning, Director, Washington, D. C.

Metallurgy & Metallography A12-19 Manganese. Uses of Manganese Other Than for Steel Making by W. C. Phalen, Minerals Investigations Series No. 16, Bureau of Mines, Address Van. H. Manning, Director, Washington, D. C.

Metallurgy & Metallography A13-19 Flotation Oils. Oils from hard wood tar have been shown to have high flotation values. Crude tar obtained in making of wood alcohol has been shown to be as good as redistilled oils. The presence of pitch from hard wood tar and oils has been shown to be desirable and not detrimental. Forest Products Laboratory, Madison, Wis. Address Director.

Metallurgy & Metallography A16-19 Graphite. Preparation of Crucible Graphite by George D. Dub, War Minerals Investigations Series No. 3, Bureau of Mines, Address Van H. Manning, Director, Washington, D. C.

Metallurgy & Metallography A19-19 Graphite. Refining Alabama Flake Graphite for Crucible Use by Frederick G. Moses, War Minerals Investigations Series No. 8, Bureau of Mines, Address Van H. Manning, Director, Washington, D. C.

Petroleum, Asphalt & Wood Products A1-19 Gasoline from Natural Gas. Recent Developments in the Absorption process for Recovering Gasoline from Natural Gas by W. P. Dykema, Bulletin 176, Bureau of Mines, Address Van. H. Manning, Director, Washington, D. C.

Wood Products A1-19 Hints on Storing Timber to Prevent Decay. Store on well drained ground, remove debris and keep down weeds, use proper foundations, slope timber piles, assist ventilation by avoiding close piling in the open, take care of stickers, keep sheds dry and well aired, check fungus with breaks. Technical Notes, Feb. 15, 1919. The Forest Products Laboratory, Madison, Wis. Address Director. Also Bulletin 510, Department of Agriculture, "Timber Storage Conditions in Eastern and Southern States with Special Reference to Decay Problems." Address Superintendent of Documents, Government Printing Office, Washington, D. C. Price 20c.

Wood Products A2-19 Moisture-Proofing Wood with Aluminum Leaf. Aluminum leaf is very effective for water proofing woods. When exposed for seventeen days in atmosphere of 95 to 100 per cent humidity natural birch absorbed fifty-five grams of moisture per sq. ft. of surface. Wood treated with five coats of linseed oil and two coats of floor wax absorbed coat of spar varnish eight grams; with filler and three coats of spar varnish absorbed fifteen grams per sq. ft. Samples coated with filler and three coats of orange shellac absorbed ten grams per sq. ft., with filler, two coats of enamel and one coat of spar varnish eight grams; with filler and three coats of rubbing varnish, seven grams. With two coats of shellac, one coat of spar varnish, one coat of aluminum leaf, two coats of shellac and one coat of spar varnish about 1½ grams. A little less than this was obtained from one coat of spar varnish, one sizing coat of spar varnish, aluminum leaf and two coats of spar varnish. The leaf is applied from the book without the aid of gilders tips as soon as the size reaches the right condition. It is important to let the size reach the right condition just before the varnish sets dust free. It takes 1½ hr. for this condition to be reached. Forest Products Laboratory, Madison, Wis. Address Director.

Wood Products A4-19 Circulation and Piling in Dry Kilns. The Forest Products Laboratory at Madison, Wis., has shown that the piling of lumber in a kiln must suit the circulation of the kiln in order to make the product uniform and cut down the time required. In a kiln having vertical lateral circulation lumber piled endwise dried quicker and gave more uniform results. Forest Products Laboratory, Madison, Wis. Address Director.

Wood Products A6-19 Scratched and Smooth Joints in Gluing. Tests of hard maple blocks with smooth and tooth planed contact surfaces were sheared after standing one week after gluing with high grade hide glue. Eleven tests gave 1988 lb. per sq. in. for scratched joints with 35 per cent of wood surface in the fracture while eleven smooth pieces gave a shearing strength of 2040 lb. per sq. in. with 47 per cent of wood surface in the failure. Forest Products Laboratory, Madison, Wis. Address Director.

Wood Products A7-19 Kiln Drying. Quarter sawed oak was dried in kiln originally at 105 deg. fahr. with 85 per cent humidity and with final temperatures of 145 deg. fahr., 155 deg. fahr. and 165 deg. fahr. The higher temperature produced a marked difference in the drying rate without causing visible defects. Douglas Fir in 2½-in. planks required twenty hours to reduce the moisture content from 50 per cent to 8 per cent. This was reduced to fourteen hours when starting at 130 deg. fahr. and ending with 150 deg. fahr. Ten tests were required with a temperature ranging from 160 deg. fahr. to 180 deg. fahr. and eight days with temperatures ranging from 220 deg. fahr. to 240 deg. fahr. Higher humidities were used with higher temperatures. Checking, warping, and cupping were very slight, but the higher temperatures seemed to darken the wood. In drying butt log cypress a high humidity in the kiln was used with a high temperature. This increased the rate of drying without producing checking. Forest Products Laboratory, Madison, Wis. Address Director.

B—Research in Progress

The purpose of this section of engineering research is to bring together those who are working on the same problem for coöperation or conference, to prevent unnecessary duplication of work and to inform the profession of the investigators who are engaged upon research problems. The addresses of these investigators are given for the purpose of correspondence.

Aircraft B6-19 Air Propellers. A general study of air propellers at Leland Stanford Jr. University undertaken for the National Advisory Committee for Aeronautics, of a general

character and scope as indicated by reports of the above committee and issued as a government publication. Address Prof. W. F. Durand, Leland Stanford Jr. University, Stanford University, Cal.

Bureau of Mines B1-19 The activities of the Bureau of Mines have recently been communicated to the Research Committee of the American Society of Mechanical Engineers, and during the next few months these will be listed in this department. To show the activities, however, the following statement of the work of the Bureau is given:

Number of Problems Under Investigation or Planned by Stations

Station or Office	Number of Problems Under Investigation	Planned or Outlined	Number of Men Employed
Bartlesville, Okla	4	3	7
Berkeley, Cal	6	3	6
Columbus, Ohio	10	..	9
Fairbanks, Alaska	9	3	3
Golden, Colo	8	7	9
Ithaca, N. Y	4	4	3
Minneapolis, Minn	6	1	9
Moscow, Idaho	5	3	3
Pittsburgh, Pa	..	..	.
Chemical Research	9	2	32
Coal Mining	6	..	8*
Electrical	9	3	5
Fuels	7	7	15
Iron and Steel	1	3	1
Mechanical Equipment	1	1	1
Mine Safety	6	1	4*
Non-Ferrous Metals	1	4	1
Petroleum Research	6	2	6
Physical Testing of Explosives	8	4	6
Technical Service	4	..	12
Salt Lake City, Utah	13	13	9
San Francisco, Cal	8	2	10
Sattle, Wash	11	6	6
Tucson, Ariz	4	5	4
Urbana, Ill	8	1	7
Totals	154	78	176

*These numbers do not include various field engineers.

Fuels, Gas, Tar & Coke B2-19 Aero Fuel Development. So far most favorable fuels were (1) Hecter (a synthetic cyclohexane and benzol); (2) Gasolines using large percentage of napthane hydrocarbons; (3) Mixtures of Gasoline and benzol. W. B. Dykema, Bureau of Mines Station, Bartlesville, Okla.

Fuels, Gas, Tar & Coke B3-19 Coal Analysis by A. C. Fieldner and W. A. Selvig, Bureau of Mines Station, Pittsburgh, Pa. Analysis of standard coal samples of the United States collected from July 1, 1916, to July 1, 1919, by the Bureau of Mines. Address Bureau of Mines, Van H. Manning, Director, Washington, D. C.

Fuels, Gas, Tar & Coke B4-19 Ash. Fusibility of Coal Ash by A. C. Fieldner and W. A. Selvig, Bureau of Mines Station, Pittsburgh, Pa. Investigations on the fusibility of coal ash from the well known coals of the United States. Results on coals from West Virginia, Illinois, Indiana, Kentucky, Kansas, Missouri, Oklahoma and Arkansas have been completed and published. Tests on Pennsylvania coals have been completed and results are being compiled. Maryland, Virginia, Eastern Kentucky and Ohio coals have been tested but results are not yet available, one thousand samples are yet to be tested. A final report covering all coals will be published in the form of a Bulletin. Bureau of Mines, Address Van H. Manning, Director, Washington, D. C.

Fuels, Gas, Tar & Coke B5-19 Constitution of Coal by A. C. Fieldner and R. Theissen. An extensive investigation including a large number of photo-micrographs. These show that the bright bands or anthraxylon consist of coalified wood, while the dull bands consist of small layers of bright coal or woody chips embedded in ground mass of dull coal composed of macerated remains of cellulodic degradation products, cultlicles, spore-exines, resinous particles, etc., which are all called attritus. Bureau of Mines Station, Pittsburgh, Pa. Address Van H. Manning, Director, Washington, D. C.

Hydraulics B3-19 Surge Chambers. A research problem in power hydraulics relating to the operation of a surge chamber in connection with an adjacent auxiliary reservoir, or in effect, the operation of two surge chambers, one large and one small, and separated by a conduit about 1400 ft. in length. This combination is one which gives rise to six differential equations in order to represent the hydraulic conditions. It is therefore quite beyond the range of investigation by analytical or other direct mathematical processes. The problem is being investigated by means of a model representing a special application of the law of kinematic similitude, and in accordance with methods developed by Professor Durand as given in Transactions, A. S. M. E., Vol. 34, p. 359. Address Prof. W. F. Durand, Leland Stanford University, Cal.

Metallurgy & Metallography B5-19 Alloy Steels. Simple and Complex Steels using uranium, tungsten, molybdenum, chromium, vanadium, titanium and aluminum. Light Armor Plate Steels containing zirconium. These steels are to be tested physically and in some cases ballistic tests are to be made. Some are to be used in forgings and some in castings. H. W. Gillett, Field Office of the Bureau of Mines at Ithaca, N. Y. Address Van H. Manning, Director, Washington, D. C.

Metallurgy & Metallography B6-19 Aluminum Chips. Melting of Aluminum Chips. This investigation is to be continued although results of investigations by H. W. Gillett and G. E. James were published in Bureau of Mines Bulletin No. 108, (Van H. Manning, Director). H. W. Gillett, Chief Alloy Chemist, Field Office, Bureau of Mines Station, Ithaca, N. Y.

Metallurgy & Metallography B7-19 Aluminum. Metallurgy of Aluminum, Robert J. Anderson, Metallurgist, Bureau of Mines Station, Pittsburgh, Pa. Object of experiment is to prevent waste in metal and fuel and to secure and disseminate information regarding metallurgy of aluminum. Problems being investigated are:

1 Causes for and prevention of defects in aluminum-alloy castings.

2 Blowholes, porosity, and unsoundness in aluminum-alloy castings.

3 Comparison of methods of melting aluminum and aluminum alloys.

4 Comparison of methods of introducing copper into the production of aluminum copper alloys.

5 Electric furnace melting of aluminum and aluminum alloys.

6 Study of quality of aluminum ingot as related to casting practice.

7 Pyrometry for aluminum-alloy foundries.

8 Development of method of analysis for aluminum oxide in ingot and alloy castings.

Worthless alloys are being discussed in a Technical Paper now in the course of publication.

This work is being done with the coöperation of various aluminum alloy foundries.

Coöperative work is being done with The Foundry. Metallographic studies have been made. These show that micrographs to seven diameters are very instructive. Address Van H. Manning, Director, Bureau of Mines, Washington, D. C.

Mining, General B1-19 Dust. Explosibility of Coal Dust by J. W. Paul, Bureau of Mines Station, Pittsburgh, Pa. Work done at experimental mine at Bruceton, Pa. Tests are being conducted on explosibility of coal dust from mines in all coal producing states to determine the explosibility and the treatment to render dust inert to explosion influences. Address Van H. Manning, Washington, D. C.

Mining, General B2-19 Coal. Mechanical Preparation of Coal by E. A. Holbrook, Bureau of Mines Station, University

of Illinois, Urbana, Ill. Work being conducted in laboratory of the university equipped with every type of coal washing and dressing machine. Probably the best equipped coal laboratory in the country. Problems so far worked upon include coal washing tests and the separation of pyrite from coal and especially coals used for cooking purposes. Bureau of Mines. Address Van H. Manning, Washington, D. C.

Wood Products B1-19 Effect of Kiln Drying on Strength. The Forest Products Laboratory is conducting a research on the strength of lumber when dried in the kiln and when air dried. Twenty-six species are to be examined. Forest Products Laboratory, Madison, Wis. Address Director.

Wood Products B2-19 Swelling and Shrinking of Wood as Influenced by Various Treatments and Coatings. The Forest Products Laboratory has 450 test panels coated with varnish, enamel or aluminum leaf. One-half of these will be hung in the laboratory under room conditions and one-half will be exposed to the weather. The effect of exposure will be measured from time to time. Forest Products Laboratory, Madison, Wis. Address Director.

C—Research Problems

The purpose of this section of engineering research is to bring together persons who desire coöperation in research work or to bring together those who have problems and no equipment with those who are equipped to carry on research. It is hoped that those desiring coöperation or aid will state problems for publication in this section.

Fuels, Gas, Tar & Coke C1-19 Alcohol. The Commercial Applications of Alcohol Fuels. Work is being done on this problem by a number of engineers and manufacturers, but other applications are needed to increase the demand for this fuel. Address Prof. Charles E. Lucke, 117th Street and Broadway, New York.

D—Research Equipment

The purpose of this section of engineering research is to give in concise form notes regarding the equipment of laboratories for mutual information and for the purpose of informing the profession of the equipment in various laboratories so that persons desiring special investigations may know where such work may be done

Aircraft D5-19 Wind Tunnel. The tunnel of the Bureau of Standards has been altered to permit the attainment of air speed up to 180 miles an hour. Address Bureau of Standards, S. W. Stratton, Director, Washington, D. C.

Stanford University D1-19 Laboratory of the Department of Mechanical Engineering.

1 *General Laboratory:* Miscellaneous instruments and equipment necessary for general problems including dynamometers, measuring instruments for pressure, time, revolutions, electrical quantities, etc.

2 *Laboratory of Steam Prime Movers:* Simple and compound engines of various kinds, including special Nordberg corliss experimental engine; one high pressure B. & W. experimental boiler; one vertical tubular boiler; one horizontal tubular boiler.

3 *Laboratory of Internal Combustion Prime Movers:* Internal combustion engines of industrial, automatic and aeronautic types.

4 *Laboratory of Hydraulic Machines:* Various forms of pumps and water wheels with special facilities for the investigation of problems in power hydraulics.

5 *Laboratory of Aerodynamics:* Special wind tunnel of circular section 7 ft. 6 in. in diameter equipped for wind velocity up to 60 m.p.h. Especially intended for problems relating to air propellers.

6 *Miscellaneous Equipment:* Mechanical refrigerating unit for measuring and testing various quantities in refrigerating problems. One piston air compressor. One turbine air compressor. Apparatus for use in problems of lubrication, bearing friction, etc. Address Prof. W. F. Durand, Leland Stanford Jr. University, Cal.

E—Research Personnel

The purpose of this section of engineering research is to give notes of a personal nature regarding the personnel of various laboratories, methods of procedure for commercial work or notes regarding the conduct of various laboratories.

During the absence of Dr. Van H. Manning, Prof. O. P. Hood of the Bureau of Mines has been Acting Director.

F—Bibliographies

The purpose of this section of engineering research is to inform the profession and especially the members of the A. S. M. E. of bibliographies which have been prepared. These bibliographies have been prepared at the request of members, and where the bibliography is not extensive, this is done at the expense of the Society. For bibliographies of a general nature the Society is prepared to make extensive bibliographies at the expense of the Society on the approval of the Research Committee. After these bibliographies are prepared they are loaned to the person requesting them for a period of one month. Additional copies are prepared which are available for periods of two weeks to members of the A. S. M. E. or to others recommended by members of the A. S. M. E. These bibliographies are on file in the offices of the Society and are to be loaned on request. The bibliographies are prepared by the staff of the Library of the United Engineering Society which is probably the largest Engineering Library in this country.

Welcome-Home Dinner to Herbert Hoover

FEW receptions have expressed the enthusiasm accorded Herbert Hoover during a dinner held at the Waldorf Astoria Hotel on Sept. 16. The grand ball-room was filled to its utmost capacity by some 1200 of his colleagues, members and friends of The American Institute of Mining and Metallurgical Engineers of which Mr. Hoover is a member.

The honor of toastmaster was bestowed upon W. L. Saunders, past president of the society, and in his address of welcome he said, turning to Mr. Hoover: "Here we have the example of an engineer who typifies the modern definition of engineering which is thus written in large letters on the wall of the engineer's library in New York: 'Engineering, the art of organizing and directing men, and controlling forces and materials of nature for the benefit of the human race.'"

In referring to Mr. Hoover's strongest characteristic, capacity to think straight in advance, the toastmaster said: "While Congress was hesitating and amending the Food Act Bill, Hoover was busy organizing every state and territory, even going into counties of each state, so that when the bill was finally passed the machine had been completed and was ready to function. His abiding faith in public opinion is based upon the belief that the people will always support an effort to do that which is right."

Herbert Hoover is a graduate of Stanford University. He first served with the United States Geological Survey, then went to West Australia and China, in mining activities. Shortly after America entered the war Mr. Hoover was summoned to Washington to take charge of the food situation here. The problem was a large one as food demands from Europe were centered upon the United States. His organization in every state and county comprised 8500 men and women, giving their whole time to the Food Administration. In addition to this there were half a million persons registered and ready to be called upon for emergency work. Twelve million families were pledged to support the work. It has been estimated that this administration carried out its functions, 92 per cent by voluntary effort, 7 per cent by persuasion and 1 per cent by legal authority.

"Immediately after the armistice was signed Mr. Hoover was directed to proceed to Europe to investigate the part that America could play in the relief of the civilian population. Though he had but four days before sailing he arranged for the purchase and shipment of 250,000 tons of food. It was not until February of the following year that Congress appropriated one hundred million dollars for European relief. At that time several hundred thousand tons of food-stuffs had been actually distributed. Up to a recent date over three million tons of food-stuffs, valued at over seven hundred and seventy million dollars have been distributed.

Mr. Hoover's speech reviewed his impressions gained since the armistice. He said that as a result of the stupendous social ferment and revolution which has existed, the people of Europe have been attempting to find a solution for their social ills by practical experiments in socialism, resulting in bankrupting the productivity of industrial commodities.

"In the situation which existed in Europe, with its desperation, greed, century-old animosities, its idealistic and proper aspirations, there was only one hope; that hope, expressed by every city and state, was that the American people, being the one disinterested and uncrippled economic and political force, still existing in the world, should again intervene. It was in response to this call that the President, comprehending the real heart of the American people, intervened in Europe a second time and took those steps which resulted in a practical economic organization of Europe pending the consummation of peace and the arrival of the forthcoming harvest.

"I cannot pay enough tribute to all these thousands of Americans, many of them engineers, men taken from the common life of the United States, who were thrust into the face of staggering political economic problems, the solution of which must affect the well-being, not of hundreds, but of millions. The proof of their performance lay in the fact that Europe has come through the most terrible period of its history with no loss of life from economic causes, with a stronger democracy and a glow in its heart for the United States.

"These matters have been brought to a successful close with the arrival of the harvest and the prospect of peace. What the future has a right to demand from us in further economic support is not yet clear, but it is at least certain that if the world cannot quickly secure the settlement of peace and safeguards for the future through the League the whole of our two great interventions in Europe will have gone for nothing, and the menace of reaction will again return against us upon the wings of chaos."

In Russia the majority of their people were comparatively well fed, warmly clothed and housed, but due to their ignorance it was possible to introduce most desperate conditions. "Socialism was brought in overnight at the hands of a small minority of intellectual dilettante and criminals. And this tyranny of minority, more terrible even than the old, has now had nearly two years in which to effect the conversion of the wicked competitive system into the elysium of communism. Two-thirds of the railways and three-fourths of the rolling stock that they control are out of operation. The whole population is without any normal comforts of life and plunged into the most grievous famine of centuries. Her people are dying at the rate of hundreds of thousands monthly from starvation and disease. The capital city has diminished in population from nearly 2,000,000 to less than 600,000. The streets of every city and village have run with the blood of executions. Nor have these executions been confined to the so-called middle and upper classes, for lately the opposition of the workmen and farmers to this regime has brought them also to the firing squad in appalling numbers."

Herbert Hoover

The aims of socialism were thus defeated and in reversing their methods are now trying to summon back the forces of production, for we know that country has ample supplies of food, coal, oil, wood, flax, cottons and metals and the factories with which to work them and that their sole deficiency is human effort.

"My conclusion from all these observations is, therefore, that socialism as a philosophy of possible human application has already bankrupted itself. Bankruptcy of the socialist idea, however, does not relieve us from the necessity of finding a solution to the primary question in the better division of the products of industry and the steady development of higher productivity. The bankruptcy of the socialist idea should, if reaction is to be prevented, return the guardianship of this problem from the radical world to the liberal world of moderate men, working upon the safe foundations of experience."

CORRESPONDENCE

CONTRIBUTIONS to the Correspondence Departments of MECHANICAL ENGINEERING by members of The American Society of Mechanical Engineers are solicited by the Publication Committee. Contributions particularly welcomed are suggestions on Society Affairs, discussions of papers published in this journal, or brief articles of current interest to mechanical engineers.

Theory of Tolerances

To the Editor:

The writer noted with considerable interest an abstract of an article from Le Génie Civil, May 3, 1919, in MECHANICAL ENGINEERING of July 1919, on Theory of Tolerances. This subject has developed in the machine shop and has, up to recently, received comparatively no attention from theoretically-trained men. Mathematicians have played with the theory of probability, but a gap has been left between the mathematicians' results and machine-shop requirements.

Judging from current technical literature, the above-mentioned gap is going to be bridged and great value will result thereby.

The writer disagrees with the methods of analysis on some points used in this article, believing them to be unsound and likely to be very misleading in the initial stages of this subject. The following remarks are, therefore, made for the purpose of correcting these supposed defects and in the hope of encouraging further discussion on this subject.

The probability curve is admittedly the basic starting point. However, it is very necessary that this be applied with a considerable mixture of common sense, for possibly in no branch of mathematics can false steps be so easily made as in the application of probability theory. The psychology of the operator must be kept in mind all the time.

Fig. 14, of the article referred to, shows the result of an asymmetrical system of tolerances but very rarely represents the facts. The physical interpretation is that the operator tried to make all these shafts of diameter a as nearly as possible. Then the inspector chose both a positive and a negative tolerance, but unequal. Surely, if the inspector is going to use unequal positive and negative tolerances, then the operator will be aware of this before he does the work in question. In the interests of economy the operator certainly should be aware of this, and usually always is. This being the case, it is a rational guess that he plays for the mean of the high and low permissible diameters. Briefly, he uses the available tolerance to the best possible advantage. If he does this then Fig. 14 would change so that the axis of symmetry OY will be exactly in the middle of the shaded area, as is the case in Fig. 13. To restate the case, no matter how asymmetric the tolerances might be in respect to the nominal shaft diameter, the operator will interest himself with the limits and this reduces the case to a symmetric one.

In Figs. 18 and 19, it is seen that the controlling factor in stepping from Case 1 to Case 2 is to keep the theoretical play constant. This seems somewhat artificial. From the standpoint of a designer the theoretical play, which is really average play, is not a feature of prime importance. The minimum play is an important feature, as this will measure the risk of seizing; also, the maximum play is an important feature, as this might interfere with accuracy. As to which of these two is the more important depends entirely upon the particular bearing under discussion. It would appear more rational, as a rule, to decide upon a minimum play and then let tolerances be controlled by manufacturing convenience, keeping, of course, the maximum play as small as possible. The writer believes that the complete results of the argument, centering on Figs. 18 and 19, are invalidated due to an artificial hypothesis having been taken.

Figs. 20 and 21, which are used in discussing a comparison between symmetrical and asymmetrical tolerances when the tolerances are suddenly cut in half, are particularly misleading. The following free translation of these diagrams is given in order to bring out the error:

Fig. 20 says that a man is grinding shafts and aiming at a diameter D. Then his results would show variation of diameters represented by the given curve. This is perfectly true provided he made an infinite quantity and it may be taken as true in principle for a small quantity. He makes exactly 50 per cent of these shafts oversize and 50 per cent undersize, as would be expected. The total shaded area, if suitable units be taken, represents the number of shafts ground within tolerance t. Any area under the curve and outside the shaded area represents scrap. The doubly-shaded area, to the same units, represents shafts within tolerance $\frac{1}{2}t$

$$\frac{\text{Shafts within tolerance } \frac{1}{2}t}{\text{Shafts within tolerance } t} = \frac{\text{Doubly-shaded area}}{\text{Total shaded area}}$$

Fig. 21 says that the operator endeavors to make shafts of diameter exactly D but that these are inspected on the basis of a minus tolerance t. Now if this were so, what would be the results? Obviously there would be exactly 50 per cent scrap. Fig. 21 appears to be based on the assumption that the operator does the work in the belief that both plus and minus tolerances are allowable, and then the inspector decides to use only a negative one. The diagram, Fig. 21, is distinctly incorrect. It could be justified only on the assumption of 50 per cent scrap existing, which is clearly an untenable position. Excluding this, then we must assume the operator knew that a negative tolerance only would be permitted. Under these circumstances let us temporarily assume he would endeavor to strike the mean permissible diameter. Then the axis of symmetry OB would be exactly in the middle of the figure where line cC now is. In this case, of course, Figs. 20 and 21 become identical, the results identical, and the whole case that is being pleaded, namely the advantage of the symmetric over the asymmetric system, fades away as the two merge into each other, so far as results are concerned.

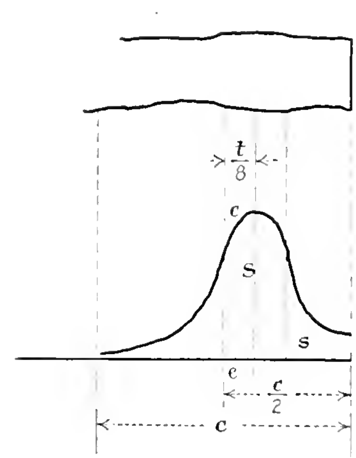

Fig. 1 Average Probability Curve Suggested by the Writer

Actually there are rational arguments for moving the axis of symmetry of the probability curve a little to the right in Fig. 21. An operator who had a perfectly mathematical instinct would attempt to make the diameter exactly the mean of the maximum and minimum permissible diameters. However, there are various psychological traits, which make the operator differ from a perfectly mathematical one. For instance, an operator, who was a high-grade mechanic, might take sufficient pride in his work virtually to reduce the permissible tolerance and try to play more

nearly to the maximum diameter. Probably most of us know from observation that this is usually true, although it is not the soundest business. Furthermore, there is a natural tendency on the part of an operator to play on the big side due to the ever present instinct that he can take off but that he cannot put on. The diagrammatic result of the above two points would be to displace the axis of symmetry of the probability curve somewhat to the right. Just how much depends upon the individual operator. It is probable that an average operator would give a curve similar to the writer's, shown in Fig. 1.

Yours truly,

J. Airey.

East Moline, Ill.

Industrial Relations

To The Editor:

The following quotation is from a paper read before the National Conference of Social Work at Atlantic City on June 2 by Hon. Basil M. Manly who in acting with Hon. Wm. H. Taft as joint chairmen of the National War Labor Board has probably had a better opportunity than anyone else to obtain a correct interpretation of existing conditions with regard to labor conditions and their possible developments.

> We are about to enter a period of the most acute industrial unrest and the most bitter industrial controversy that the American nation has ever known. Unless effective and radical steps are taken to bring about a better understanding between labor and capital and to establish an equitable basis for orderly industrial progress we are certain to see within the next year strikes and mass movements of labor beside which all previous American strikes will pale into insignificance. Those who regard the American industrial situation with complacency ignore both the psychology of the workers and the compelling facts. The workers of the Allied world have been told that they were engaged in a war for democracy; that out of the ruins of war would arise a new and more beautiful world. They are asking now where is that democracy for which they fought. When are we to enter into this new world with its greater regard for the rights of the common man? They see no change for the better but they find themselves in conditions in many respects worse than those against which they protested before they entered the war. The masses of the people are being rapidly disillusioned and when the people lose their illusions there is danger ahead.

Mr. Manly says further that workers now realize more than ever the autocratic control of industry in which the majority of the people of the country are participants and that there can be no real democracy where the people are under autocratic rule during the greater number of their waking hours. So they are fighting for the democracy here that they fought for abroad and they want to have something to say in the control of the management of their affairs. They feel that they are partners in business and they are demanding that they be recognized in that capacity.

Here is a terse and concise statement of facts and a plain warning of what may happen, and what are the members of this Society, many of whom are employers of labor, doing to meet the serious situation thus described as confronting them?

The Committee on Industrial Relations has advised against "establishing a standing committee on relations between employer and employe" and "entering the controversial field of industrial economics as involved in the relationship between employer and employe."

The only constructive suggestion, if it can be so construed, is from a member of the Committee on Aims and Organization who advises the Society that "there should be an awakening that will match and help to head off the stampede of those who are doing things with their hands." And how does he recommend that this shall be done? He says "*if we select the right slogan* the activities of the country will no longer be handicapped by unwise guidance of labor." Now the dictionary says a slogan is "a Scottish war cry" and if we are only to resort to a war cry to bring about the wonderful results prophesied by this committee man, we should have an American one which logically would be an Indian war whoop and "whoop it up" as in the good old pre-war days, and by hiring and firing and lockouts and shut-downs, head off the threatened stampede. Then of course we may expect the workers to come back with their tomahawks raised and we will continue to have each house divided against itself, resulting in the same old inefficiency.

But the way to meet the present discontent is not to assume the right to fire and lockout for that implies the converse right to leave and strike at will and we know now and should have known long ago the cost of labor turnover if we had given the thought we should have to the psychology of the workers and to industrial economics. And we are too apt to forget our responsibility to the community to whom we commit those whom we fire and lockout and which has to bear the expense of our inefficient management.

What is necessary is for employer and employe to get together and drop these strong-arm methods and work for their own and the community's welfare. Democratic methods have been working satisfactorily in so many industrial plants and for so long a time that there can be no excuse for the continuance of autocratic methods by employers. I do not know of any plant in which democratic methods have been properly introduced and maintained where either employer and employe would think of reverting to what existed previously.

The Government through the War Labor Board has recommended employes' representation in management in more than one hundred plants doing work for the Government. The War Department is now introducing these democratic methods in the Arsenals. The employes' representatives in the Rock Island Arsenal have stated in a report to Secretary of War Baker that a condition of antagonism and distrust had developed owing to the autocratic methods long existing but that since the employes have their shop committees "they no longer feel like mere employes, simply bent on holding down a job quite apart from their conception of life, for no other purpose than the earning of wages, the only crude means available to them for securing the necessaries and perhaps a little of the better things of life. They are beginning to see that they are on their way towards becoming partners in a large enterprise." Whereas, before the introduction of democratic methods they not only refused to have the Taylor system of Scientific Management introduced but deliberately restricted production, they now ask for technical experts to help them and say that under the new spirit dominating the men "a spontaneous efficiency is in the making which we sincerely feel will before long produce records of production that will make the most ardent Taylor system advocate envious. And this will all be because the employes want to produce not because they are obliged to do so." There is all the difference in the world between volition and compulsion, the will to do and enforced obedience. The new spirit is cutting cost in half now. What will it do under the willing guidance of technical experts?

Secretary Baker verifies these statements and says that the committees which the employes have formed are coöperative with the management who thereby have lost no control which they cannot yield as they are held responsible by the Government for results.

It has been asked how great a part shall the workers be granted control in industry. They should be granted all the control that they are capable and competent to exercise. They will not want more for they are human beings and are looking out for their own interests which are involved in the success of the enterprise. Already in many of the plants in which democratic methods are installed, including the Government arsenals, the foremen are elected and so become leaders instead of drivers. In some other plants the workers are represented in the Board of Directors. The employes should be considered as partners and so treated. They should be taken into confidence and authority and responsibility apportioned where it properly belongs, a square deal and fair play should be the principles adopted and no slogan can take their place.

When these democratic principles are properly operating the employe works with increased efficiency and the cost of product is thereby reduced. The greater profits which accrue are then divided equitably between the employer in increased dividends, the employe in higher wages and the public in lower costs. Thus the three partners in business coöperate. How many employer

members of the Society are doing their part to lower the cost of living in this manner?

It seems to me that it is high time that the members of this Society who are both engineers and employers and therefore well qualified to analyze the problems inherent in the situation, if we expect to be recognized as taking an active, even if not a leading part, in the large and important questions of the day affecting the public welfare, should do something more than have qualified speakers talk at meetings as the committee recommends. We have had enough talk on the subject and gotten nowhere. Now we should have a standing Committee authorized to do something definite.

H. F. J. Porter.

New York, N. Y.

WORK OF THE BOILER CODE COMMITTEE

The Boiler Code Committee meets monthly for the purpose of considering communications relative to the Boiler Code. Any one desiring information as to the application of the Code is requested to communicate with the Secretary of the Committee, Mr. C. W. Obert, 29 West 39th St., New York City.

The procedure of the Committee in handling the cases is as follows: All inquiries must be in written form before they are accepted for consideration. Copies are sent by the Secretary of the Committee to all of the members of the Committee. The interpretation, in the form of a reply, is then prepared by the Committee and passed upon at a regular meeting of the Committee. This interpretation is later submitted to the Council of the Society for approval, after which it is issued to the inquirer and simultaneously published in Mechanical Engineering, in order that any one interested may readily secure the latest information concerning the interpretation.

Below are given the interpretations of the Committee in Cases Nos. 240-246, inclusive, as formulated at the meeting of June 27, 1919, and approved by the Council. In this report, as previously, the names of inquirers have been omitted.

Case No. 240

Inquiry: Is it necessary under the rules of the Boiler Code to use an internal feedwater delivery pipe in the boiler of a traction engine, and also if such internal delivery pipe be omitted, is it necessary to use a boiler bushing?

Reply: Neither the boiler bushing nor internal feed pipe is required for boilers of the locomotive type, as will be observed by reference to Par. 315 of the Boiler Code.

Case No. 241

Inquiry: Are we correct in our understanding that under the requirements of Part 1, Section 2, of the Boiler Code:

a There are no restrictions as to the manner of making rivet holes?

b There are no particular requirements as to the method of suspending the boiler?

c A manufacturers' Data Report is not required?

d An inspector's affidavit is not required by Par. 373, if the manufacturer should furnish a data report?

e We have the right to stamp a heating boiler which conforms to the requirements of the Boiler Code with an A.S.M.E. Stamp without having a state inspector present?

Reply: *a* and *b* Your understanding is correct.

c Your understanding is correct as far as the requirements of the A.S.M.E. Boiler Code are concerned, but the actual requirements in any particular locality in regard to this will, of course, depend upon the local laws governing boiler construction there.

d The requirement for the inspector's affidavit on a Data Report, if furnished, will depend on the laws of the localities where Manufacturers' Data Reports are required.

e Under Par. 377 of the Boiler Code, it is permissible to mark all heating boilers built according to the Code Rules with the designation "A.S.M.E. Standard." In regard to the feature of inspection, this will also depend entirely on the laws of the locality in which the boiler is to be installed.

Case No. 242

Inquiry: Is it permissible under the requirements of the Boiler Code to use "marine steel" in lieu of firebox steel for a boiler to be stamped A.S.M.E. Code standard, if the marine steel has chemical and physical properties very similar to those required for Boiler Code material?

Reply: If the "marine steel" will conform in all respects to the specifications for boiler plate steel given in the Boiler Code, and is re-stamped by the manufacturer in the way specified in the Code, it may be employed in the construction of Code boilers

Case No. 243

(In the hands of the Committee)

Case No. 244

(In the hands of the Committee)

Case No. 245

Inquiry: Is it permissible under the requirements of the Boiler Code to close up handhole openings in a boiler by the use of oval plates slightly larger than the handhole openings, placed inside and welded tight against the opening by the electric welding process?

Reply: If the plate which is placed on the inside of the opening is as strong as would be employed in the cap of a handhole fitting, or the like, which would not be welded to the boiler, there is nothing in the Code to prohibit the construction described except where the temperature of the gases striking the surface would limit the allowable thickness of the material. This is in accordance with Par. 186, which specifies that autogenous welding may be used in boilers in cases where the strain is carried by other construction which conforms to the requirements of the Code and where the safety of the structure is not dependent upon the strength of the weld.

Case No. 246

Inquiry: Will low-pressure heating boilers of the double, return-tubular type, with all joints welded instead of riveted, but which are built for heating service only, comply with the Rules of the Boiler Code? It is pointed out that the electric process of welding is used in this construction throughout and advised that all the boilers built in this manner have been operated for low pressure heating service (not exceeding 15 lb.), and that no trouble has ever resulted with them.

Reply: When the heating boiler section of the Code was formulated, welded joints were not considered for heating boilers. In general, the Code Committee does not approve of autogenous welding for any joint subject to tension (see Par. 186). This matter of welding joints for heating boilers is being referred to the Sub-committee on Heating Boilers and to the Sub-committee on Welding of the Boiler Code Committee.

According to the *Scale Journal* of July, 1919, the Pennsylvania Railroad has just completed one of the largest engines, and possibly the heaviest, ever built. The engine alone, without the tender, weighs 610,000 lb. As the engine is longer than the scale at Harrisburg, Pa., upon which it was weighed, its total weight was placed on the scale by means of jacking up the pilot wheels clear of the track and chaining them to the frame, thereby hanging them from the engine frame; thus, the total load of the engine was on the scale.

ENGINEERING SURVEY

A Review of Progress and Attainment in Mechanical Engineering and Related Fields, as Gathered from Current Technical Periodicals and Other Sources

SUBJECTS OF THIS MONTH'S ABSTRACTS

AERONAUTICS

Engine Designed to Operate at High Altitudes

The Napier Lion Aircraft Engine. Description of an engine very unusual in several respects. In the first place, it is unique in being the only example of its type which has been accepted by the Air Ministry as a "program" engine in that it is of the triple-four type, being of three rows of four cylinders each.

Next, it is lighter per horsepower than any water-cooled aero engine yet produced [a statement, which, however, has to be qualified by the fact that it is by no means certain what rating an engine of this type should be given, as will be evident from what follows].

The relation of the three rows of cylinders may be understood from Fig. 1 which gives a section through the timing gears. The engine was originally designed for work at high altitudes. The initial specifications of the Air Ministry required an engine at full throttle at a height of 10,000 ft. only, and to give at that altitude not less than 300 hp. These requirements have been amended to read that the engine would not be expected to run at full throttle at ground level.

The three rows of cylinders are at an angle of 60 deg. between the rows, which gives a short though fairly broad engine. Four overhead valves per cylinder are fitted and are operated by two overhead camshafts per row of cylinder. The cylinder blocks are built up of a single casting, forming the head for the four cylinders into which are secured separate steel barrels with water jackets made up of thin sheet steel. The crankshaft is a simple four-throw type mounted on roller bearings with a reduction gear between it and the propeller hub of simple spur type.

The inlet valves are of phosphor bronze and the outlet and exhaust valves of steel. Separate valve seats are used and the makers state that they have not expressed any trouble with them, while, on the other hand, the flanged valve seats form a convenient method of fastening the cylinder barrels and heads together. The writer criticizes this arrangement claiming that it makes the construction inaccessible and the removal of a valve difficult.

An interesting problem came up in connection with the connecting rod assembly. In this type of engine three connecting rods work on to a common crankpin and the method adopted (Fig. 2) has been to use a central master rod on each side of which is mounted an articulated rod carried on wrist pins fixed in lugs integral with the big end of the master rod.

The most remarkable part about the engine is the arrangement made for permitting it to run at high power at extremely high altitudes.

[The engine is really what might be called an "undercharged" engine (as opposed to the conventional idea of a supercharged engine) in that it has been designed to operate at an air density lower than the atmospheric.

The compression ratio is 5.55 to 1, which is an exceedingly high figure, but the engine is not designed to operate at full throttle at sea level but only at high altitudes. Therefore, notwithstanding the very high compression ratio the actual compression pressures at which the engine operates do not differ materially from those at which engines of conventional design operate at sea level.

This required, of course, great care and skill in design but the result is an engine with which a ceiling of more than 30,000 ft. has been reached.]

Fig. 4 is of interest as it gives the average power curve of the engine based on official tests taken over a number of engines at ground level and corrected for the barometric reading. The weight of the engine complete without water, fuel or oil is approximately 840 lb. and the gross weight of the engine in running order but without fuel and oil is 1132 lb. With fuel and oil for six hours it weighs 2671 lb. The engine is of 5.5-in. bore and $5\frac{1}{8}$-in. stroke, giving a total volume of the engine of 1461 cu. in., and a normal piston speed of 1708 ft. per min. (*The Automobile Engineer*, vol. 9, no. 129, August 1919, pp. 250-258, 29 figs., *d*)

BLAST FURNACES (See Gas Engineering)

ENGINEERING MATERIALS (See Heat Treatment)

FUELS AND FIRING

By-Product Recovery from Coal in Power Plants Practically Paying for Fuel

Low-Temperature Distillation of Coal, C. M. Garland, Mem.Am.Soc.M.E. An article which makes claims deserving the most careful consideration. Among other things, that for power plants with constant load burning over 50 tons of coal per day a combination of the low-temperature process with the by-product gas producer to recover ammonium sulphate improves economy to such an extent that the by-products pay for the coal, the overhead and operating expense, while the gas containing about 70 per cent of the heat in the coal and burning at higher efficiency is available for fuel under the boilers or for direct use in gas engines.

Low-temperature distillation is carried out in closed retorts at temperatures ranging from 700 to 1200 deg. fahr. The coke produced is much softer than in high-temperature distillation, but it has sufficient mechanical strength for all practical purposes, permits the maintenance of a fuel bed under low draft and burns without smoke notwithstanding the fact that it has from 3 to 18 per cent of volatile remaining in it. It is, however, not suitable for metallurgical operations.

As regards by-products, from 20 to 30 gal. of tar are produced per ton of coal. This tar contains a high percentage of pitch and free carbon and also a high percentage of tar acids suitable

for wood preservation, as well as low boiling distillates suitable for motor fuel. Investigations indicate that this tar at the present time has a value close to 10 cents per gal. in the crude state.

The temperatures in the low-temperature process are too low to yield much ammonium sulphate. The volume of gas produced is also low and varies from 1000 to 4000 cu. ft. per ton of coal. The gas has a heat value of from 750 to 1000 B.t.u. per cu. ft.

The author briefly describes the processes of Traer, Bostaph, Smith ("Carbocoal"), and G. & L. The essential differences between the processes are, as follows: In the process of Traer and

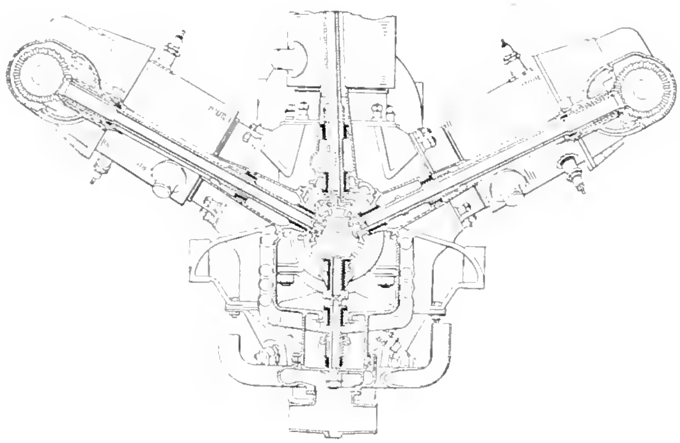

FIG. 1 NAPIER LION AIRCRAFT ENGINE SECTION THROUGH TIMING GEAR

Bostaph the coal is coked in cast iron forms, in the Traed process in a vertical form divided by partitions to produce rectangular slabs of coke about 4 x 12 in. in cross-section by 6 ft. in length. In the Bostaph system the coal is coked in the form of slabs, but these slabs form segments of a cylindrical drum which is provided with a hollow core for drawing off the products of distillation. Furthermore, in the Bostaph process the heat is supplied externally and the products of distillation pass through perforations in the inner wall of the retort to the central core, the idea being that the products of distillation should not come into contact with a higher temperature than from which they are distilled, as such contact may result in the chemical breaking up of the products.

In the carbocoal process the coking is carried out in two stages, the first stage being straight distillation of the coal, which gives a finely divided coke with a high percentage of volatile. This coke is mixed with some pitch and briquetted, the briquets being then subjected to a temperature in the neighborhood of 800 deg. fahr. which cokes the pitch and drives off most of the volatile.

The tar from the low-temperature process yields a large quantity of oil suitable for motor fuel, and it is possible to increase this quantity still further by cracking the tar.

The author believes that ultimately it will be possible to combine this low-temperature process with a by-product recovery gas producer, such as the Mond producer, and recover ammonia in the form of ammonium sulphate.

An important limitation to the application of this system lies in the fact that installations of this character are adapted only to plants using 50 tons or more of coal per 24 hr. and operating continuously 24 hr. per day and preferably every day in the year. On the other hand, it would mean that a plant using as much as 50 tons per day with an ammonium sulphate recovery of 85 lb. per ton of coal would generate power practically at no cost, while a larger plant may even have a small surplus after the disposal of the by-products. (*Power*, vol. 50, no. 7, Aug. 12, 1919, pp. 248-251, 4 figs., *dg*)

FURNACES

USE OF A MODIFIED ROSENHAIN FURNACE FOR THERMAL ANALYSIS, H. Scott and J. R. Freeman, Jr. Rosenhain in 1915 published a description of a furnace for the thermal analysis of metals operating under a new principle. Instead of carrying the temperature of the furnace containing the specimen under investigation, he heated the furnace so as to produce a uniform temperature gradient along its length and moved the specimen through the furnace. The present paper describes in detail some improvements in the design of his furnace and considers certain features of its operation. A simple method of mounting is described which gives highly satisfactory results using specimens of less than 2 grams weight. (*Abstract of Scientific Paper No. 348, U. S. Bureau of Standards, d*)

GAS ENGINEERING

GAS WASHERS, Geo. B. Cramp. The article discusses the general principles of gas-washer construction and operation and suggests a certain design which is claimed to increase the efficiency of gas washers. In order to secure a thorough and efficient wet washing of the blast furnace gas, it is necessary, the author states, to subdivide the gas volume into as small bodies as possible and bring them into intimate and positive contact with as small an amount of water as will clean the gas to the desired limit of dust content without too great a reduction in the temperature of the gas.

Washers having sprays of water directed on baffles between which the gas must pass give a positive contact of gas with water, but their efficiency depends upon a number of conditions, such as uniformity of water, distribution and uniformity of baffle arrangement and area of baffle space. Of these conditions, the first, uniformity of spray, may be considered as satisfied in the modern spray nozzle and it only remains to arrange judiciously the nozzles themselves to secure a uniform distribution of water over any area greater than one nozzle spray can cover. The next point is, therefore, the selection of the baffle shape to be used in the washer. The writer considers several shapes of baffles, such as, straight, angular and wavy (corrugated) and gives preference to this latter type. Corrugated sheet is a commercial shape in general use and can be readily bent without deformation of its corrugations to fit within a cylindrical shell of a gas washer. Furthermore, the corrugations permit the wash water to flow evenly down the entire surfaces of the plates while preventing the gas from travelling in a straight line, and cause it to deviate, eddy, and wind its way between the plates, so as to bring it time after time into contact

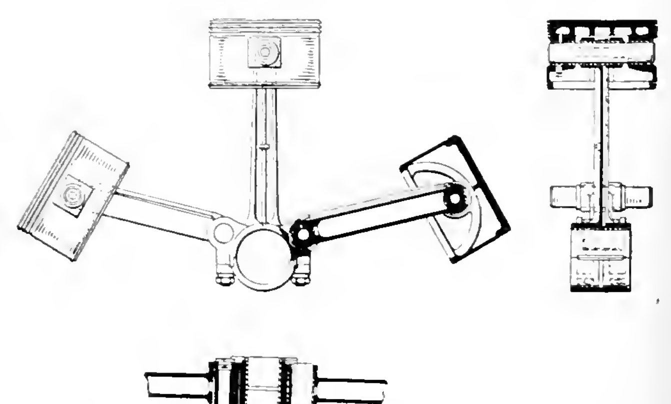

FIG. 2 NAPIER LION AIRCRAFT ENGINE ASSEMBLY OF CONNECTING RODS AND PISTONS

with the perfectly flush surfaces at the baffles and in so doing remove a far greater amount of dust from the gas.

The writer describes in general terms the construction of a washer using corrugated sheets. (*The Blast Furnace and Steel Plant*, vol. 7, no. 9, September 1919, pp. 430-432, 4 figs., *d*)

HEAT TREATMENT

THE HEAT TREATMENT OF DURALUMIN, P. D. Merica, R. G. Waltenberg, and H. Scott. The heat treatment of alloys of the type, duralumin, was investigated and the effect observed of variations in the heat treating conditions, such as quenching

temperature, temperature of quenching bath, and of aging or tempering, and time of aging upon the mechanical properties.

Conclusions were drawn relative to the best conditions for commercial heat-treating practice for this alloy. The temperature of quenching should not be above that of the $CuAl_2$ aluminum eutectic, which is usually about 520 deg. cent., but should be as near to this as possible without danger of eutectic melting. The pieces should be held at this temperature from 10 to 20 min. and quenched preferably in boiling water. The hardening may for most purposes best be produced by aging for about 5 days at 100 deg. cent.

A theory of the mechanism of hardening of duralumin during aging after quenching from higher temperatures was developed which is based upon the decreasing solubility of the compound $CuAl_2$ in solid solution in aluminum with decreasing temperatures from 520 deg. to ordinary temperatures. It is believed that the precipitation of excess $CuAl_2$, which is suppressed by quenching, proceeds during aging, the precipitation taking place in very highly dispersed form. The hardening is due to the formation of this highly dispersed precipitate.

According to this theory the hardening of duralumin during aging or tempering after quenching presents a very close analogy with that of steel, and the evidence in support of the theory is of the same nature and of approximately the same competence as that in support of the prevailing theory of the hardening of steel. (*Abstract of Scientific Paper* No. 347, *U. S. Bureau of Standards*, *t*)

HOISTING MACHINERY

British Standard Crane Developed During War by the Government

A British Crane. Description of the standard crane developed during the war by the Technical Branch of the Directorate of Inland Waterways and Docks. By the end of April 1918 some 200 steam cranes of this type, known as the I. W. D. standard, were completed.

The crane was designed to perform the ordinary work of a traveling crane on the standard British railway gage and to be capabile of easy conversion into a floating, fixed or gantry crane for dock or general purposes. The conversion is effected without alterations to the machinery or ropes by using special jibs and extra balance weights.

The crane is designed to lift loads up to 2½ tons on a single

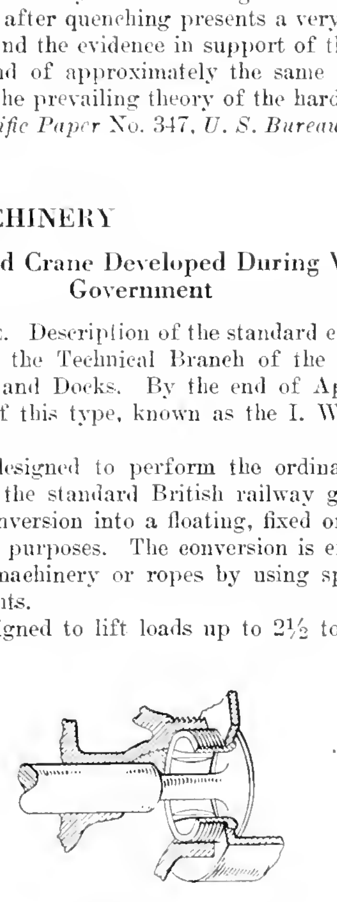

Fig. 3 Napier Lion Aircraft Engine Valve Seating

rope direct off the barrel, greater loads up to 10 tons being dealt with by a block. The lifting barrel accommodates 200 ft. of working rope so that the range of lift is about 200 ft. for the single rope and 2½-ton hook, and 100 ft. and 50 ft. for the 5-ton and 10-ton blocks, respectively.

Figs. 5 and 6 show the general arrangement of the crane and the gear. No rail clips or blocking girders have to be fitted, as the reserve stability is 50 per cent on a level track and the crane is stable backwards with jib removed and coal bunkers and tanks full.

Steam was adopted as the motive power in order to render the crane self-contained and independent of local power. The operating levers are in front of the crane on the left-hand side so that the crane driver has a clear view of his work under all conditions.

The boiler used on these cranes is No. 14 Spencer Hopwood squat pattern water-tube type designed for a working pressure of 100 lb. per sq. in. This type of boiler steams very fast, and as there are only 18 cwt. of water in the boiler, the water level has to be watched very carefully. To avoid fluctuations in the water level the cranes are provided with an independent duplex feed pump, placed on top of the water tank on the right-hand side of the crane. This enables the driver to regulate the speed of the pump to suit the work being performed (the steam valve of the feed pump is fixed to the left-hand side of the boiler). In addition to this an injector is provided as a reserve, the injector

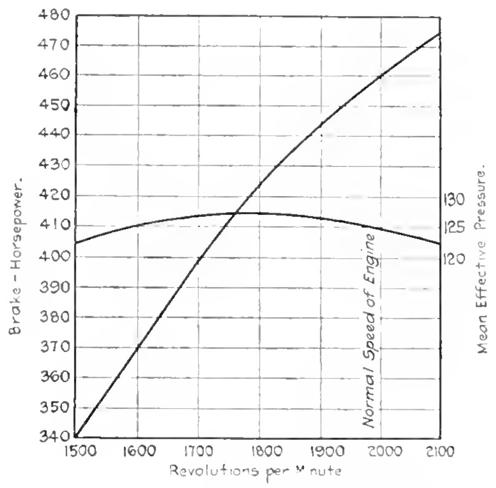

Fig. 4 Napier Lion Aircraft Engine Average Power Curve

steam valve being placed on the right-hand side of the boiler.

A standard design of fire bars was adopted, consisting of four segmental bars around the firebox with single center bars resting on the segmental bars. The use of this design enables the center bars which burn out first to be removed cheaply and easily. (*The Railway Gazette*, vol. 31, no. 7, August 15, 1919, pp. 206-210, 14 figs., *d*)

HYDRAULIC ENGINEERING

New Method for Graphically Representing Water Turbine Performance

Comprehensive Plotting of Water Turbine Characteristics, Karl R. Kennison. The paper presents a chart for the comprehensive plotting of water turbine characteristics intended to enable a manufacturer of waterwheels to show the performance of his turbine under any and all conditions, and also to compare the merits of different turbines and their compliance with specified requirements.

The usual system of representing test performances of a turbine by a series of curves, one for each gate opening used in the test, does not give a sufficiently clear indication of the results that would be obtained at any other gate opening not included in the test, though an engineer who specialized on the subject may be enabled to interpret these curves and fit them to any desired conditions of operation. It is claimed that the method of plotting described here is free from this objection.

Water turbine operation is determined by the following seven variable quantities:

D = rate of diameter in inches
H = head in feet
N = speed in revolutions per minute
P = power output in horsepower
Q = discharge in cubic feet per second
Gate opening
Efficiency

These quantities are interconnected by twelve simultaneous equations which the writer gives. Of these seven variables only six are independent, since power output and discharge are interrelated through efficiency and either of them may be eliminated for the sake of simplicity. Contrary to present practice, the

auth[illegible] eliminates power output and retains discharge capacity.

In deriving his characteristics the writer takes advantage of a fortunate mathematical coincidence, namely, that what he proposes to call specific "r.p.m." or the relation between speed, head and discharge is numerically equal to the "specific speed" currently expressed as the relation between speed, head and power output at the efficiency attained by wheels of good design, namely, 88 per cent.

The characteristics are as follows:

$$\text{Specific Head} = \frac{H \times 10^6}{N^2 D^2}$$

$$\text{Specific discharge} = \frac{Q \times 10^6}{N D^3}$$

$$\text{Specific diameter} = \frac{D H^{1/4}}{Q^{1/2}}$$

$$\text{Specific r.p.m.} = \frac{N Q^{1/2}}{H^{3/4} \times 10^3}$$

MACHINE DESIGN (See Power Plants)

MACHINE TOOLS

Huge Tool Doing Thirty Days' Work in Two Days

Crankshaft Lathe, Ethan Viall, Mem.Am.Soc.M.E. The full title of the article here abstracted is "A Record-Smashing Crankshaft Lathe," a title which is justified both by the design and results secured by the new machine.

The machine was the outcome of the shortage of crankshafts for multiple-cylinder oil engines of large horsepower which existed in the summer of 1917 and was designed by T. K. Webster, of Chicago, previously engaged in manufacturing a single-purpose gun-boring and shell-making machines.

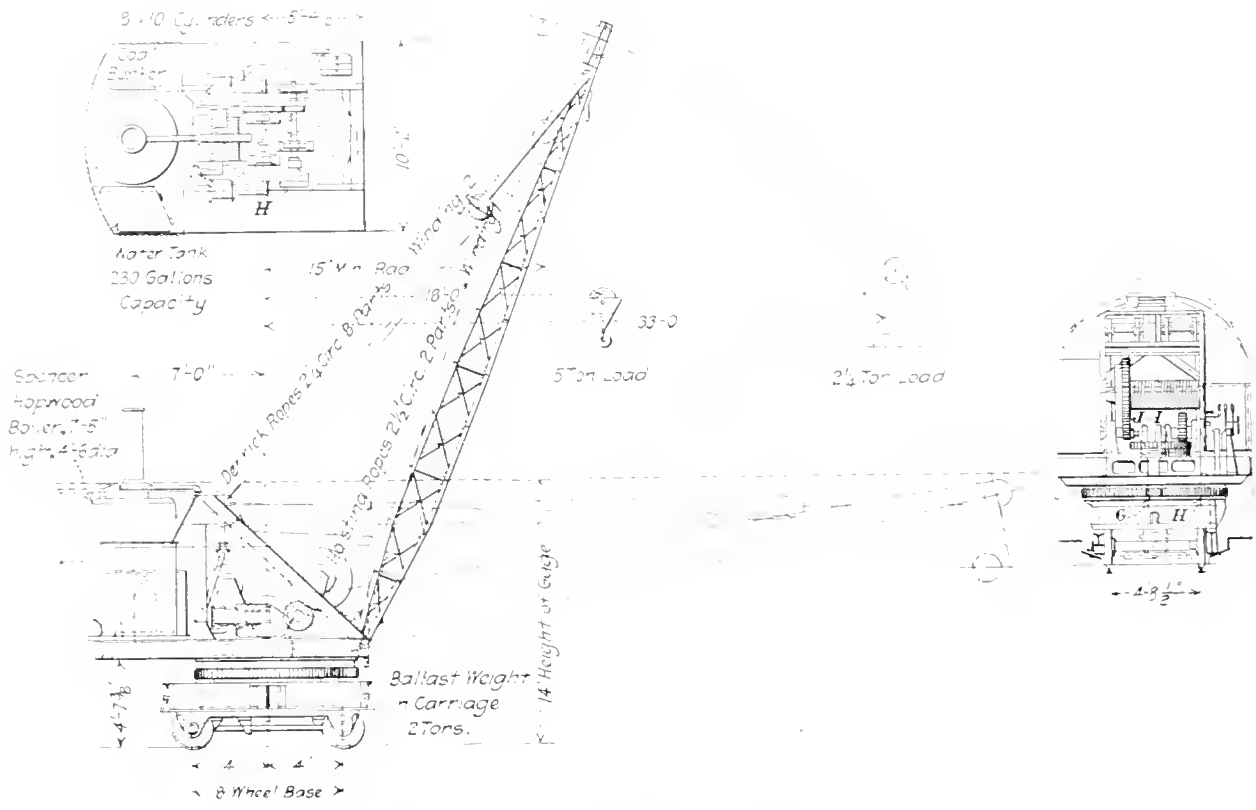

Fig. 5 General Arrangement of British Wartime Standard Steam Crane

The chart is simply a means of plotting efficiency and gate opening in terms of these four fundamental type characteristics.

The vertical and horizontal scales represent the two most important variables, namely, head and discharge, respectively, so that when the characteristic curves are plotted for any type of turbine the available range of head and discharge stand out very clearly.

A logarithmic scale of coordinates is used which permits comparing the range of operation of any two types regardless of their location on the chart. The writer gives several charts for typical water turbines of American manufacturers (inward- and downward-flow type) and describes in detail the method of using the charts. Several charts are given in the original article. (*Proceedings of the American Society of Civil Engineers*, vol. 45, no. 6, August 1919, pp. 475-481 and 3 large charts. *dp*)

HYDRAULIC MACHINERY (See Pumps)

The machine is of very large dimensions and is capable of machining crankshafts of from 7 to 10 in. in diameter and any throw. It machines the sides of the webs and turns the ends of the crankpins on all of the throws at once. Fig. 7 shows that the machine has a main and an auxiliary bed. The main bed is 33 ft. 10 in. long, 50 in. wide and carries two opposing spindles 14 in. in diameter and tool carriages after the manner of a lathe. Each of the opposing spindles is driven through back gears by means of a 20-hp. Triumph variable-speed motor with the range of 400 to 1200 r.p.m., the motors being synchronized by means of a special electrical device so that the drive on each spindle is exactly the same at all times, and no twist is imparted to the crankshaft being machined. Before the crankshaft is placed in the machine it is slabbed out, blanked by drilling and sawing, twisted according to the arrangement of the throws, centered and has the concentric bearings turned in a big lathe. Heavy-flanged driving plates are then shrunk on to each end of the crankshaft and the crankshaft is put into the machine, where it is centered

to run true and the driving plate bolted to the faceplates of the machine at each end.

The turned parts of the crankshaft run in steadyrests *A* (Fig. 8 which shows the machine with the 4-throw crankshaft in place), the bearing of which are babbitted to fit the turned parts. After this is done the crankshaft is ready for the placing of the crank-action tool carriers shown at *D*. These tool carriers have the same stroke and action as the connecting rods of the engine and are made to machine the inside faces of the crank webs and about a quarter of each end and the fillets on the crankpins.

The placing of the tool carriers is an operation requiring expert skill of high order. With the tool carriers all placed and the tools set, the machine is ready for starting. As the crankshaft revolves the two tools *H* and *I* (first tool carrier) in the sliding block are automatically fed forward and machine the inside of the webs and turn down each end of the crankpin. All the other tool carriers act in the same way. At the same time the tools in the carriages at *J* feed straight in and machine the outside faces of the webs.

While in action on the 4-throw crankshaft the machine closely resembles a huge 4-cylinder engine. One of the great advantages claimed for this method of machining is that all the webs and crankpins are machined at once. It would take 30 days to turn a 4-throw crankshaft of the size indicated in the ordinary way and it takes only two days to do the same work on this machine. Furthermore, the tools can be held close up to the cutting point, eliminating the spring, since all the tools are set out the same distance from the tool blocks for a length of throw which improves the final work.

The size of this machine may be well imagined from the fact that it weighs approximately 95 tons. (*American Machinist*, vol. 51, no. 9, August 28, 1919, pp. 395-399, 8 figs., *dA*)

Thread-Cutting Mechanism of a Norwegian Lathe. The following description is given by *Machinery* of an engine now manufactured by Broederne Sundt, Christiania, Norway. The lathe is equipped with two lead-screws for cutting both inch and metric screw threads, and the gearing is so arranged that threads of very coarse pitch, or helical grooves with leads up to 12 in., may be cut, in addition to the usual range of pitches for threads. The headstock, which is the geared type, is so designed that its gear ratios may be utilized in connection with screw cutting, the different gear combinations being used to drive the lead-screw. With this arrangement the total number of pitches obtained in the ordinary way will be multiplied by the number of gear ratios in the headstock. For example, if the lathe is set to cut ½-in. pitch, and the ratio of the gearing between the driving pulley and

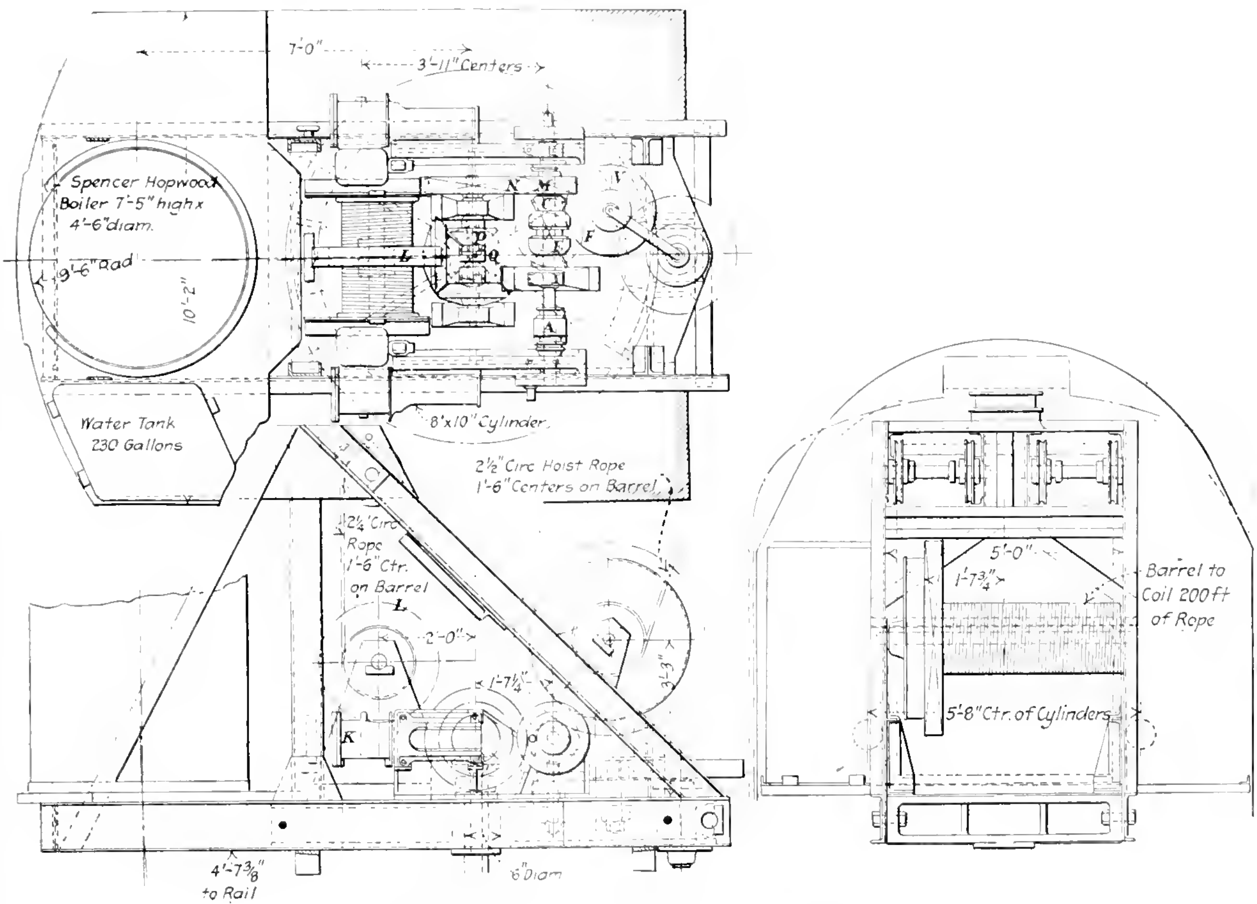

Fig. 6 Arrangement of Gear of the Crane Shown in Fig. 5

spindle at this particular time is 24 to 1, then by turning a handle the pitch may be changed from ½ in. to 12 in.; or if a metric thread of, say, 8-mm. pitch were being cut, the pitch would be changed to 192 mm. ($24 \times 8 = 192$).

The headstock of the lathe has eight different gear ratios, and it is said that the stress on the gearing is not much heavier when cutting the large pitches than when cutting the finer ones. There is one lead-screw for the inch pitches and one for the millimeter pitches. The metric lead-screw also serves as a feed-rod; in fact, it is practically a threaded feed-rod. When used as a feed-rod the threads are not engaged by the nut on the carriage, as there is a keyway which transmits the feed motion worm and spur gearing in the usual manner. The apron has separate nuts for engaging each screw, but they are both operated by the same handle, and only one can be engaged at a time. By means of this additional screw on the feed-rod, metric threads can be cut without using translating gears and by employing the same gearing as for the inch pitches. Both lead-screws run at the same speed, and either one may be disconnected when the other is in use. The inch lead-screw is ¼-in. pitch, and the feed-rod 4-mm pitch; hence, when the lathe is geared for cutting $\frac{1}{16}$-in. pitch, it is also geared for cutting a pitch of 1 mm. with the metric lead-screw.

The change-gear box in connection with one set of spur gears

and the gear ratios of the headstock provide for cutting 342 different pitches, there being 167-in. pitches and 175 millimeter pitches. These different pitches are obtained by shifting the handles or levers and without changing any gear; and if other gears are inserted an entirely different series of 342 pitches may be obtained. The maximum pitch is 12 in. The pitches are divided into a large series and a small series. The latter, which is for general use, is obtained when the lead-screw is driven from the spindle in the usual manner. In the small series there are 37-in. pitches and 37 millimeter pitches. The large series is obtained when the lead-screw is driven from the driving pulley through the headstock gearing.

The lathe may be used for cutting worms intended for worm-wheels based on the module system. (The module of a gear is equal to the pitch diameter in millimeters, divided by the number of gear teeth.) With eleven change-gears, 69 module pitches may be obtained, having a range of from 0.75 to 60.

The cross-feed screw of this lathe is connected to the feed-rod, or metric lead-screw, with gearing, so that spiral grooves may be cut on a plane or flat face; as, for example, when making the scroll of a chuck. There is a fixed ratio between the movement of the cross-slide and that of the carriage. For instance, on one lathe if it is geared for ½-in. pitch with the inch screw, and 8 mm. pitch with the millimeter screw, a spiral of 4 mm. pitch will be obtained, the cross-slide moving half as fast as the carriage when using the metric screw. By means of a special device, the carriage may be moved automatically along the bed while the spindle is stationary. (*Machinery*, vol. 26, no. 1, September 1919, pp. 59, *d*)

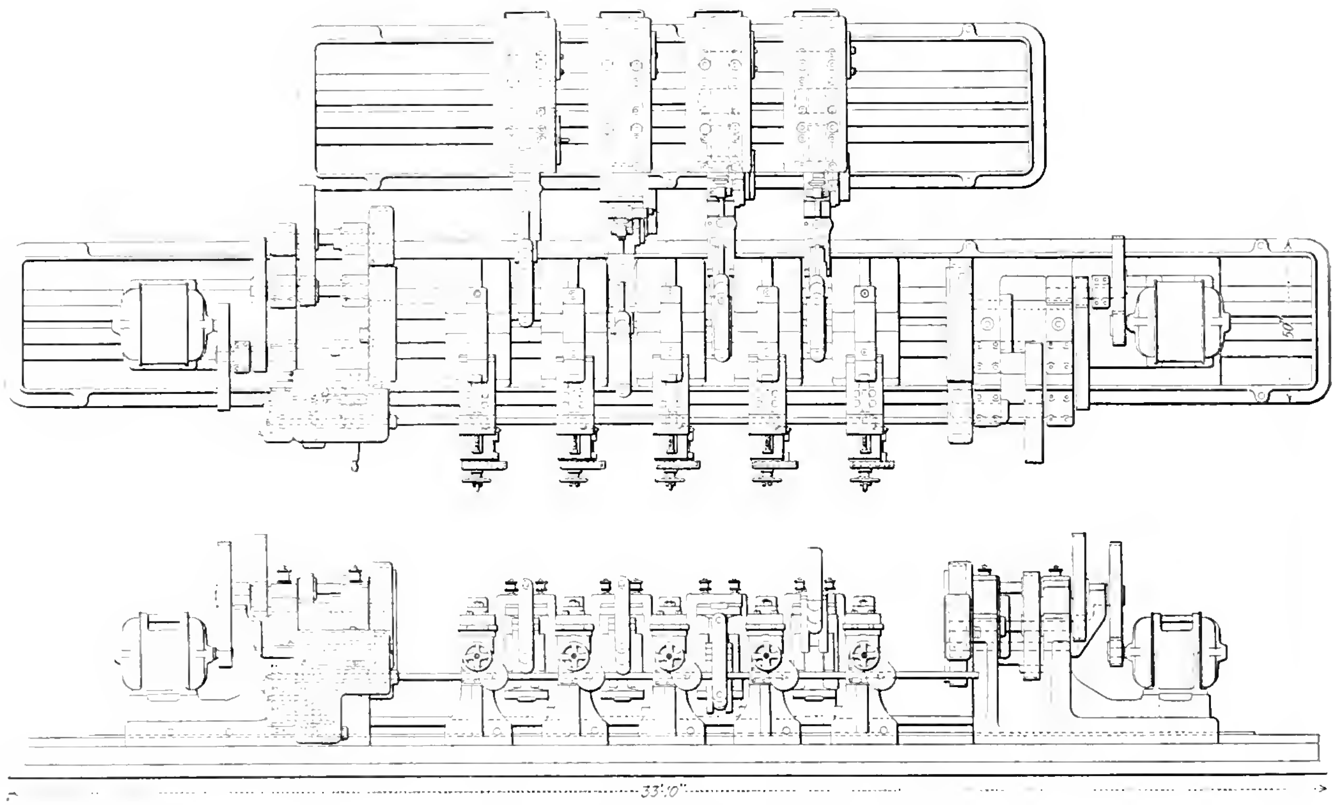

Fig. 7 Details of Crank-Shaft Lathe

MEASUREMENTS AND TESTING

Advance Publication of an Investigation by the U. S. Bureau of Standards

Photoelectric Spectrophotometry by the Null Method, K. S. Gibson. In connection with the color standardization work of the National Bureau of Standards (I. G. Priest, The Work of the National Bureau of Standards on the Establishment of Color Standards and Methods of Color Specifications, Trans. I. E. S. XIII, p. 38, 1918) it is desired to have available a number of independent methods of making spectrophometric determinations, especially in the visible part of the spectrum; for it is generally admitted that the fundamental basis of color specification is spectrophotometry. To supplement the other methods at present in use at the Bureau and especially to overcome the well-known uncertainty of measurements by these other methods in the blue and violet, the author in 1917 was given the problem of developing a method for accurate and convenient photoelectric spectrophotometry suitable for routine determinations. This was especially desirable for the measurement of spectral transmission. The sensitive potassium-hydride photoelectric cells now on the market (made by Kunz) when used with an incandescent lamp and a glassdispersing prism, give a maximum response usually near 460 millimicrons, and are thus very suitable for the purpose. The making and assembling of apparatus was completed in April, 1918; and since that time it has been in continual use, being very satisfactory as to speed of operation, ease of keeping in working condition, and accuracy of measurement.

In the null method as used, two photoelectric cells and the proper batteries are connected in a sort of Wheatstone bridge arrangement (F. H. Richtmyer, Phys. Rev. (2), VI, p. 66, 1915), with the electrometer as the indicator. Radiant energy from a 600-watt Mazda C moving picture lamp, after dispersion through a hilger constant deviation spectrometer, is incident upon one of the photoelectric cells. Radiant energy from a 14-watt Mazda C lamp is incident on the other photoelectric cell. The photoelectric currents generated in the two cells by the radiant energy from the two lamps tend to nullify each other so far as charging the electrometer is concerned; and by proper adjustments, the two currents may be made exactly equal, the zero motions of the spot of light from the electrometer indicating the balanced condition.

Measurements of the spectral transmission of a specimen are made by observing at any desired wave length the distances of the

600-watt lamp from the spectrometer slit necessary to obtain a balance of the electrometer with and without the specimen in position, all other factors such as slit widths, currents, etc., being kept constant. The ratio of the squares of these two distances respectively is the transmission. By this use of the null method all errors are eliminated, as well as the necessity of any kind of calibration, in connection with the relation between photoelectric current and incident radiant power, with the dark currents through the photoelectric cells, and with electrometer deflection methods.

The accuracy has been tested in various ways, chief of which are the measurements of rotating sectors of known transmission and comparisons with values obtained by other methods. It is considered that the uncertainties of values obtained from 410 to 550 millimicrons, inclusive, are not greater than 0.01 for any values of transmission between 0.00 and 1.00 and not greater than 0.003 for transmissions between 0.00 and 0.10. Beyond these wave lengths just given, as far as 390 and 600 millimicrons, inclusive, the uncertainties of measurement are not greatly increased, being at 390 and 600 not more than twice as great as throughout the better range. Measurements can be made from 380 to 650 millimicrons.

The apparatus has also been used for the measurement of spectral diffuse reflection relative to that of a standard such as magnesium carbonate, and is adapted to the measurement of the relative distribution of radiant power of two sources, to the measurement of fluorescence, and to extension into the ultra-violet if quartz parts instead of glass were used. (*Abstract of Scientific Paper* No. 349, *U. S. Bureau of Standards*, *dA*)

MECHANICS

Mathematical Investigation Abstracted from a Japanese Publication

The Stability of Long Struts of Variable Section, Prof. Akimasa Ono. The writer considers the determination of critical loads for long struts of variable section, in particular a long strut fixed at one end and free at the other tapered end. Furthermore, the same calculations may be applied to the case of a strut symmetrically formed about the middle and with tapered ends free to bend, in which case, however, either half of the strut must be taken separately.

The calculation is based on the assumption, as in the deduction of Euler's formula, that the axis of strut is quite straight, the material is homogeneous, the loading takes place without eccentricity and, moreover, the length of the strut is sufficiently long. Next, the cross section is supposed to vary in such a manner that the least moment of inertia is proportional to a certain power of the distance from the free end, where the axial thrust acts on the strut and the corresponding axis of reference lies always in a plane. Then the bending takes place in one plane and the differential equation to the elastic line is of a standard form whose solution can be readily written down. This being done the critical load may be determined with due regard to the end conditions, and the result thus obtained may be applied to find the least volume of struts for the same load and height.

In this connection, the author states that Professor Aichi has also deduced a formula based on the same principle as stated above, but obtained the results expressed in a form different from that obtained by the present writer owing to the difference in the expressions for the root of Bessel's function.

The author obtains the following expression for the critical load on the strut

$$P = \left(1 - \frac{n}{2}\right)^2 z_1^2 \frac{EI_1}{l^2}$$

where P is the end thrust on the strut, E the modulus of elasticity, I_1 is the moment of inertia of cross section, n a numerical constant, l the distance between a plane at which the strut is fixed and the free end, and z_1 is given by

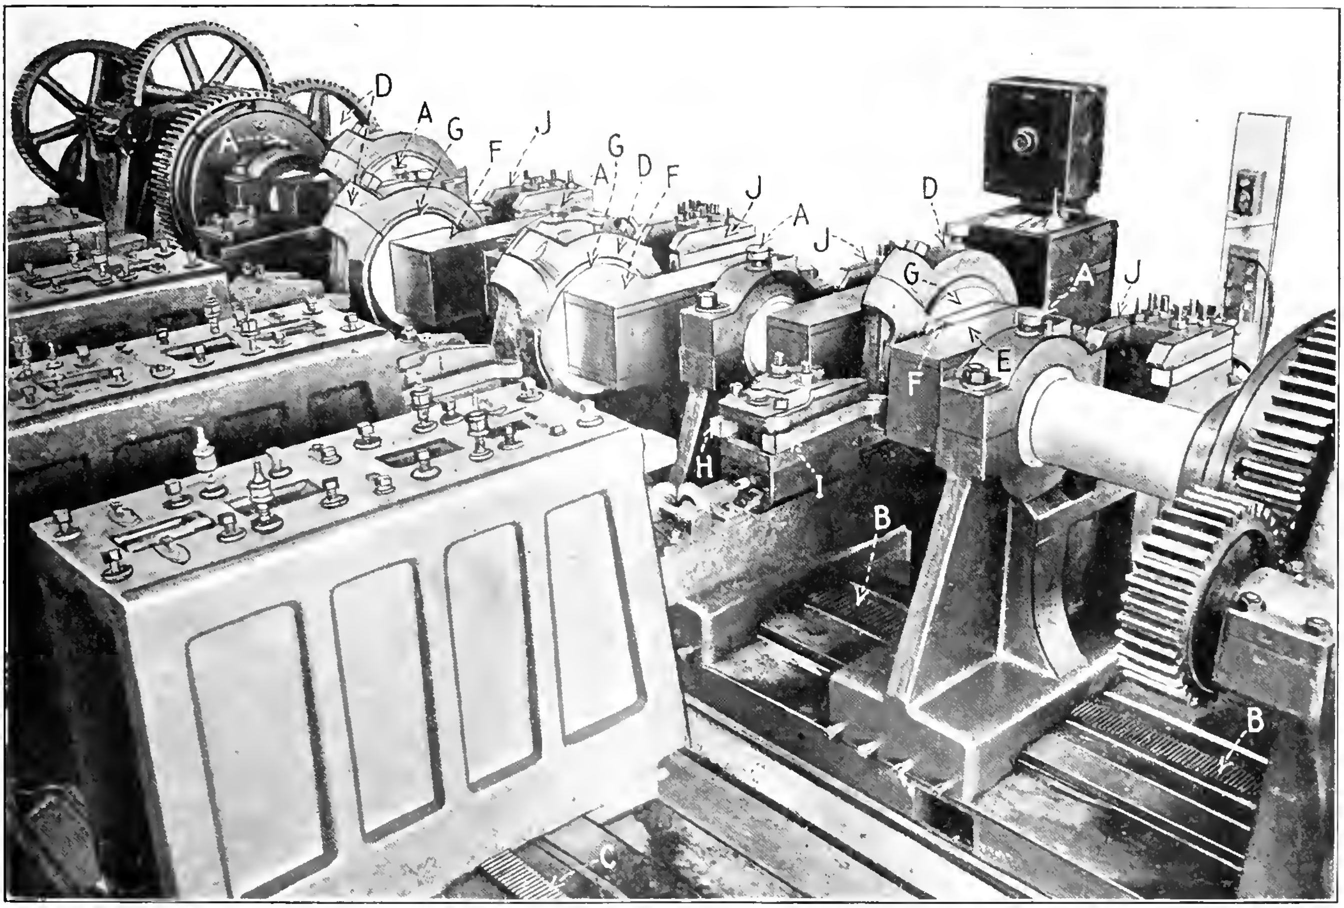

Fig. 8 The Machine with a Large-Crankshaft in Place

$$z = \frac{a^{\frac{1}{2}}}{1-\frac{n}{2}}\, l$$

where a is given by

$$\frac{Pl^n}{EI} = a \text{ (constant)}$$

The author gives a numerical example by means of which he shows the laws of variation of the constants.

He also gives equations expressing the volumes of struts and shows that all other conditions being assumed to be equal, except the form of rods, the volumes of tapered and prismatic struts, V and V_s, respectively, are in the ratio

$$\frac{V}{V_s} = \frac{1}{n+2} \times \frac{\pi}{\sqrt{c}}$$

where both n and c are constants. (In another part of the paper it has been shown that the coefficient c varies in accordance with the certain law with the variation of the coefficient n).

The following summary of the paper is given by the author:

(1) The assumption that the amount of inertia varies as the n-th power of the distance of the section from the free end, leads to the simple formula for the critical load.

(2) For a given rod, whose cross section varies in any assigned manner, the present formula may be used to judge the range, in which the critical load lies.

(3) With proper choice of form, the volume of struts may be reduced to a limit about 13 per cent less than the uniform rod of similar sections for the same load and height.

(4) When $n = 1$, the volume is nearly least, though the tapering is a little over. In this case the stress is a maximum at the distance equal to about one-third of the length of the strut from the tapered end.

(5) An empirical formula may be conveniently used for finding the first root of Bessel's function $J_s(z)$ in a small range of s. (*Memoirs of the College of Engineering, Kyushu Imperial University*, Fukuoka, Japan, vol. 1, no. 5, 1919, pp. 395-406, 4 figs., *mt*)

POWER GENERATION (See Fuels and Firing)

POWER PLANTS

Description of a New Type of Governor for Steam Turbines

PNEUMATIC STEAM TURBINE GOVERNOR. Description of a new type of pneumatic governor designed by the Ridgway Dynamo and Engine Company, of Ridgway, Pa. Air replaces the metal balls or weights as well as the connecting linkage levers, etc., between the centrifugal elements and the valves. It is described in the following manner in an interesting article in *Power*:

Referring to Fig. 9, a small fan impeller A bolted to the end of shaft B is enclosed by the fan housing C and generates an air pressure of about 12 in. of water at 3600 r.p.m. This air pressure acts on the under side of two light aluminum pistons D and E, Fig. 10, forcing them upward. This movement is opposed by the spring F. At the upper end of the piston rod G the lever H operates the pilot valve I, which admits oil to and from the cylinder J, the piston K of which operates the main inlet valves L, M, N, N being an overload valve. The spring O is for the purpose of closing the main valve in case the oil pressure should fail for any reason.

A synchronizing motor P is for adjusting the speed from the switchboard. Q is a worm on the motor shaft and R is a wormwheel which engages with the handwheel S by means of pin T. The speed may, therefore, also be adjusted by hand with the sheel S. An electric contact U is for the purpose of breaking the circuit in case the motor is run too far in either direction.

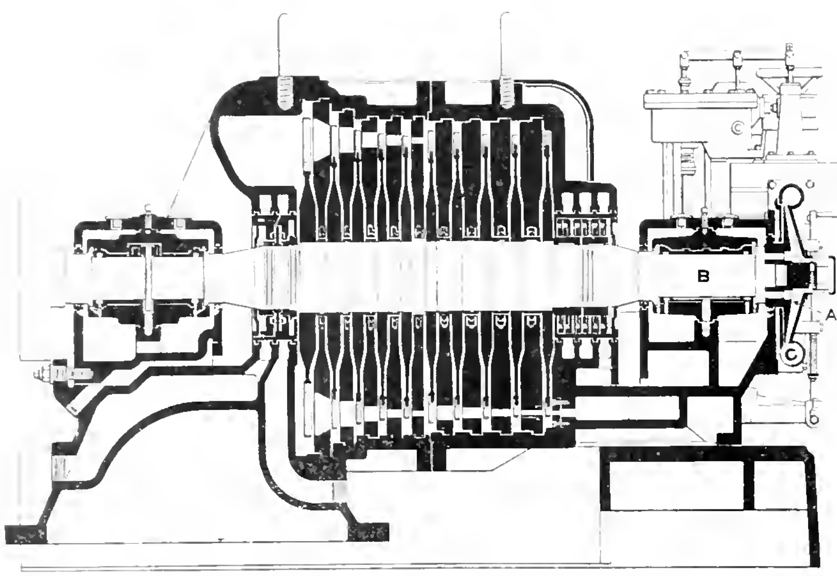

FIG. 9 APPLICATION OF FAN IMPELLER TO THE TURBINE SHAFT

The hub of the fan impeller A has a spring bolt V, for operating the emergency trip. In case of overspeeding this bolt V strikes the hair trigger W, releasing the hammer X, which in turn strikes the main latch Y a blow, releasing the rod Z which, due to the spring A^1 closes the butterfly valve B^1 in the steam line. Handle C^1 is in the form of a loose toggle, the lost motion of which permits some movement of Z before a movement of the bell crank takes place; thus the inertia of Z under movement is used to start the butterfly below the throttle valve.

The pneumatic governor has many advantages. The only running part is a plain disk, with vanes on the side of it, which is bolted to the end of the shaft. Air forms the connecting medium between it and the other moving parts, and these move only on a change of speed due to a change of load. The small pilot valve I and piston K move in oil and should therefore last indefinitely. The governor as a whole is simple and little subject to wear. The only work to be performed by the air pistons is to operate the small $\frac{5}{8}$-in.-diameter pilot valve, which is balanced and floats in oil. The air force on these two pistons is about 150 lb. The pneumatic action is therefore quite powerful and reliable. The air pressure generated by the fan is as the square of the speed, and slight change in speed, therefore, is quick and effective in its action.

Oil is used in the power cylinder J because it acts like an oil dashpot, preventing jumping, overtraveling or hunting of the main valves, and at the same time it insures long life to these parts. Oil for the operation of the governor is supplied from a branch off the oiling system for the bearings. The conditions of atmosphere may slightly change the speed of the turbine, but these are so slight as to be negligible and need not be considered. (*Power*, vol. 50, no. 8, Aug. 19, 1919, pp. 300-301, 2 figs., *d*)

Suggested Standard Form for Reporting Economizer Tests

PERFORMANCE TESTS OF ECONOMIZERS, B. M. Baxter, Mem.Am. Soc.M.E. The author suggests a standard method of making and reporting economizer tests.

The important factors entering into the design of an economizer are the rate of heat transfer from the gases to the water, the draft loss and to some extent the efficiency. The first of these determines the heating surface necessary for the desired results; the second, the arrangement of the heating surface and the amount of free area between the tubes necessary to be provided to avoid undue resistance to the flow of the gases, or expressed in another way, loss of draft; the efficiency affects the performance

in that it determines the percentage of available heat of the gases which can be counted upon to be absorbed by the feedwater. Furthermore, the rate of heat transfer from the gases to the water is materially affected by the velocity of the gases through the economizer. Hence, it is essential that as high velocity of the gases be obtained as the conditions of the installation in question will permit, but the higher the gas velocity the greater the draft loss, and it is in connection with the calculation of draft loss that present knowledge of economizer performance is deficient.

The author suggests the following form for reporting economizer tests:

1 Date of test
2 Type of economizer, parallel flow or staggered tube
3 Length of tubes
4 Number of tubes per section
5 Number of sections
6 Square feet of heating surface, builder's rating
7 Square feet free area between tubes
8 Duration of test in hours
9 Total amount of water passed through economizer
10 Average rate of flow of water through economizer, lb. per hour
11 Average temperature of water entering economizer, deg. fahr.
12 Average temperature of water leaving economizer, deg. fahr.
13 Average temperature rise of water in passing through economizer
14 Average temperature of gases entering economizer, deg. fahr.
15 Average temperature of gases leaving economizer, deg. fahr.
16 Average analysis of gases: carbon dioxide, per cent; carbon monoxide, per cent; excess oxygen, per cent
17 Pounds of flue gas per hour passing through economizer
18 Average velocity of gases through economizer
19 Average draft at entrance to economizer
20 Average draft at exit from economizer
21 Average draft drop through economizer
22 B.t.u. transmitted per hour per sq. ft. of heating surface
23 Mean temperature difference between gases and water
24 B.t.u. transmitted per hour per sq. ft. of heating surface per degree mean-temperature difference (Coefficient of heat transfer)
25 Specific heat of gases (State whether assumed or calculated)
26 Efficiency (Ratio of heat absorbed by water to heat lost by gases)
27 Draft loss per section

PUMPS

Water Pumps of the Drainage Station at Codigoro. Part of an article describing the whole installation. The general construction of the pump appears in Fig. 11. The pump is designed for a delivery of 8000 litres (2113 gallons) per sec. and the rotor is so located that even at the lowest level of the water the pump can be started without priming. The water itself is of an exceedingly corrosive nature attacking both wrought iron and steel. Hence, the use of these materials has been carefully avoided and where inevitable the metal parts were protected by bronze bushings or sleeves.

The weights of the rotating parts of the pump are taken up in starting by a roller bearing located under the crankshaft bearing. During the operation of the pump, however, the load on the roller bearing is entirely taken up by a pressure oil bearing, the construction of which appears from Fig. 12.

The suction and pressure chambers are so proportioned that in each group these chambers may be emptied without thereby affecting the operation of the other groups. For this purpose, protective devices have been installed on the suction chambers so that they could be kept empty during repairs or cleaning. A special centrifugal pump is provided to take care of the emptying of these chambers. (Part of serial article in *Schweizerische Bauzeitung*, vol. 74, no. 3, July 19, 1919, the part abstracted here being on pp. 30-31, 7 figs., *d*)

RAILROAD ENGINEERING

Production of Corrugations on Rail Surfaces. (F. Märtens, *Organ fur die Fortschritte des Eisenbahnwesens*, April 15, 1919). This well-known and troublesome phenomenon is discussed in detail. Faults in rail material and manufacture have their influence, the composition and structure of the steel can either facilitate or hinder corrugation; but the essential causes

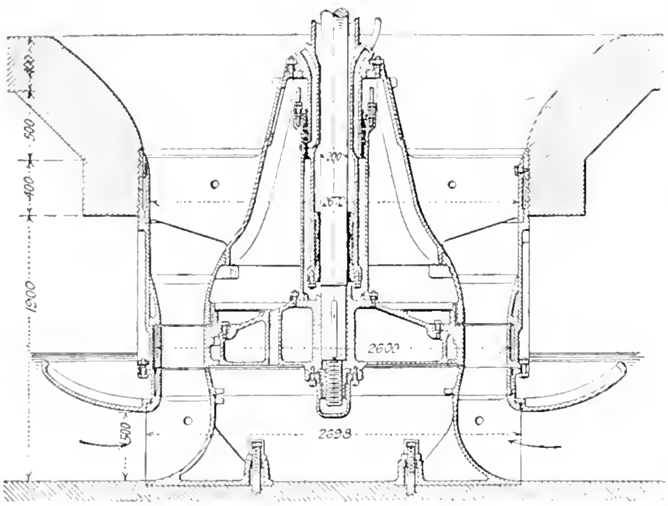

Fig. 11 Cross Section Through the Axial Pump at the Codigoro Drainage Plant

are mechanical, and may be induced by rough surface left on the rail by defective rolling, or on the wheel by excessive lathe vibration during turning.

Especially on hard and non-resilient track, oscillations are set up in running by these causes, which increase with increase of

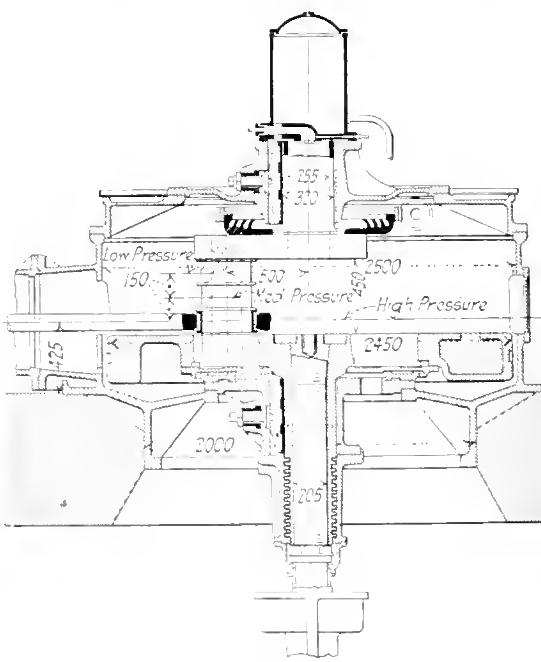

Fig. 12 Section Through the Bearings of the Pump Shown in Fig. 11

speed. Both rail and rolling stock are set in oscillatory motion; the wheel ceases to roll uniformly, and partly slips, partly jumps along the track. The wheel positions constantly alter, transverse axle movement takes place, and friction from side to side as well as in the line of travel takes place upon the rail.

By these forces the original inequalities are hammered flat, and these places become harder than the other parts of the rail, the unequal hardness leading to uneven wear, and the development of further corrugations. Rough-surfaced rails should therefore never be used.

To prevent lateral movement of the wheels on the rails, the causes of which are explained in detail, it is necessary to see that uniform wheel diameter is maintained. It is further recommended to lay the rails with the surrfaces inclined inwards.

The great importance of the condition of the rail joints is insisted upon; the defective joints are fertile initial causes of corrugation.

The influences of braking and speed acceleration are dealt with, and results of the author's observations described.

Corrugation is not so likely to take place at lower speeds and with resilient track.

A number of photographs and a diagram are given, showing the microscopic structure of the steel in the troughs and on the peaks of the corrugations, and the shape and arrangement of the latter.

Remedies are discussed, and the importance is indicated of finding the relation between the rates of pulsation of the rails, trackwork, and rolling stock, so that by alterations of construction these may be made to neutralize each other, when the corrugations will, in time, disappear.

The question of rail joints is dealt with. The vertically interleaved joint would, theoretically, be the ideal one, but in practice such joints have been found to be dangerous through their tendency to open and spread. An improvement in the horizontal type of overlapping joint is suggested as a fruitful line of experiment, though it is admitted that these also have hitherto proved too weak in service.

In spite of the low speeds usual on street tramway lines, corrugation is a frequent and obstinate trouble in these also. The corrugations are usually removed by hand or by special planing machines, but quickly reappear.

Corrugation can only be remedied by an analysis of its causes and the adjustment of these to counteract each other, or by such an improvement in rail material as will defy the action of these causes altogether. (*Technical Supplement to the Review of the Foreign Press*, vol. 4, no. 4, August 19, 1919, p. 122, no. 5857, *t*)

CLASSIFICATION OF ARTICLES

Articles appearing in the Survey are classified as *c* comparative; *d* descriptive; *e* experimental; *g* general; *h* historical; *m* mathematical; *p* practical; *s* statistical; *t* theoretical. Articles of especial merit are rated *A* by the reviewer. Opinions expressed are those of the reviewer, not of the Society.

A triple-motored monoplane of the seaplane type, with twin floats, is being constructed at the Los Angeles factory of the George D. White Company. This monoplane is intended for use in a trans-Pacific voyage from Los Angeles to Shanghai, and will stay at San Francisco, Victoria,, Sitka, Unalaska, Petropavlovsk, and Yokohama, making in all a 7000-mile trip.

The dimensions of the machine are as follows: wing spread 82 ft.; length overall 39 ft.; height to top of fuselage, 9 ft.; weight empty, 3700 lb.; weight with crew and fuel for the Pacific flight, 7900 lb.; total horsepower, 660, generated by three Hispano-Suiza engines. Two 180-hp. engines are located, one on each wing, on each side of the body. The third engine, 300 hp., is installed in the nose of the fuselage as in single-motored aeroplanes.

Either the two 180's or the one 300-hp. engine will be used, but all three are not to be used simultaneously. A speed of 110 miles an hour will be given by the 300-hp. engine. By having approximately the same amount of power in reserve as is being used, it is expected that the possibility of failure will be lessened. At the start the two 180's will be used with the 300-hp. engine in reserve. After running a number of hours the central engine will be switched on and the two smaller engines shut off. This method will be followed throughout the entire flight in order to allow the engines to rest and also to allow the engine expert to make an inspection and the necessary minor adjustments. New spark plugs can be installed, carburetor adjustments made, ignition troubles overcome, or other minor requirements which, under ordinary conditions, mean motor failure and an interrupted flight. From *Aerial Age Weekly*, August 11, 1919.

Recent Work of C. E. Johansson

C. E. Johansson, the Swedish gage manufacturer, whose invention and production of the famous Johansson gage blocks has constituted one of the important steps in the development of interchangeable manufacturing, is now in this country and exhibits some exceedingly interesting measuring and gaging devices of almost unbelievable accuracy. Prominent among these is a set of 11 gage blocks, the opposite surfaces of which Mr. Johansson assures are parallel and accurate within 1/1,000,000 in. In other words, he states, and shows his gages as evidence, that he not only is able to measure to this degree of accuracy, as others have done, but actually to produce surfaces having this remarkable accuracy. These blocks start at 1/10 in. in thickness and increase

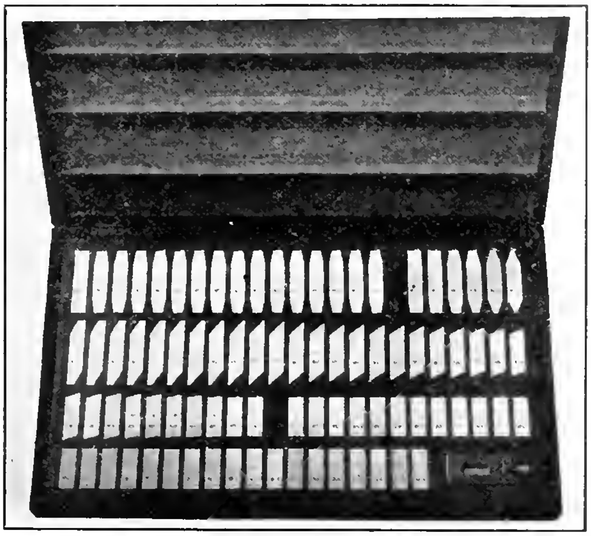

Fig. 1 Set of Angle Gage Blocks

by increments of 0.000001 in. up to a thickness for the last block of 0.00010 in.; that is, the distance between the parallel surfaces of the last block of the series of 11 blocks is only 1/100,000 in. greater than in the first block.

Even more striking is a large set of angle gages shown in Fig. 1. The adjacent edges of the successive gages form angles increasing by increments of one minute until 60 minutes or one degree is reached; after which they increase by increments of one degree up to 90 degrees, thus completing the first quadrant of the circle. A third group then divides the last degree of the quadrant into minutes. By means of these gages any angle can be obtained to a refinement of one minute. By their use, for example, screw threads can be measured on a line parallel with the center line of the screw as well as normal to the screw spiral.

A rigid test of the regular Johansson blocks is made by Mr. Johansson with a new type of micrometer in the screw casing of

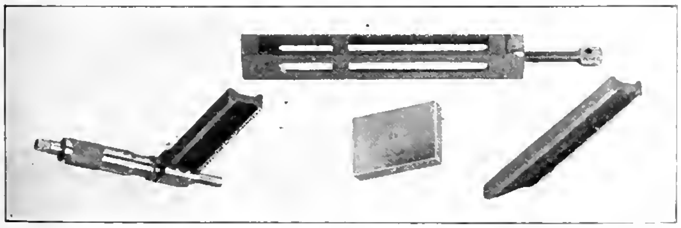

Fig. 2 Parts of Adjustable Micrometer used in Combination with Gage Blocks of Different Sizes

which is a row of standard disks spaced definite distances apart, by means of which the micrometer screw can be set at certain definite distances from the anvil; and when so set the Johansson block corresponding to the reading of the micrometer can easily be slipped between the measuring points and held suspended there by the almost imperceptible friction of the surface. Repeated trials with different blocks and different settings showed not the slightest variation from standard by either blocks or micrometer —truly a remarkable test.

The parts of one of a series of micrometers of another type, in which gage blocks are used to set the instrument for measuring a piece of any desired size, are shown in Fig. 2. There is a holder in which the several parts are clamped and held while measuring. The micrometer head is slipped in at one end and a bar constituting the anvil at the other; while between them is inserted a gage block used as a distance piece against which the two other parts are clamped by the screw at the end of the holder.

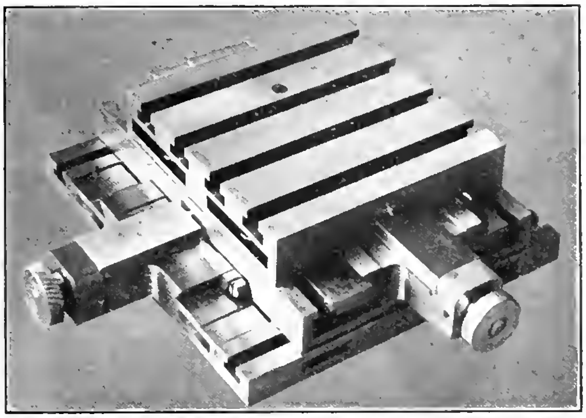

Fig. 3 Compound Dividing Plate used in Combination with Gage Blocks

In Fig. 3 is a compound table or dividing plate for laying out jigs or other work requiring the accurate location of holes or definite points. It will be noted that the table itself is moved either parallel or at right-angles to the slots of the baseplate in the usual way by means of the adjusting screws; but that the location of the plate in either direction is determined by the insertion of gage blocks between fixed surfaces and the edges of the two moving parts of the table. By bringing these edges firmly against the blocks the desired setting is obtained with great precision.

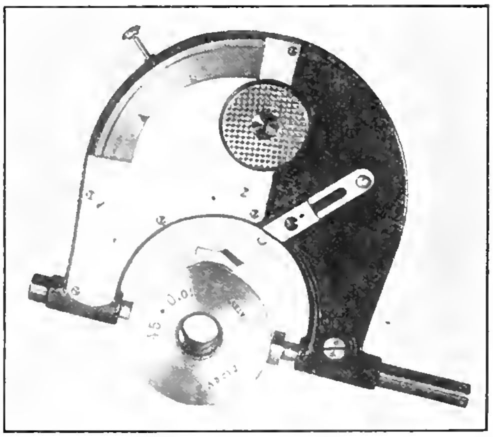

Fig. 4 Rapid-Indicating Snap Gage

In Fig. 4 is a rapid indicating snap gage measuring in minute fractions of a millimeter. The pointer will be seen in the upper left-hand part of the gage, as it appears in the engraving, and after the measurement has been taken and read the pointer is returned to zero, ready for the next reading, by pushing the projecting button seen projecting from the edge of the gage.

Announcement has been made of scholarships in the various universities and colleges in Pennsylvania now available for ex-service men. Special short courses, reduced rates, and loan funds are also being offered, and every effort is being made to assist those who desire a college education.

The printing industry in New York City is threatened with the most serious strike in the history of the industry, to occur October 1. While it is hoped, and by many expected, that matters will be adjusted by the time this number of Mechanical Engineering is issued, the immediate result has been congestion in the printing offices of the city which has caused the omission from this number of certain matter, particularly relating to the work of the Sections for the past year, which otherwise would have appeared. Whether difficulties will be encountered in the publication of the November and subsequent issues yet remains to be seen. This brief announcement, however, is made to our members so that in the event of the strike being called, they will understand that any delays which may occur are unavoidable.

The Annual Meeting

Following the plan of the meetings which have been called during the past few years, there will be a keynote session at the Annual Meeting on the Industrial Situation in Relation to Present Conditions, with papers on several topics, including wage payment, rights of workers, systems for mutual control of industry and profit sharing. This is a continuation in a broader field of the session on Industrial Relations held at the Spring Meeting at Detroit which evoked so great an interest and resulted in a vote by the meeting in favor of continuing the discussion at the time of the Annual Meeting.

There was so great interest at Detroit, also, in the subject of fuels, and particularly pulverized fuel, that the subject will again come up at the Annual Meeting for further discussion. It is proposed, also, to have a session on Appraisal and Valuation Methods.

The Sub-Committees on Machine Shop and Foundry Practice, Textiles and Gas Power are planning sessions. The Foundry Sub-Committee has arranged for papers on castings of various metals and bronzes, and die castings. The Textile Committee will devote its attention this year to education for the textile industries in our technical schools. There will be the usual miscellaneous technical papers.

At this meeting, following as it does the signing of the armistice and the return of our troops from abroad, the tendency will be to deal with subjects which concern the forward movement of the nation and the engineer in the work of building up the industries and putting the nation on a stable basis as regards labor and industrial conditions. At the same time, the past will not be forgotten. There will be the memory of those of the Society who have given their all in the service of the country and the winning of the condition of democracy which all hope may eventually obtain. As a testimony to these, there will be a memorial service with suitable exercises during the period of the meeting.

International Pipe Threads Hearing

The Committee on International Standard for Pipe Threads, of the American Society of Mechanical Engineers, is to hold a public hearing in the Engineering Societies Building, New York, on October 2, 1919, at 10:30 a. m. The Committee is to meet at this time to discuss and prepare resolutions which are to be presented at the next meeting of the Commission for an International Standard Pipe Thread, which is to be held in Paris, November 7th. As it is the desire of this committee and the Society that these resolutions express the opinions and best judgment of the American pipe industries, they will welcome to this meeting representatives of all associations and manufacturers interested in this important branch of engineering.

Final Hearing of National Screw-Thread Commission

The last public hearing in America of the National Screw-Thread Commission on national screw-thread standards will occur on Monday, October 6, 1919, at 10 a. m., in the Engineering Societies Building, New York. The engineering bodies interested and the industries manufacturing and using screws will meet and give full and final consideration to the report. A general invitation is issued to all who are interested to attend, and it is hoped that a large number will be present.

Labor Problem Discussed at New York

Industrial Unrest and the Engineer was the subject discussed at a largely attended meeting of the New York Section of the A. S. M. E., the first to be held this fall, in the Engineering Societies Building on September 17. The speaker of the evening was Dr. William M. Leiserson, formerly Chief, Division of Labor and Administration, Working Conditions Service, U. S. Department of Labor.

The circular of the meeting announced the address as a "straight from the shoulder talk," and the speaker lived up to expectations. He gave an admirable review of labor conditions and difficulties in the very early days in Europe and in this country since the beginning of the last century, showing how these were first allied with religious conditions, second with political conditions and finally, at the present time, with industrial conditions. He made the statement that current labor unrest as evidenced by strikes is not relatively greater than at some other periods in our history, in spite of its present huge proportions and widespread distribution.

He analyzed the various classes of strikes, showing that those which occurred independently of our large organizations are less influential in the labor problem as a whole, even where extreme radicalism is displayed, than well-organized, conservative movements on a large scale, as for example, by the railroad employees of the country. With his historical background as a basis, he discussed causes and possible remedies of our industrial unrest in which he emphasized the need for consideration of the public welfare rather than of class interests.

In referring to unions of municipal and federal employees, he said that undoubtedly the American public was not willing to sanction their affiliation with a central body like the A. F. of L., but that he persoanlly could see no serious objection to such affiliation. This remark gave the cue to the first speaker on the

list to discuss the address, Mr. Richard H. Rice, Acting Manager of the General Electric Company's plant at West Lynn, Mass. Mr. Rice said he had just come from Boston and knew what the conditions were because of the police strike there, and that he was unalterably opposed to any division of allegiance on the part of public employees, to which the audience responded with unqualified cheers of approval.

During the discussion, a report was presented by the New York Committee in charge of this meeting, which contended that the engineer is the only one who speaks the language of both the capitalist and the workman, and that out of his ranks must come the remedy—a remedy which must be nation-wide in its purpose, as have been the solutions of past crises in this country, such as that of taxation without representation during the Revolutionary War, and preservation of the union during the Civil War.

The discussion lasted until well past twelve o'clock, at which time, fortunately, the chairman was obliged to catch his last train for home and closed the meeting; but the interest was so great that it was voted unanimously to continue the subject at a later meeting. As a whole, the discussion failed to focus on any definite policy, because of the tendency to emphasize individual experiences and interests, rather than a constructive policy.

Joint Mid-Section Meeting

Eight Sections to Participate in Two-Day Session at Indianapolis—October 24-25

The Indianapolis Section has invited the Sections at Birmingham, Chicago, Cincinnati, Cleveland, Detroit, Milwaukee, and St. Louis to join with it in conducting a two-day session on Friday and Saturday, October 24 and 25.

The program is being developed along the following outline:

Headquarters—Claypool Hotel

Friday, October 24

9:00 a.m.	Registration Hotel Claypool
10:00 a.m.	Council Meeting
10:00 a.m.	Meeting of Several Committees
10:00 a.m.	Visit to Indianapolis Industries
12:30 p.m.	Luncheon—Claypool Hotel
2:00 p.m.	Professional Session on "Industrial Unrest"
6:30 p.m.	Banquet and Entertainment at Claypool Hotel

Saturday, October 25

9:30 a.m.	Professional Session on "Research"
9:30 a.m.	Visit to Indianapolis Industries
12:00 m.	Automobile Trip to various interesting points about the City
1:00 p.m.	Canoe Club for luncheon, continuing trip thereafter until 4:30 p.m.

Sunday, October 26

For those remaining over Sunday an automobile trip to Turkey Run or Wyandotte Cave has been proposed.

Quarterly Joint Sections Meetings

This meeting is being planned with an aim to secure two such Quarterly meetings to be held alternately with the Annual and Semi-Annual (or Spring) meetings. The Indianapolis meeting will compare favorably with the recent Spring Meetings of the Society and warrants the attendance of a large representation of the membership. The central location of Indianapolis should secure a registration of one thousand members and their friends. Members should advise the Secretary of the Society of the names and addresses of any engineers whom they would like to have formally invited.

Every member of the Society is, of course, expected to attend this meeting, and those who avail themselves of the opportunity are assured a meeting which will be enjoyed by all, and which will be good and lively throughout the entire two days. The many attractions of Indianapolis will add to the interest.

Ninth Volume of Condensed Catalogues

The ninth annual volume of The American Society of Mechanical Engineers' Condensed Catalogues of Mechanical Equipment, with General Classified Directory and Engineering Data Section, is now being printed and will be ready for distribution on October first if conditions in the printing trade remain normal.

It is with much pleasure that the Society records the continued satisfactory development of this volume. Five hundred and five firms are this year represented by publication of catalogue data, as against four hundred and fifteen last year.

There are six hundred and sixty-nine catalogue pages, and the general Mechanical Equipment Directory, in which all eligible manufacturers are entitled to listing of their products free of charge, within reasonable limits, has been further extended this year.

The Engineering Data Section is continued and contains the current data from the Society's publications, the Transactions and Mechanical Engineering, as well as other useful information concerning the standards issued by the Society, and a list of papers published in the Transactions since the beginning of the Society's activities.

To the Members of the American Society of Mechanical Engineers

A committee has been organized to assist in securing employment for blind and other disabled soldiers and sailors who have been specially trained for useful pursuits by the Red Cross Institute for the Blind at Baltimore. The Institute is educating the blind soldiers along certain definite lines, so as to train them in trades and occupations, and thus enable them to become useful and self-supporting members of the industrial community. In time this service will be extended to include blind civilians as well as soldiers and sailors.

Individuals so trained will be competent to take their appropriate places in industry, and will in no sense be subjects for charity. They will only ask that they be given equal opportunities with those not so handicapped.

Now is the time to inaugurate a movement looking toward the teaching and employment, not only of disabled soldiers, but also of crippled civilians. To train and use men and women, who from one cause or another have been partially disabled, will be an economic gain, as well as a social duty, and will add a valuable asset to our national ledger.

The committee appeals to you, as a member of this Society and as employers of labor, to lend your assistance in this important work by studying the problem as it affects your establishment, by finding employment for such disabled workers as may come to you and by endeavoring to develop a sympathetic attitude in your community.

We further hope that you will give suitable publicity to the work being done by the American Red Cross for the blind soldiers, sailors, and marines. News items and editorial comment in your local papers will help in this. The Red Cross Institute will gladly furnish any needful information.

May we not count on you to give this subject earnest consideration and to assist the committee by your coöperation and by such counsel as your experience dictates? The committee will appreciate any response which you may see fit to give.

C. H. Benjamin,
Chairman, Committee on Rehabilitation of the Blind.

That the Blind May See and Work

In the above letter Dean C. H. Benjamin, Chairman of the A. S. M. E. Committee for the Rehabilitation of the Blind, makes an appeal to engineers to provide employment for the blind men of the army who have been trained for useful service at the Red Cross Institute at Baltimore.

It is gratifying to know at the outset that the number of the young men of the A. E. F. who lost their eyesight in the war is no greater than one hundred and twenty-five; and it is also gratifying to know that their training is under the direction of an en-

gineer, Mr. L. W. Wallace, a member of this Society, who is combining his knowledge of the industries with his qualifications as a teacher and as an engineer to give the soldiers a practical training of such a character that they may become capable wage earners. Mr. Wallace is conducting this work with enthusiasm, in full confidence of its successful outcome.

The men receive four distinct lines of training: (1) preparatory, (2) vocational, (3) in avocations, and (4) in recreation. All the men learn Braille, typewriting, English and self-expression and parliamentary law so that they may keep informed and be able to convey their ideas correctly and effectively by the written and spoken word. They learn the usual occupations taught to blind people, such as playing musical instruments, weaving, basketry, carpentry, etc., only to give the men a pastime. Their vocational work is much more serious and important. A careful study has been made of many of the operations in the industries to determine which of these can be performed without the use of the eyesight. For example, it has been found that certain operations in the manufacture of automobile tires, on the inside of the tire, can be done by the blind, and a group of blind men are expected to find employment in the works of the Goodyear Rubber Co. under the direction of a blind lieutenant who is already at the plant making a study of the work.

The training and education of these men of the army, while worthy as a direct accomplishment, has much greater significance than is generally understood. It is aimed to make the Institute a permanent institution for training blind civilians of whom there are estimated to be 80,000 in this country alone. If this training of the soldiers by scientific engineering methods is as successful as expected, it will constitute a great inspiration and a bright ray of hope to this great army of peacetime beings, and particularly to the young. All success to this great work which constitutes another example of the varied duties which an engineer may be called upon to perform in the practice of his profession!

Employers Plan National Organization

A national organization of employers, into a body to look out for managerial interests in the United States in the same way that the unions are protecting labor, was launched in Chicago during September by the Illinois Manufacturers' Association.

Charles Piez, Mem.Am.Soc.M.E., formerly with the U. S. Shipping Board, but now returned to the Link Belt Company, has been named as chairman of the committee for organization throughout the country. Other members of the committee are: Alba B. Johnson, president, Baldwin Locomotive Co.; H. H. Merrick, president, Chicago Association of Commerce; Thomas Creigh, Cudahy Packing Co.; and John M. Glenn, secretary, Illinois Manufacturers' Association.

The chief work of the new organization will be to make felt the wishes of the business interests that concern the welfare of the entire nation in Washington. The first steps of the organization committee will be to bring together trade bodies, chambers of commerce, and other groups of business men and impress them with the need of a national organization. Resolutions which deplore the spread of radicalism, urge a return to thrift and industry, and advise that a federation of employers be formed were recently passed by the recent "Our Country First" conference held in Chicago and have been sent out to business organizations all over the United States.

John M. Glenn is the originator of the idea of a national organization. He recently said: "Three million laboring men affiliated with the unions have made themselves heard in Washington. Manufacturers have found this out. This organization will do the same thing for the manufacturers."

Commenting on the situation, Charles Piez said: "Manufacturers are awakening to the fact that they must present their views to Congress collectively, if they are to get what is their due in the way of legislation. Labor has had the advantage while employers have been organized into comparatively small organizations. It must not be inferred that this federation is to be an anti-union body. We are not out to fight anyone. We intend, merely, to look out for the interests of business."

Employers organizations represented on the permanent committee are: Illinois Manufacturers' Association; Minnesota Employers' Association; National Conference of State Manufacturers' Associations; National Association of Manufacturers; Railway Business Association; Mississippi Valley Association; American Institute of Industrial Engineers; Railway Age; Ohio Manufacturers Association, and various associations representing different trades and classes of business.—H. T. L.

President Wilson's Conference on Capital and Labor

As announced in the daily press, President Wilson, before leaving Washington, wrote a letter to the presidents of several national organizations representing labor, farming, and financial interests, calling upon them to select delegates to the Capital and Labor Conference which he has called to meet in Washington on October 6.

The President's letter was addressed to Magnus W. Alexander (Mem.Am.Soc.M.E.), director of the National Industrial Conference Board, Boston; President Samuel Gompers, American Federation of Labor; President William G. Baker, Jr., of the Investment Bankers' Association, Baltimore; President J. H. Tittamore, American Society of Equity, Omro, Wis.; President Oliver Wilson, National Grange, Peoria, Ill.; President C. S. Barrett, National Farmers' Union, Union City, S. D., and President Homer L. Ferguson, Chamber of Commerce of the United States, Newport News, Va.

In his letter the President fixes the representation at the conference as follows: American Federation of Labor, 15; Chamber of Commerce, 5; National Industrial Conference Board, 5; farming organizations, 3; investment bankers, 2; selected by the President, 15. Total, 45.

The President stated the purposes of the conference to be:

1 To canvass every relevant feature of the present industrial situation.

2 To work out coöperatively a practicable method of association based upon real community of interest which will redound to the welfare of all the people.

A copy of the President's letter received by Mr. Magnus W. Alexander, managing director of the National Industrial Conference Board, was transmitted to The American Society of Mechanical Engineers as one of the members of the National Board. This was accompanied by a letter from Mr. Alexander to the Society asking for suggestions of men to nominate to the President, and urging the importance of a definite and constructive program for presentation at the conference at Washington. At the time of going to press the selection of names for recommendation is having consideration.

Free Coal?

In the Engineering Survey in this issue is given an abstract of an article in *Power* discussing low-temperature coal distillation. This article makes a statement, apparently well borne out by recent experiences, to the effect that a plant consuming 50 tons of coal or more per day of 24 hrs. and operating on a 24-hr. schedule, can, by adopting the comparatively inexpensive process of low-temperature coal distillation, secure enough by-products to pay for the cost of the raw material (coal) and have enough fuel left for its own use to generate all the power that it needs. Particularly would this be the case if this low-temperature process were combined with that of the by-product gas producer, such as the Mond, whereby ammonium sulphate might be recovered from the coal.

In other words, a plant operating under the above conditions would not only have its fuel free, but would materially conserve the supply of coal for other purposes. If future research and experience shows the process to be practicable, it is an extremely important development from two points of view.

In the first place, the majority of our public service utilities belong to the class of concerns consuming more than 50 tons per

day and operating on a 24-hr. schedule. They also belong to the class of concerns which were hardest hit by the rise in the cost of labor and materials, in particular the cost of fuel, and the result of low-temperature distillation of coal with its attending saving might help them to pass through an unusually bad business contingency.

But even more important is the promise of fuel conservation held out by the new development. What it amounts to really is an improvement of about 100 per cent in the utilization of the resources contained in our coal, and if the installation of a comparatively simple and cheap process may produce such a tremendous saving what greater promises does the near future hold out to us.

Post-Graduate Course in Gasoline Engine Design

The design of gasoline engines for automobiles was a comparatively simple matter. An automobile engine nine times out of ten operates at less than overload and at full load is usually relieved by the use of a gear shaft. If an automobile engine meets a load it cannot handle it stalls and the driver takes it in a friendly spirit.

Moreover, an automobile engine operates under fairly uniform conditions of air pressure and when these conditions change materially, as in taking a car from a sea-level country to high altitudes, special carburetor adjustments for which sufficient time is allowed are considered to be in order and are made without objections.

With the aeroplane engine the case is different. It is many times as powerful as an automobile engine; in fact, as regards power output an aeroplane engine just about starts off where the automobile engine stops. Coupled with this greater power output is the necessity of keeping the weight of the aeroplane engine to the lowest possible limit consistent with safety, which means an immeasurably finer design of every part and a much deeper knowledge of the strains of the parts and the physical properties of the materials used. To a certain extent, however, this disadvantage is counterbalanced by the fact that at least the question of cost did not come in as a material consideration in the design of aeroplane engines.

The aeroplane engine is further supposed to run all the time at or near full load, which, of course, stresses the engine far more than the more leisurely operation of an automobile engine.

A new requirement brought about by the war, and which presented a difficult problem for the engine designer to solve, was to produce an engine capable of delivering a high power output at high altitudes. It was attempted to solve this problem in three ways, the first and most obvious of which was for the flier to carry a supply of oxygen, either as gas compressed in cylinders or in the form of some material having a very high oxygen content. This was the method used by Captain Schroeder at McCook Field, Dayton, Ohio, last summer, in the flights made for the United States Army. The second method was to add another element to the fuel at high altitudes, as in some flights in France, for example, where wood alcohol was used.

The third method was that of direct supercharging, mainly by means of a centrifugal blower operated by a turbine driven by exhaust gases. In this connection some very fine work was done by Professor Rateau in France and Messrs. Sherbondy and Sanford A. Morse, Mem. Am. Soc. M. E., in this country. This method was devised by the British Napier and Sons Company, in their Lion machine. The engine of this machine was really designed to operate at densities far below atmospheric, so that if operated at atmospheric density at full throttle for any length of time it would probably fly to pieces. By a skillful proportioning of parts, however, the engine has been designed so that it can operate at ground level at part throttle, but develops its full rate of power at full throttle at an altitude of about 10,000 ft.

The solution of all of these problems represents what might be called a post-graduate course in gasoline engine design and it is predicted that we shall soon see material changes in the design of motorcar engines generally, brought about by the greater experience gained in the design of aeroplane engines.

Movement in Germany Toward Union of Technical Men

The following interesting translation of a German report was prepared by Sir Robert Hadfield, and shows the important steps being taken in Germany to bring about a Union of Technical Men, from foremen to technical chiefs. The report relates to the inaugural meeting of the Union held in Berlin, November 25, 1918.

TECHNICAL MEN: JOIN! FORGET WHAT SEPARATES YOU!
YOUR FUTURE DEPENDS ON IT!

RAPID FORMATION OF LOCAL SECTIONS AN URGENT NECESSITY

The objects of the Union are as follows:

1 To ensure that Technologists may bring their influence to bear on Government, Parliament, and the Economic Life of the country.

2 To attain this object it will use every endeavour to bring the representatives of all branches of Technical Practice, from the Foreman to the Technical Chief, into one comprehensive organization.

3 The programme of the Union will be based on the foundations of a free, democratic Constitution.

4 The Union desires the active collaboration of its members in public life. In order to realize this programme, the Union will—

a *Inside Work:* Ensure its members a more clear comprehension of the conditions under which the people live, of national life, of legal machinery, administration, economy, politics, and cultural matters, with special reference to the systematic training of members capable of acting as the representatives of technology on public bodies.

b *Outside Work:* Explain to other circles of society the importance of technical work for the life of the people and the maintenance of civilization at the proper level of culture, and the necessity of leaving technical questions to be settled by technical men only.

5 The Union repudiates any unconstitutional attitude towards other circles of the population, and will use every endeavour to secure intelligent coöperation, based on trust and respect, with the working classes.

6 The Union declares it as necessary for securing its objects that its activities should provide means for an adequate existence for every one belonging to the technical trades or professions, in order that he may work independently of his own or outside support.

The first general meeting of the Union took place in the Rheingold, Berlin, on November 25, more than 2,000 technical men belonging to all branches and grades of the calling being present. On December 2 representatives met from all the larger technical societies of Greater Berlin, and agreed on the necessity for the formation of the Union and on the correctness of its aims. The majority of those present declared themselves ready to coöperate actively for the expansion of the Union.

The declaration containing this and other resolutions was signed, among others, by representatives of:

Committee of Technical Officials of the Ministry of Marine
Society of Architects
Automobile and Aeronautical Society
Society of German Engineers
Society of German Civil Engineers
German Technical Society
German Union of Technologists
Electro-Technical Society
Society of Naval Architects
Union of Academical Architects' Societies
Union of German Electrical Engineers
Society of German Patent Agents
Society of Surveyors
German Chemical Society
German Foundrymen's Society
Society of German Mechanical Engineers.

Negotiations with other bodies are under way and promise complete adherence to the objects.

NEWS OF THE ENGINEERING SOCIETIES

Reports of Meetings of Western Society of Engineers and American Steel Treaters' Society

Western Society of Engineers Discusses Transportation Situation

Remedies designed to bring about a readjustment of the transportation situation, particularly among electric railway lines, were presented by James Roland Bibbins, Mem.Am.Soc.M.E., associated with Bion J. Arnold, Chicago, and three other speakers, at the first regular fall meeting of the Western Society of Engineers, Chicago, on September 8.

The general subject of the evening's program, The Economic Future of Transportation Facilities, brought out a large crowd of public-spirited engineers. While the electric railway was used by all speakers as an illustration of a public utility, yet the discussion was so broad and far-reaching in its character that the plans as outlined might embrace a utility of any public nature, such as steam railroads, water works, lighting systems, etc.

The various alternatives named by Mr. Bibbins, and left to the body of engineers to determine whether or not they are equitable, were:

Capital may be scaled down, but by so doing we admit that the railway industry in its present form is a failure.

Operating deficits may be met by general taxation, but misplaces a burden on the man too poor to use the service.

The zone fare system would increase the number of short riders, but would tend to interfere with the freedom of inter-city transit.

Labor might accept a reasonable profit sharing plan.

Cities should assume a responsibility of providing special lighting, paving, etc., for the companies.

Cities might waive their share of the profits in order to reduce the price of fares or increase the service.

Lastly, the public might assume the risks of carrying a deficit through a system of municipal ownership.

Mr. Bibbins, who is a recognized authority on transportation problems, declared that the five-cent fare is a psychological fact which has been bred into the minds of the people. Should the transportation companies revert to the old system of the five-cent fare and establish fare zones the population would become much more dense in the cheaper districts and tend to defeat the purpose of a cheaper fare—of getting the public away from the city into the suburbs. Only a study of the railway problem in its three phases, past, present and future, will bring about a happy medium of control. Public control of utilities should not be subjected to destructive radicalism or reaction, he declared.

The public, today, wants to pay only rates based on the depreciation value of utilities, Mr. Bibbins said, and it is for that reason that the continued hostility between the owners and the public has reached such a critical state. To offset the loss through depreciation, companies should have set aside at the time of beginning operations a depreciation reserve. The purchasing power of the five-cent fare has declined in comparison with the purchasing power of our currency and has decreased stability in the operating companies.

The speaker illustrated his discussion with a brief but thorough history of an electric railway company, operating in one of the large cities of this country, which electrified its roads in 1890 on an investment less than one-third of that of today. Because of ill-considerate competitive construction permitted by the city, extensions did not become normal until ten years later. During this period net earnings vanished. After 1900 the earnings of the company continued at a much lower rate until the beginning of the war. To lay the earnings are negligible.

To establish electric railway companies on a paying basis for the future, one or more of the several alternatives outlined by Mr. Bibbins must be adopted only after an intelligent and comprehensive survey of existing conditions has been made. He urged that the engineering profession lend its ability and weight in rectifying the mistakes that have been made in the past in handling technical problems of utility development.

Col. P. J. Kealey, president of the Kansas City Railway Company, who was unable to attend the meeting, sent a written discussion on valuation in which he declared that the ultimate solution of the present problems before the railway companies and the people will be private ownership and operation with municipal supervision of service. "The car rider should not be made pay for anything more than transportation," Colonel Kealey wrote. "In order to do this traction companies must be relieved of all indirect taxes." Public opinion is the only medium which can bring about a settlement of the labor problem for during the past two years seemingly promising settlements have been disrupted by the union.

The next regular meeting of the society will be held October 4 but section meetings are held every Monday evening throughout the month.

Harold T. Elliston,
Office of *Western Society of Engineers*.

Convention of Steel Treaters' Society

The National Convention of the American Steel Treaters' Society was held at the 7th Regiment Armory, Chicago, September 23rd to 27th.

The purpose of the convention was to promote the science and art connected with the heat treatment of steel and to bring into closer relationship, the members of the profession.

Eighty exhibitors placed for public inspection the latest developments of heat-treating appliances and products. The papers discussed cover every branch of the field. Notable among the speakers were Shipley N. Brayshaw, London; E. F. Collins, General Electric Company; W. G. Dauncey, associate editor, *Iron and Steel*, Montreal, Canada; Fred Grotts, Holt Manufacturing Co.; Wilfred Hanby, Rotherham, England; W. G. Lottes, International Harvester Co.; and Prof. A. E. White, University of Michigan.

The promoters of the exhibition were greatly elated over the success of the convention and predicted that a national convention, only on a much larger scale, would be held next year.

The American Steel Treaters' Society is a comparatively new organization but its influence is already being felt in the building up and advancement of the steel industry. Local chapters of the organization have been established in Chicago, Cleveland, Pittsburgh, Milwaukee, Philadelphia, Cincinnati, Buffalo, Rochester, and New York City. Others are to be organized in industrial centers.—H. T. E.

New England Water Works Association

The thirty-eighth annual convention of the New England Water Works Association was held at Albany, N. Y., September 30—October 3. In addition to a number of important committee reports, a number of interesting technical papers were presented. Norman J. Howard discussed the operation of a new drifting sand filter system at Toronto. The Schoharie development of New York City's water supply formed the subject of an address by J. Waldo Smith, Chief Engineer, Board of Water Supply. Another paper by Leonard Metcalf and William T. Barnes, of the firm of Metcalf & Eddy, consulting engineers, Boston, was devoted to the 10,000,000-gallon covered reservoir at Dayton, Ohio. Two papers on pumping engines were also presented: The first was by Creed W. Fulton of the Gould's Manufacturing Co., and the second by D. A. Decrow of the Worthington Pump & Machinery Corporation.

ENGINEERING COUNCIL

Engineering Council[1] is an Organization of National Technical Societies of America, Created to Consider Matters of Common Concern to Engineers, as Well as Those of Public Welfare in Which the Profession is Interested

Classification and Compensation of Engineers

In Mechanical Engineering for July (p. 632) there was presented the substance of a preliminary report of the Committee on Classification and Compensation of Engineers. Since that time there has also been made public a report prepared by the Canadian Civil Service Commission, which dealt with the same problem, and it is of interest, therefore, to compare this report with that prepared by the Council. The letter from the chairman of the Committee on Classification and Compensation of Engineers, accordingly follows:

New York, August 27, 1919.

Mr. Alfred D. Flinn, Secretary, Engineering Council,
29 West 39th St., New York.

Dear Sir:

From time to time within the past few weeks, you have forwarded to me various letters addressed to you concerning the proposed "Classification of the Civil Service of Canada" as recommended by Arthur Young & Company of Chicago, Toronto, and New York. The copy of this classification, which was also received, indicates that its preparation was authorized by the Canadian Parliament and that the work upon it was done under the direction of the Civil Service Commission.

Your correspondents offer objections to the classification, particularly on the ground that the compensations proposed for higher grades of service are inadequate. In view of the investigation now being made on behalf of Engineering Council as to the classification and compensation of engineers in Federal, State, Municipal, and Railroad service, this report is of more than usual interest, and especially so since Council's Committee is informed that Arthur Young & Company are performing a similar service for the Congressional Committee on Reclassification and Compensation of Government Employees, including engineers.

Engineering Council's Committee on Classification and Compensation for the State and Municipal services has tentatively proposed that all positions in these services be limited to 13 in number, of which 7 are distinctly professional, while the remaining 6 are in a class directly leading to professional work, but not necessarily of a professional character. In the questionnaire recently issued by the Committee the views of the responsible heads of the services affected are being sought, and in the responses which have been received up to the present writing, there has been practically unanimous agreement on the classification. The inquiry has not progressed for enough to warrant any expression as to the views concerning compensation other than to say that there is an unquestionably strong belief that if the engineering service is to be maintained on a proper plane, there must be a very substantial increase in pay.

The Canadian report appears to cover every position in the civil service. It is arranged alphabetically and in the absence of grouping, a complete analysis of the engineering service involves a task of a magnitude greater than I have found time for. I have attempted, however, to make such examination as time permitted and am impressed with a belief that the objections raised are well founded. No attempt seems to have been made to standardize titles. Consequently there are in the engineering service at least 157 independent titles as compared with the 13 titles proposed by our Committee. It is recognized that qualification of a general title to show the nature of the service rendered, is quite proper, but in the judgment of the writer there is no reason for treating similar positions as entirely unrelated and as warranting entirely independent specifications.

The report states that the compensations proposed are intended for "normal times" and that pending restoration of such times, the rates recommended should be "supplemented by a bonus," but no information appears as to the magnitude of the bonus.

From my study of the report it would appear that the groups and ranges of compensation, tabulated as far as practicable, under the classification tentatively proposed by Engineering Council's Committee are about as given in the accompanying table.

In general, promotion through most of the grades is by increments of about \$120, the minimum and maximum rates of each being respectively higher and lower than the rates fixed for the grades below and above, thus resulting in a comparatively small salary range for each position and, in this respect corresponding with what seems to have been the general practice heretofore. This treatment is one which would seem desirable to modify, to the end that the relative ability and experience of men performing similar work may be given adequate recognition.

Exceptions are noted in the case of "Topographical Engineer," where a salary range of from \$2,160 to \$3,120 is proposed, and in the case of promotion from "Junior Electrical Engineer" at a maximum salary of \$1,980 to "Electrical Engineer" with a minimum salary of \$2,640, each of the two latter grades having an extreme salary range of only \$360. In the case of "Chief Draftsman," "Structural Engineer," and "Chief Topographical Engineer" maximum salaries are proposed of \$3,000, \$3,240, and \$3,840, with no provision for promotion to other engineering grades, although for each position the qualifications required are such as to indicate ability to progress to high positions in the service. The table also shows that only 6 engineering positions are open to compensation at a rate of more than \$6,000 per annum.

It would seem to the writer that this report is open to serious criticism on the grounds that it fails to group engineering service along orderly lines, that it provides too narrow limits for promotions within a grade, and that the compensation proposed for all grades, is inadequate for the service rendered. The latter criticism seems particularly pertinent in comparison with the rates now being demanded by organized labor. The practicability of properly meeting present day conditions by the addition of a "Special War Bonus" to the proposed rates in order to meet the present high cost of living is also to be questioned on the ground that, and as set forth in the circular letter issued by Council's Committee on Classification and Compensation of State and Municipal Engineers, the "revolutionary change in the cost of living" is one which "unless modified by further economic disturbance is likely to be permanent or to continue for a long time to come."

Very truly yours,
(Signed) Arthur S. Tuttle.
Chairman, Committee on Classification and Compensation of Engineers, and of State and Municipal Section.

TABULATION OF TITLES AND SALARIES FOR ENGINEERS IN CANADIAN CIVIL SERVICE REPORT UNDER CLASSIFICATION PROPOSED BY COMMITTEE OF ENGINEERING COUNCIL

Tentative Classification of Positions in State and Municipal Service Proposed by Engineering Council's Com. on State and Munic. Serv.	No. of Titles provided in proposed Canadian Classification.	Salary Range Proposed for Canadian Service				Qualifications proposed for Canadian Service

NATIONAL SERVICE COMMITTEE

Contributed by the Washington Office[1]

An Explanation of the Proposed Department of Public Works

THE name Department of Public Works at once leads to a misconception of its scope. Public Works is a poor name but such a name, or its equivalent in other languages, has been almost universally adopted to embrace tangible property owned by a Government or that over which a Government has direct sovereign jurisdiction, together with all official functions and activities related thereto and necessary to public utility. There can be no fixed and comprehensive definition of public works, because that which may be considered a part of public works in one country may be altogether lacking in such qualifications in another.

It is, therefore, natural that the bill which proposes to establish a Department of Public Works in this country (see MECHANICAL ENGINEERING for August, page 709, for the terms of the bill) should fail to propose public works jurisdiction over several Government properties or activities which, under strict construction of the definition, should be included. Conversely it includes Government bureaus, certain parts of which may not appropriately fall under a Public Works Department but which, at present, and pending reorganization, are so inextricably interwoven with purely public works functions that their separation is not now regarded as expedient. Because of this it appears desirable to explain many points of the bill which have puzzled those who are not in touch with the legislative and departmental situation in Washington. Such explanations therefore follow:

Why Is It Proposed to Transform the Department of the Interior Instead of Creating a New Department? First, because there are already enough Executive Departments to perform Government business, if the functions were properly corelated, and second, because there is a natural reluctance on the part of Congress to create new Departments. This latter reason, of course, would be an enormous handicap to any public works legislation.

Why Is It Proposed to Divide Control of the Duties of the Office of Indian Affairs? The main purpose of the Office of Indian Affairs is to educate the American Indian who is now a ward of the Nation, provide for his social welfare, and eventually create citizens. Therefore, the principal functions of this office fall under the branches of education and labor. When these objects are accomplished the Office of Indian Affairs will automatically go out of existence. The greatest and most important engineering work connected with this office, namely the construction of irrigation systems, is now and has for many years been performed by the Reclamation Service. Therefore, the proposal to divide the functions does little more than to continue a very advantageous arrangement already in effect.

Why Is It Proposed to Transfer from the War Department the Jurisdiction Over Rivers and Harbors? Because, entirely aside from the decidedly adverse opinions that the great body of engineers entertains as to the fitness of the Corps of Engineers, U. S. A., and its past performances, rivers and harbors improvements for navigation constitute a purely civil function which is merely one phase of our rivers and harbors development and utilization, and the whole cannot go forward effectively and economically without thorough coördination. Navigation improvements are public works, and are so defined the world over, and the fact that in an early day in the history of our Republic they were placed under the Corps of Engineers, as a purely emergency measure, which has since been continued by well directed influence and legislative inertia does not constitute the slightest reason why an illogical arrangement should be perpetuated.

Why Is It Proposed to Include the Construction Division of the Army in the Department of Public Works? Because this division is made up almost entirely of civilian engineers highly experienced in construction work who have, in connection with the war emergency, performed the most extensive and remarkable achievements in engineering construction ever performd by any one organization in the history of the country; because it has worked out a most effective plan of organization and operation which is in a large degree responsible for the results achieved and which could be amalgamated most efficiently with many of the peace-time construction operations of the Government; because the War Department has not provided for the perpetuation of this organization, as such, in its plan for a new military establishment, which is now the subject of investigation by Congress, and, at least by inference, proposes to allow the Construction Division to lapse or to merge its functions with certain old-line military departments where it will be in an environment entirely foreign to the spirit and practice which has caused it to be so unqualified a success; because the construction work which this Division has accomplished is for the most part, not military engineering at all, and the only military significance which it has is derived from the subsequent utilization thereof for military purposes; because when the United States entered the Great War it was necessary to organize the Construction Division under an extreme emergency attended by costly delay, and there should be an active construction organization in the service of the Government, which in the case of a future war could be made to function at an instant's notice as a construction branch of the military establishment. The only way by which this can be accomplished is to have such an organization in active practice in peace time work.

What Is the Reason for Including the Forest Service in the Department of Public Works? While it is true that the science of forestry, so far as its sylvicultural aspects are concerned, is an agricultural science the real problems of operation and maintenance of a National forest, as they occur under the conditions prevailing in this country, are more truly related to engineering than to agriculture. In the first place, forest reserves are unquestionably public works. They are properties owned by the Government and set apart for public purposes. The harvesting of lumber, fire prevention, the construction of roads and trails, the conservation of water, and the administration of water powers are unquestionably engineering operations. There is yet a third phase of the subject which is perhaps more important than the other two from the standpoint of efficient public administration. The bill retains within the proposed Department of Public Works certain bureaus of the Interior Department which have largely to do with public lands. These are the General Land Office, the Geological Survey, the National Park Service, the Reclamation Service, and the Bureau of Mines. These Services are concerned in a more or less intimate way with public land boundaries, surveys and the classification of the land for one or another purpose under the public land laws. It is of unquestionable advantage and productive of large economies to have these bureaus under one roof. The Forest Service, however, has quite as intensive relation to public land matters as has any of the other bureaus above mentioned—indeed, a far more intimate relation in many respects. Therefore, in view of the multiplicity of engineering functions necessarily comprised in the administration of forest reserves, together with the obvious public advantage of coördination in land administration, there seems to be no question but that distinct public advantage would result by including the Forest Service in the Department of Public Works, notwithstanding the fact that one of the important functions of such a service is pure forestry.

What Is the Explanation of the Section Providing for Four Assistant Secretaries? Much doubt has been expressed as to the ability of the Government to secure qualified men to accept these positions of Assistant Secretary at a compensation of $7,500 per annum. It is admitted that such compensation is inadequate but the figure was determined upon with full recognition of present legislative expediency. A compensation of $7,500 per annum is about 50 per cent greater than the present average salary of the Assistant Secretaries of Federal Departments. A saving factor is provided, however, in that these Assistant

[1] Washington Office in charge of M. O. Leighton, *Chairman*, National Service Committee, McLachlen Building, 10th and G Streets

Secretaries shall be included within the scope of civil service retirement laws. Such laws have been advocated for nearly a generation and the principle constantly gains strength. Undoubtedly some suitable law will be enacted in the near future. Properly qualified men will, in many cases, be content with moderate compensation during active life provided they are assured of suitable retirement pay after they have become superannuated. We are familiar with many notable examples in the Army and Navy. Every man who enters these two branches of the service faces a life of moderate income supplemented by retirement pay. This has attracted and will in the future attract good men who recognize that in practically every other walk of life there can be no certainty of income, either large or small.

Some good friends of this cause have questioned the plan concerning the assignment of duties to Assistant Secretaries according to the character of the work. They contend that if the work of any one Bureau should involve all the functions designated in the section, that is, engineering, architectural, surveys, and law, the said Bureau would have four commanding officers instead of one and confusion and loss of efficiency would result. This criticism is a result of misconception of the language. These Assistant Secretaries will not be chiefs of bureaus but merely arms of the Secretary of Public Works. The chief of any bureau will, as at present, have executive authority over all of the operations of his bureau. His ultimate superior will in all cases be the Secretary of the Department of Public Works. Were it possible to secure an omnipotent person as head of the Department, Assistaut Secretaries would not be necessary, but as at present the world is not producing omnipotent men it is necessary to give a Secretary of Public Works the advantage of specialized brains. The four Assistant Secretaries proposed are in effect merely additional lobes of the Secretary's brain and are a part of his official entity. Instead of reporting to an individual as done under the present practice, the bureau chief will report to and take counsel of an expert.

The Engineer Corps Under the Proposed Army Reorganization

The so-called Army Reorganization Bill now before Congress provides for a largely increased Corps of Engineers. The total engineer personnel under the Regular Army organization now provided by law is 12,933, while the bill now before the Senate Committee on Military Affairs authorizes an enrollment of 28,338. The reorganization scheme provides that the Chief of Engineers shall have the rank of Major General, whereas under the present law he is a Brigadier General. Two Brigadier Generals are provided and the number of Colonels is increased from 23 to 43; Lieutenant Colonels from 30 to 52; Majors from 72 to 134; Captains from 152 to 322, and First Lieutenants from 148 to 431.

There is much speculation, inside as well as outside of the service, as to the source from which this largely increased personnel of engineer officers will be secured. It seems apparent that a large number of the newly created commissions must be filled through the Reserve Corps or otherwise. Unless some fundamental change is made in the method of selecting engineer officers from among West Point graduates a large proportion of the engineer officers in service will lack those exclusive qualifications, which have heretofore characterized the Corps, by reason of the fact that engineer officers are, under the present law, selected from West Point graduates who have attained the highest rank in academic studies.

It is reported that since the signing of the armistice about 1500 Regular Army officers have presented their resignations, and these include a number of engineer officers of the highest usefulness whose loss to the Corps will be severely felt. The Chief of Engineers in recent testimony before a committee of Congress commented upon the present low state of morale among Regular Army officers and it has been assumed that he included in this category the officers of his own department, as well as those in others. In any event the situation is interesting from the point of view of the civilian engineer because unless some expedient is adopted, the nature of which is at present not quite clear, it may occur that the enlarged engineering program of the War Department may make it possible for duly qualified civilian engineers to render service to the country via the military route, even in time of peace.

War Department Equipment for Trade, Technical Schools and Universities

A bill which was proposed in the last session of the 65th Congress,—" providing further educational facilities by authorizing the Secretary of War to sell at reduced rates certain machine tools not in use for Government purposes to trade, technical schools, universities and other recognized educational institutions,"—was re-introduced early in the present session of Congress and has just been reported favorably by the Military Affairs Committee.

An amendment has been affixed to this bill whereby the educational institutions are to pay 20 per cent of the purchase price of the tools even when depreciation is taken into consideration instead of 10 per cent as proposed in the original bill. In the meantime, the Director of Sales announces that the machine tool section is operating with representatives of the several bureaus of the War Department which have surplus machine tools and is fixing prices at which all standard tools held by the Department will be offered for sale. Because of the large and greatly diversified stock of these tools now held by the War Department, it is contemplated that the requirements of the technical schools can be amply and quickly taken care of following the passage of the proposed bill.

The Alaskan Railroad

When it became apparent that the Alaskan Engineering Commission would be unable to complete the Alaskan Railroad with the original appropriation of \$35,000,000, a new bill was introduced into the House appropriating an additional \$17,000,000 for this work. Up to September 15 the bill had passed the House and been favorably reported to the Senate calendar by the Committee on Territories.

The engineer of the Commission, J. L. McPherson, explained to the Committee why it was more economical to construct the line in two sections, and further explained that the original appropriation was insufficient because wages had increased 59 per cent, cost of material had increased up to 161 per cent, and cost of transportation up to 147 per cent. The average cost per mile of the completed line will not exceed \$73,300, which is regarded by Mr. McPherson as a very good showing when the difficulties of railroad work in Alaska are considered. The road consists of 601 miles of track, including sidings.

The greatest expense yet to be met is for new work on various sections. One of the heavy items of expense will be the bridge over the Tanana river, which it is estimated will cost \$1,220,298. Approximately \$14,000,000 of the proposed appropriation is required for new work; the remainder is for reconstructing the Alaska Northern Railway, rehabilitating the Chatanika branch, constructing terminals and bridges, and for rolling stock and expenses in excess of revenue.

It is expected that the development made possible by this road will be comparable to the development which followed the construction of transcontinental lines in the United States. This is especially true if the main line of the road is connected with the base of Mt. McKinley.

Investigations of the Committee indicated that in addition to the mineral resources of Alaska which this road will open up, there is every prospect of Alaska becoming an important producer of agricultural crops. Investigation further developed that private capital had probably not built a line through this country because the government owns 99 per cent of the area of Alaska, which makes the government the logical interest to construct such a railway.

NECROLOGY

EDWARD PAYSON BATES

Edward Payson Bates, a life member of the Society, died on August 3, 1919, in Butte, Mont. Mr. Bates was born on March 3, 1841 in Savannah, Ga. His parents were of New England stock; his father, Levi Whitcomb Bates, was a descendant of Clement Bates, who came to this country from England with his brother Joseph. They, in turn, were descendents of John Bate (or Bates) of Lydd, England, who was a mayor of the town and justice in the court. His mother was Ruth Ann Bailey. She was born in Meredith, Delaware County, N. Y. Her father, Timothy Bailey, was a skillful mechanic and inventor, having invented the knitting frame which made underclothes and made radical changes in the spinning jenny which tended to save time and decrease the cost of producing cloth. This knitting frame was first used in Cohoes, N. Y. and is in use there to this day.

Edward Payson Bates

Mr. Bates was a born mechanic, his ideas running in that direction from the time he could handle a hammer and saw, which was very early in his experience. At the age of seventeen he entered the machine shop of Hobart B. Bigelow, in New Haven, who was afterward one of the beloved governors of the State of Connecticut. He remained there only a short time when he moved to New York State in the vicinity of Albany and entered a machine shop. After two years he could do all the ordinary work skillfully and correctly. He received a journeymen's wages for the second year of his experience, during that time learning to assemble a locomotive and operate it on the road. His next move was to New York City where he learned how to build a marine engine and install it in a ship. He studied at nights with a professor connected with Cooper Institute, was granted his marine license and for several years went to sea as an engineer.

During the Civil War he saw service on a transport which was bearing home the wounded from Libby Prison. Soon after this, Willis Warner, widely known in engineering circles, his childhood friend, induced him to enter his employ to learn how to erect steam-heating apparatus, with the idea of opening a branch business in Syracuse, N. Y. That business he was thereafter engaged in, the character changing much from time to time. He added to it ventilation, hot-water heating, factory equipment, power plants, sprinkler work, and various contracts of a similar nature. He was in Mr. Warren's employ for several years when the latter's sudden and unexpected death threw him on his own resources. He was enabled by fortuitous circumstances to buy out the business and it was known thereafter as Bates & Johnson Co. Upon taking over the business he increased the number of branches until at one time there were offices of the concern in eleven cities. As conditions changed and trade unions made drastic rules he found it advisable to cut off business conducted at a distance and limit himself to two offices—the principal one at Syracuse and a branch at Utica. At the beginning of 1917 Mr. Bates incorporated the business under the laws of New York State and was the new company's first president, Mrs. Bates being one of the directors. The company proposed to carry on the same line of business which Mr. Bates, himself, organized and maintained.

Mr. Bates was a member of the Society of Naval Architects and Marine Engineers, charter and life member of the Technology Club of Syracuse, life member of the Mayflower Society of Massachusetts, life director of the American Bible Society, life member of the Archæological Institute of America, member of the Robert Fulton Memorial Association, life member of the Bates Association and director of the Syracuse Museum of Fine Arts. In 1910, Mr. Bates was appointed official delegate of the Society of Naval Architects and Marine Engineers to the Fiftieth Anniversary of the foundation of the Institution of Naval Architects, which was held in London.

In the middle of March, 1919, Mr. and Mrs. Bates started on an extended trip that took them southward to New Orleans by steamer, through Texas into Southern California, north to Alaska, then through Yellowstone Park; a singularly happy and delightful trip which was interrupted in Butte, Mont., by his peaceful death.

CHARLES H. McGWIRE

Charles H. McGwire, assistant chief engineer for the Board of Public Utilities, Los Angeles, Cal., died on August 6, 1919. Mr. McGwire was born in 1868 in High Ridge, Conn. He studied for one year in Cornell University. He was formerly connected for varying periods with the following firms: Daniels & Fisher Store Co., Denver, Colo.; Barber Asphalt Paving Co., Denver; Frazer Mountain Copper Co., Twining, N. M.; Longmont Sugar Co., Longmont, Cal.; Pacific Electric Railroad Co., Los Angeles, and the Busch-Sulzer Bros. Diesel-Engine Co., Los Angeles. Mr. McGwire became a member of the Society in 1909.

CARL ANTHONY HEILMANN

Carl Anthony Heilmann, Captain, 5th Engineers, U. S. A., died July 12, 1919, as a result of an accident near Camp Humphreys, Alexandria, Va., when an army motor truck plunged over the side of a bridge.

Captain Heilmann was born in Brooklyn, N. Y., January, 1886. He was a graduate of Manual Training High School, and also studied at Worcester Polytechnic Institute for two years, graduating in 1908 as a mechanical engineer from Purdue University, where he completed the studies begun in Worcester. He served his apprenticeship in various machine shops during summer vacations. He was associated with the Ideal Portland Cement Company, Portland, Colo., as draftsman; with the Monett Electric Light Company, Monett, Mo., where he had charge of the electrical equipment and construction; with the Green Fuel Economizer Company in the capacity of sales engineer; with the American Radiator Company as engineering representative, Philadelphia, Pa.; and with Warren Webst r and Company, as district manager, Washington, D. C.

Carl Anthony Heilmann

Captain Heilmann had been stationed at Camp Humphreys after eight months of arduous service in France, with the First Division, having returned to the United States in order to make a lecture tour of the country. He entered the service shortly after the declaration of war and was commissioned as first lieutenant, Engineer Corps, at Fort Myer, Va., in June, 1917. He was promoted to Captain soon after his return to the United States. Captain Heilmann was elected to membership in the Society in 1913.

THEODORE COOPER

Theodore Cooper, for 30 years one of New York's best known consulting engineers, and an authority on bridge design and construction, died August 24 at his home in New York City. Mr. Cooper was born at Cooper Plains, N. Y., January 12, 1839. He was an engineering officer in the Navy during the Civil War, and assistant professor at the Naval Academy from 1865 to 1868. He was one of the five expert engineers selected by the President to determine the Hudson River bridge span and a member of the board of experts on the Manhattan Bridge plan in 1903. He had also been consulting engineer for the New York Public Library and the Quebec Bridge. He retired ten years ago.

PERSONALS

In these columns are inserted items concerning members of the Society and their professional activities. Members are always interested in the doings of their fellow-members, and the Society welcomes notes from members and concerning members for insertion in this section. All communications of personal notes should be addressed to the Secretary, and items should be received by October 15 in order to appear in the November issue.

CHANGES OF POSITION

Robert P. McCarty has become associated with the Electric Boat Company, Groton, Conn. He was formerly connected with the Knox Motors Company, Springfield, Mass.

J. Harland Billings has resigned his lectureship in machine design in the University of Toronto, to become professor of mechanical engineering at Drexel Institute, Philadelphia, Pa.

Arthur S. Lewis, formerly with Flint and Chester, Inc., New York, as assistant to the president, has become affiliated with the Barco Manufacturing Company, Chicago, Ill.

George N. Somerville, until recently, chief engineer, Skandia Pacific Oil Engine Company, Oakland, Cal., has joined the staff of the Pacific Marine Review, San Francisco, Cal.

Carleton A. Orr has become associated with the Baker Steam Motor Car and Manufacturing Company, Inc., Pueblo, Colo. He was formerly connected with the Arkansas Valley Railway, Light and Power Company, Pueblo, Colo., in the capacity of superintendent of power plant and shops.

C. H. Vickers, formerly with the Willys-Morrow Company, Elmira, N. Y., has accepted the position of machine designer with the Utah Copper Company, Garfield, Utah.

Robert B. Stanton, Jr., has entered the service of the United Cast Iron Pipe and Foundry Company, New York. He was, until recently, sales engineer with the Worthington Pump and Machinery Company, New York.

Paul A. Cushman, formerly assistant professor of mechanical engineering, Pennsylvania State College, State College, Pa., has become affiliated with the mechanical engineering department, The Polytechnic Institute, Brooklyn, N. Y.

Noyes D. Farmer has become associated with the Carborundum Company, Niagara Falls, N. Y. He was formerly connected with the Atlantic Corporation, Portsmouth, N. H., in the capacity of supervisor of costs.

C. C. Wilcox has assumed the duties of chief engineer of the Durant Building Corporation, Detroit, Mich. He was recently assistant to consulting electrical engineer, Hodenpyle, Hardy and Company, Jackson, Mich.

Millard F. Cox has assumed the duties of first vice-president and consulting engineer, Louisville Fire Brick Works, Highland Park, Ky. He was formerly connected with the Louisville and Nashville Railroad Company, Louisville, Ky., in the capacity of assistant superintendent of machinery.

Eric L. Bergland has entered the employ of Brokaw-Eden Company, New York. He was, until recently, engineer with the E. I. duPont de Nemours and Company, Wilmington, Del.

Axtell A. Lloyd, formerly maintenance draftsman, Hillsboro Mills, Wilton, N. H., has accepted the position of designer, Springfield Armory, Springfield, Mass.

Walter C. Setzer, formerly instructor, mechanical engineering department, University of Pennsylvania, Philadelphia, Pa., has accepted the position of mechanical engineer for The H. B. Smith Company, of the same city.

Clarence W. Lewis, until recently with the Empire Gas and Fuel Company, Eldorado, Kan., has entered the service of the National Petroleum Corporation, New Orleans, La., in the capacity of district engineer.

James T. Enes has become associated with Perin and Marshall, of New York. He was formerly designer, Garfield Works of the Tennessee Coal, Iron and Railroad Company, Birmingham, Ala.

Harry S. Badger has accepted the position of resident engineer, American Cities Company, Houston, Tex. He was formerly connected with Vanderbilt University, Nashville, Tenn., in the capacity of engineer.

J. E. Fricker, formerly superintendent, liquid air division, Air Nitrates Corporation, New York, and more recently with the American Cyanamid Company, Niagara Falls, Ont., in a consulting capacity, has assumed the duties of superintendent with the Niebling-Markstein Company, of Cincinnati, Ohio.

Henry R. Trotter has assumed the duties of president of the Trotter-Patterson Corporation, consulting engineers, Hartford, Conn. He was formerly connected with the S K F Industries, Inc., in the capacity of chief engineer.

Leon K. Davis, until recently fire protection engineer, U. S. Railroad Administration, Washington, D. C., has become affiliated with the New York Reciprocal Underwriters, N. Y.

Charles T. Owens has accepted the position of one of the assistant chief inspectors with the U. S. Shipping Board, New York. He was formerly in the employ of the Alabama Power Company, Birmingham, Ala.

Morris Wenk, formerly engineering draftsman, G. M. Standifer Construction Corporation, Vancouver, Wash., has assumed the position of instructor in mechanical drawing at Oregon Agricultural College, Corvallis, Ore.

Byron F. Stowell, for many years connected with the Hendee Manufacturing Company, Springfield, Mass., as master mechanic and mechanical engineer, is now associated with the Napier Saw Works, Inc., of Springfield, Mass., as mechanical engineer.

Fred J. Queripel, formerly with the Electric Furnace Construction Company, Philadelphia, Pa., as chief draftsman, is now doing plant engineering work for the National Aniline and Chemical Company, Marcus Hook, Pa.

S. J. Millard, until recently instructor in industrial engineering, Pennsylvania State College, State College, Pa., has become associated with the Scranton Technical High School, Scranton, Pa.

B. F. Safberg, formerly with the production department of the Emergency Fleet Corporation, Plainfield, N. J., is now a member of the Technical Advisory Committee of the War Claims Board, Washington, D. C.

V. Edgar Walters has severed his connection with the Savage Arms Corporation, Utica, N. Y., to accept a position with the General Motors Corporation, Detroit, Mich.

Howard E. Degler has accepted the position of mechanical engineer with the McClintic-Marshall Construction Company, Pottstown, Pa. He was formerly instructor in automobile technique, United States Training Detachment, Hampton Institute, Hampton, Va.

Harry C. Buffington, formerly motor engineer, Minneapolis Steel and Machinery Company, Minneapolis, Minn., has assumed the position of chief engineer, The Holt Manufacturing Company, Peoria, Ill.

William H. Baker has resigned from the Atlas Portland Cement Company and has joined the staff of the Hardinge Conical Mill Company, New York, as vice-president.

Robert W. Rogers, until recently employed by the United States Government as a training expert in the Department of Labor Training Service, is now directing the Shop Training Department which has recently been established by the Wilson Foundry and Machine Company, Pontiac, Mich.

Irving E. Tuttle, formerly with Meyer, Strong and Jones, consulting engineers, has become president of the Nate-Earle Company, New York, engineering contractors in power plants, heating and ventilating systems and piping of all descriptions.

L. H. Schickedanz, until recently assistant mechanical engineer with the Cleveland Cliffs Iron Company, Ishpeming, Mich., has become connected with the United States Fuel Company, Westville, Ill.

Harold B. Bernard has been relieved as assistant superintendent, Sinclair Cudahy Pipe Line Company, Tulsa, Okla., to become general superintendent of the gasoline department of the Sinclair Companies, Tulsa, Okla.

Walter K. Cabot has accepted a position with the American Can Company, New York. He was formerly assistant manager with William Underwood Company, Boston, Mass.

Robert S. Drummond has become affiliated with the American Pressweld Radiator Corporation, Detroit, Mich. He was until recently general manager of the Wilson Welder and Metals Company, Inc., New York.

F. W. Leahy has resigned from the Emergency Fleet Corporation to assume charge of the marine department of the Diamond Power Specialty Company, Detroit, Mich.

F. J. Schlink, associate physicist, Bureau of Standards, and for the past two years technical assistant to the director of the Bureau, has resigned to accept a position as physicist with the Firestone Tire and Rubber Company, of Akron, Ohio.

Burt A. Waltz has severed his connection with the B. F. Goodrich Company, of Akron, Ohio, and has become associated with the Osborn Engineering Company, consulting engineers of Cleveland, in the capacity of assistant mechanical engineer.

J. H. Sengstaken, formerly associated with Lewis A. Riley, of New York, as engineer, has assumed the duties of assistant works superintendent of The Green Fuel Economizer Company, Beacon, N. Y.

Louis J. Pelissier, formerly mechanical superintendent at the works of the Marlin Rockwell Corporation, Tacony division, has become connected with the Edison Lamp Works of the General Electric Company, Harrison, N. J., in the capacity of foreman in the experiment and development department.

Alvin L. Smith has accepted the position of engineer with the Coldwell Lawn Mower Company, of Newburgh, N. Y. He was, until recently, plant engineer with The Griest Manufacturing Company, New Haven, Conn.

ANNOUNCEMENTS

I. E. Moultrop has been elected chairman of the Technical and Hydro-Electric Section of the National Electric Light Association.

W. S. Hazzard has become affiliated with Adams, Evans and Company, New York.

Alfred S. Kellogg has consolidated his engineering office with that of the architects, Brainerd, Leeds, of Boston. The new firm, under the name of Brainerd, Leeds and Kellogg will devote its entire energies to the design of complete structures, including architecture and engineering.

E. Everett Buchanan, Jr., has accepted the position of assistant in the metallurgical department of the Willys-Morrow Company, Elmira, N. J.

S. R. Willock has entered the employ of The Woodard Machine Company, Wooster, Ohio.

Lieut. Fred E. Hosmer, Aviation Section, Ebbetts Field, Tonoke, Ark., has become affiliated with the Gulf Production Company in the capacity of chief engineer.

The production division of the American Car and Foundry Company will be directed by William C. Dickerman who will be designated as vice-president in charge of operations. Mr. Dickerman has been connected with the company since its incorporation in 1899 advancing from apprenticeship in the shop to his present position.

Franklin R. Magill, Sergeant Q. M. C., N. A., Motor School, Camp Holabird, Baltimore, Md., has become identified with the Poole Engineering and Machine Company, New York.

C. B. Veal has become associated with the Curtiss Aeroplane and Motor Corporation, New York.

W. D. Hoxie, formerly vice-president of the Babcock and Wilcox Company, New York, has been elected president of the company.

Henry L. Wilson, Lieutenant, Q. M. C., A. E. F., has accepted the position of mechanical engineer with the Atlantic Dyestuff Company, of Boston, Mass.

K. Jellum, 2d Lieut., 308th Engineers, has become connected with the Western Electric Company, Chicago, Ill., as designer of special machinery.

Henry S. Johnson has become associated with the engineering department of E. I. duPont de Nemours Company, Wilmington, Del.

Robert P. Messenger, for the past nine years connected with the International Harvester Company, has now been promoted to the position of inspector general of European experiments of the same company, with headquarters in Brussels, Belgium.

A. L. DeLeeuw, formerly associated with the Singer Manufacturing Company, Elizabethport, N. J., has opened a consulting engineering office, at 149 Broadway, New York, for the building and equipping of industrial plants, specializing in machine shop problems to economic production.

Joseph S. String, Major Ordnance, U. S. A., has received his discharge from the Army and has become associated with Charles A. Lunn under the firm name of String-Lunn Company, engineers and contractors, industrial and power-plant equipment, with headquarters in New Haven, Conn.

Lee E. Barrows, formerly with the Texas Company, Fort Worth, Tex., has assumed the position of superintendent, gasoline division, producing department of the Houston, Tex., office of the company.

Levin A. Moore has assumed the duties of treasurer and general manager of H. W. Schrimpf and Company, Perth Amboy, N. J.

Howard M. Ingham has resumed his professional practice as industrial engineer after 18 months of service in the U. S. Naval Reserve Force, in the capacity of assistant naval inspector of ordnance, in charge of inspection in several plants engaged in the manufacture of ordnance, and is again prepared to take up problems in all phases of industrial engineering. He has associated himself with the firm of C. D. Giles and Company, accountants and auditors, New York.

John E. Taylor, Private, Company F, 31st Engineers, A. E. F., has accepted a position with the Locomotive Superheater Company, New York.

William H. Gref, Captain Ordnance Department, Frankfort Arsenal, Philadelphia, Pa., has become associated with the T. B. Foster and Brother Company, of Providence, R. I.

O. N. Edgar has left the Chamber of Commerce, Houston, Tex., where he had been in the capacity of engineer in charge of the industrial department, and has opened an office for industrial engineering work in a consulting capacity.

Leland G. Knapp, formerly affiliated with the Wisconsin Motor Manufacturing Company, Milwaukee, Wis., has become a member of the firm of Goodwin and Knapp industrial engineers, of Chicago, Ill.

George B. Massey, who was engaged in mine-laying work in the North Sea during the war, has left the United States Navy and has resumed his work as consulting engineer on excavation, with offices in Chicago, Ill.

George W. Mixter, vice-president of Deere and Company, Moline, Ill., has been named vice-president and general manager of the Pierce-Arrow Motor Car Company, Buffalo, N. Y. Mr. Mixter will retain his business relations with Deere and Company.

Ulysses G. Rogers, formerly in charge of the plant of the Smurr and Kamen Machine Company, of Chicago, Ill., manufacturers of turret lathes and special wire-working machinery, resigned his position August 1, and with W. W. Franklin and C. E. Schryver has organized the Commercial Engineering Association, Chicago, Ill., designers and builders of machinery, tools and equipment for the wire-working industry.

Francis L. Hill, Captain, 55th Infantry, A. E. F., is now assistant in graphics and descriptive geometry, Virginia Polytechnic Institute, Blacksburg, Va.

James F. Cyphers, Captain, Ordnance Department, U. S. A., Picatinny Arsenal, Dover, N. J., has entered the engineering department of E. I. duPont de Nemours and Company, Wilmington, Del.

W. T. Ayer has entered the employ of the Hercules Powder Company, Wilmington, Del.

James M. Forsyth, First Lieutenant, U. S. A., Air Service, is a member of the firm of Forsyth Engineering Company, Temple, Tex., which was organized by soldiers who were assigned to duty at the Aviation Repair Depot at Dallas, Tex., for the purpose of operating a first class machine shop.

APPOINTMENTS

William H. Timbie, until recently head of the Department of Applied Science, Wentworth Institute, Boston, Mass., has been appointed associate professor of electrical engineering, Massachusetts Institute of Technology, Cambridge, Mass.

Sverre Petersen has been appointed head of the technical department of the Roxana Petroleum Company of Oklahoma, St. Louis, Mo.

Paul J. Kiefer, formerly with the Towne Scientific School, University of Pennsylvania, and recently released from active service as Lieutenant, U. S. Naval Reserve Force, has been appointed assistant professor of steam engineering, University of Illinois, Urbana, Ill.

Joseph W. Roe, formerly assistant professor, mechanical engineering, Sheffield Scientific School, Yale University, New Haven, Conn., has been appointed secretary to Dr. W. F. M. Goss, Past-President, Am. Soc. M. E., president of the Railway Car Manufacturers Association, New York.

LIBRARY NOTES AND BOOK REVIEWS

BOILER FEED WATER. A Concise Handbook of Water for Boiler-Feeding Purposes (Its Effects, Treatment and Analysis). By Percy G. Jackson. J. B. Lippincott Co., Philadelphia, 1919. Cloth, 5 x 7 in., 102 pp., $2.

Contents: Mineral Constituents; Corrosion; Softening; Selection of Softening Plates; Priming; Scale, Grease and Overheating; Methods of Analysis; Analysis of Scale; Control Tests for Water Softening; Sampling; Solutions. Appendix: List of Factors; List of Atomic Weights; Clark's Table of Hardnesses.

This volume is intended to be a reliable, concise and practical compendium of information on boiler waters and feed-water troubles. It is based on long experience as chemist to an English boiler insurance company.

ELECTRIC POWER TRANSMISSION. Principles and Calculations, including a Revision of "Overhead Electric Power Transmission." By Alfred Still. Second Edition. McGraw-Hill Book Co., Inc., New York. 1919. Cloth, 6 x 9 in., 407 pp., illus., tables, $3.50.

"Overhead Electric Power Transmission" was written to provide a discussion of the fundamental principles and scientific laws determining the correct design of overhead transmission lines, suited to the needs of the office engineer in charge of calculations and specifications. The addition of a chapter on underground conductors has now made it necessary to alter the title. The work has also been thoroughly revised, obsolete matter has been omitted and new material added.

MANUAL OF THE CHEMICAL ANALYSIS OF ROCKS. By Henry S. Washington. Third edition. John Wiley & Sons, Inc., New York, 1919. Cloth, 6 x 9 in., 283 pp., 1 pl., tables, $2.50.

The author's object is to present a selection of methods for the analysis of silicate rocks, especially those of igneous origin, adapted to the needs of chemists, mining engineers, etc., who have not made a particular study of quantitative analysis. The present edition has been thoroughly revised and considerably enlarged.

MECHANICAL DRAWING FOR HIGH SCHOOLS. A Text with Problem Layouts. By Thomas E. French and Carl F. Svensen. First edition. McGraw-Hill Book Co., Inc., New York, 1919. Cloth, 6 x 9 in., 221 pp., illus., tables, $1.25.

The object of this book is to present mechanical drawing as a definite educational subject by which the student's power of visualization may be developed and his constructive imagination strengthened, while he is also taught to think exactly, to understand and make mechanical drawings and to know modern drafting-room practice. The course outlined covers two years' work and is a complete textbook and book of problems.

THE NAVAL ARCHITECT'S, SHIPBUILDER'S AND MARINE ENGINEER'S POCKETBOOK. By Clement Mackrow and Lloyd Woollard. Twelfth edition. The Norman W. Henley Publishing Co., New York, 1918. Flexible cloth, 4 x 7 in., 760 pp., illus., tables, $6.

The twelfth edition of this pocket-book appeared two and one-half years after the eleventh, from which it differs by the correction of errors and the addition of seventeen pages containing supplementing notes on various sections of the book and an article on estimating the weight and cost of a merchant vessel. In addition to the subjects usually discussed in such works, articles on aerodynamics and aeronautics are included.

PRACTICAL HELPS for the Electric Railway Shop, Track, Power, Line and Rolling Stock Departments. Compiled from the Mechanical and Engineering edition of *Electric Railway Journal*. First edition. Published by *Electric Railway Journal*. McGraw-Hill Book Co., Inc., New York, 1919. Cloth, 6 x 9 in., 331 pp., illus., tables, $2.

Contents: Track and Structures, by R. C. Cram; Power Generation, by Hartley Leh Smith; Power Transmission, by Charles R. Harte; Car Design, by Norman Litchfield; Car Equipment, by C. W. Squier.

These extended articles have been selected from a series published in the *Electric Railway Journal*, which was prepared for the information of men responsible for the upkeep of the physical equipment of an electric railway system. These articles cover the fundamentals of the various subjects in a broad practical manner.

PUMPING MACHINERY. A Treatise on the History, Design, Construction and Operation of Various Forms of Pumps. By Arthur M. Greene, Jr. Second edition, revised. John Wiley & Sons, Inc., New York, 1919. Cloth, 6 x 9 in., 703 pp., 504 illus., tables, $4.

Gives a brief, historical review of the development of pumping machinery, describes the action of a number of common forms of pumps and states the methods of design of pumping apparatus. It is intended to develop certain general principles of mechanics which are applicable to pumping machinery as well as to train the student in application of the theoretical portions of an engineering course. The descriptive chapters on modern pumps have been prepared from the catalogs and bulletins of manufacturers and from current technical literature. A full bibliography is included.

SHORE PROCESSES AND SHORELINE DEVELOPENT. By Douglas Wilson Johnson. First edition. John Wiley & Sons, Inc., New York, 1919. Cloth, 6 x 9 in., 601 pp., 149 illus., 73 pl., $5.

Professor Johnson has recorded in compact form the results of an extended study of the scattered literature on shore processes and shoreline forms. Water waves, the work of waves, current action, the development of the shore profile and the shoreline, shore ridges and minor shore forms are discussed, and a statement of the fundamental principles which seem best established is given. The author hopes that the book will prove useful to engineers, geologists, and geographers. Full lists of references and a bibliography are included.

STANDARDIZATION OF MINING METHODS. By Charles A. Mitke. A series of important articles reprinted from *Engineering and Mining Journal*. First edition. Published by *Engineering and Mining Journal*. McGraw-Hill Book Co., Inc., New York, 1919. Cloth, 5 x 7 in., 110 pp., 47 illus., 6 charts, 4 tables, $1.50.

As mining engineer for the Phelps Dodge Corporation the author has studied mining practices in detail, with a view to the establishment of standard methods. The present volume is based on his experience and is an account of the standardization of various mining practices in the interests of safety and economy.

STUDIES IN THE CONSTRUCTION OF DAMS: EARTHEN AND MASONRY. Arranged on the Principle of Question and Answer for Engineering Students and Others. By Prof. E. R. Matthews. J. B. Lippincott Co., Philadelphia, 1919. Paper, 6 x 9 in., 43 pp., 30 illus., $1.50.

This book is intended for students preparing for examinations, especially those for associate membership in the Institution of Civil Engineers, or the Institution of Municipal and County Engineers, or for the degree of bachelor of science in engineering in universities.

A TEXT-BOOK OF HEAT ENGINES. By Andrew Jamieson. Vol. 1; eighteenth edition. Revised by Ewart S. Andrews. J. B. Lippincott Co., Philadelphia, 1919. Cloth, 5 x 8 in., 551 pp., $3.

This volume is a revised edition of Professor Jamieson's "Textbook on Steam and Steam Engines," with the omission of the chapters on steam turbines and boilers. The omitted chapters, with others on thermodynamics, entropy and internal combustion engines will appear in volume two.

CENTRIFUGAL COMPRESSORS

(Continued from page 799)

c DETERMINATION OF THE BASIC CHARACTERISTIC FROM A GIVEN PRESSURE CHARACTERISTIC

From magnitudes obtained by measurement can be determined the average temperature T_1 at the entrance to the groups, the average temperature of the cooling water T_2 and the average ratio of temperatures $\frac{T_2}{T}$. The average ratio of pressures of the groups is again

$$\frac{p_2}{p_1} = \left(\frac{p\ \text{II}}{p\ \text{I}}\right)^{\frac{1}{i}}$$

Further, the total work of compression E_s has to be measured. If, for a certain speed of rotation in revolutions n_n a certain load be taken as normal there follows from equation [17] the average admission ε_m of the groups corresponding to any weight of the air flowing through the compressor G. Equation [4-b] permits determining the value of $\left(\frac{m}{\eta_i}\right)_m$. From this, by using Equation [16] and an estimated value of T_m (which is closer to T_2 than T_1), the magnitude of the pressure head m may be determined and from this may be determined the coefficient of efficiency η_m by using the expression $\left(\frac{m}{\eta_i}\right)_m$. This gives the corresponding points of the basic characteristic and all that remains to be done is to determine the coefficient of heat transmission k_n and the exponent q. The best way to do this is to insert into Equation [1] various arbitrary values of a until the value of the ratio of temperatures $\frac{T_2}{T_1}$ is secured, which agrees with the average value obtained by direct measurement. If this be properly done equation [13] ought to be satisfied also (this gives a test of the correctness of the value of T_m. Thereafter from Equation [14] may be computed the value of

$$z = k_n\left(\frac{G}{G_n}\right)^{1-q}$$

If this determination be carried out for several points of a given characteristic and if in accordance with Fig. 5

$$\log Z = \log k_n + (1-q)\log\frac{G}{G_n} \quad \ldots\ldots\ldots\ldots [18]$$

be plotted as a function of $\log\frac{G_n}{G}$, the straight line AB may be drawn through these points, and then

$$OC = \log k_n$$

$$\frac{OC}{OA} = 1 - q$$

This determines the value of k_n and q.

As has been shown in a previous investigation of the author concerning a new process for the calculation of centrifugal compressors Equation [11] holds good under the assumption that the coefficient of heat transmission is the same throughout the entire group of stages. This is, however, actually not so, and in order to take this factor into consideration it is necessary in accordance with Fig. 5 to set the end temperatures $T_2 - T_{a2}$ as well as T_m and T_a in Equations [11], [15] and [17] somewhat higher than corresponds to their actual values.

GAGE LIMITS IN INTERCHANGEABLE MANUFACTURING

(Continued from page 805)

If both mating parts of the work have errors in lead in the same direction, the work will go together easier, because these errors in lead in the work require enlarging the threaded hole and reducing the screw to receive the gages their whole length, and when these mating parts come together, the errors being in the same direction, the flanks of the threads coincide, and the above-mentioned compensation in diameter for lead error makes the mating parts loose. This condidition is often blamed on the gages, when, as a matter of fact, the error in lead on the work reduces the tolerance in order to allow the work to mate, and the gage only insures the mating.

As master gages cannot be made exactly to the component dimensions, except at a prohibitive cost, the inaccuracy comes out of the working tolerance for the reasons before stated, and on close work this should be taken into account when setting the component tolerance. If the minimum screw plug gage has an error in angle, it necessitates that the nut be made larger in pitch diameter than that of the gage in order to be accepted, therefore errors in angle on the minimum plug gage reduce the working tolerance.

If the maximum screw plug gage has an error in angle, it facilitates the approval of the work or adds to the working tolerance, as will be plainly seen if a maximum gage with thread angle 50 deg. be used to check a nut whose thread angle is 60 deg. The pitch diameters being alike, the plug would "no-go" into the threaded hole, thereby passing the work which is off on the angle. Therefore, these gage angle errors off-set each other, and do not rob the tolerence. From what has been said before, it is plain that errors of lead in the "go" screw thread gage rob the tolerance slightly, and this should be taken into account on close fitting work.

The "no-go" thread gage is not expected to go more than a couple of threads, hence the lead error in the "no-go" gage can be neglected. The total errors then which can affect the final working tolerance, if all are in the same direction, are two diametrical errors, and the diametrical equivalent of the lead error of the "go" gage.

Some engineers think that the law of averages ought to apply in this condition by assuming that on an average only half of the errors ought to be present in one set of gages, and that the allowance on the tolerances as affected by master gages should be one half of the sum of the three above-mentioned errors.

The new Webster's Collegiate Dictionary and Webster's New International Dictionary fail to give any shade of difference in meaning between the use of the words "electrical" and "electric," and yet those of us who constantly mingle with men of the electrical engineering profession know there is a decided difference in usage.

For instance we hear constantly of an "electrical" engineer, never an "electric" engineer, and almost universally we hear of "electric" toasters, and quite infrequently do we hear of "electrical" toasters. By study of such instances as these we are able to formulate a rule that will guide us in the most elegant or choice use of these words.

It would seem that the use of the word "electric" is preferred where a piece of machinery or apparatus is involved that is worked or operated by electricity and in almost all cases where inanimate things are to be modified. Thus we have "electric" current, "electric" baker (meaning a stove operated by electricity), "electric" trolley, "electric" supply company (a store that deals in "electric" supplies).

On the other hand, when matters pertaining to things or people connected with "electrical" affairs but not necessarily involving the direct use of electricity are considered, especially where people and organizations are described, the word "electrical" is preferred in its use. Thus we have "electrical" baker (one who operates an "electric" baking apparatus), "electrical" engineer, "electrical" supply jobbers' association, "electrical" contractors and dealers' association, "electrical" engineering profession, and among inanimate uses, "electrical" science, "electrical" affairs and such other instances as may be cited where electricity is not directly employed but which pertain merely to matters "electrical." (*Journal of Electricity.*)

Oct. 1920

THE ENGINEERING INDEX

Published Monthly by The American Society of Mechanical Engineers

The Engineering Index was Founded in 1884 *by the Association of Engineering Societies; Published from* 1895 *to* 1919 *by The Engineering Magazine Company; and Acquired January* 1919 *by The American Society of Mechanical Engineers*

THE following pages form a descriptive Index to articles on engineering and related subjects in current periodicals. In its preparation the Society's engineering staff regularly examines all of the technical journals and society publications received by the Engineering Societies Library, which form one of the greatest and most complete collections of scientific periodicals in the world, comprising upward of 1100 distinct publications in some ten languages. Cross-references are freely introduced in the Index, and in all cases where the titles of articles are not sufficiently descriptive, explanatory sentences are appended. The main abbreviations used in the items are given at the bottom of this page.

PHOTOSTATIC COPIES OF ARTICLES LISTED

THE Society is prepared to supply photostatic copies (white printing on black background) of any of the articles listed. Copies of the periodicals themselves, or clippings of articles, cannot be supplied.

Price of each print (up to 11 x 14 in. in size), 25 cents plus postage. A separate print is required for each page of the larger-size periodicals, but where possible two pages will be photographed together on the same print. Bill will be mailed with the prints.

Those holding coupon books for clippings formerly issued by The Engineering Magazine Company may use the coupons in payment for photostatic prints. In ordering, state plainly

(1) Page number of Index on which item appears
(2) Title of article
(3) Name of periodical.

Orders should be sent to

Harrison W. Craver, *Director,*
Engineering Societies Library,
29 West 39th Street, New York City.

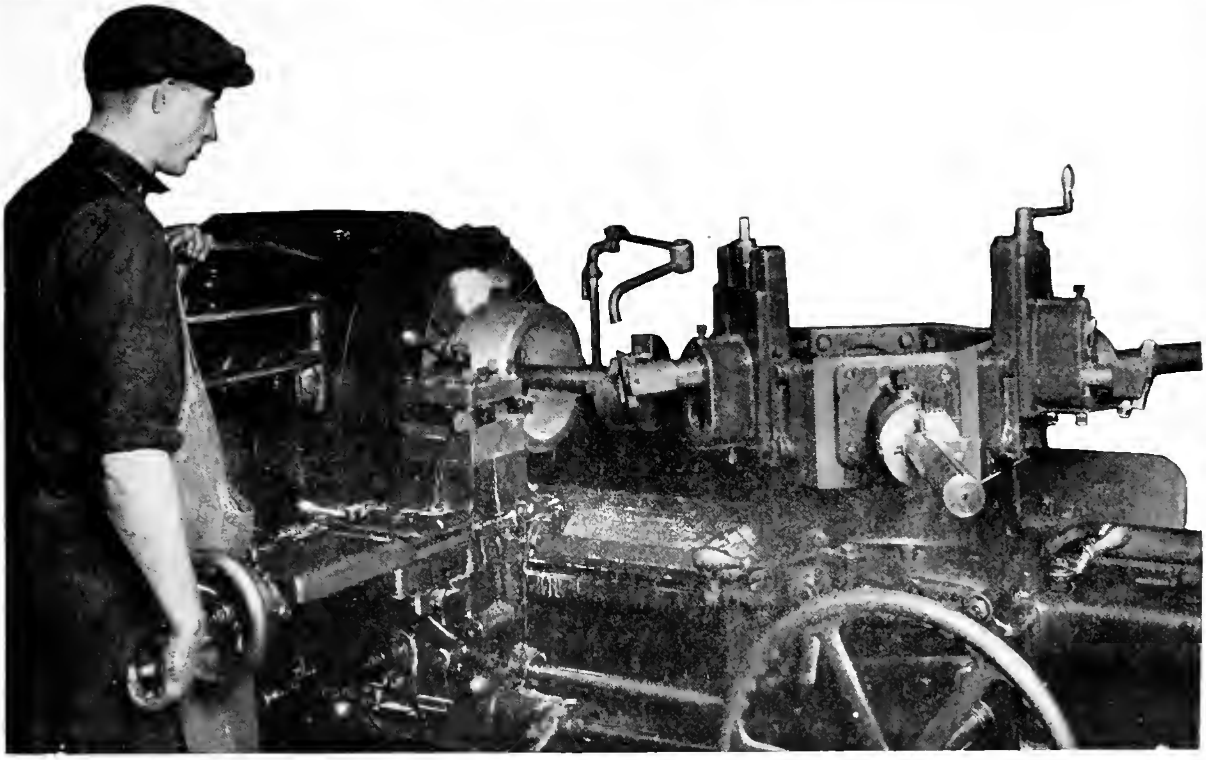
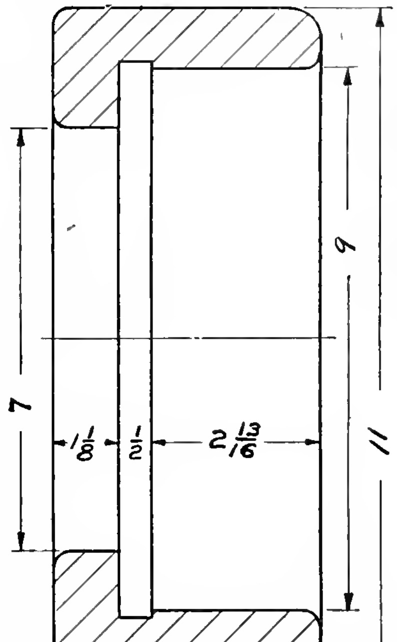
LIST OF TOPICS
THE ENGINEERING INDEX
OCTOBER, 1919



Breaks Another Time Record



The Hahn Manufacturing Company, a jobbing machine shop in Cleveland, reduced production time one-half on this drop forged Clutch Ring when the work was transferred from an engine lathe to a

No. 3-A Universal Hollow Hexagon Turret Lathe

Because of the flexibility of the tool equipment of the No. 3-A, the jobbing shop finds it adaptable for finishing small lots of different pieces as well as long runs of the same piece. Then the time saved by operating both square and hexagon turrets simultaneously, and the wide range of feeds and speeds for all classes of work makes the Universal Hollow Hex the machine for the jobber.

No. 4 Universal, 1½" x 10",	**16" Swing**
No. 2-A Universal, 2½" or 3¼" x 29",	**16½" Swing**
No. 3-A Universal, 3½" or 4½" x 44",	**21½" Swing**

THE WARNER & SWASEY COMPANY

CLEVELAND, OHIO, U. S. A.

TURRET LATHES—TURRET SCREW MACHINES—BRASS WORKING MACHINE TOOLS

NEW YORK Office—Singer Bldg. **Boston Office**—Oliver Bldg. **Buffalo Office**—Iroquois Bldg. **Detroit Office**—Ford Bldg. **Chicago Office and Show Room**—618-622 Washington Blvd.

FOREIGN AGENTS: Chas. Churchill & Co., Ltd., London, Birmingham, Manchester, Newcastle-on-Tyne and Glasgow. Allied Machinery Company, Paris, Turin, Barcelona, Zurich and Brussels. Stokvis & Zonen, Rotterdam. Wilhelm Sonesson Company, Malmo, Copenhagen, Gotenburg and Stockholm. Yamatake & Co., Tokio. Benson Brothers, Sydney and Melbourne. A. Asher Smith, Sydney. A. R. Williams Machinery Co., Ltd., Toronto, St. John, Winnipeg and Vancouver. Williams & Wilson, Ltd., Montreal.

Mechanical Engineering

AIR MACHINERY

Air Chambers

Installation and Use of Air Chambers, H. D. Fisher. Power, vol. 50, no. 6, Aug. 5, 1919, pp. 209-210, 6 figs. Arrangement which is said to have the advantage that by throttling valve it can be arranged to deliver just the quantity of air required and that it will work indefinitely without attention.

Air Receiver

[illegible] Receiver, Frank Richards. Compressed Air Mag., vol. 24, no. 8, Aug. 1919, pp. [illegible]-256. Suggestions in regard to design and installation.

Fans

Centrifugal Fans, Frank S. Townsend. Popular Engr., vol. 12, no. 2, Aug. 1919, pp. 13-15, 3 figs. Their application in gas engineering practice. Paper read before Midland Junior Gas Association, England.

Transportation

The Utilization of Compressed Air in Transportation (Die Verwendung der Pressluft in der Verkehrstechnik). Kasten, Zeitschrift f. komprimierte u. flüssige Gase, vol. 19, no. 11, 1917-18, pp. 97-100, 4 figs. Pneumatic mail tubes in Berlin.

Wind Motors

Wind Motors: Their Possibilities and Limitations, Faville C. Poulton. Jl. Roy. Soc. Arts, vol. 67, no. 3480, Aug. 1, 1919, pp. 590-594. Argues that there is room for wind motor in these days of super-economy because a modern wind motor properly installed gives 15 per cent efficiency while a modern steam plant using coal of 15,000 B.t.u. per lb. gives 13 per cent only.

CORROSION

Copper

Corrosion of Copper—VII, G. F. Bengough and O. F. Hudson. Metal Industry, vol. 15, no. 2, July 11, 1919, pp. 26-28. Tables giving results of immersion tests in both distilled water and sea water. From fourth report of Corrosion Committee of Inst. of Metals.

Earth Currents

Corrosion through Earth Currents from Electric Traction (Die Korrosion durch Erdströme elektrischer Bahnen). Elektrotechnik u. Maschinenbau, vol. 37, no. 6, Feb. 9, 1919, pp. 56-57. Report of the Swiss Electrotechnical Soc. regarding corrosion of gas and water mains.

Rustproofing

Metallic Coatings for Rustproofing. Brass World, vol. 15, no. 8, Aug. 1919, pp. 242-245. Methods of testing coatings. Recommendations concerning coatings.

FORGING

Drop Stamping

Drop-Stamping, Drop-forgings, etc.—VI, Joseph Horner. Mech. World, vol. 66, no. 1700, Aug. 1, 1919, p. 55, 5 figs. Example in which entire forging must be stamped at one time in order to produce recessed form of web. (To be continued).

FOUNDRIES

Casting Machine

New Casting Machine for Pig Iron (Neue Masselgiessmaschine). Zeitschrift f. die gesamte Giessereipraxis, vol. 40, no. 9, Mar. 1, 1919, pp. 109-110, 3 figs. Consists of two turntables holding cast-iron molds; while the specially constructed ladle pours a regulated amount into mould of first table, the second table automatically advances one mold. It is claimed that ingots made by this process are of even size and weight.

Chinese Foundries

Chinese Iron Foundries, F. A. Foster. Am. Mach., vol. 51, no. 8, Aug. 21, 1919, pp. 345-352, 30 figs. Notes the specially remarkable thinness and smooth finish of products in spite of crudeness of method of production.

Condensers

Making and Casting Cylindrical Condensers—I, Ben Shaw. Mech. World, vol. 66, no. 1700, Aug. 1, 1919, pp. 54-55, 3 figs. Illustrating instances where company built cast iron condenser "as one means of reducing the work required to be done by riveters."

Electric Casting

Electric Casting and Welding (Elektrisches Giess- und Schweissverfahren). Zeitschrift f. die gesamte Giessereipraxis, vol. 40, no. 7, Feb. 15, 1919, pp. 81-83. With special reference to Dr. Zerener's method.

Engine Cylinder Casting

Marine Gasoline Engine Cylinders, R. H. Palmer. Foundry, vol. 47, no. 329, Aug. 15, 1919, pp. 567-569, 5 figs. Foundry problems encountered in marine-engine shop.

Gating

Method of Gating Test Bars Affects Results, A. W. Sorgenz, Foundry, vol. 47, no. 329, Aug. 15, 1919, pp. 559-560, 4 figs. Double annealing recommended.

Ingot Mold Foundry

Bethlehem's Ingot Mold Foundry, E. C. Kreutzberg. Iron Trade Rev., vol. 65, no. 8, Aug. 21, 1919, pp. 495-498, 7 figs. Capacity is 10,000 tons of ingot molds, stools and bottom plates per month. Attention is particularly called to arrangement for storing and charging coke and method of pouring molds from long platform.

Layout

A Dayton Foundry of Progressive Design. Iron Age, vol. 104, no. 6, Aug. 7, 1919, pp. 355-356, 3 figs. Method of distributing air for heat and ventilation, use of transferable jib crane, and storage of sand in pits below foundry floor level quoted as interesting features.

Malleable Iron

Insure the Integrity of Malleable, Enrique Touceda. Foundry, vol. 47, no. 329, Aug. 15, 1919, pp. 551-552. Writer believes that soundness of metal in castings is secured by eliminating chills and strict adherence to use of feeding heads to furnish metal at proper pressure. Paper presented before American Foundrymen's Assn.

Molding

Long Castings From Short Patterns, R. R. Clarke. Foundry, vol. 47, no. 329, Aug. 15, 1919, pp. 561-564. Hints on molding light and heavy bushings.

Molding Machines

Molding Machine That Throws Sand, Pat Dwyer. Foundry, vol. 47, no. 329, Aug. 15, 1919, pp. 535-538, 6 figs. Also in Iron Trade Rev., vol. 65, no. 9, Aug. 28, 1919, pp. 567-579, 6 figs. Device in which projectile principle is employed for ramming sand. Sand is thrown by rapidly revolving head.

Patterns

Gear Patterns, Joseph A. Shelly. Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1133-1137, 10 figs. Methods of laying out and constructing patterns for spur and bevel gears and wormwheels.

Ship Castings

Castings for Ship Construction—VIII, Ben Shaw and James Edgar. Foundry, vol. 47, no. 329, Aug. 15, 1919, pp. 540-544, 15 figs. Concerning care necessary in preparing mold for propeller shaft brackets to insure proper allowances for contraction of metal. Writers hold that large flasks are not necessary.

Standardization

Standardization of Foundry Practice, S. W. Wis. Mech. World, vol. 66, no. 1701, Aug. 8, 1919, pp. 69-70. Tabulated records of different conditions under which various foundry operations are conducted are presented as evidence to justify writer's belief that it is well-nigh impossible to approach anything like uniform practice. He suggests idea of a foundry equivalent to National Laboratory. Paper read before Newcastle Branch of British Foundrymen's Assn.

FUELS AND FIRING

Alcohol

Alcohol Motor Fluid. Engineer, vol. 128, no. 3314, July 4, 1919, pp. 17-18. Also in Jl. Soc. Chem. Industries, vol. 38, no. 13, July 15, 1919, pp. 250R-252R, and in Eng. & Indus. Management, vol. 2, no. 3, July 17, 1919, p. 67. Report of committee appointed by British Government to consider and report upon available sources of supply, methods of manufacture and cost of product; suitability, either alone or in admixture with other combustibles, for use in internal-combustion engines, and modifications of existing types of such engines which may be necessary to attainment of efficiency, and question of denaturing alcohol, and alterations to be made in present excise arrangements.

Fuel Saving

Fuel Saving in Industrial Plants. John F. Tinsley. Mech. Eng., vol. 41, no. 9, Sept. 1919, pp. 750-751. Manner in which Worcester, Mass. Fuel Conservation Committee conducted campaign during war.

Gaseous Fuel

Utilization of Gaseous Fuel in Commercial Practice, F. W. Epworth. Metal Industry, vol. 15, no. 2, July 11, 1919, pp. 21-25, 9 figs. With consideration of types of gas-fired furnaces and methods for their control.

Low-Grade Fuel

The Production of Steam from Low Grade Fuel and a Chemical Works Power Plant, P. Parrish. Chem. Industry, vol. 38, no. 14, July 31, 1919, pp. 234T-239T and (discussion) 239T-241T, 5 figs. Details of Crosthwaite's patent forced-draft air tubes.

Metallurgical Furnaces

Fuel for Metallurgical Furnaces, Rose Demorest. Blast Furnace & Steel Plant, vol. 7, no. 8, Aug. 1919, pp. 386-389. Bibliography of oil fuel for metallurgical furnaces compiled from chief sources of technical literature.

Powdered Coal

The Use of Pulverized Coal—II, Leonard C. Harvey. Engineer, vol. 128, no. 3315, July 11, 1919, pp. 26-28, 5 figs. Notes on various types of burners.

Waste Heat Boilers and Pulverized Fuel in Chemical Factories, C. J. Goodwin. Chem. Industry, vol. 38, no. 14, July 31, 1919, pp. 213T-220T and (discussion) 220T-222T, 6 figs. Typical installations at various English works.

High Efficiency of Powdered Coal as Fuel—I. Coal Trade Jl., vol. 50, no. 33, Aug. 13, 1919, pp. 981-982, 1 fig. Quigley system. (To be continued.)

The Use of Pulverized Coal, L. C. Harvey. Engineering, vol. 108, no. 2796, Aug. 1, 1919, pp. 160-164, 13 figs. Systems of Locomotive Pulverized Fuel Co. and Powdered Coal Engineering Co. (Concluded.) Paper read before Iron and Steel Inst.

The Use of Pulverized Coal, L. C. Harvey. Engineering, vol. 108, no. 2795, July 25, 1919, pp. 125-128, 11 figs. Particulars of various systems. (Continuation of serial.) Paper read before Iron and Steel Inst.

Pulverized Coal as a Fuel for Boilers, Edward R. Welles and W. H. Jacobi. Mech. Eng., vol. 41, no. 9, Sept. 1919, pp. 744-749 and p. 787, 5 figs. General study of its characteristics and the operating conditions met with in its commercial applications; also a discussion of the nature of flame, types of burners and of a design of pulverized-fuel furnace for a 500-hp. boiler.

High Efficiency of Powdered Coal as Fuel—II. Coal Trade Jl., vol. 50, no. 34, Aug. 20, 1919, pp. 1018-1019, 2 figs. Description of controller and burner. Comparison of other fuels.

FURNACES

Heat-Treating Furnaces

Heat Treating Furnaces for Heavy Artillery, William J. Harris, Jr. Blast Furnace & Steel Plant, vol. 7, no. 8, Aug. 1919, pp. 378-380, 2 figs. Vertical steel shell-type furnace installed at U. S. Government arsenal at Watertown, Mass. for heat treatment of gun tubes and other parts of heavy artillery.

Heating Furnaces and Annealing Furnaces—VIII, W. Trinks. Blast Furnace & Steel Plant, vol. 7, no. 8, Aug. 1919, pp. 390-393, 9 figs. Diagram for determining generator size.

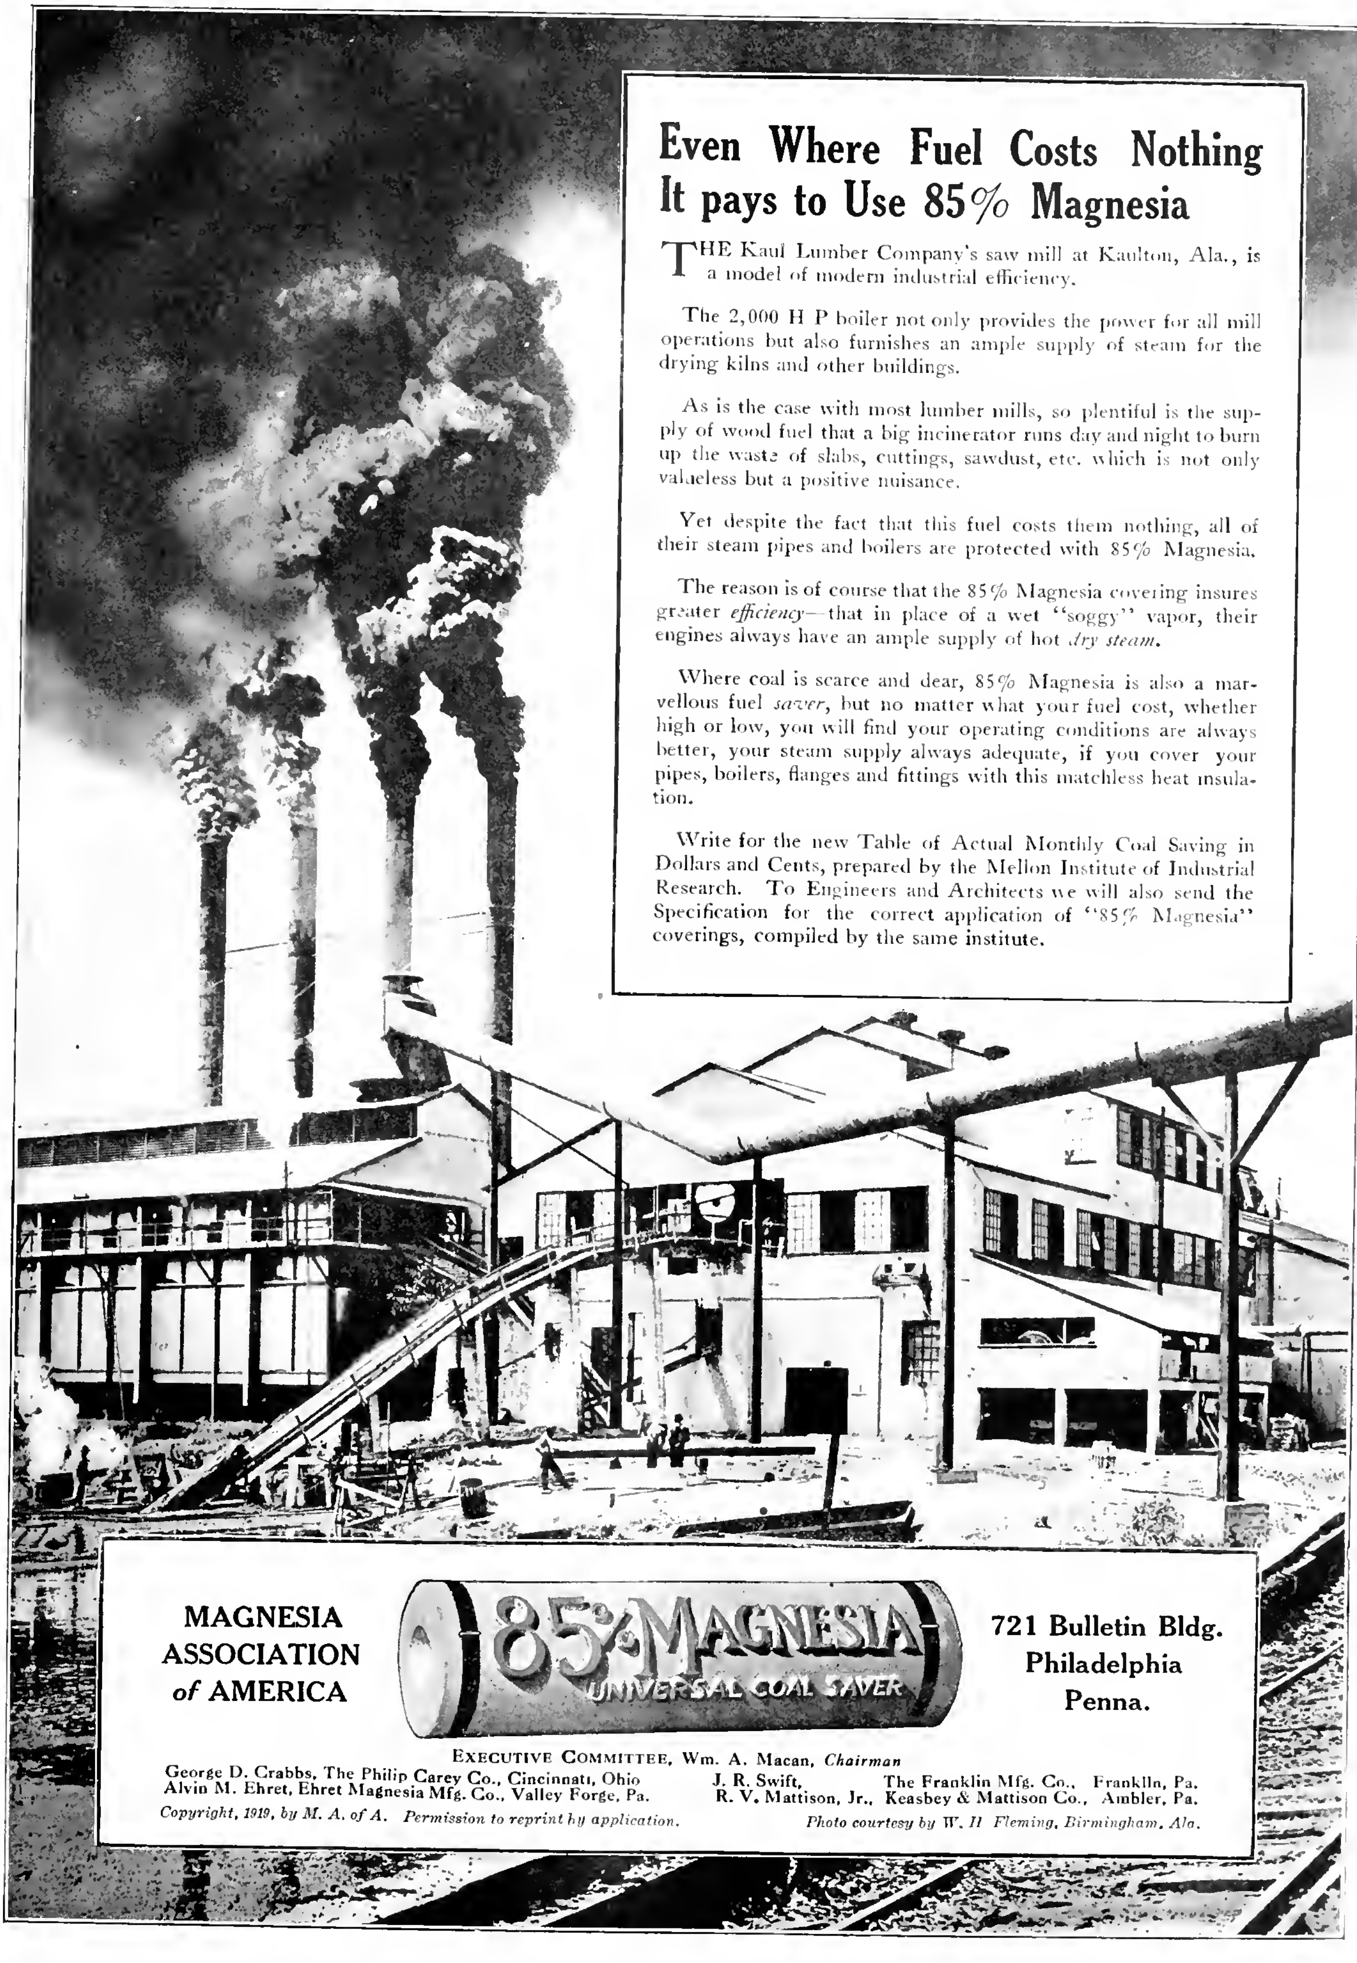
GAGES

Grinding Gages

Producing Screw Thread Gauges by Grinding, C. Edgar Allen. Machy. (Lond.), vol. 14, no. 356, July 24, 1919, pp. 504-507, 9 figs. Method which utilizes disintegration of wheel during grinding to yield ultimate thread form.

Newall Gages

Newall Measuring Machines and Gauges. Engineering, vol. 108, no. 2795, July 25, 1919, pp. 104-105, 12 figs., partly on two supplement plates. Details of test room specially noted.



Even Where Fuel Costs Nothing It pays to Use 85% Magnesia

THE Kauf Lumber Company's saw mill at Kaulton, Ala., is a model of modern industrial efficiency.

The 2,000 H P boiler not only provides the power for all mill operations but also furnishes an ample supply of steam for the drying kilns and other buildings.

As is the case with most lumber mills, so plentiful is the supply of wood fuel that a big incinerator runs day and night to burn up the waste of slabs, cuttings, sawdust, etc. which is not only valueless but a positive nuisance.

Yet despite the fact that this fuel costs them nothing, all of their steam pipes and boilers are protected with 85% Magnesia.

The reason is of course that the 85% Magnesia covering insures greater *efficiency*—that in place of a wet "soggy" vapor, their engines always have an ample supply of hot *dry steam.*

Where coal is scarce and dear, 85% Magnesia is also a marvellous fuel *saver*, but no matter what your fuel cost, whether high or low, you will find your operating conditions are always better, your steam supply always adequate, if you cover your pipes, boilers, flanges and fittings with this matchless heat insulation.

Write for the new Table of Actual Monthly Coal Saving in Dollars and Cents, prepared by the Mellon Institute of Industrial Research. To Engineers and Architects we will also send the Specification for the correct application of "85% Magnesia" coverings, compiled by the same institute.

MAGNESIA ASSOCIATION *of* AMERICA

85% MAGNESIA
UNIVERSAL COAL SAVER

**721 Bulletin Bldg.

Taft-Peirce Measuring Machine

Taft-Peirce Measuring Machine, F. J. B[illegible]. Inspector, vol. 1, no. 3, Aug. 15, 1919, pp. 9 and 17, 1 fig. For checking dimensions of plug gages and similar objects.

Tolerances

Tolerances as Affected by Workshop Conditions, A. Whitehead. Engineering, vol. 108, no. 2798, Aug. 15, 1919, pp. 201-203, 1 fig. Article deals with shafts and holes such as occur in motor chassis and smaller works under conditions associated with intensive production.

GAS ENGINEERING

Cleaning Gas

Cleaning Gas By Effective Method, George B. Cramp. Iron Trade Rev., vol. 65, no. 8, Aug. 21, 1919, pp. 506-507, 4 figs. Corrugated baffle plates built on interior of gas washer said to give large cleaning area and uniform condition throughout washer.

Distribution Under Pressure

Report on the Distribution of Gas under Pressure at a Distance (Rapport sur la distribution du gaz sous pression à distance), M. A. Schmidt. Bulletin de la Société Industrielle de Mulhouse, vol. 84, no. 6, June-July Aug. Sept. 1911, pp. 453-460, 1 fig. Question of economical distribution studied with reference to Monnier-Pohl expression. Diameter of conduit, pressure and quantity delivered.

Gas-Main Connection

Standardized Method for Connecting Gas Mains, Duncan D. Randsdell. Gas Age, vol. 44, no. 4, Aug. 15, 1919, pp. 137-139, 2 figs. Experience of Washington Gas Light Co. in cutting in sections of cast-iron gas mains.

Gas Production to Standards

Fuel Economy at the Apedale Works of the Midland Coal, Coke and Iron Company, Limited, William Hill and J. A. Cork. Iron & Coal Trades Rev., vol. 99, no. 2682, July 25, 1919, pp. 106-107. Special attention is said to be given to gas purification, regular heating value of gas, constant pressure of gas at engine stop valves, provision of circulating water at constant pressure and free from impurities, and means to enable foregoing conditions to be automatic. Paper read before North Staffordshire Inst. of Min. Engrs.

Great Britain

Present Conditions in the British Gas Industry, D. Milne Watson. Gas Age, vol. 44, no. 3, Aug. 1, 1919, pp. 97-98. Address delivered to British Board of Trade.

Low-Temperature Distillation

Low Temperature Distillation of Coal, C. M. Garland. Power, vol. 50, no. 7, Aug. 12, 1919, pp. 248-251, 4 figs. Recommends for power plants with constant load burning over 50 tons of coal per day, combination of low-temperature process with by-product gas producer to recover greater percentage of ammonium sulphate. Claimed economical advantages are pointed out.

Measurement of Gas

Electrical Method for Commercial Measurement of Gases, G. A. Sharland. Iron & Coal Trades Rev., vol. 99, no. 2680, July 11, 1919, pp. 37-38, 4 figs. Meter gives in standard units graphic record of actual amount of gas passing during any specific interval of time.

Natural Gas

Methods for More Efficiently Utilizing Our Fuel Resources—XXX, Samuel S. Wyer. Gen. Elec. Rev., vol. 22, no. 8, Aug. 1919, pp. 636-648, 11 figs. Natural gas.

Providence Gas Company

Manufacturing Plant of the Providence Gas Co.—III, Walter M. Russell. Chem. & Metallurgical Eng., vol. 21, no. 3, Aug. 1, 1919, pp. 147-153, 8 figs. Installation and operation of battery of 40 Koppers cross-regenerative, combination, by-products ovens. Coal and coke-handling apparatus. Paper read before Am. Inst. Chemical Engrs.

HANDLING OF MATERIALS

Coal Handling

Insuring Adequate Coal Supply with the Least Expenditure, George E. Wood. Elec. Ry. Jl., vol. 54, no. 7, Aug. 16, 1919, pp. 312-315, 10 figs. Layout of coal-handling equipment and storage facilities of Conn. Company at New Haven.

HEAT-TREATING

Steel

Some Remarks concerning the Heat Treatment of Steel and Their Application to the Treatment of Steels Used for Airplane Motors, Albert Sauveur. Jl. Franklin Inst., vol. 188, no. 2, Aug. 1919, pp. 189-197. Distinguishing between three treatments: softening treatment, strengthening treatment and hardening treatment.

Notes on Heat Treatment of Steel, T. D. Lynch. Proc. Engrs. Soc. of Western Pa., vol. 35, no. 5, June 1919, pp. 215-237 and (discussion), pp. 238-242, 11 figs. Materials of design; standardized treatments; results of standard heat treatment.

HEATING AND VENTILATION

District Heating System

The Transmission of Steam in a District Heating System by Means of High-Velocity Feeders, Norman W. Calvert. Heat. & Vent. Mag., vol. 16, no. 8, Aug. 1919, pp. 32-35, 3 figs. Notes connection for reducing flow velocity at end of feeder.

Fan Heating System

A Fan Heating System Installed Without the Use of Galvanized Iron, F. B. Rowley and John R. Allen. Heat. & Vent. Mag., vol. 16, no. 8, Aug. 1919, pp. 17-23, 11 figs. Temporary work at Univ. of Minn. while preparing building for prospective registration of 5,000 men in S. A. T. C.

Farm Building Ventilation

Farm Building Ventilation, W. B. Clarkson. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 51-57. Asserts that there is need for more specialization on subject by those who will assume responsibility for good results.

Homes

Coal and Electricity Compared for the Heating of Homes. Heat. & Vent. Mag., vol. 16, no. 8, Aug. 1919, pp. 24-28. From report of Hydro-electric Power Commission of Ontario.

Oil Elimination from Condensation

Removing Oil from Condensation, Charles L. Hubbard. Domestic Eng., vol. 88, no. 7, Aug. 16, 1919, pp. 301-303 and 332. Devices eliminating oil from condensation in steam-heating systems. Their installation and operation.

Radiating Surface

Placing Hot Water Radiators Below Boiler Level, Wm. Hutton. Domestic Eng., vol. 88, no. 7, Aug. 16, 1919, pp. 297-299, 2 figs. Method of proportioning radiating surface to promote circulation at various levels.

Schools

The Mechanical Equipment of Washington School, Bayonne, New Jersey, Donald G. Anderson. Am. Architect, vol. 116, no. 2278, Aug. 20, 1919, pp. 251-256, 8 figs. Heating, ventilating and electric wiring.

Testing

Testing Modern Plumbing Installations, Robert J. Gordon. Domestic Eng., vol. 88, no. 7, Aug. 16, 1919, pp. 294-296, 5 figs. How to test sewers, drains, soil, waste and vent piping by water, air and smoke.

HOISTING AND CONVEYING

Conveyor Control

The Curtis Bay Pier of the B. & O. R. R.—II. Coal Trade Jl., vol. 50, no. 33, Aug. 13, 1919, pp. 985-986, 3 figs. Automatic control of conveyor and balancing pin described.

Conveyor, Portable

Modernizing Freight-Handling Methods. Iron Trade Rev., vol. 65, no. 6, Aug. 7, 1919, pp. 351-355, 6 figs. Illustrating uses of portable conveyors.

Crane, Breakdown

35-Ton Steam Breakdown Crane, Great Northern Railway, H. N. Gresley. Ry. Gaz., vol. 31, no. 4, July 25, 1919, pp. 118-119, 3 figs. Locomotive portion and jib supported upon ten-wheeled carriage; wheelbase of engine truck is 21 ft.; engine is equipped with two high-pressure cylinders.

Crane, Reinforced Concrete

Traveling Crane of Reinforced Concrete. Eng. & Contracting, vol. 52, no. 5, July 30, 1919, p. 127, 1 fig. Capacity three tons; span 32.8 ft. Translated from Génie Civil.

Cranes, Floating

The World's Largest Floating Cranes. Coal Trade Jl., vol. 50, no. 32, Aug. 6, 1919, pp. 956-957, 1 fig. Cranes with lifting capacity of 150 tons at radius of 105 ft. recently completed and installed at Navy Yards at Norfolk, Va., and Mare Island, Cal.

Cranes for Steel Works

Special Cranes with Electric Drive for Steel Works (Beispiele neuer elektrisch betriebener Spezialkräne für Stahlwerke), Ernst Blau. Elektrotechnik u. Maschinenbau, vol. 37, no. 9, Mar. 2, 1919, pp. 81-86, 7 figs. Scrap-iron loading crane with lifting magnet and tray arrangement and trough-charging crane of the Ardelwerke, Berlin.

Cranes, Quarry

Ship Cranes for Quarrying Operations. Rock Products, vol. 22, no. 16, Aug. 2, 1919, pp. 21-24, 13 figs. Features of pit-type quarry and crushing plants in Montreal.

Elevators, Electric

Future Possibilities of Push Button Control for Electric Elevators, Alexander Marks. Am. Architect, vol. 116, no. 2276, Aug. 6, 1919, pp. 187-194, 8 figs. Possibilities opened up by removal of mandatory restrictions against such type of operation, notably at New York City.

Grain Elevator

Portable Pneumatic Grain Elevator; Duckham System, George Frederick Zimmer. Engineering, vol. 108, no. 2797, Aug. 8, 1919, pp. 191-192, 7 figs. partly on two supplement plates. Mounted upon railway rolling stock.

Portable Grain Elevator. Engineering, vol. 108, no. 2796, Aug. 1, 1919, p. 145, 5 figs. Consists of hopper supported by three columns from wagon-type body.

Gravity Runways

The Utility of Gravity Runways. Ry. Gaz., vol. 31, no. 3, July 18, 1919, pp. 87-88. Notes on their application and operation.

Ore Unloader

An Automatic Iron-Ore Unloader. Eng. & Min. Jl., vol. 108, no. 8, Aug. 23, 1919, pp. 305-307, 3 figs. Wellman-Seaver-Morgan electrically driven machines used for the moving of cargoes from lake steamers to cars or stock-piles ready for shipment to furnaces.

Rock Conveyors

Roe's Patent Rope Conveyor, George Frederick Zimmer. Eng. & Indus. Management, vol. 2, no. 3, July 17, 1919, pp. 89-91, 5 figs. Total length is 1800 ft. It consists of two endless ropes running around a pair of edge sheaves at either terminal, the drive being taken through one pair while the other pair is mounted on a low trolley attached to tensioning arrangement.

Tipping Bucket

Refuse Tipping Bucket. Colliery Guardian, vol. 118, no. 3058, Aug. 8, 1919, pp. 373, 3 figs. Consists of bucket supported on angle-iron rings which rest on rollers fixed in frame provided with wheels that run upon track or roller to top of bing.

HYDRAULIC MACHINERY

Ontario Power Company's Plant

Extension to the Ontario Power Company's Plant. Elec. News, vol. 28, no. 16, Aug. 15, 1919, pp. 23-30, 15 figs. Features are wood-stave pipe 13½ ft. in diameter and 6700 ft. long, differential surge tank of 60 ft. outside diameter and 78 ft. high, and power house with walls designed to withstand 40 ft. rise in tail water. Added capacity is 30,000 kva.

Seewer Regulating System

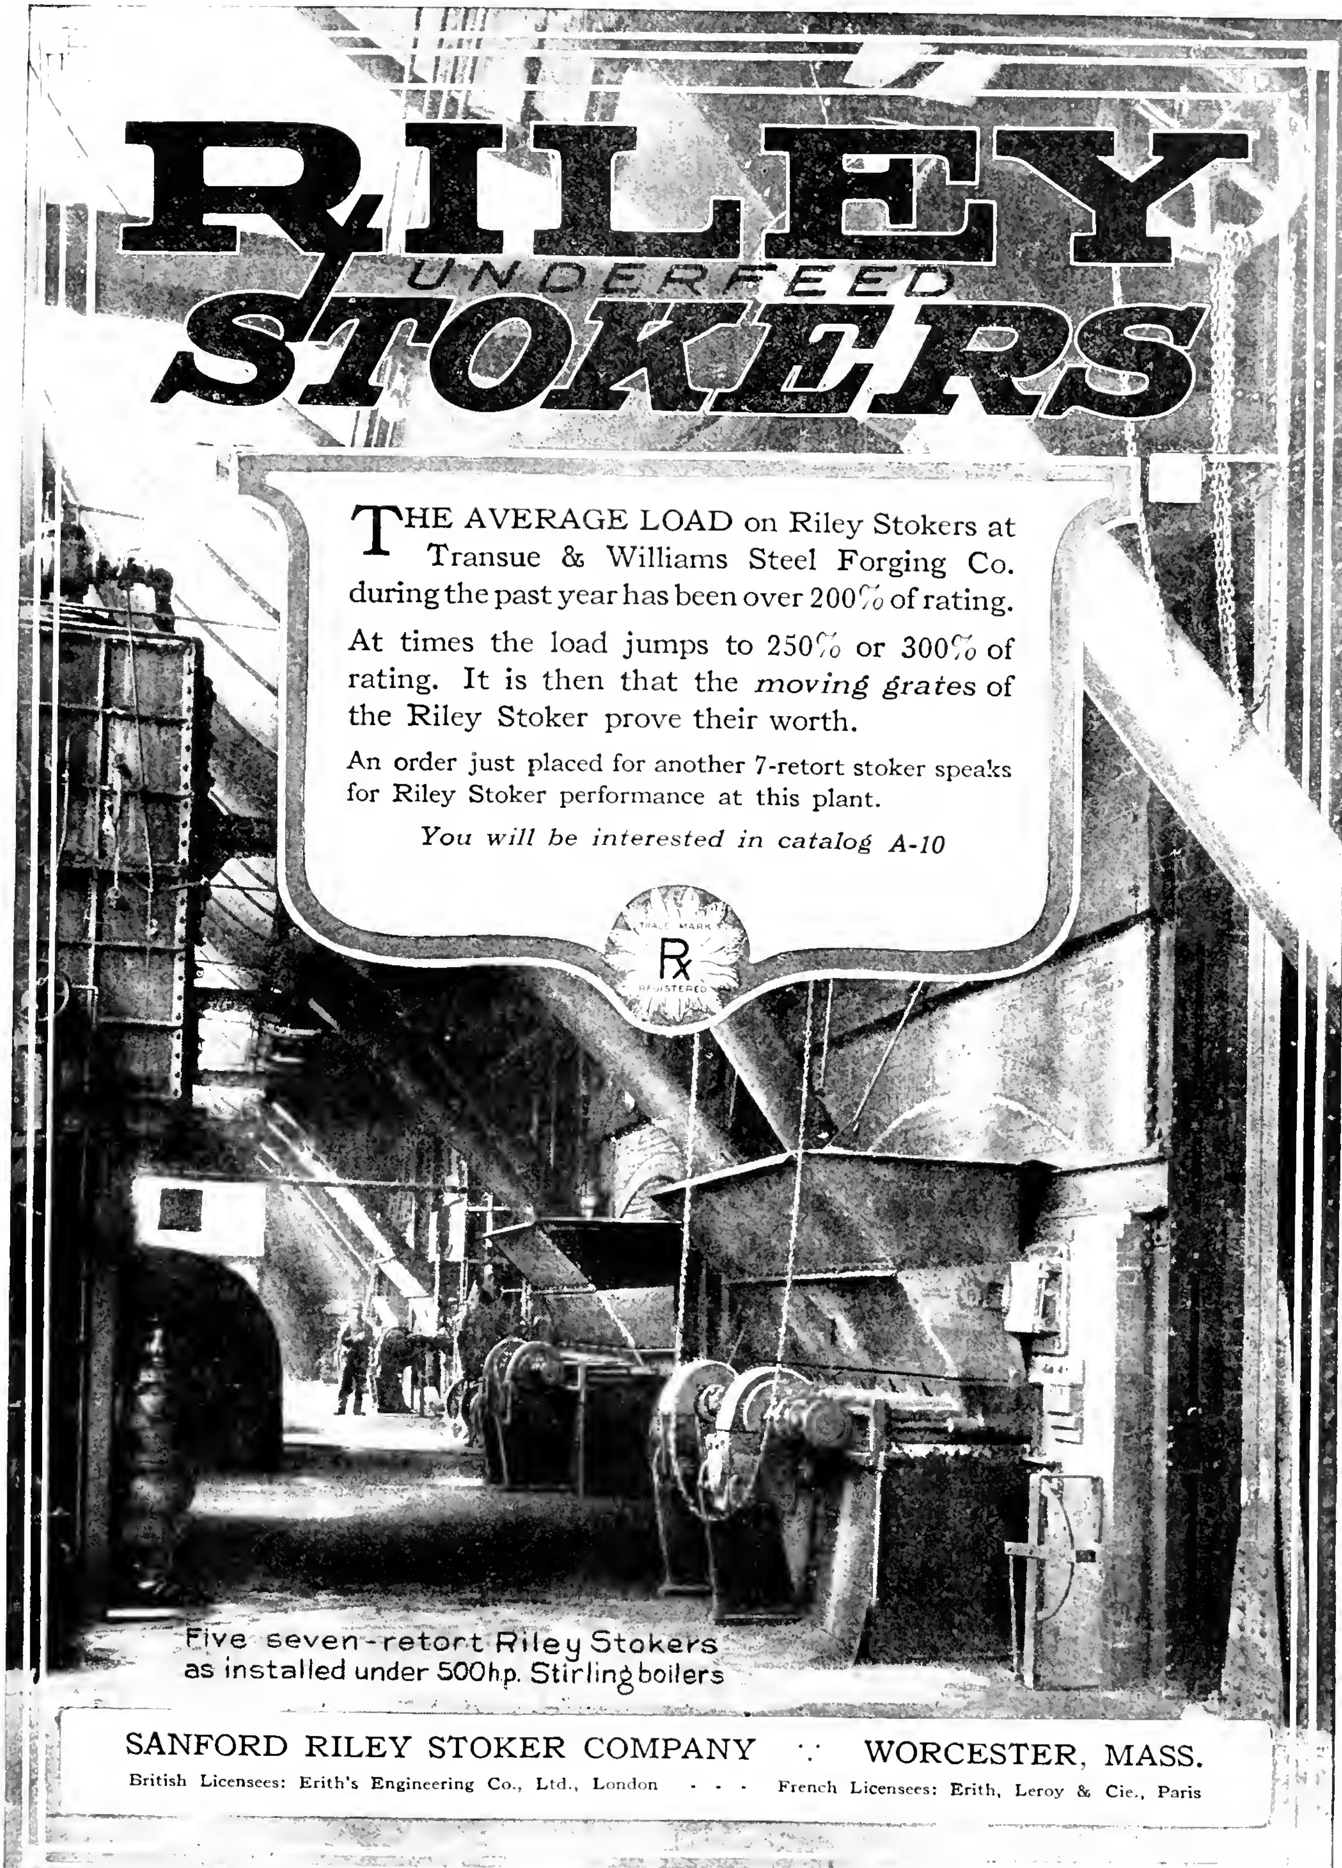
See Turbine Governors.

Turbine Design

Progress in Water-Turbine Design, A. H. Wilson and A. J. McDougall. Can. Engr., vol. 37, no. 8, Aug. 21, 1919, pp. 241-242. From annual report of Can. Elec. Association's Committee on Prime Movers.

Turbine Governors

Seewer's Universal Regulating System for High-Pressure Pelton Turbines (Universal-Regulierung System Seewer für Hochdruck Pelton Turbinen), Franz Prasil. Schweizerische Bauzeitung, vol. 73, no. 23, June 7, 1919, pp. 263-267, 9 figs. Curves, tables and tachograms of tests made.



RILEY
UNDERFEED
STOKERS
THE AVERAGE LOAD on Riley Stokers at Transue & Williams Steel Forging Co. during the past year has been over 200% of rating.
At times the load jumps to 250% or 300% of rating. It is then that the *moving grates* of the Riley Stoker prove their worth.
An order just placed for another 7-retort stoker speaks for Riley Stoker performance at this plant.

Turbine Testing Station

Turbine Testing Station of Mechanical Works at Vevey, S. A. Bulletin Technique de la Suisse Romande, vol. 45, no. 15, July 26, 1919, pp. 145-150, 2 figs. Built specially for connecting Francis types under all running conditions.

Water Hammer

Water Hammer in Conduits under Pressure (Note sur le calcul du coup de bélier dans les conduites sous pression). Bulletin Technique de la Suisse Romande, vol. 45, nos. 15 and 16, July 26 and Aug. 9, 1919, pp. 153-155 and 161-166, 12 figs. July 26: Application of theory to various examples. Aug. 9: Illustrating application of formulæ in actual computations.

INTERNAL-COMBUSTION ENGINES

Carburetors

Mathematical Study of Operation of Spray Constant Level Carburetors (Étude mathématique du fonctionnement des carburateurs à giclage et à niveau constant), M. Carbonaro. Génie Civil, vol. 75, no. 5 and 6, Aug. 2, 1919 and Aug. 9, 1919, pp. 96-99 and pp. 120-124, 7 figs. Laws of flow of gasoline through capillary passages. Relation between gasoline-air ratio and depression caused by motor in admission pipe. (To be continued).

The Zephyr Carburetter. Autocar, vol. 43, no. 1240, July 26, 1919, pp. 131-132, 4 figs. Operates on submerged jet principle.

Engine Tests

Some Experiments on a Small Engine, Harry R. Ricardo. Automobile Engr., vol. 9, no. 129, Aug. 1919, pp. 236-240, 6 figs. Tests to investigate performance of Continental engine as fitted to Morris-Crowley car.

Hot Spot

Accessibility and Hot Spot Device for Vaporizing of Fuel Feature New Gray Truck Engine. Commercial Vehicle, vol. 21, no. 1, Aug. 1, 1919, pp. 28-29, 3 figs. Engine is of valve-in-head type.

Marine Oil Engines

The Ansaldo-San Giorgio Marine Oil Engine. Engineering, vol. 108, no. 2794, July 18, 1919, pp. 80-82, 1 fig. Four-cylinder two-cycle type with valve-controlled port scavenging.

Rotary and Radial Engines

Rotary and Radial Engines, T. L. Sherman. Automobile Engr., vol. 9, no. 129, Aug. 1919, pp. 248-249. Comparative review of dynamic and various minor problems as they effect these two types.

Starters

A New Development in Motor Starters. Engineer, vol. 128, no. 3315, July 11, 1919, pp. 32-33, 7 figs. "Navy" type starter designed for submarine work.

Tars, Raw, as Fuel

The Use of Raw Tars as Fuels for Diesel Engines, Harold Moore. Engineering, vol. 108, no. 2797, Aug. 8, 1919, pp. 167-168. Summary of chemical and physical properties of tar oils and of practical experience of their behavior in Diesel engines.

Thermal Efficiency, Limits

The Limits of Thermal Efficiency in Internal Combustion Engines, Dugald Clerk. Engineering, vol. 108, nos. 2794, 2795, 2796, July 18, 26 and Aug. 1, 1919, pp. 77-79, 130-132 and 157-159, 22 figs. July 18: Technical discussion of future possibilities of obtaining motor power by gas and liquid fuel in most effective manner. July 25: Variation of engine weight with increasing dimensions. Aug. 1: Determination of heat loss and varying specific heat of flame and products of combustion in engine cylinder by Clerk zigzag diagram. Also abstracted in Engineer, vol. 128, no. 3315, July 11, 1919, pp. 40-42, 1 fig.

LUBRICATION

Bearing Lubrication

Oiling and Lubricating Devices, Otto Abdt. Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1146-1147, 4 figs. Some methods of lubricating inaccessible bearings.

MACHINE ELEMENTS AND DESIGN

Crank Analysis

An Analysis to Distinguish Between a Crank and an Eccentric as Driving or Driven Elements, H. S. Dickinson. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 96-124, 18 figs. Formula and diagrams comparing resultant moments.

Riveted Joints

Riveted Joints for Steel Penstocks and Tanks, H. A. Babcock and J. R. Montagne. Can. Engr., vol. 37, no. 6, Aug. 7, 1919, pp. 195-200, and 209, 8 figs. Formula and tables of their design. Examples of solution of maximum joint efficiency.

Roller Bearings

Roller Bearing Types and Applications. Raw Material, vol. 1, no. 5, July 1919, pp. 265-267, 7 figs. Construction features of various makes of roller bearings and their applications to various types of machinery and machine tools. (To be continued).

Screw Grading

A Pitch Engagement System of Grading Screws. Machy. (Lond.), vol. 14, no. 357, July 31, 1919, pp. 529-532, 5 figs. Screw threads graded on number of threads in engagement.

MACHINE SHOP

Gear-Cutting Machines, Setting Operations

Setting Operations on Gear-Cutting Machines, Fred Horner. Machy. (Lond.), vol. 14, no. 357, July 31, 1919, pp. 521-527, 29 figs. As practiced at various English shops and at works of Oerlikon Machine Tool Co. of Switzerland.

Grinding Cutters

Latest Practice in Cutter Grinding—III, IV & V. Am. Mach., vol. 51, nos. 6, 7 & 8, Aug. 7, 14 & 21, 1919, pp. 251-254, 323-325, and 369-371, 24 figs. Angular cutter grinding and grinding of form cutters and taps. Modern practice in hand and chucking reamer grinding for steel, cast iron and bronze; tables giving vertical adjustment for above center for both cutting clearance and second clearance. Methods used by Cincinnati Milling Co. in grinding hand reamers for steel and also chucking reamers for cast iron, bronze, or steel, both roughing and finishing. (Concluded.)

Motor-Truck Repair Work

Equipment Required for Upkeep of 54 Gasoline Trucks, George Heron. Commercial Vehicle, vol. 21, no. 2, Aug. 15, 1919, pp. 52-55, 8 figs. Itemized list of machines used for repair work.

Plano-Milling Practice

Plano-Milling Practice in Automobile Plants —II. Machy. (Lond.), vol. 14, no. 355, July 17, 1919, pp. 461-465, 9 figs. Milling operations on cylinder blocks and heads of typical American engines.

Small-Shop Work

General Work in the Small Shop—XXII. Mech. World, vol. 66, no. 1698, July 18, 1919, pp. 26-27, 6 figs. Cutting of wormwheels to suit V-thread worms. (Continuation of serial).

Standardized Part Production

Jigs, Tools, and Special Machines with Their Relation to the Production of Standardized Parts, H. C. Armitage. Mech. World, vol. 66, no. 1699, July 25, 1919, pp. 39-40, 4 figs. Comparative cost results between three schemes small production, large production and maximum production. (Concluded.)

MACHINERY, METAL-WORKING

Chucking and Turning Machines

Semi-Automatic Chucking and Turning Machine. Machy. (Lond.), vol. 14, no. 355, July 17, 1919, pp. 472-474, 7 figs. Swing of 12¼ in. diameter over bed or 8 in. diameter over cross slide is possible and turning limit is 8 in. diameter with standard tools supplied.

Crankshaft Lathe

A Record Smashing Crankshaft Lathe, Ethan Viall. Am. Mach., vol. 51, no. 9, Aug. 28, 1919, pp. 395-399, 8 figs. For machining sides of webs and turning ends of crankpins on all of throws at the same time. Machining time is claimed to be reduced from thirty to two days.

Drill Heads

Novel Portable Electrical Drill Heads, Frank C. Perkins. Can. Machy., vol. 22, no. 7, Aug. 14, 1919, pp. 177-178, 4 figs. Operation of English and German types illustrated.

Grinding Machines

Machine and Fitting Shop Practice, Fred Horner. Mech. World, vol. 66, no. 1699, July 25, 1919, pp. 38-39, 5 figs. Types used in internal grinding machines. (Continuation of serial.)

Hand Tools

Portable Motor-Driven Hand Tools for Wood and Metal Working. Elec. Rec., vol. 26, no. 2, Aug. 1919, pp. 91-97, 33 figs. Details concerning construction and operating features.

Lathes

Recent Machine Tool Developments—II & III, Joseph Horner. Engineering, vol. 108, no. 2794 and 2797, July 18 and Aug. 8, 1919, pp. 70-73 and 172-176, 46 figs. Forms of beds, legs, standards, framings, slides, and tool and work supports. Illustrating typical example of longitudinal outlines of lathe beds, legs and equipment.

See also Crankshaft Lathe.

The Design and Construction of a 4½-in. Lathe Tail-stock. Model Eng. & Elecn., vol. 41, no. 951, July 17, 1919, pp. 61-64, 4 figs. Operations required in construction and fitting of tailstock to old lathe. (To be continued.)

Milling Machines

Tilted Rotary Milling Machine. Machy. (Lond.), vol. 14, no. 355, July 17, 1919, pp. 481-484, 5 figs. In addition to allowing machine to be used as continuous rotary miller, provision is made for using it as indexing machine.

Tooling Equipment for Piston Rings

Tooling Equipment for an Automobile Piston Ring. Machy. (Lond.), vol. 14, no. 355, July 17, 1919, pp. 475-477, 7 figs. Performing two operations—splitting on each side and peening until strung together—at one time.

Vice

"Fland" Machine Vice. Engineering, vol. 108, no. 2796, Aug. 1, 1919, pp. 140-141, 13 figs. Constructed on "three point of suspension" principle, usually two jaws of vice being replaced by three sliding blocks.

MACHINERY, SPECIAL

Farm Machinery

A Study of the Plow Bottom and Its Action upon the Furrow Slice, E. A. White. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 42-50, 13 figs. Machine for studying mathematical action of plow bottoms.

See also Equalizers and Hitches.

Draft Tests of Farm Machiery, E. J. Stirniman. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 9-25. Result of series of drawbar tests and power required to operate various power machines.

Plow Bottom Design, C. A. Bacon. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 26-40, and (discussion) pp. 40-42, 10 figs. It is observed that search for material that would withstand erosive influence of silicon led to manufacture of chilled plow. Reference is made to experiments with different shaped plow bottoms.

Standardization of Farm Machinery, A. B. Dinneen. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 151-159. Review of accomplishments.

Gimbals

Gimbal Stabilization, V. Bush. Jl. Franklin Inst., vol. 188, no. 2, Aug. 1919, pp. 199-215, 9 figs. Analysis of effectiveness of gimbals of various designs for maintaining horizontal platform on shipboard and of gyroscopic stabilizing of such devices.

Gun, Machine, Tripod

High-Production Tooling Methods as Applied to the Machine-Gun Tripod, Model 1918—II, Albert A. Dowd and Donald A. Baker. Am. Mach., vol. 51, no. 9, Aug. 28, 1919, pp. 401-407, 7 figs. Tools for machining pintle.

Pintle Machining

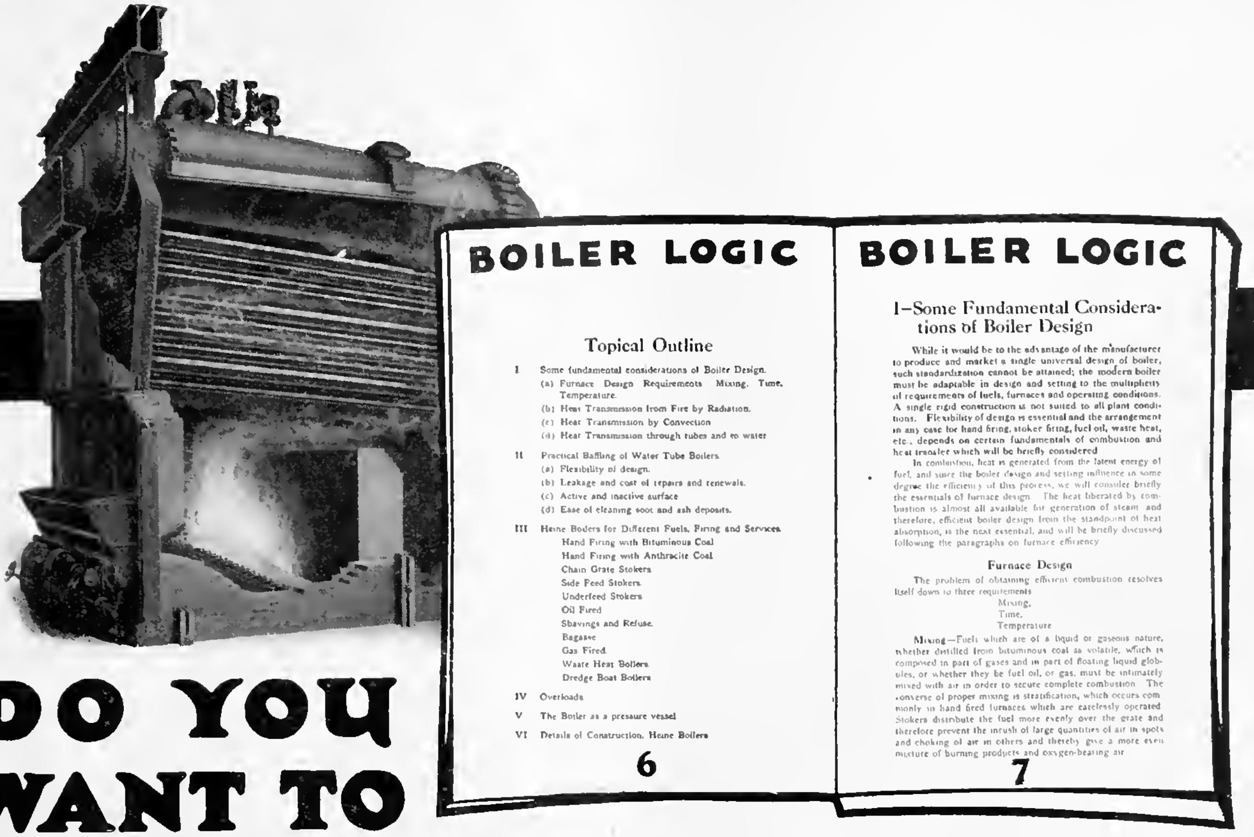
See Gun, Machine, Tripod.

Plow Bottoms

See Farm Machinery.

Sine Bars

Universal Sine Bar for the Toolmaker, J. B. Gray. Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1159-1162, 8 figs. Also Machy. (Lond.), vol. 14, no. 357, July 31, 1919, pp. 533-535, 8 figs. Method of making, and application to various classes of precision work.



BOILER LOGIC

Topical Outline

I Some fundamental considerations of Boiler Design.
(a) Furnace Design Requirements Mixing, Time, Temperature.
(b) Heat Transmission from Fire by Radiation.
(c) Heat Transmission by Convection
(d) Heat Transmission through tubes and to water

II Practical Baffling of Water Tube Boilers.
(a) Flexibility of design.
(b) Leakage and cost of repairs and renewals.
(c) Active and inactive surface
(d) Ease of cleaning soot and ash deposits.

III Heine Boilers for Different Fuels, Firing and Services.
Hand Firing with Bituminous Coal
Hand Firing with Anthracite Coal
Chain Grate Stokers
Side Feed Stokers.

BOILER LOGIC

1–Some Fundamental Considerations of Boiler Design

While it would be to the advantage of the manufacturer to produce and market a single universal design of boiler, such standardization cannot be attained; the modern boiler must be adaptable in design and setting to the multiplicity of requirements of fuels, furnaces and operating conditions. A single rigid construction is not suited to all plant conditions. Flexibility of design is essential and the arrangement in any case for hand firing, stoker firing, fuel oil, waste heat, etc., depends on certain fundamentals of combustion and heat transfer which will be briefly considered

In combustion, heat is generated from the latent energy of fuel, and since the boiler design and setting influence in some degree the efficiency of this process, we will consider briefly the essentials of furnace design. The heat liberated by combustion is almost all available for generation of steam and therefore, efficient boiler design from the standpoint of heat absorption, is the next essential, and will be briefly discussed following the paragraphs on furnace efficiency

Furnace Design

The problem of obtaining efficient combustion resolves itself down to three requirements

Mixing,
Time,
Temperature

Mixing—Fuels which are of a liquid or gaseous nature, whether distilled from bituminous coal as volatile, which is composed in part of gases and in part of floating liquid globules, or whether they be fuel oil, or gas, must be intimately mixed with air in order to secure complete combustion. The converse of proper mixing is stratification, which occurs commonly in hand fired furnaces which are carelessly operated. Stokers distribute the fuel more evenly over the grate and therefore prevent the inrush of large quantities of air in spots and choking of air in others and thereby give a more even mixture of burning products and oxygen-bearing air

7

DO YOU WANT TO KNOW—

Why the boiler is not subjected to greater stress when overloaded?

How vertical and horizontal baffles affect boiler operation?

Why the header or waterleg construction influences free circulation in a steam boiler?

How to reduce dead corners and increase the percentage of active boiler heating surface?

Why efficient combustion depends on mixing, time and temperature?

✦ BOILER LOGIC TELLS HOW ✦

It gives all this information and more of practical value to the Chief Engineer interested in steam boilers, boiler theory and boiler practice.

Steam-Hammer Work

Hand Tools for Steam Hammer Work, A. S. Hesse. Am. Mach., vol. 51, no. 6, Aug. 7, 1919, pp. 247-250, 19 figs. Auxiliary equipment needed for such operations as flanging, pressing, stamping, bending, shearing, drop forging etc.

Tube-Shaping Machine

Forming Machine for Shaping Steel Tubes. Blast Furnace & Steel Plant, vol. 7, no. 8, Aug. 1919, pp. 369-372, 2 figs. Work is spun while applied against nest of three rolls. Machine for forming various shapes of noses in steel cylinders and tanks suitable for commercial transportation of explosive gases and liquids.

Vacuum Evaporators

Industrial Vacuum Evaporators. N. Frank Coxon. Mech. World, vol. 66, no. 1698, July 18, 1919, p. 30, 2 figs. Concerning sizes of steam and vapor pipes. (Concluded.)

MACHINERY, WOODWORKING

Pattern Manufacture

Wood Patterns Made in a Factory. Iron Trade Rev., vol. 65, no. 7, Aug. 14, 1919, pp. 429-431, 4 figs. How shop was organized for quantity production.

MATERIALS OF CONSTRUCTION AND TESTING OF MATERIALS

Boiler Plates

Physical Tests of Boiler-Steel Plates, Frederick Biggam. Power, vol. 50, no. 7, Aug. 12, 1919, pp. 252-253. Instances quoted to show that despite persistence with which bending tests recur in amended rules of inspection societies, "these tests . . . have not the finality that such persistence would seem to imply."

Exposure Tests of Sheeting Material

Exposure Tests of Sheeting Material, Samuel L. Hoyt. Chem. & Metallurgical Eng., vol. 21, no. 3, Aug. 1, 1919, pp. 142-144, 7 figs. Tests are interpreted as indicating that best sheeting material is copper-bearing steel with 0.20 to 0.25 per cent copper.

Fatigue in Metals

Fatigue Phenomena in Metals. Mech. Eng., vol. 41, no. 9, Sept. 1919, pp. 731-738, 7 figs. Summary of available facts and theories relating to fatigue failure and discussion of some unsolved problems. Progress report of Committee on Fatigue Phenomena in Metals, which is acting under joint auspices of Eng. Foundation, and Div. of Eng. of Nat. Research Council.

A Fatigue Testing Machine, F. M. Farmer. Am. Mach., vol. 51, no. 6, Aug. 7, 1919, pp. 271-273, 4 figs. Apparatus developed at electrical testing laboratories for Research Sub-Committee of Welding Committee of the Emergency Fleet Corporation. Purpose was to obtain information in regard to relative durability of electrically welded joints in ½-in. ship plates when subjected to repeated reversed stresses.

Firebrick Testing

A Machine for Testing the Hot-Crushing Strength of Firebricks, H. G. Schurecht. Jl. Am. Ceramic Soc., vol. 2, no. 8, Aug. 1919, pp. 602-607, 7 figs. partly on supp. plate. Designed by Bureau of Mines.

Foundry Materials

Foundry Materials (Die Materialien der Giesserei), E. Schutz. Zeitschrift f. die gesamte Giessereipraxis, vol. 40, no. 6, Feb. 8, 1919, pp. 66-68. Vanadium, ferrovanadium. Specific weights and analysis.

Hardness Measurement

Some Recent Advances in the Measurement of Hardness in Metals, F. C. Thompson. Jl. Soc. Chem. Indus., vol. 38, no. 13, July 15, 1919, pp. 241R-243R. Account of recent investigations, noting tendency to modify Brinell test by working with constant deformation.

Malleable Iron

What is Modern Malleable Iron, H. A. Schwartz. Ry. Mech. Engr., vol. 93, no. 8, Aug. 1919, pp. 479-481. Sketch of methods of manufacture and characteristics of material.

Manganin

Manganin, M. A. Hunter and J. W. Bacon. Thirty-six General Meeting of Am. Electro-Chem. Soc. Sept. 23, 1919, advance copy, paper no. 2, pp. 9-21, 3 figs. Experiments for measuring effect of small variations in percentage of manganese, nickel and iron and electrical resistivity and on temperature coefficient of resistivity. Writers conclude that small variations in manganese affect resistance but not its temperature coefficient and that small quantities of iron affect temperature coefficient considerably.

Notched-Bar Resistance

Resistance of Notched Bars to Shock (Sur les essais de flexion par choc de barreaux entaillés), André Cornu-Thénard. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 26, June 30, 1919, pp. 1315-1318. Tests cited as having shown that within limits of testing machines generally used in France, action of velocity may be considered as practically negligible.

Paper, Waterproofed

The Industrial Possibilities of Waterproofed Paper Products, Judson A. DeCew. Jl. Eng. Inst. Can., vol. 2, no. 8, Aug. 1919, pp. 558-559. It is considered as very difficult to make a paper product that will not absorb moisture and thus expand and contract to some extent. It is asserted, however, that paper and board can, without difficulty, be made so that it will resist further penetration or absorption of water after their fibres have taken up a quantity of moisture equal to about one-fifth their weight. This is considered sufficient for commercial uses.

"Stainless" Steels

Corrosion Proof Steels, F. Rowlinson. Sci. Am., vol. 121, no. 7, Aug. 16, 1919, p. 156. Present uses of nickel steels, copper steels, nickel-copper steels and chromium "stainless" steels.

Steel, Mechanical Properties of

The Various Mechanical Properties of Steel. W. H. Hatfield. Can. Machy., vol. 22, no. 8, Aug. 21, 1919, pp. 204-205, 2 figs. Takes up consideration of question of brittleness, together with investigation of failures of various kinds. (Continuation of serial.)

Mechanical Properties of Steel and Iron. Iron Age, vol. 104, no. 9, Aug. 28, 1919, pp. 565-568. Compilation made public by Bur. of Standards to secure criticism for purposes of revision.

MEASUREMENTS AND MEASURING APPARATUS

Acceleration Determination

An Apparatus for the Direct Determination of Accelerations, B. Galitzin. Proc. Roy. Soc., vol. 95, no. A 673, July 15, 1919, pp. 492-507, 8 figs. Instantaneous value of acceleration due to any arbitrary function determined by means of simple pendulum.

See also Accelerograph.

Accelerograph

Accelerograph (Sur un accélérographe), Auclair and Boyer-Guillon. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 1, July 7, 1919, pp. 24-26, 3 figs. For measuring periodic movement without having fixed points of reference, for example, vibrations of a ship's deck.

Air Meters

See Meters.

Calibration of Instruments

The Calibration Function in Indicating Instruments, Frederick J. Schlink. Engineering, vol. 108, no. 2798, Aug. 15, 1919, pp. 204-106, 4 figs. The relation of apparent to virtual calibration function.

Calorimeters

An Adiabatic Bomb Calorimeter, E. B. Holland, J. C. Reed, and J. P. Buckley. Chem. & Metallurgical Eng., vol. 21, no. 4, Aug. 15, 1919, pp. 190-191, 1 fig. Adapting Berthelot Mahler Kroecker calorimeter to control of temperature required in adiabatic work by fitting it with double-walled copper jacket.

Coal Weighing

Weighing Methods for Boiler Plants. Coal Trade Jl., vol. 50, no. 34, Aug. 20, 1919, pp. 1015-1017, 2 figs. Descriptions of various methods and devices for use in weighing coal consumed at boiler plants.

Dynamometers

Commercial Dynamometers—XIII, P. Field Foster. Mech. World, vol. 66, no. 1699, July 25, 1919, pp. 13-14, 8 figs. Bevis and Gibson flash-light meter built on optical principle. (Continuation of serial.)

Gas Meters

See Meters.

Indicators

Indicator and Indicator Diagram (Der Indikator und das Indikatordiagramm), W. Wilke. Prometheus, vol. 27, no. 30, Apr. 22, 1919, pp. 472-476, 11 figs. Construction of recent types, with special reference to those made by Rosenkranz, Schaffer & Budenberg, Lehmann & Michels and Maihak.

Meters, Air and Gas

Differential Pressure Meters for Measuring Air, Gas and Steam Flows, John L. Hodgson. Chem. Industry, vol. 38, no. 14, July 31, 1919, pp. 222T-228T, 8 figs. "Curved tube" manometer developed by writer for use with pitot tube. It consists of reservoir containing oil, which is connected to upstream pressure hole and curved tube connected to downstream pressure hole, and so shaped that equal increments in velocity past pitot tip will cause equal movements of oil meniscus along its length.

Micrometer, Fluid Gage

The Prestometer Fluid Gage, Charles E. Coats. Inspector, vol. 1, no. 3, Aug. 15, 1919, pp. 5-8, 10 figs. Liquid micrometer gage. Deflection of center of diaphragm causes liquid to leap up in tube. Least count of instrument said to be 0.001 in.

Prestometer Gage

See Micrometer, Fluid Gage.

Pyrometers

Temperature Indicating and Controlling Systems, Franklin D. Jones. Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1138-1145, 16 figs. Pyrometers for controlling furnace temperatures automatically and for recording the temperature variations in a single furnace or in several furnaces which are successively connected with the recording instrument. Second article.

Devices and Methods for Measuring High and Low Temperatures with Special Reference to Engineering Problems, Herman Henry Albers. Stevens Indicator, vol. 36, no. 2, April 1919, pp. 67-103, 31 figs. Classified and discussed according to basic principles upon which they operate. Recommendations offered for selecting instrument or method best suited for various specific purposes.

Scales

See Coal Weighing.

MECHANICS

Acceleration, Infinite

Infinite Acceleration, A. Johnson. Automobile Engr., vol. 9, no. 129, Aug. 1919, pp. 245-246, 1 fig. Technical illustration of serious character of stresses developed in mechanism, notably of kind where operation of cams is involved, when velocity of part is suddenly changed from zero to some finite magnitude.

Beams, Ferro-Concrete

The Design of Continuous Beams in Ferro-Concrete, H. Brodrick. Soc. Engrs., vol. 10, no. 6, 1919, pp. 199-211, 8 figs. partly on supp. plate. Review of comparison of methods adopted by different designers particularly in dealing with question of minimum deformation.

Catenary

The Catenary in Engineering (Die Kettenlinie im Ingenieurwesen), J. Brunner. Schweizerische Bauzeitung, vol. 74, no. 2, July 12, 1919, pp. 13-14, 5 figs. Practical application in constructions involving long stretched cables, chains or wires.

Centrifugals, Sugar, Pressure in

Pressure in Sugar Centrifugals, J. J. Munson. Sugar, vol. 21, no. 8, Aug. 1919, pp. 410-411, 1 fig. Calculation of factors which determine total pressure exerted on top of centrifugal.

Columns, Engine

The Design of Engine Columns—I, W. K. Wilson. Mach. World, vol. 66, no. 1701, Aug. 8, 1919, p. 66, 2 figs. Calculation of bending stresses.

Crankshaft, Whirling

The Whirling of a Crankshaft, J. Morris, Aeronautics, vol. 17, no. 299, July 10, 1919, pp. 15-46, 2 figs. Illustrates method of determining whirling speed by application to case of single-cranked crankshaft.

Graphical Velocity of Shaft (Velocità critiche), P. E. Brunelli. Revista Marittima, vol. 52, no. 6, June 30, 1919, pp. 307-344, 6 figs. Calculations and formulæ.

To cut down the cost per cut

A Matter of Teeth

The efficiency of a hack saw blade depends almost entirely upon the rake, the "set," and the pitch or number of teeth to the inch.

There's no overhanging "hook" to the teeth on a Starrett blade. With proper adjustment of weight or pressure, they'll cut just as fast on the last cut as on the first. The teeth are uniform in shape, "set" and spacing. That's why every blade in a box of Starrett saws cuts alike.

Starrett Hack Saws are made in varying pitches or number of teeth to the inch, from 10 to 32, according to the work they are intended for.

Different kinds and shapes of metal need different blades for economical cutting. Get Starrett blades, use them according to the Starrett Hack Saw Chart and watch your cost per cut decrease. Write for Catalog No. 21 "LD," it's free.

THE L. S. STARRETT CO.
The World's Greatest Toolmakers
Manufacturers of Hack Saws Unexcelled
ATHOL, MASS.

the blade

Starrett Hack Saws Cut Quicker Last Longer

Use Starrett Hack Saw Blades

42-93

Equalizers and Hitches

Equalizers and Hitches, E. A. White. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 124-135, 11 figs. Mechanical analysis of distribution of pull between draft animals.

See also Farm Machinery.

Hitches

See Equalizers and Hitches.

Knife Edges Under Pressure

The Form of Knife Edges Under Pressure, C. A. Briggs. Scale Jl., vol. 5, no. 11, Aug. 10, 1919, p. 7, 3 figs. Experiments made with gelatin cubes placed against gelatin plate interpreted as representing on highly magnified scale what takes place with steel knife edges.

Plane Lamina, Two-Dimensional Motion

The Two-Dimensional Motion of a Plane Lamina in a Resisting Medium, S. Brodetzky. Proc. Roy. Soc., vol. 95, no. A-673, July 15, 1919, pp. 516-532, 9 figs. Mechanics of problem.

Shafts, Critical Speed

See also Crankshafts, Whirling.

Stresses

See Acceleration, Infinite.

Stress, Combined, Theory

Practical Application of the Combined Stress Theory, N. Barnes Hunt. Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1171-1172. Formula based upon true stresses in structural members and applicable to cases where an axial tensile or compressive stress acts in combination with a transverse shearing stress. Reference is made to Mansfield Merriman's Mechanics of Materials, and discussion of combined stresses by A. Lewis Jenkins in Jl. Am. Soc. Mech. Engrs. for August 1917.

Wet Sand, Angle of Repose

On the Angle of Repose of Wet Sand, A. G. Webster. Proc. Nat. Acad. Sciences, vol. 5, no. 7, July 1919, pp. 263-265, 1 fig. Experiments gave 33 deg. for dry sand and various other values for moist sand, including 12 deg. for composition of 10 lb. of sand and 5 lb. water.

MECHANICAL PROCESSES

Abrasive Wheels

The Manufacture of Abrasive Wheels, S. C. Linbarger. Jl. Am. Ceramic Soc., vol. 2, no. 8, Aug. 1919, pp. 638-646. Account of process.

Drying

Drying by Heat in Conjunction with Mechanical Agitation and Spreading, Eustace A. Alliott. Jl. Soc. Chem. Indus., vol. 38, no. 13, July 15, 1919, pp. 173T-183T, and (discussion) pp. 183T-185T, 24 figs. Report of experiments performed to determine influence of both initial and final moisture on length of drying and other factors.

Glass Pots

Note on the Casting of Porcelain Glass Pots, J. W. Wright and D. H. Fuller. Jl. Am. Ceramic Soc., vol. 2, no. 8, Aug. 1919, pp. 659-663. Mixtures used in Pittsburgh Laboratory by Bur. of Standards.

The Equipment of a Casting Plant for the Manufacture of Glass Pots, Frank H. Riddle. Jl. Am. Ceramic Soc., vol. 2, no. 8, Aug. 1919, pp. 647-658, 5 figs. Proposed plans for plant suitable for casting ten 600-lb. glass pots per day.

Hot-Rolling

Theories of Hot Rolling (Les théories du laminage à chaud), P. Maringer. Revue Universelle des Mines, de la Métallurgie, vol. 1, no. 2, Feb. 1919, pp. 177-308, 105 figs. Physical study of phenomena which takes place in steel. (To be continued.)

Interchangeable Manufacture

Principles of Interchangeable Manufacturing-I, Earle Buckingham. Machy. (Lond.), vol. 14, no. 355, July 17, 1919, pp. 466-471. Economy of interchangeable manufacturing. Design as it affects success in interchangeable manufacturing. Manufacturing tolerances. Production problems as related to interchangeable manufacturing.

Internal Gear, Williams

The Williams Internal Gear, Reginald Trautschold. Am. Mach., vol. 51, no. 6, Aug. 7, 1919, pp. 255-258, 4 figs. Notes on manufacture of Williams gear and its comparison with other forms in regard to economy and simplicity.

Machinery, Various, Manufacture of

Manufacture of Machinery at Plant of C. F. Braun & Company. Metal Trades, vol. 10, no. 8, Aug. 1919, pp. 339-343, 18 figs. Company manufactures pumps, both reciprocating and centrifugal, heat exchanges, including condensers, feedwater heaters, oil coolers and heaters, cooling towers, evaporators, and smaller specialties.

Motorcycles

Motorcycle Production has peculiar problems, P. M. Heldt. Automobile Industries, vol. 41, no. 6, Aug. 7, 1919, pp. 259-264, 17 figs. Methods of forming side-car panels and electroplating installation mentioned as peculiar to this industry.

Roller Bearings

Making Roller Bearings—I. Machy. (Lond.), vol. 14, no. 356, July 24, 1919, pp. 498-503, 13 figs. Methods of heat-treating and inspecting Timken roller bearings.

Sheet Manufacture

Features of the Iron and Steel Sheet Industry. Raw Material, vol. 1, no. 5, July 1919, pp. 255-260, 6 figs. Recommends careful selection of base metal in sheet bars. (To be continued).

Manufacture of Sheet Iron in South Russia (La Fabrication des toles minces dans la Russie méridionale). Génie Civil, vol. 75, no. 2, July 12, 1919, pp. 34-36, 2 figs. Scheme showing arrangement of machines at works at Briansk and Taganrog. (Concluded.)

Sprocket Chain

Making Diamond Sprocket Chain, Edward K. Hammond. Machy (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1165-1170, 9 figs. Operations involved in making no. 9 bicycle chain at works of Diamond Chain & Mfg. Co., Indianapolis. Number corresponds to standards prepared by Chain Standards Committee of Am. Soc. Mech. Engrs. and Soc. Automotive Engrs. First of two articles.

Turbo-Gear Manufacture

Turbo-Gear Manufacture, E. A. Suverkrop. Am. Mach., vol. 51, no. 8, Aug. 21, 1919, pp. 357-363, 22 figs. By Poole Eng. and Machine Co., of Baltimore. Mechanism is of planet internal-ring gear type and is comparatively light in weight.

Turbine, Small Steam, Manufacture

Problems in Designing Small Turbines for Industrial Purposes, Sanford A. Moss. Gen. Elec. Rev., vol. 22, no. 8, Aug. 1919, pp. 620-630, 19 figs. Manufacture on quantity basis of type L turbines from standardized and interchangeable parts.

Wheels, Cast-Iron

The Manufacture of Cast Steel Road Wheels. Engineer, vol. 128, no. 3314, July 4, 1919, pp. 5-6 and 12, 11 figs. Foundry at works of Thwaites Brothers, Ltd., of Bradford, England. It is said that during war material used for casting consisted of some 80 per cent of steel turnings, remainder being scrap.

Williams Internal Gear

See Internal Gear.

MOTOR-CAR ENGINEERING

Albion

The Albion 30 Cwt. Chassis. Motor Traction, vol. 29, no. 750, July 16, 1919, pp. 47-48, 5 figs. Design allowing of alternative gears to suit different purposes.

Austin

The New 20 h.p. Austin. Autocar, vol. 43, no. 1241, Aug. 2, 1919, pp. 161-165, 13 figs. Specifications: Four cylinders, 95 x 127 mm. bore and stroke (3601 cc.); unit construction, light balanced reciprocating parts; single-plate clutch; spiral bevel final drive; semi-elliptic springs.

British Tractors

Originality in Design Shown in New British Tractors. Automotive Industries, vol. 41, no. 6, Aug. 7, 1919, pp. 253-255, 4 figs. Notes on tractor exhibit at Annual Show of Royal Agricultural Society.

Caterpillar Vehicle, Steering of

Steering of Caterpillar Vehicles (Das Steuern von Raupenfahrzeugen), E. Seiler. Motorwagen, vol. 22, no. 9, Mar. 31, 1919, pp. 162-164, 4 figs. Difficulties in short curves considered as due to impossibility of entirely cutting out one of caterpillars and braking it efficiently, so that vehicle can turn when other caterpillar chain is accelerated.

Cleveland

Specially Designed Engine and Axle for Cleveland Car. Automotive Industries, vol. 41, no. 7, Aug. 14, 1919, pp. 304-306, 7 figs. Engine is six-cylinder, block-cast, with overhead valve; camshaft is in crankcase and valves in line in head assembly.

Darracq

The New 15 h.p. Darracq. Autocar, vol. 43, no. 1241, Aug. 2, 1919, pp. 177-178, 5 figs. Features of 1919 model of French firm.

Enfield-Allday

Unconventional Design of a British After-War Car. Automotive Industries, vol. 41, no. 7, Aug. 14, 1919, pp. 312-315, 7 figs. Enfield-Allday with five-cylinder, radial, air-cooled engine.

A British Light Car. Engineer, vol. 128, no. 3315, July 11, 1919, pp. 40-41, 5 figs. Fitted with five-cylinder, radial air-cooled engine. Chassis weighs 7 cwt.

Kerosene for Farm Tractors

Kerosene as a Fuel for Farm Tractors, John A. Secor. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 171-187. Summary of experiments and research, and conclusions in regard to possibilities and future developments.

Military Transport Chassis

Military Transport Chassis-XVI. Automobile Engr., vol. 9, no. 129, Aug. 1919, pp. 241-244, 5 figs. Performance of 40-hp. Pagefield W. D. type chassis under war conditions. Article refers to development of this type of heavy motor vehicle as interesting example resulting from the war.

Military Trucks, German

Extremely Heavy Frames for German Military Trucks-III, Arthur J. Slade. Automotive Industries, vol. 41, no. 8, Aug. 21, 1919, pp. 360-363, 5 figs. Sketches of most notable of frames handed over by Germans to A. E. F. Writer remarks that there was little effort at standardization and that some unimportant features required special dies.

No Standardization of Parts of the German Army Trucks-II, Arthur J. Slade. Automotive Industries, vol. 41, no. 7, Aug. 14, 1919, pp. 307-311, 12 figs. Tabulation of 47 types as to weight and drives. Attention is called to lack of standardization and difficulty in making repairs. Article based on study of German trucks delivered to A. E. F.

Morris

Morris 1919 Light Cars. Autocar, vol. 43, no. 1241, Aug. 2, 1919, pp. 169-172, 10 figs. Morris-Oxford and Morris-Cowley models. Specifications: 11.9 hp., four cylinders, 69x100 mm. bore and stroke (1495 cc.); engine and gear box in one unit; multiplate clutch; three speed and reverse gear box; spiral bevel final drive.

Radial-Engined Car

See Enfield-Allday.

Reo

Revised Manifold and Detachable Head among Reo Engine Changes, J. Edward Schipper. Automotive Industries, vol. 41, no. 6, Aug. 7, 1919, pp. 256-258, 4 figs. Changes in design claimed to provide greater vaporization of fuel, increased accessibility of intake valve assembly, increased engine speed and cleaner design.

Standardization

See Military Trucks, German.

Steering

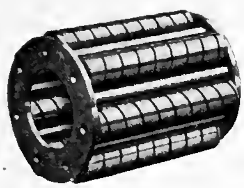
See Caterpillar Vehicle, Steering.

Tire Substitutes

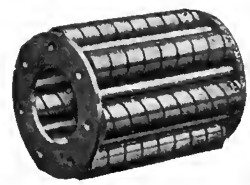
Tire Substitutes. Autocar, vol. 43, no. 1240, July 26, 1919, p. 120, 7 figs. Emergency spring wheels used by German transport vehicles.

Trailers

Trailer Lessons from the Allied Army Service, W. F. Bradley. Automotive Industries, vol. 41, no. 8, Aug. 21, 1919, pp. 354-359, 13 figs. Writer claims that automobile trailers in use with ordinary trucks having normal capacity of 1.5 to 5 tons proved valuable during war as means of economizing cost of road transportation.



A Frank Discussion



We wouldn't attempt to tell you that the Hyatt Roller Bearing is the "ideal" bearing—because right away you'd say "bunk" to yourself and probably read no further.

But while we're on this subject of bearings, let's consider a moment. For instance, what would be some of the qualifications of YOUR "ideal" bearing? Lowest possible friction? A positive method of lubrication? Durability? Ability to absorb sudden shocks and jars? Dependability? Minimum lubrication requirements? Freedom from attention?—Wouldn't these be the essential qualifications of your "ideal" bearing?

Well, we still won't claim that the Hyatt Roller Bearing is your "ideal" bearing, but we do say that there is no bearing on the market today which so nearly meets your "ideal" specifications as the Hyatt Roller Bearing.

Now and then we come across a design for which our Engineers will not recommend the Hyatt Roller Bearing, knowing that some other type will give better results under the given conditions. But for the great majority of applications we believe the Hyatt Roller Bearing to be the most practical bearing which can be used.

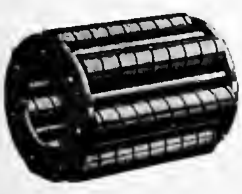
We feel, that as an Engineer, responsible for the design of modern, dependable machinery, you owe it to yourself to carefully investigate the many advantages of Hyatt Roller Bearings.

We will gladly send you our complete Engineering Data covering the class of machinery in which you are interested.

MOTOR BEARINGS DIVISION
DETROIT, MICHIGAN

HYATT ROLLER BEARING COMPANY
INDUSTRIAL BEARINGS DIVISION
METROPOLITAN TOWER, NEW YORK

TRACTOR BEARINGS DIVISION
CHICAGO, ILL.



Manufacturers of Bearings for Mine Cars, Ore Cars, Steel Mill Cars, Roller Tables, Trolleys, Cranes, Hoists, Machine Tools, Line Shafts, Countershafts, Concrete Machinery, Textile Machinery, Conveyors, Lift Trucks, Industrial Trucks, Railway Service Cars, Storage Battery Locomotives, etc.

Trucks, Electric

Electric Trucks, J. Humphrey. Iron & Coal Trades Rev., vol. 99, no. 2680, July 11, 1919, pp. 46-47, 2 figs. General features of types made by various firms.

Wheels, Steel Truck

Steel Truck Wheels, P. Klinger. Jl. Soc. Automotive Engrs., vol. 5, no. 2, Aug. 1919, pp. 160-161. Strength of wood and metal wheels compared.

PIPE

Concrete Sewage Pipe

Large Concrete Sewage Pipe, Eng. World, vol. 15, no. 3, Aug. 1, 1919, pp. 40-42, 9 figs. Units are 72 in. inside diameter, 8 ft. long, with wall thickness of 7 in., and are designed to carry sewage at pressure of 20 lb. per sq. in.

Fuel Pipeline

The Admiralty Oil Fuel Pipeline. Petroleum Times, vol. 2, no. 28, July 19, 1919, pp. 53-56, 4 figs. System is divided into three sections each approximately 12 miles in length. Details of line and of pumping stations are given.

Steel Pipe

Machinery and Pipe Arrangement-XIX, C. C. Pounder. Mech. World, vol. 66, no. 1698, July 18, 1919, pp. 31-32, 5 figs. Deciding on pipe lengths when designing steel pipes.

POWER GENERATION

Bavarian System

Central Station of Walchen Lake and Bavarian System of Electric Distribution at 100,000 (La station centrale du lac Walchen et le réseau bavarois de distribution d'électricité à 100,000 volts). Génie Civil, vol. 75, no. 3, July 19, 1919, pp. 61-62, 2 figs. System extends over 250 miles; aluminum overhead conductors used. From Frankfurter Zeitung (technical supp.) April 18, 1919.

Water Power in Bavaria (Bayerns Wasserkräfte und die deutsche Volkswirtschaft), K. Meyer. Technik u. Wirtschaft, vol. 12, no. 4, April 1919, pp. 195-205. According to writer's calculations the total amount of power that could be used by German industries is around 1,800,000 hp. in Bavaria alone.

Canada

Hydro-Electric Development on the Segnin River. Can. Engr., vol. 37, no. 8, Aug. 21, 1919, pp. 231-234, 11 figs. Municipally-owned plant being constructed for town of Parry Sound, Ont., designed to generate from 2200 to 2900 hp. Dam is of gravity type and is made of concrete.

Electric Power Collection

Electric Power Collection, Chas. P. Steinmetz. Gen. Elec. Rev., vol. 22, no. 8, Aug. 1919, pp. 565-567. Proposes use of small generator installations with simple switches and fuses to make use of our small water powers and thus conserve our fuel resources.

Foreign Water Power

Water Power on the Farm, J. S. Fitz. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 88-96, 8 figs. Considerations in regard to choosing a suitable site for water-power development.

France, Laws

New Law Regarding Utilization of Hydraulic Energy (Le nouveau projet de loi sur les forces hydrauliques). Industrie Electrique, vol. 28, no. 651, Aug. 10, 1919, pp. 283-290. General conditions of exploitation and classification of hydraulic enterprises. (Continuation of serial.)

Legislation Relative to Utilization of Hydraulic Energy in France (Le régime légal des chutes d'eau en France), G. Tochon. Génie Civil, vol. 75, no. 3, July 19, 1919, pp. 51-56. Project adopted by Chamber of Deputies on July 10, 1919. (Concluded.)

Iowa

Utilizing Old Mills for Hydroelectric Power Plants, F. I. Clark. Elec. Rev., vol. 75, no. 5, Aug. 2, 1919, pp. 181-182, 2 figs. Iowa electric transmission lines supplying farming districts.

Japan

The Undeveloped Water Powers of Japan, Hachiji Higo. Jl. Electricity, vol. 43, no. 4, Aug. 15, 1919, pp. 163-164, 2 figs. Data presented in official report of Director General of Bureau of Electrical Exploitation of Japan.

New England

New England Hydroelectric Developments. Eng. World, vol. 15, no. 3, Aug. 1, 1919, pp. 46-49, 5 figs. Includes description of expansion joints used at Rumford Falls, Me.

New Hampshire

Potential Water Power and Coal Saving. Elec. World, vol. 74, no. 8, Aug. 23, 1919, pp. 401-404, 3 figs. U. S. Geol. Survey field investigations and engineering estimates place available utilization of additional storage sites in New Hampshire at 490,000,000 hp-hr. more yearly than is now produced in Connecticut and Merrimac Rivers.

New Zealand

Hydroelectric Development in Canterbury, New Zealand, L. Birks. Jl. Electricity, vol. 43, no. 4, Aug. 15, 1919, pp. 155-156, 2 figs. Outline of scheme to utilize outlet of lake, carrying normally 100 to 200 cusecs of water, at site 500 ft. below lake level.

St. Maurice River

Power Developments on the St. Maurice River, F. T. Kaelin. Can. Chem. Jl., vol. 3, no. 8, Aug. 1919, pp. 245-249, 3 figs. At Shawinigan Falls. Combined generating capacity is 330,000 hp. Further developments are expected to raise this to over 600,000 hp.

POWER PLANTS

Ash Removal

The Mechanical Removal of Ashes from Power Houses, George Frederick Zimmer. Eng. & Indus. Management, vol. 2, no. 7, Aug. 14, 1919, pp. 217-222, 7 figs. Methods of handling ashes mechanically, independently of use of gravity buckets on similar conveyors.

Boilers, Heat Absorption

Factors Affecting Heat Absorption of Boilers, Robert June. Elec. Rev., vol. 75, no. 7, Aug. 16, 1919, pp. 270-273, 5 figs. Also Cement, Mill & Quarry, vol. 15, no. 4, Aug. 20, 1919, pp. 41-45, 5 figs. Advantages of mechanical soot blowers.

Boiler-Plant Data

Exact Data on the Running of Steam Boiler Plants, D. Brownlie. Engineering, vol. 108, nos. 2795 and 2796, July 25, and Aug. 1, 1919, pp. 101-104 and 138-139, table on supplement plate. Working details of 100 typical colliery steam boiler plants in Great Britain presented as contribution to fund of specialized knowledge writer considers it is necessary to accumulate in order to undertake efficiently question of national coal economy.

Coal Analyses

Coal Analyses Made at the Power Plant, E. D. Hummel. Power, vol. 50, no. 9, Aug. 26, 1919, pp. 332-335, 5 figs. Proposed method with Parr standard calorimeter and Parr sulphur photometer.

Condensers

See Turbines.

Notes on Surface Condensing Plants, with Special Reference to the Requirements of Large Power Stations, R. J. Kaula. Jl. Instn. Elec. Engrs., vol. 57, no. 283, June 1919, pp. 440-446, and (discussion) pp. 447-464. Suggests use of parallel-flow principle on syphonic circulating-water systems; recommendations also made concerning selection of material for various units and in regard to operating practices.

Culm

The Puget Sound Traction, Light and Power Company's Pulverized Coal Plant. Stone & Webster Jl., vol. 25, no. 2, Aug. 1919, pp. 96-109. Results of tests and availability of culm dump of over 225,000 tons led to decision to use pulverized coal as fuel for plant.

Domes, Manholes and Nozzles

Domes, Manholes and Steam Nozzles, W. H. Wakeman. Power, vol. 50, no. 9, Aug. 26, 1919, pp. 338-339, 11 figs. Writer's experience with various forms in present use.

Economizers

Performance Tests of Economizers, B. M. Baxter. Power, vol. 50, no. 8, Aug. 19, 1919, pp. 299-300. Suggested method of making and reporting economic tests.

Feed Water

Curing Boiler Trouble Due to Impure Water, J. N. Helpenbringer. Elec. World, vol. 74, no. 6, Aug. 9, 1919, pp. 296-297, 2 figs. Experiments made in Kansas City plant that are said to have shown how to prevent priming in water-tube boilers of vertical tube type at an average cost of $645 per boiler.

Grates

Fletcher's Rolling-Bar Furnace Grate. Engineering, vol. 108, no. 2798, Aug. 15, 1919, pp. 208-209, 3 figs. Intended to obviate difficulties experienced when burning coal containing high percentage of ash.

Manholes

See Domes, Manholes and Nozzles.

Nozzles

See Domes, Manholes and Nozzles.

Plant Revamping

Making Three Boilers Do the Work of Five, J. J. Spangler. Power, vol. 50, no. 6, Aug. 5, 1919, pp. 206-208, 6 figs. Accomplished, it is said, by revamping plant.

Steam Economy

Steam Economy of Power Plants, James M. Taggart. Steam, vol. 23, no. 2, August 1919, pp. 36-37, 1 fig. Curves for efficiency and power equivalent. Initial pressure and back pressure are taken as constants.

Stokers

The Functioning of the Chain-Grate Stoker, T. A. Marsh. Power, vol. 50, no. 9, Aug. 26, 1919, pp. 342-344, 5 figs. Including analysis showing why ash is always at bottom of fuel bed.

Superheaters

Superheaters at British Collieries, M. Meredith. Coal Age, vol. 16, no. 7, Aug. 14, 1919, pp. 267-268. Said to have resulted in effecting considerable economy in coal.

Turbines

Turbines and Condensers. Power Plant Eng., vol. 23, no. 16, Aug. 15, 1919, pp. 718-721, 2 figs. Abstract of report of Committee on Prime Movers read before Nat. Elec. Light Assn.

Vacuum System

Vacuum—I, Roger Taylor. Power Plant Eng., vol. 23, no. 16, Aug. 15, 1919, pp. 716-717, 2 figs. Technicalities of vacuum system in power-plant practice.

Waste Heat

Fuel Economy in Power Production, W. T. Lane. Proc. South Wales Inst. of Engrs., vol. 35, no. 1, July 18, 1919, pp. 171-210, 11 figs. Also Colliery Guardian, vol. 118, no. 3068, Aug. 8, 1919, pp. 360-361, 2 figs. Description of Draper washer and discussion of utilization of waste heat in relation to carbonization and generation of steam.

POWER TRANSMISSION

Belting

Why Belting is Superior to Individual Electric Drives, Harrington Emerson. Belting, vol. 15, no. 4, Aug. 20, 1919, pp. 21-23. Electric drive described as luxurious magnificence, actual usage being cited to show economy of belting.

Rope Driver

Manila Rope Drives, H. T. Hesselmeyer. Metal Trades, vol. 10, no. 8, Aug. 1919, pp. 351-354, 3 figs. Advantages claimed, care required in installation, and performance obtained.

PRODUCER GAS

Suction Gas Traction

Suction Gas Traction. Motor Traction, vol. 29, no. 753, Aug. 6, 1919, pp. 122-124, 2 figs. Report of Gas Traction Committee upon results of road tests of different producer-plant systems. Some of tests were conducted in conjunction with War Department.

PUMPS

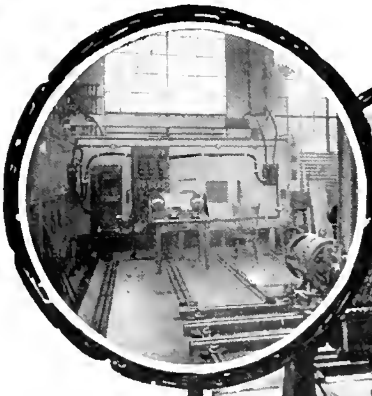
Calumet Pumping Station

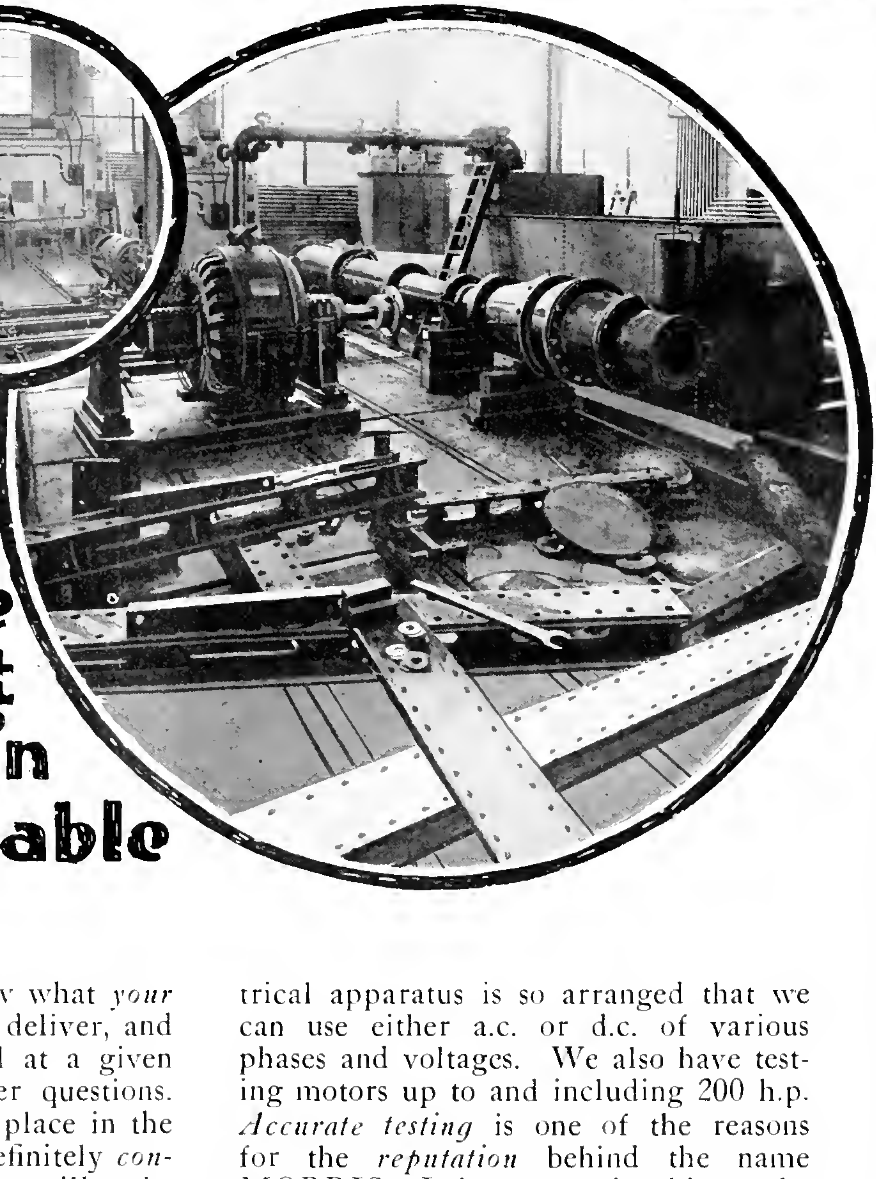
Calumet Pumping Station and Intercepting Sewer, W. T. Christine. Eng. World, vol. 15, no. 4, Aug. 15, 1919, pp. 23-27, 11 figs. Steel building with brick and stone finish, 80 x 185 ft. and about 56 ft. high. Pumping arrangement and features of plant outlined.

Centrifugal-Pump Tests

High Efficiency Pumping Units, F. W. Capellen. Power Plant Eng., vol. 23, no. 16, Aug. 15, 1919, pp. 725-726, 2 figs. Official tests of

MORRIS





Here is where You can test Your Pump in any Conceivable manner—

Of course you want to know what *your* pump will do—what it will deliver, and how—its capacity and head at a given speed—and numberless other questions. There is probably no other place in the country where you can so definitely *convince yourself* that your pump will make good as in our testing room. Here we have every type of necessary checking device. We have a complete set of venturi meters giving us a range of tests on pumps from 5 gals to 13,000. Our electrical apparatus is so arranged that we can use either a.c. or d.c. of various phases and voltages. We also have testing motors up to and including 200 h.p. *Accurate testing* is one of the reasons for the *reputation* behind the name MORRIS. It is a very wise thing to be *sure* of your equipment. This "pump laboratory"—plus the experience and facilities of this company—give you this surety, no matter what type of Centrifugal you require.

Builders of Centrifugal Pumps, Hydraulic Dredges and Steam Engines

SEE OUR DATA IN 1919 A.S.M.E. CONDENSED CATALOGUES OF MECHANICAL EQUIPMENT

MORRIS MACHINE WORKS, BALDWINSVILLE NEW YORK

Branch Offices in Principal Cities

motor-driven centrifugal pumps at Minneapolis are said to have shown high efficiency and low cost, using off-peak current.

History of the Principles of Centrifugal Pumps, J. H. Moore. Can. Machy., vol. 22, no. 6, Aug. 7, 1919, pp. 151-156, 10 figs. Description of Rees-Ro-Turbo type of water pump. Design comprises a single or a series of pressure drums (number depending on nature of work), rotating inside cast-iron casing at high speed.

Pumping Machinery of A. E. F.

Pumping Machinery Used by the Service of Supply of the American Expeditionary Forces in France, W. B. Gregory. Proc. La. Eng. Soc., vol. 5, no. 3, June 1919, pp. 208-215. Records of operation.

Pump Troubles

Pump Troubles, Charles Labbe. Eng. & Min. Jl., vol. 108, no. 6, Aug. 9, 1919, pp. 217-222, 1 fig. Suggestions in regard to installation and operation of pumps.

Quarry Pumps

Pumps in Quarry Service—H. Stone, vol. 40, no. 8, Aug. 1919, pp. 361-362, 2 figs. Experiences at various quarries.

REFRACTORIES

Clay

On the Effect of Extraction Upon the Plasticity of Clay, W. A. Homer and H. E. Gill. Jl. Am. Ceramic Soc., vol. 2, no. 8, Aug. 1919, pp. 595-601. It was found experimentally that a certain place after being treated with organic solvents was less plastic than original materials.

A Study of Some Light-Weight Clay Refractories, M. F. Beecher. Jl. Am. Ceramic Soc., vol. 2, no. 5, May 1919, pp. 336-350 and (discussion) 350-355, 3 figs. Experiments established that working properties and drying behavior of a fire clay mixture are affected by additions of sawdust in same manner as by additions of grog.

Firebrick

Preventable Defects on Fire Brick, C. E. Nesbitt and M. L. Bell. Iron Trade Rev., vol. 65, no. 7, Aug. 14, 1919, pp. 423-426, 9 figs. Illustrating how irregularities in bricks may be detected by careful visual inspection and by other means. Paper presented at meeting of Am. Soc. for Testing Materials.

Porcelains

A Study of High-Fire Porcelains, Chi C. Lin. Jl. Am. Ceramic Soc., vol. 2, no. 8, Aug. 1919, pp. 622-637, 3 figs. Results of investigation to determine effect of composition on strength.

Japanese Porcelains from Chemical Point of View, and How to Improve Them. Chem. & Metallurgical Eng., vol. 21, no. 4, Aug. 15, 1919, pp. 183-185. Indicating ranges of chemical composition both in bodies and glazes which analyses show to be much wider than has been believed by ceramists.

The Progress of Vitrification and Solution in Some Porcelain Mixtures, Arthur S. Watts. Jl. Am. Ceramic Soc., vol. 2, no. 5, May 1919, pp. 400-409, 7 figs. Microscopic examinations interpreted as indicating that development of sillimanite starts in feldspar grains and progresses as fusion progresses.

Special Spark-Plug Porcelains, A. V. Bleininger and F. H. Riddle. Jl. Am. Ceramic Soc., vol. 2, no. 7, July 1919, pp. 564-575. Experimental tests claimed to have shown injurious quality imparted to electrical porcelains by use of feldspar as flux, and desirability of replacing quartz by minerals or synthetically prepared materials which are more constant in volume when heated.

REFRIGERATION

Compressors, Ammonia, Racing of

Unusual Causes of Racing of Ammonia Compressors, E. W. Miller. Power, vol. 50, no. 8, Aug. 19, 1919, pp. 298-299. Following causes mentioned: Dry compressor valves sticking at extreme of travel; working loose of valve disk in section line shutting off flow of gas; breaking of springs holding false head in place.

Economy

Refrigerating Plant Efficiency, George T. Taylor. Refrig. World, vol. 54, no. 8, Aug. 1919, pp. 27-28 & 35. Helpful rules and information of correct proportioning considered as one of essentials for maximum plant economy.

Ice Machines, Dense-Air

Experience with a Dense-Air Ice Machine, C. H. Willey. Power Plant Eng., vol. 23, no. 16, Aug. 15, 1919, pp. 732-734, 1 fig. Diagram of dense-air ice machine and suggestions in regard to its operation.

Ice Plant

Electrically Driven Raw Water Ice Making Plant. Ice & Refrigeration, vol. 57, no. 2, Aug. 1, 1919, pp. 45-50, 8 figs. Plant is of 120 tons daily capacity, using 400-lb. stationary cans. The ice dumps are placed in center of tank room.

See also Ice Machines, Dense-Air; Methyl Chloride Ice Machines.

Methyl Chloride Ice Machines

Methyl Chloride Ice Machines, Charles H. Herter. Refrig. World, vol. 54, no. 8, Aug. 1919, pp. 12-14. Data concerning chemical action of ethyl and methyl chlorides upon cast iron.

Non-Condensible Gases

Non-Condensible Gases, John E. Starr. Refrig. World, vol. 54, no. 8, Aug. 1919, pp. 11-12. Reasons and suggested remedies for troubles experienced with non-condensible gases in absorption machinery.

Packing-House Refrigerating Plant

Making a Packing-House Refrigerating Plant Carry Its Load, J. C. Moran. Power, vol. 50, no. 9, Aug. 26, 1919, pp. 328-329, 2 figs. Unable to put more coil surface in the coolers, brine circulation over the direct-expansion coils was provided and the temperatures lowered and maintained.

Ships, Refrigerator

Equipped Nine Refrigerator Ships. Mar. Rev., vol. 49, no. 9, Sept. 1919, pp. 417-418, 4 figs. How nine ships of 6400 deadweight tons each, which were commandeered by Shipping Board at outbreak of the war, were fitted out with insulating material and cooling coils.

Vapor Refrigeration Processes

Vapour Refrigeration Processes, P. Ostertag. Cold Storage, vol. 22, no. 256, July 17, 1919, pp. 177-180, 8 figs. Entropy diagrams. From Schweizerische Bauzeitung.

RESEARCH

High Voltage Laboratory

See Purdue University.

Lausanne University

Mechanical, Physical and Chemical Testing Laboratory of Engineering School of Lausanne University (Le laboratoire d'essais mécaniques, physiques et chimiques de l'école d'ingenieurs de l'Université à Lausanne). Bulletin Technique de la Suisse Romande, vol. 45, nos. 14 and 15, July 12 and 26, 1919, pp. 137 and 148-151, 6 figs. July 12: Torsion machine. July 26: Apparatus for taking photomicrographs of metals.

National Physical Laboratory

The National Physical Laboratory. Engineering, vol. 108, no. 2795, July 25, 1919, pp. 107-108. Thermometer-testing; radium and X-ray work. (Concluded.)

Purdue University

High-Voltage Laboratory at Purdue University, C. Francis Harding. Elec. World, vol. 74, no. 6, Aug. 9, 1919, pp. 284-285, 2 figs. Design and layout of equipment intended for investigation and testing with potentials up to 600,000 volts.

Research Work Results

How Research Work Brings Results, H. E. Diller. Foundry, vol. 47, no. 329, Aug. 15, 1919, pp. 545-549, 10 figs. Experiments at laboratories of General Elec. Co. undertaken primarily to develop control system for electric furnaces brought benefits in unexpected directions.

Works Testing Laboratory

Equipment of a Works Testing Laboratory, H. S. Primrose. Metal Industry, vol. 15, no. 3, July 18, 1919, pp. 41-44, 4 figs. Recommendations in regard to selection of equipment and coördinating work.

Money Saved by Testing Laboratory, H. R. Simonds. Foundry, vol. 47, no. 329, Aug. 15, 1919, pp. 556-559, 9 figs. Practice of Eastern Malleable Iron Co. in watching composition of pig iron and of finished product in order to prevent undue irregularity of metal in castings.

SPECIFICATIONS

Plates for Tank-Car Construction

Specifications for Plates for Forge-Welding in Tank-Car Construction. Ry. Mech. Engr., vol. 93, no. 8, Aug. 1919, pp. 477-478. From report of sub-committee II of committee A-1 on steel, presented at annual meeting of Am. Soc. of Heat Treating Materials.

STANDARDS AND STANDARDIZATION

Machine Parts

Standardization of Machine Parts (Die Normalisierung der Maschinenelemente). Zietschrift f. die gesamte Giessereipraxis, vol. 40, no. 10, Mar. 8, 1919, pp. 121-122. Standardization Committee appointed by Soc. of German Engineers has already started to publish standard specifications for such articles as split couplings, flange couplings, wall brackets, boiler rivets, etc.

STEAM ENGINEERING

Alignment Chart for Steam

Alignment Chart for Finding the Properties of Saturated and Superheated Steam, Clinton E. Pearce. Power, vol. 50, no. 6, Aug. 5, 1919, pp. 224-227, 1 fig. Construction of chart explained and its application to various problems illustrated.

Boiler Horsepower Chart

Boiler Horsepower, R. L. Wales. Natl. Engr., vol. 23, no. 8, Aug. 1919, pp. 392-396, 3 figs. Graph for computing horsepower.

Boilers, Surface Combustion

Recent Developments in Surface Combustion Boilers, William A. Bone. Chem. Industry, vol. 38, no. 14, July 31, 1919, pp. 228T-233T and (discussion) 233T-234T, 10 figs. Experiments which led to introduction of Bonecourt system of surface combustion.

Steam Chart

See Alignment Chart.

Turbine Machinery for Destroyers

Development of Turbine Machinery for Torpedo-Boat Destroyers. Engineering, vol. 108, no. 2796, Aug. 1, 1919, pp. 139-140 and 148, 4 figs. on two supplement plates. Progress in (1) reduction of weight of plant and space occupied, (2) more economical generation of power, and (3) improvement in manœuvring and sea-keeping capabilities of vessel.

WELDING

Arc Welding

See Electric Welding.

Electric Welding

Notes and Regulations for Arc Welding, H. M. Sayers. Eng. & Indus. Management, vol. 2, no. 4, July 24, 1919, pp. 107-109, 1 fig. Regulations for ship building practice drawn up by Admiralty Committee from records of experience in England and communications received by Admiralty from U. S. Research Committee.

Electric Arc Welding Methods, H. L. Unland. Elec. Ry. Jl., vol. 54, no. 7, Aug. 16, 1919, pp. 343-344, 4 figs. Function and practical operation of various types of equipment for carbon- and metal-electrode welding.

Electric Arc Welding Equipment, H. L. Unland. Metal Trades, vol. 10, no. 8, Aug. 1919, pp. 355-359, 1 fig. Table showing approximate kilowatt-input required for various systems; also classification of different types of welding equipment and discussion of uses of each.

Electric Welding: Its Theory, Practice, Application and Economics, H. S. Marquand. Elecn., vol. 83, nos. 2149, 2150 and 2151, July 25, Aug. 1 and 8, 1919, pp. 91-92, 116-118 and 139-141, 29 figs. July 25: Tests to determine strength of electrically welded flanges. Aug. 1: Examples of welding an anchor and locomotive frames: Aug. 8: Example of repairing main drive wheel of Atlantic type locomotive, in which three of spokes gave way by cracking in neighborhood of coupling rod crankpin boss.

Electrodes

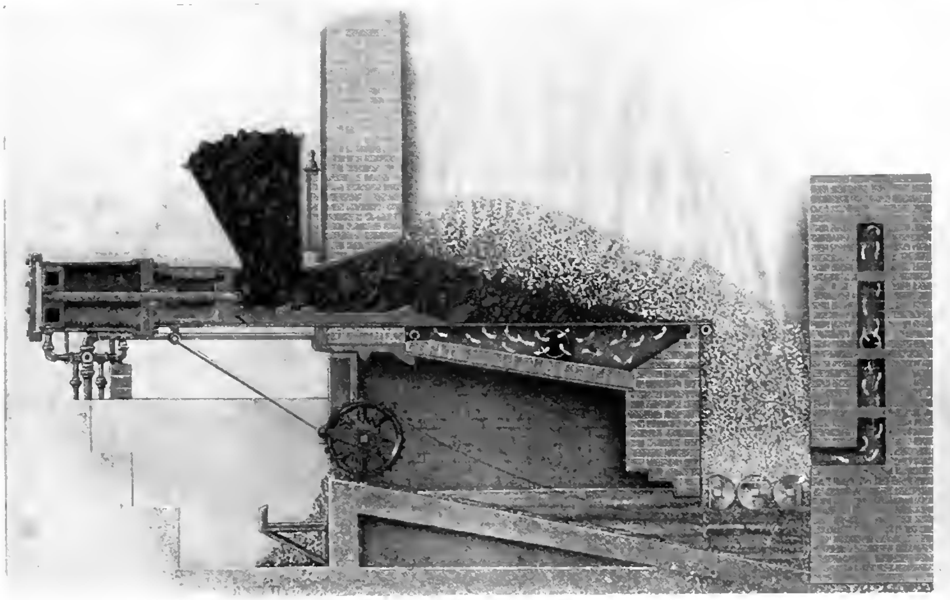
Composition of Electrodes. Iron Age, vol. 104, no. 8, Aug. 21, 1919, pp. 503-504, 8 figs. Tests to determine effect of chemical composition on physical characteristics of weld made by Wilson Welder and Metals Co., New York City.

Effects of Chemical Composition of the Electrode on the Welded Material, Decey Welder. Welding Engr., vol. 4, no. 8, Aug. 1919, pp. 42-44, 9 figs. Results of analysis.

Fusion Welding

Fusion Welding as Applied to Drop-Forging, S. W. Miller. Am. Mach., vol. 51, no. 8, Aug. 21, 1919, pp. 378-382, 29 figs. Consideration given to both electric-arc and oxy-acetylene processes. Physical effects that may occur in weld and in adjoining sections of metal due to heat developed and method of application of processes illustrated with photomicrographs.

Our Guarantee Is 90% Stoker Efficiency On 13,500 B.T.U. Fuel



Longitudinal section of a typical installation, showing main and supplemental combustion chambers as well as one method of automatically removing ashes outside the furnace walls.

It is not necessary to take any chances on performance when you buy a Stoker.

You are assured of satisfactory operation when you install the **Universal Automatic Under-Feed Stoker,** *because we make definite guarantees in our contract with you.*

We are able to do this because the Universal is especially designed to reproduce just such results. The main point is to carry combustion to the degree of completeness desired, in each case, to approach chemical perfection needed, as nearly as possible.

This aim is accomplished principally in the stoker combustion chamber by careful dimensional proportioning, proper fuel distribution, agitation of the fuel bed by the automatic breaker bar, and admission of the proper amounts of air and supplemental gases. In the supplemental combustion chamber, extraction of the remaining available heat units is carried to completion; additional air being supplied, preheated when practical.

Hard, vitreous or sticky clinkers never make their appearance in Universal Stokers.

Chemical and mechanical interference with the formation of such clinkers is a special feature of this stoker. Space does not permit of full explanation of this feature. Ask us about it.

From coal hopper to ash dump inclusive, every operation is automatic, so that need of attention is reduced to a minimum. One man per shift, with mechanical coal and ash systems, is easily able to operate any number of Universals.

Our guarantees are based on investigation of your plant conditions by our engineers.

The Universal Automatic Under-Feed Stoker is suitable for a single unit or the largest Power Plant, Metallurgical Furnaces, Kilns, etc.

We will give a definite guarantee of the percentage of B.t.u., in commercial grades of soft coal, that we can deliver over the bridge wall, based on the heat content of the quality you use.

Let us tell you what we will do for your specific case.
This involves no expense or obligation to you.

The Universal Automatic Under-Feed Stoker Co.

JOHNSTOWN, PA.

THE UNIVERSAL

Hydraulic-Press Cylinder, Welding of

Welding a Badly Broken Cylinder of a 200 Ton Capacity Hydraulic Press, Nels Johnson Welding Engr., vol. 4, no. 8, Aug. 1919, pp. 34 36, 2 figs. Work done at Soo Line Railroad shops at Minneapolis, Minn.

Liberty Engine Welding Plant

Liberty Engine Welding Plant, Otis Allen Kenyon. Elec. World, vol. 74, no. 8, Aug. 23, 1919, pp. 396-399, 9 figs. Closed-circuit arc welding system used to eliminate distortion. Description of joints which are adapted to this process. Special control boards and their operation.

Malleable-Iron Welding

Some Considerations Affecting the Welding of Malleable Iron, H. A. Schwartz. Welding Engr., vol. 4, no. 8, Aug. 1919, pp. 21-23, 9 figs. Photomicrographs illustrating various kinds of welds.

Oxy-Acetylene Welding

Filling Cavities and Putting on Parts by the Oxy-Acetylene Process, J. F. Springer. Ry. & Locomotive Eng., vol. 32, no. 8, Aug. 1919, pp 233-234. Cases in which cavities in castings may be filled and thus save expense of recasting.

Oxy-Acetylene Welding Investigation, J. H Davies. Can. Manufacturer, vol. 39, no. 8, Aug. 1919, pp. 33-34. Concerning conditions for securing good results; also results of carbon-steel experiments. Paper read before Instn. Mech. Engrs.

Building Special Work with an Oxygen-Acetylene Cutting and Welding Outfit, Montelle C. Smith. Elec. Ry. Jl., vol. 54, no. 7, Aug. 16, 1919, pp. 317-319, 8 figs. Construction of frogs, switches, switchmates, and similar work jobs.

Preparing Work

Preparing Work for Electric Arc Welding, E. Wanamaker and H. R. Pennington. Ry. Elec. Engr., vol. 10, no. 8, Aug. 1919, pp. 265-270, 20 figs. Methods used for welds of various kinds, noting precautionary measures taken for expansion and contraction.

Wrought-Iron Welding

Welding Wrought Iron and Steel, H. L. Unland. Welding Engr., vol. 4, no. 8, Aug. 1919, pp. 52-56, 7 figs. Suggestions in regard to operating details. Also Iron Age, vol. 104, no. 6, Aug. 7, 1919, pp. 365-367, 3 figs.

WOOD

Wood Preservative Treatment

Modern Developments and Practical Details in the Preservative Treatment of Wood, Kurt C. Barth. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 75-87, 5 figs. Details of (1) pressure and (2) nonpressure processes. Also specifications for refined coal tar creosote oil treatment of U. S. Shipping Board Emergency Fleet Corporation.

VARIA

Chemical Federation, Inter-Allied

Inter-Allied Chemical Federation, William Pope. Chem. Industry, vol. 38, no. 14, July 31, 1919, pp. 208T-211T and (discussion) 211T-212T. Its motives and objects.

Engineering Societies, Rand, South Africa

Notes on the Closer Working and Joint Housing of Technical and Scientific Societies on the Rand, Percy Cazalet. Jl. of Chem., Metallurgical and Min. Soc. of South Africa, vol. 19, no. 11, May 1919, pp. 228-238 and (discussion) pp. 238-240. Proposed scheme provides freedom of action for each society together with possibility of full amalgamation when time is ripe and evolution of some scheme of federation resulting "from the mere fact of joint and harmonious action over a period.

Engineers in Public Affairs

Civic Duties and Opportunities of the Engineer, Howard C. Parmelee. Eng. & Min. Jl., vol. 108, no. 8, Aug. 23, 1919, pp. 318-320. Value of scientific societies to Government. Advisability of utilizing services of engineers in public affairs.

Engineer's Work in South America

The Engineers' Part in the International Situation, Charles Lyon Chandler. Monad, vol. 4, no. 7, Aug. 1919, pp. 11-13. Examples of successful engineering enterprises in South America conducted by American engineers.

Fractional Notation

Fractional Notation. Automobile Engr., vol. 9, no. 129, Aug. 1919, pp. 246-247, 1 fig. Standard dimensions table suggested for use in conjunction with fortieth scales.

Government Machine Tools, Fixing Prices

Fixing Prices of Government Machine Tools. Iron Age, vol. 104, no. 6, Aug. 7, 1919, pp. 377-379, 3 figs. How selling prices are determined. Method and conditions of making sales of stocks of standard machines, both used and unused.

Instructional Factory, Loughborough Technical College

Loughborough Technical College Instructional Factory. Iron & Coal Trades Rev., vol. 99, no. 2684, Aug. 8, 1919, pp. 172-174, 6 figs. Education of institution combining technical with practical training.

Interchangeable Manufacturing, Terminology

Terms Used in Interchangeable Manufacturing, Earle Buckingham. Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1118-1121, 5 figs. Definitions of terms and illustration of meaning of some of them.

Patents

Patents in Relation to Industry. Elecn. vol. 83, no. 2151, Aug. 8, 1919, pp. 150-153. Conference held at British Sci. Products Exhibition.

Photometric Scale

The Photometric Scale, Herbert E. Ives. Jl. Franklin Inst., vol. 188, no. 2, Aug. 1919, pp. 217-235, 3 figs. Compilation of data and practices relative to definitions, standards and photometric measures, with particular reference to work of Bureau of Standards.

Organization and Management

ACCOUNTING

Cost Factors

Arranging Industrial Cost Factors, M. H. Potter. Iron Trade Rev., vol. 65, no. 8, Aug. 21, 1919, pp. 508-510, 6 figs. Charts illustrating relation of machine rates to production factors; also forms for tabulating various elements.

Cost Systems

Manufacturing Cost Systems, M. H. Potter. Metal Indus., vol. 17, no. 8, Aug. 1919, pp. 366-368, 4 figs. Author deals with economic production and consequent efficiency in operation of metal shop.

German Costing Systems

Costing Systems in Sulphuric Acid Works, H. J. Bush. Chem. Age, vol. 1, no. 3, July 5, 1919, pp. 58-59. Method pursued at one of large chemical works in South Germany.

Overhead

Overhead and General Costs in Manufacturing, Thomas R. Deacon. Jl. Eng. Inst. Can., vol. 2, no. 7, July 1919, pp. 505-506, 1 fig. Shows importance of overhead expense, and how failure of legitimate business "can be traced to inadequate provision for indirect or overhead expense."

Standardized Accounting Systems

Standardized Accounting System. Jl. Electricity, vol. 43, no. 4, Aug. 15, 1919, pp. 168-170, 1 fig. Outlined in committee report of Nat. Elec. Contractors and Dealers' Assn.

EDUCATION

Apprentices

Recording the Progress of Apprentices. Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1155-1156, 3 figs. Plan followed by Westinghouse Elec. & Mfg. Co.

The Training of Engineering Pupils and Apprentices, George Knox. Proc. South Wales Inst. of Engrs., vol. 35, no. 1, July 18, 1919, pp. 59-80 and (discussion) pp. 81-115. Urges establishing junior technical schools for preparatory training of apprentices; also addition of scientific departments in secondary schools for preparatory training of pupils. Scheme for apprentice and tutelage courses is outlined.

Architectural Instruction

The Need of Architectural Instruction in American Colleges, George C. Nimmons. Am. Architect, vol. 116, no. 2276, Aug. 6, 1919, pp. 169-172 and 175-176. Argument is based on assistance which understanding of arts, particularly architecture, is claimed would be in acquiring of good taste and refinement, and appreciation of and preference for finer and better things of life.

Factory Training

An Efficient Training Department in a Large Plant. Am. Mach., vol. 51, no. 9, Aug. 28, 1919, pp. 420-421. Bulletin issued by U. S. Training Service, Washington, D. C.

Machine Tool Builders

Training for the Building of Machine Tools, Edward A. Kraus. Am. Mach., vol. 51, no. 8, Aug. 21, 1919, pp. 353-356. Details of elimination of those undesirable or not suited to fit into production organization; training green workers for simple operations; studying personnel of factory with view to possibility of upgrading and studying to straighten out problem of misplaced help.

Vocational Training

Vocational Training, A. P. Fletcher. Jl. Cleveland Eng. Soc., vol. 11, nos. 5 & 6, Mar.-May 1919, pp. 283-289 and (discussion) pp. 289-291. Suggests getting for boys in schools half-time jobs with employers that will pay their way through school the other half of time. Instances of thus placing boys reported.

EXPORT

British Machine Tool Trade

British Machine Tool and Metal Industries, Alexander Luchars. Iron Age, vol. 104, no. 9, Aug. 28, 1919, pp. 573-577. Report issued by Am. Trade Commissioner sent abroad by Dept. of Commerce.

The Machine Industry in England and France, A. C. Cook. Am. Mach., vol. 51, no. 7, Aug. 14, 1919, pp. 331-335. Present economical aspect and plans being laid for future development.

China

China's Industrial and Commercial Outlook, Julean Arnold. Jl. Electricity, vol. 43, no. 4, Aug. 15, 1919, pp. 157-158, 1 fig. Writer sees great possibilities in electrical development and railroad building.

Cement

International Trade in Cement. Cement, Mill & Quarry, vol. 15, no. 4, Aug. 20, 1919, pp. 19-25. Export opportunities for American producers.

France

See British Machine Tool Trade.

Greece

Engineering Opportunities in Greece. Engineer, vol. 128, no. 3315, July 11, 1919, pp. 30-31. Calls attention to various engineering projects being contemplated.

Latin-American Markets

Entering the Latin American Markets, Percy F. Martin. Eng. & Indus. Management, vol. 2, no. 5, July 31, 1919, pp. 142-143, 1 fig. Opening for farming machinery pointed out.

Siberia

Resuming Trade with Siberia. Jl. Electricity, vol. 43, no. 4, Aug. 15, 1919, pp. 153-154, 1 fig. Conditions and possibilities of stable trading. Report of U. S. Bureau of Commerce based on recent investigation undertaken by Sub-Committee on Markets and Supplies of Canadian Economic Commission in Siberia.

South America

West Coast Electrical Trade with South America. Jl. Electricity, vol. 43, no. 4, Aug. 15, 1919, pp. 150-152, 4 figs. Conditions of market indicating disadvantages and opportunities for business as reported by trade commissioner sent by Bureau of Foreign and Domestic Commerce to investigate field.

Spain

American Progress in Spanish Industry. Iron Age, vol. 104, no. 8, Aug. 21, 1919, p. 513. From document prepared by British Department of Overseas Trade concerning conditions and prospects of iron and steel industries and engineering projects in Spain.

FACTORY MANAGEMENT

Bonus System

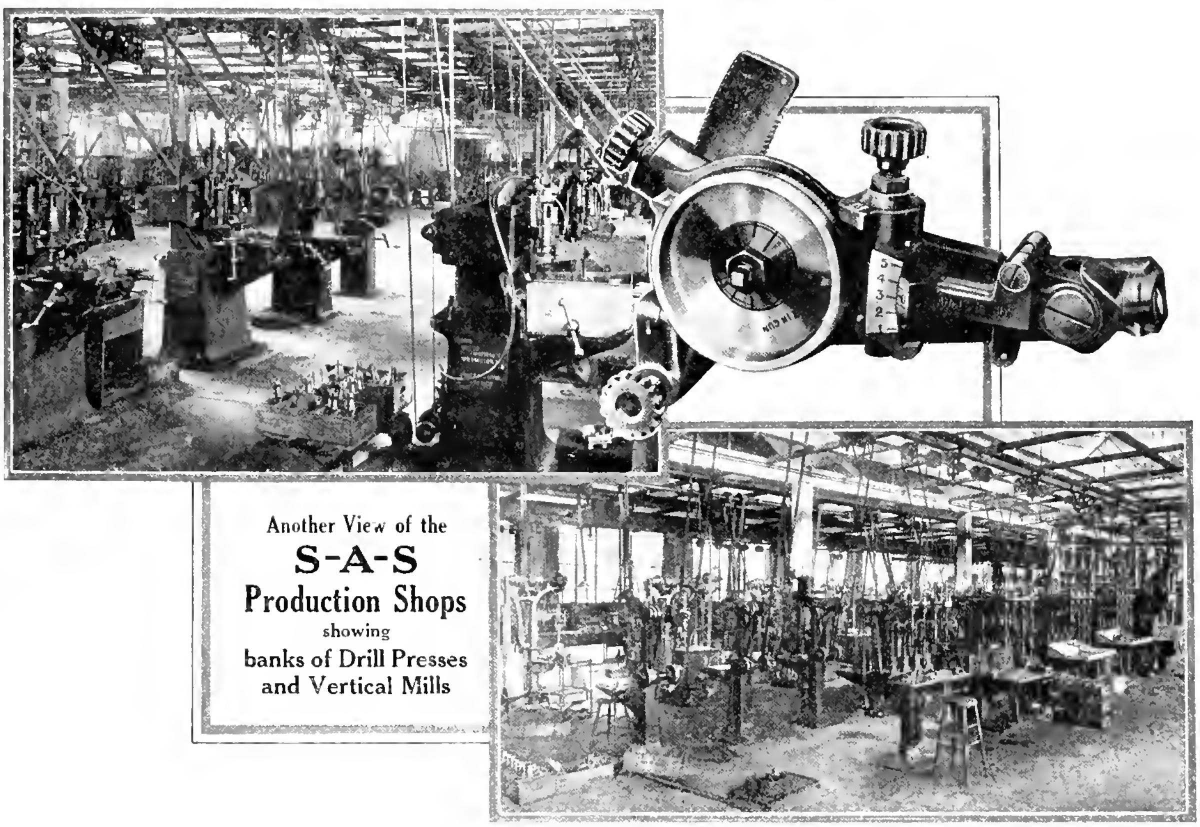
Management of the Power Plant, Robert June. Textile World Jl., vol. 56, no. 5, Aug. 2, 1919, pp. 93-95, 3 figs. Principles and ad-

Production Work
As you want it — and when you want it

Production Shops—
where quantity work is produced accurately and on time

Be your requirements large or small, complex or easy—let us show you new standards in production—standards that mean better work, elimination of production troubles for you and economy in production costs. Not only have we a large plant and modern equipment to make high standard production possible—but we have the men—men trained to produce accurate work.

The insert in the illustration below shows the 4.7 Range Quadrant which was never made outside of government arsenals. We were the only manufacturer for the U. S. Government and produced 1386 of them on record time—another achievement in S-A-S Production. The work was of most delicate and exacting nature, requiring utmost accuracy and finest technical skill—another example of S-A-S production



Another View of the
S-A-S
Production Shops
showing
banks of Drill Presses
and Vertical Mills

S-A-S Production Service Par Excellence

A detailed statement of "Why" and "How" we render superiority in service and finished product would prove a recital that you would scarcely have time to read or we to write. Suffice to say we are "big" and thorough in everything we do—big in designing and developing, big in organization, big in equipment and big in trained men—and big in work produced.

If you are facing difficult problems in development or production—our services are at your command, and if necessary we will assume management of your product—its development and production

Our staff of experts and shops are especially organized to meet every production need

Let us relieve you of the responsibility of production and thus save time and money for you.

This is the seventh of a series of advertisements telling about our plant, our methods and the work we are doing—another view of our production shops in the next issue.

SLOCUM, AVRAM & SLOCUM
LABORATORIES, Inc.
Production Plant: NEWARK, N.J. *New York Office:* Woolworth Bldg., N.Y.

SLOCUM-AVRAM-SLOCUM MANAGEMENT

ministration of bonus systems in boiler rooms Fourteenth article.

Bonus System for Boiler Room Employees, Robert June. Refrig. World, vol. 54, no. 8, Aug. 1919, pp. 25-26, 2 figs. Experience of various plants after applying system and suggestions in regard to principles on which to base system.

Business Organization

Visualizing the Management's Part in Business for Employees, Henry Tipper. Automotive Industries, vol. 41, no. 8, Aug. 21, 1919, pp. 378-381, 10 figs. Concerning talks on business organization given by president of American Multigraph Co. to all employees.

Administration of Industrial Enterprises (Pratique de la réorganisation administrative des entreprises industrielles), Paul Legler. Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 131, no. 3, May-June 1919, pp. 540-571, 14 figs. Illustrates with various examples necessity for administrative technique, based on H. Fayol's book, entitled "Administration industrielle et generale."

Control of Materials

Using Punched Cards for Controlling Materials, A. E. Van Bibber. Am. Mach., vol. 51, no. 7, 1919, pp. 295-300, 10 figs. Description of system used at Hog Island Shipyard, with reproduction of forms used, matter tabulated and examples of use of system.

Employment Management

Employment Management-IV, V, VI, A. Rowland-Entwistle. Eng. & Indus. Management, vol. 2, nos. 4, 5 and 7, July 24, 31 and Aug. 14, 1919, pp. 102-106, 146-149 and 203-206, 7 figs. July 24: Suggests forms for labor requisition, interview forms, and forms for keeping employment record. July 31: Applications of psychology and the reading of character. Aug. 14: Comparison of labor turnover in America and in England.

Applying Army Methods of Selecting Men for Industry, P. N. Golden. Am. Mach., vol. 51, no. 9, Aug. 28, 1919, pp. 409-411, 7 figs. Experience of army described as having resulted in prevention of much lost motion and expense by sorting out applicants for employment before they get into shop.

Heat-Treating Plant

Methodic Organization of Metallurgical Plant (Essais d'organisation méthodique dans une usine métallurgique), G. Charpy. Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 131, no. 3, May-June 1919, pp. 572-606, 35 figs. How Taylor system was introduced at heat-treating plant of Saint-Jacques of Montluçon.

Industrial Relations

The Works and Products of Messrs. Barr and Stroud, Limited. Engineering, vol. 108, no. 2796, Aug. 1, 1919, pp. 133-134. Administrative methods and industrial relations of works manufacturing range-finders. (To be continued.)

Job Planning

Planning a New Job, Otto Knaak. Am. Mach., vol. 51, no. 7, Aug. 14, 1919, pp. 313-316, 2 figs. Procedure of H. H. Franklin Manufacturing Co., Syracuse, N. Y., noting forms which permit coöperation between designers and shopmen in planning out sequence of operations.

Machinery Handling

Relation of Large Machine Units to Production, Arnold P. Yerkes. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 136-150, 1 fig. Urges extending use of efficient machines and methods on farms.

Plant Layout

The Works and Products of Messrs. Barr and Stroud, Limited. Engineering, vol. 108, no. 2798, Aug. 15, 1919, pp. 198-200, 10 figs. Arrangement of buildings. (Continuation of serial.)

Progress Department

Planning a Progress Department-IV, V, W. J. Hiscox. Eng. & Indus. Management, vol. 2, nos. 3 and 6, July 17 and Aug. 7, 1919, pp. 79-80 and 163-166, 7 figs. July 17: For motor car factory. Aug. 7: On plant manufacturing a.c. and d.c. electric motors.

Rate Setting

Time Study and Rate Setting in a Machine Tool Plant. Machy. (Lond.), vol. 14, no. 356, July 24, 1919, pp. 493-497, 8 figs. Review of methods used by R. K. Le Blond Machine Tool Co. in making time studies and setting bonus rates.

Restaurants

Plant Restaurant Managed by Employees. Iron Age, vol. 104, no. 8, Aug. 21, 1919, pp. 489-492, 6 figs. Experiment at Wisconsin Steel Works. To convince men that restaurant was operated solely for service and with no idea of profit, company turned over management of institution to employees. Plan said to have proven great success.

Scientific Management

Scientific Management-I, II, III, Henry Atkinson. Eng. & Indus. Management, vol. 2, nos. 3, 5 and 7, July 17, 31 and Aug. 14, 1919, pp. 71-73, 137-140 and 197-199, 1 fig. July 17: Its meaning and object. July 31: Its rapid rise since Taylor expounded his system before Am. Soc. M. E., an indication of its more recent tendencies. Aug. 15: On Taylor's fundamental principles of management.

Works Management. Eng. & Indus. Management, vol. 2, no. 6, Aug. 7, 1919, pp. 168-169, 2 figs. Suggestions in regard to promoting efficient organization in factory.

Application of Taylor System in large Government Powder Works (Essai d'application du système Taylor dans un grand établissement d'Etat), E. Nusbaumer. Bulletin de la Société d'Encouragement poud l'Industrie Nationale, vol. 131, no. 3, May-June 1919, pp. 495-539, 17 figs. With tables giving detailed statements of manufacturing costs.

Ship Yards

Results of Applying Working Methods in Ship Yard Employing 3,000 Workers (Resultats obtenus par l'application des nouvelles méthodes de travail dans un chantier de 3,000 ouvriers), L. Lavallée. Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 131, no. 3, May-June 1919, pp. 441-494, 24 figs. Noting especially forms used in keeping records of work and workmen and indicating arrangements by which time was saved in various operations.

Sites

Some factory Sites Not Cheap, Even as a Gift. Can. Machy., vol. 22, no. 6, Aug. 7, 1919, pp. 146-148. Discussion of geographic position in relation to supply of raw material and market for finished product, transportation facilities, labor supply, health statistics, educational facilities, and cost of land and taxation assessments, as factors for selecting location of factory.

Storeroom

Definitions for Storeroom Material, H. B. Twyford. Iron Age, vol. 104, no. 6, Aug. 7, 1919, pp. 357-359, 2 figs. Method adopted by manufacturing establishment for standardizing material and small articles.

See also Tool Stores.

Stock Parts and Their Routing, Luther D. Burlingame. Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1109-1114, 12 figs. Method said to have proven successful in actual practice.

Keeping Record of Iron in Storage, D. C. Kickler. Foundry, vol. 47, no. 329, Aug. 15, 1919, pp. 538-539, 2 figs. Recommendations in regard to taking drillings.

Sugar-Mill Equipment

Better Results by Better Management, L. W. Alwyn-Schmidt. Sugar, vol. 21, no. 8, Aug. 1919, pp. 402-405, 2 figs. Suggestion in regard to selecting equipment in sugar mill. (Continuation of serial.)

Tool Stores

The Modern Tool Stores-IV, Herbert C. Armitage. Eng. & Indus. Management, vol. 2, no. 4, July 24, 1919, pp. 99-101, 4 figs. Arrangement, organization, construction and equipment. (Concluding article.)

Track Layout

Ideal Track Layout for Gravel Plant. Rock Products, vol. 22, no. 16, Aug. 2, 1919, pp. 32-33, 2 figs. Yard layout of Western Indiana Sand and Gravel Co. cited as effective design which permits handling large number of cars with minimum switching.

Working Staff, Handling

Maintenance of Works Departments. Ry. Gaz., vol. 31, no. 3, July 18, 1919, pp. 89-91. Suggests how to make more effective use of and obtain better results from working staff.

LABOR

Business Information for Employees

How to Make Your Business a Human Story for Employees, Harry Tipper. Automotive Industries, vol. 41, no. 7, Aug. 14, 1919, pp. 330-332. Tells how one company put all transactions before employees so that all could see, step by step, why a big business machine was needed.

Clubs

Making the Factory a Place of Both Work and Play. Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1130-1131, 5 figs. Employees' club built by Globe Machine & Stamping Co., Cleveland.

Farms for Employees

"Opportunity": The Anaconda Company's Farm for Employees, Oliver E. Jager. Min. & Sci. Press, vol. 119, no. 5, Aug. 2, 1919, pp. 159-162, 4 figs. How good will was created in consequence of establishment.

Fatigue

Fatigue induced by Labour, A. F. Stanley Kent. Eng. & Indus. Management, vol. 2, no. 3, July 17, 1919, pp. 82-85. Experiments and researches undertaken by various investigators are quoted and their conclusions summarized and applied to study effects of cumulative fatigue and similar phenomena. Paper read before Bristol Medico-Chirurgical Soc.

Hawaiian Islands

Some of the Factors in the Industrial Development of the Hawaiian Islands, J. N. S. Williams. Jl. Roy. Soc. Arts, vol. 67, no. 3479, July 25, 1919, pp. 571-579, 1 fig. Including features of plan of coöperation entered into by planters in 1882 in order to remedy labor shortage which became acute during that year.

Health

The Care of the Human Machine, Thomas Darlington. Eng. & Min. Jl., vol. 108, no. 8, Aug. 23, 1919, pp. 311-313, 1 fig. Wholesome food and proper care of body as aids in conservation of health and to promote efficiency. Address delivered before Min. & Metallurgical Soc. of Am.

Hours of Work

Hours of Work as Related to Output and Health of Workers. Nat. Indus. Conference Board, Research Report no. 18, July 1919, 62 pp. Including data collected in metal trades proper, foundries, automobile plants, hardware, electrical equipment and various miscellaneous establishments.

Industrial Relations

Solving the Labor Problem, K. H. Condit. Am. Mach., vol. 51, no. 7, Aug. 14, 1919, pp. 301-304. Account of H. F. G. Porter's early attempts to introduce democratic principles in industrial relations at plants of Nernst Lamp Co. and Nelson Valve Co., and later at those of Hercules Powder Co., and results of experiment. Also exposition of Int. Harvester Co. scheme.

Golden Rule Best Labor Plan, W. A. Grieves. Iron Trade Rev., vol. 65, no. 9, Aug. 28, 1919, pp. 565-566. Points out that too much democracy is as bad as too little and that loyalty is result of honest purpose and common-sense action.

Securing the Coöperation of your Employes, William A. Rockenfield, Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1128-1129. How man at head of concern determines conditions throughout plant, "not only because the men holding minor executive positions under him will reflect his ideas, but also because he will, in the first place, select the type of men for these positions who are capable of dealing with labor in the same way as he would."

Relations Between Employer and Employee, William M. Leiserson. Blast Furnace & Steel Plant, vol. 7, no. 8, Aug. 1919, pp. 394-396, and 410. Suggestions in regard to operating labor administration machinery.

Labor Problems

A Constructive Labor Program, T. N. Carver. Jl. Soc. Automotive Engrs., vol. 5, no. 2, Aug. 1919, pp. 155-158. Economical aspect of labor problem.

Rating Employees

Rating Each Workman According to Merit, W. D. Stearns. Factory, vol. 23, no. 2, Aug. 1919, pp. 297-299. Proposes dealing with employee as individual but without anything that savors of paternalism, and suggests plan.

Road Labor

The Organization of Efficient Concrete Road Gangs, Halbert P. Gillette. Concrete Age, vol. 30, no. 4, July 1919, pp. 9-11. Suggestions to college engineers.

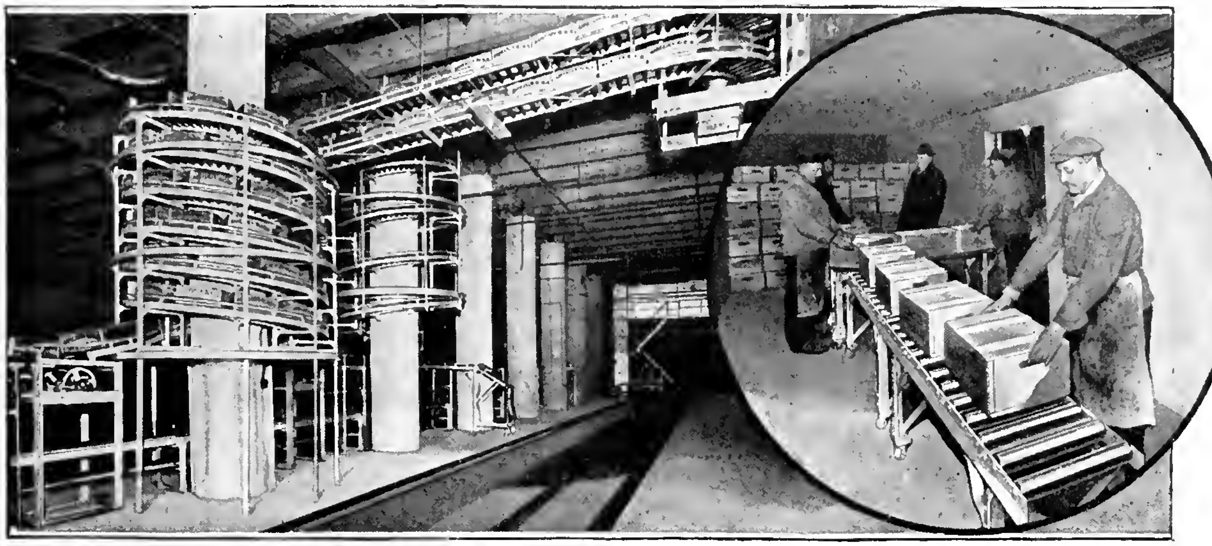
Wage Adjustments

Salary and Wage Adjustment, Mett McKune. Metal Indus., vol. 17, no. 8, Aug. 1919, pp. 375-376. Plan provides for classification of all help, adoption of minimum rate to be paid at beginning of service, for periodic increase, minimum to be attained at end of period when it is assumed employee has attained highest degree of efficiency.

Wage-Payment Systems

Wage Payment Systems in Machine Shops, W. D. Stearns. Machy. (N. Y.), vol. 25, no.

Lamson Conveyors



Notice the double spiral that feeds freight cars in two different sections of the building; the slat conveyor and portable unloading stations. Small insert shows boxes landing on short sections of gravity; in the freight car itself.

Miles of Bevo Cases Flowing to Shipment with Clock-like Regularity

With the regularity of clockwork, an endless stream of cases of filled Bevo bottles rolls uninterruptedly from the sixth floor of the Anheuser-Busch Bevo Plant into storage below or direct to freight cars.

As quickly as Bevo bottles are filled, sealed and inspected on top floor they pass downward over Lamson Spiral Conveyors—the cases are conveyed to shipping floor or may be switched into storage on intermediate floors.

At the foot of the spirals a horizontal slat conveyor provides means for passing boxes to any one of several freight cars. From the slat conveyors boxes are readily deflected on to gravity conveyors, which deliver directly to the stackers in the freight cars in which the cases are shipped.

From receiving door to shipping platform, human hands do not touch Bevo cases. Every operation is made as near automatic as possible. No trucking. No carrying. No lifting. No confusion or congestion. No wasting of precious floor space. No wasting of still more precious human labor. Overhead charges reduced to rock-bottom because underfoot expense has been practically eliminated.

No matter what your plant makes, if it's your job to *get the goods out of the works*, you owe it to yourself to talk problems over with a Lamson engineer, or send for book on Conveying, showing the versatility of the Lamson System for carrying *all* kinds of things. No obligation.

LAMSON LS SERVICE

[illegible] 1115-1117. Method evolved [illegible] W. [illegible] & Mfg. Co. after review [illegible] tices.

Welfare Work

Maintaining the Efficiency of the Working Force. Erik Oberg. Mach'y (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1149-1152, 5 figs. Methods employed in welfare work, health supervision, and medical care by R. K. Le Blond Machine Tool Co. of Cincinnati.

Women

Efficiency of Both Sexes in the Machine Industry. L. W. Alwyn-Schmidt. Am. Mach., vol. 51, no. 6, Aug. 7, 1919, pp. 281-282. Based on report of N. Y. Dept. of Labor and statistics compiled by Nat. Industrial Conference Board.

SAFETY ENGINEERING

Accident Prevention

The Work of Accident Prevention. William Conibear. Eng. & Min. Jl., vol. 108, no. 6, Aug. 9, 1919, pp. 226-227. Low accident rates said to be dependent in large measure on overcoming of carelessness when miners work at high speed.

Electrical Inspection

The Demands of Electrical Inspection. E. F. Hensler. Jl. Electricity, vol. 43, no. 3, Aug. 1, 1919, pp. 118-119. Value of regular inspection of electrical installations and appliances in their relation to safety standards.

Explosion of Chemicals

The Explosion of Chemicals. II. Workmen's Compensation Acts. Chesla C. Sherlock. Chem. & Metallurgical Eng., vol. 21, no. 3, Aug. 1, 1919, pp. 131-132. Notes that theory of compensation acts is not based upon fault at all, but upon idea that all injuries suffered by accident in course of employment should be compensated.

Fire Protection

Fire Protection for Schools. H. W. Forster. Nat. Fire Protection Assn., vol. 13, no. 1, July 1919, pp. 20-60, 28 figs. Detailed analysis of conditions and statistics of fire accidents lead writer to conclusion that what country needs is national team work in fighting fire waste. Schools, he says, have a double responsibility and opportunity in the premises first, to put their own houses in order and second, to wield a powerful educational influence.

See also Sprinklers.

Fire Hazards of Cotton Seed Oil Mills. T. C. Taliaferro. Nat. Fire Protection Assn., vol. 13, no. 1, July 1919, pp. 75-81. Scheme of subdividing oil mills into six fire divisions.

Fire Hazards Met in Storage of Fuel Oil. J. W. Lord. Eng. News-Rec., vol. 83, no. 9, Aug. 28, 1919, pp. 415-416. Precautions necessary in the installation of fuel-oil tanks in industrial plants, observed by insurance companies. Paper read before Am. Concrete Inst.

Fire Protection in Factories. Charles E. Rigby. Eng. & Indus. Management, vol. 2, no. 6, Aug. 7, 1919, pp. 180-184, 3 figs. Advises taking into consideration construction, character and arrangement of processes, protection and hazard from adjoining property.

Exits, Fire Alarms and Drills. Textile World Jl., vol. 56, no. 7, Aug. 16, 1919, pp. 47-49 and p. 63, 3 figs. Recommendations of National Safety Council.

Press Accidents

Reducing Press Accidents by Same Treatment. Can. Machy., vol. 22, no. 8, Aug. 21, 1919, pp. 197-200, 14 figs. Description of various safety devices.

Safety Committees

Organization of Safety Committees. Eng. & Indus. Management, vol. 2, no. 3, July 17, 1919, pp. 74-77, 2 figs. Means adopted by large company for accident prevention in their works.

Safety Devices

Report of Engineers of the Northeastern Iron and Steel Works Cooperative Association for 1917 (Aus dem Jahresbericht 1917 der technischen Aufsichtsbeamten der Nordöstlichen Eisen und Stahlberufsgenossenschaft). Zeitschrift f. die gesamte Giessereipraxis, vol. 40, no. 5, Feb. 1, 1919, pp. 26-27, 7 figs. Safety devices and safety measures, especially for lathes, winches, stamping presses and turntables.

Sprinklers

Impairment of Automatic Sprinkler Protection in Refrigerator Rooms. Nat. Fire Protection Assn., vol. 13, no. 1, July 1919, pp. 64-74, 9 figs. Basing conclusions on report rendered by several inspection departments and on detailed examinations conducted by Canadian Fire Underwriters Assn., Montreal, and also developments indicated by test apparatus.

SALVAGE

Scrap Reclamation

Scrap Handling and Reclamation. Chicago Rock Island & Pacific Ry. A. T. Kipping. Ry. Rev., vol. 65, no. 7, Aug. 16, 1919, pp. 219-222, 4 figs. Methods of practice employed in conducting operations at Silvis Scrap Dock and reclamation plant at Silvis, Ill.

TRANSPORTATION

Motor Cars on Rails

A Railroad Service for the Automobile. D. A. Hampson. Can. Machy., vol. 22, no. 7, Aug. 14, 1919, pp. 173-175, 3 figs. Results of operating two motor cars on 15-mi. standard-gage road.

Refuse Collection

Horses vs. Motor Trucks in Refuse Collection. E. W. Stribbling. Mun. Jl. & Public Works, vol. 47, nos. 7 and 8, Aug. 16 and 23, 1919, pp. 110-111 and 119-120. Comparison of cost of maintaining and operating each, from experiences of various cities.

Electrical Engineering

ELECTROCHEMISTRY

Copper Sulphate Solutions

Electrical Conductivity and Other Properties of Saturated Solutions of Copper Sulphate in the Presence of Sulphuric Acid. H. M. Goodwin and W. G. Horsch. Chem. & Metallurgical Eng., vol. 21, no. 4, Aug. 15, 1919, pp. 181-182, 3 figs. Gives specific electrical conductance at 25 deg. cent. of solutions saturated with copper sulphate and containing sulphuric acid ranging in concentration from 0.15 equivalent to 3.6 equivalents per liter.

ELECTRODEPOSITION

Copper Deposition

Electrolytic Deposition of Copper in the Leaching of Roasted Ore and Concentrate. Percy R. Middleton. Min. & Sci. Press, vol. 119, no. 5, Aug. 2, 1919, pp. 149-150, 3 figs. Results of experimental work.

Deposition of Metal, Time Element

A Compilation of Tables Showing the Time Required to Deposit a Given Thickness of Metal. W. G. Knox. Metal Industry, vol. 15, no. 3, July 18, 1919, pp. 46-48. Table showing time required for thickness of deposit in inches of nickel-cobalt. Calculated on basis of 100 per cent cathode efficiency.

Galvanizing Plant

Planning and Operating a Galvanizing Plant. E. P. Later. Metal Industry, vol. 15, no. 2, July 11, 1919, pp. 30-32. Concerning advisability of isolating plant from rest of factory, material to use for kettles, coating tanks used for cold acid solutions, etc.

Nickel Plating

The Re-Nickeling of Surgical Instruments. Joseph Haas, Jr. Metal Indus., vol. 17, no. 8, Aug. 1919, pp. 364-365. Results of investigations carried on in Medical Repair Dept. Laboratory established by A. E. F. in France during war.

ELECTROPHYSICS

Coils, Electromagnetic

Calculation of Electromagnetic Coils (Sur le calcul des bobines des électro-aimants). Ad. Curchod. Revue Générale de l'Electricité, vol. 6, no. 3, July 19, 1919, pp. 74-77. Formulæ for determining dimensions for a required field.

See also Solenoids.

Conduction in Liquid Dielectrics

Conduction in Liquid Dielectrics. J. E. Shrader. Elec. Jl., vol. 16, no. 8, Aug. 1919, pp. 334-338, 10 figs. Test cup developed at Westinghouse Research Laboratory.

D. C. Armature in A. C. Field

Direct-Current Armature in an Alternating Field (Der Gleichstromanker im wechselfeld). Robert Moser. Elektrotechnik u. Maschinenbau, vol. 37, no. 3, Jan. 19, 1919, pp. 25-28, 2 figs. Deduces general formulæ for any desired position of brushes, any form of field, and any period.

Eddy Currents

Problems of Eddy Currents (Wirbelstromprobleme). Milan Vidmar. Elektrotechnik u. Maschinenbau, vol. 37, no. 8, Feb. 23, 1919, pp. 69-77, 5 figs. Tests made by writer to investigate problems of heat losses in eddy currents, with special reference to turbo-generators and large transformers. Discusses also use of aluminum in construction of electric machinery.

Electromagnetism

General Laws of Electromagnetism and Induction in Circuits Having no Resistance (Lois générales de l'électromagnétisme et de l'induction dans les circuits sans résistance). G. Lippmann. Annales de Physique, vol. 12, May-June 1919, pp. 245-253. Theory developed after making $r = 0$ in expression of coefficient of self-induction in terms of resistance, intensity and electromotive force. Since phenomena of electromagnetism and induction are independent of nature of conductor, while resistance depends on this nature, writer considers as more logical to investigate laws of electromagnetism and induction by disregarding resistance.

Elongation and Magnetization

The Elongation Due to Magnetization. C. Barus. Proc. Nat. Acad. Sciences, vol. 5, no. 7, July, 1919, pp. 267-272, 3 figs. Experiments with contact lever. Interest is chiefly concentrated in continued increase of contractions, due to magnetization obtained in strong fields after magnetization has reached a maximum.

Galvanometry

Contribution to Galvanometry (Contribution à la galvanométrie). D. Germani. Revue générale de l'Electricité, vol. 6, no. 4, July 26, 1919, pp. 99-101, 2 figs. Graph showing "ballistic constant" in times of resistance of galvanometric circuit.

Harmonics in Alternating-Current Waves

Order and Amplitude of Harmonics in Voltage Wave Forms With Indicating Instruments. Leslie F. Curtis. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 8, Aug. 1919, pp. 947-958, 13 figs. Method for determining order and percentage of various components of alternating wave of e.m.f., using indicating meters and other similar apparatus. Oscillograms are included to show various phenomena and to check results of calculations. Value of so-called standards for indication of wave form is questioned.

High-Frequency Electric Waves

Production and utilization of Electrical Waves Maintained at High Frequencies (Production et emploi des ondes électriques entretenues à haute fréquence). M. Boutaric. Industrie Electrique, vol. 28, no. 649, July 10, 1919, pp. 250-255, 4 figs. Alexanderson alternator with which it is said to be possible to obtain a frequency of 100,000 periods per second. (Concluded.)

Loading Coils, Inductance

Elementary Considerations of the Inductance of Loading Coils and Their Insertion in Cables. E. S. Ritter and A. Morris. Post Office Elec. Engrs. Jl., vol. 12, no. 2, July 1919, pp. 76-87, 9 figs. General requirements of loading coil design.

Solenoid Magnetic Field

Magnetic Field of a Solenoid (Champ magnétique d'un solénoïde). O. Billieux. Revue Générale de l'Electricité, vol. 6, no. 3, July 19, 1919, pp. 67-70, 1 fig. Formula for determining self-induction, mutual induction, etc.

Transmission Circuits

Electrical Characteristics of Transmission Circuits. H. Wm. Nesbit. Elec. Jl., vol. 16, no. 8, Aug. 1919, pp. 314-326, 12 figs. Details for determining reactance of conductor directly from its resistance.

Waves

See Harmonics and High Frequency Waves.

FURNACES

Electric Furnaces (Consideraciones generales sobre hornos electricos). José M. Navarrete. Energia Eléctrica, vol. 21, no. 11, June 10, 1919, pp. 125-130. Comparative study of arc, resistance and induction types.

Ajax-Wyatt

Ajax-Wyatt Electric Furnace. C. H. Clamer. Metal Indus., vol. 17, no. 8, Aug. 1919, pp. 362-363, 2 figs. Diagrammatic sketch. Furnace is of induction type. Paper read before Am. Chem. Soc.

Carbons

Electric Furnace Carbons. Thomas Robson Hay. Raw Material, vol. 1, no. 5, July 1919, pp. 262-264, 4 figs. It is held that while both

graphitic and amorphous carbons have their advantages, latter is considered as having superior strength and lasting qualities.

Manufacture and Application of Carbon Electrodes for Electric Furnaces, Thomas Robson Hay. Elec. Rec., vol. 26, no. 2, Aug. 1919, pp. 72-74, 7 figs. Noting particularly improvements in design and practice evolved during war.

Experimental Furnace

Electric Furnace for Experimental Work, F. A. J. Fitzgerald and Grant C. Moyer. Thirty-sixth General Meeting of Am. Electrochem. Soc., Sept. 23, 1919, advance copy, no. 4, pp. 27-31. Type which has been found convenient and satisfactory for small-scale experiments at Fitzgerald Laboratories of Niagara Falls, N. Y.

Heat-Treating Furnace

Vertical-Cylindrical Electric Furnaces for Heat-Treating and Shrinking, A. M. Clark. Chem. & Metallurgical Eng., vol. 21, paper no. 4, Aug. 15, 1919, pp. 205-207, 5 figs. Types developed by General Elec. Co., notable low-temperature furnaces (up to 950 deg. fahr.) which have been used primarily for shrinking jackets over gun barrels.

Operation

Effect of Actions Inside Furnaces on Performance, W. K. Booth. Elec. World, vol. 74, no. 5, Aug. 2, 1919, pp. 236-237, 2 figs. Causes of fluctuation in load, limitations to short-circuit current, stabilization of arc and high-power-factor furnaces from service viewpoint.

Radiant Resistor Furnace

Radiant Resistor Furnace, F. A. J. Fitzgerald. Thirty-sixth General Meeting of Am Electrochem. Soc., Sept. 23, 1919, advance copy, paper no. 1, pp. 1-7, 4 figs. Unit built and operated at Fitzgerald laboratories for distillation of low-grade or scrap zinc. It is said that with current of approximately 845 amp. at 65 volts output was about 50 kg of refined zinc per hour.

Transformers

See Transformers, Converters, etc.

GENERATING STATIONS

Ground in Disturbances

See Overloading.

Operation in Parallel

Some Problems in the Operation of Power Plants in Parallel, E. C. Stone. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 8, Aug. 1919, pp. 973-996, 6 figs. It is observed that in order to operate two power plants satisfactorily in parallel, the transmission line which ties them together must have sufficient synchronizing power as well as sufficient carrying capacity. Factors determining synchronizing power are mentioned and limiting values for synchronizing power of lines under various operating conditions are given.

Paralleling Alternators-I, F. Ashton. Mech. World, vol. 66, no. 1701, Aug. 8, 1919, pp. 64-65, 3 figs. Precautions to take.

Overloading

Recent Progress Made in Preventing Overloading of Electric Installations (Die jüngsten Fortschritte in der Beurteilung und Bekämpfung von Ueberspannungen in elektrischen Anlagen), W. Kummer. Schweizerische Bauzeitung, vol. 74, no. 4, July 26, 1919, pp. 39-41, 4 figs. Grounding disturbances and how to remedy them. (To be concluded.)

Paralleling

See Operation in Parallel.

Rates

Central-Station Rates in Theory and Practice, H. E. Eisenmenger. Elec. Rev., vol. 75, no. 7, Aug. 16, 1919, pp. 266-269. How diversity of demand affects demand cost. Sixth article.

Central-Station Rates in Theory and Practice, H. E. Eisenmenger. Elec. Rev., vol. 75, no. 8, Aug. 23, 1919, pp. 304-307. Consumer cost, what it includes and how it varies. Seventh article.

Rice Rips Station

Construction Costs of Rice Rips Station, J. A. Leonard. Elec. World, vol. 74, no. 5, Aug. 2, 1919, pp. 228-230, 3 figs. Hydroelectric power plant of 2000-kva. capacity designed to carry peak loads rather than base loads.

Swiss Central Station

Central Station at Massaboden near Brig of the Swiss State Railroads (Das Elektrizitätswerk Massaboden bei Brig der Schweiz. Bundesbahnen), H. Eggenberger and A. Dänzer. Schweizerische Bauzeitung, vol. 73, no. 25, June 21, 1919, pp. 287-291, 10 figs. Pressure pipes during construction; description of water chamber; plan and cross-sections of pressure pipes and reservoir.

Switch, Air-Break

A 5000-Kva., 100,000-Volt New-Type Air-Break Switch, George T. Couthgate. Elec. World, vol. 74, no. 8, Aug. 23, 1919, pp. 407-409, 7 figs. Designed to interrupt charging current drawn by 125 miles of 100,000-volt line, it is said to have broken current of 100-mile line.

Switch House

Layout of Modern Switch House, C. A. Conney. Elec. World, vol. 74, no. 6, Aug. 9, 1919, pp. 286-290, 6 figs. Special consideration given to future requirements, safety of operators, continuity of service, economy of materials and relation to rest of generating station.

Tata Power Plant

The Tata Hydro-Electro Power-Plant, Bombay-II. Indian & Eastern Engr., vol. 44, no. 6, June 1919, pp. 187-190, 6 figs. Details of pipe line. Power house is designed for generating total of 108,000 hp.

Vienna Municipal Central Station

Municipal Central Station in Vienna (Die städtischen Elektrizitätswerke in Wien). Elektrotechnik u. Maschinenbau, vol. 37, no. 4, Jan. 26, 1919, pp. 35-40. Has seven substations with 18 steam turbines and 6 water turbines of a total horsepower of 155,095 and 21 reciprocating steam engines of 41,000 hp.

GENERATORS AND MOTORS

Bipolar Diagram

On Some Properties of the Bipolar Diagram of Synchronous Alternators in a Constant-Potential Network (Quelques propriétés du diagramme bipolaire des alternateurs synchrones (moteurs ou récepteurs) sur un réseau à potentiel constant), André Blondel. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 1, July 7, 1919, pp. 12-16. Derivation of equation of polar curve of internal power of alternator.

Breakdowns

Some Causes of Breakdown to Electrical Machinery, W. C. Worral. Elec. Rev., vol. 75, no. 8, Aug. 23, 1919, pp. 308-312. Examination of typical examples of breakdowns met in industrial plants.

Generator Plants, French

Uses of Generator Groups During the War (Emploi des groupes électrogènes à le guerre), A. Soulier. Revue générale de l'Electricité, vol. 6, no. 4, July 26, 1919, pp. 111-118, 10 figs. Illustrating general arrangement of Ballot, Aster, and Delieuvin gas engine and dynamo units.

Grounded Neutral

Grounded Neutral on Alternating-Current Generators, S. L. Henderson. Elec. Jl., vol. 16, no. 8, Aug. 1919, pp. 340-343, 10 figs. Method of grounding neutral.

Induction Generator Plants, Automatic

Automatic Induction Generator Plants, E. A. Quinn. Power Plant Eng., vol. 23, no. 16, Aug. 15, 1919, pp. 730-732, 4 figs. Abstract of Eng. Committee report of Pacific Coast Section, Nat. Elec. Light Assn.

Induction Motors

Induction Motors Driving Centrifugal Pumps, Fraser Jeffrey. Power, vol. 50, no. 9, Aug. 26, 1919, pp. 324-327, 11 figs. Adaptability of various types of motors to different kinds of pumping work, with reference to several existing installations.

Rolling-Mill Motors

Regulation Without Loss of Three-Phase Rolling-Mill Motors (Über den derzeitigen Stand der Frage der verlustlosen Regelung von Drehstrom-walzenzugmotoren), H. Hermanns. Elektrotechnische Rundschau, vol. 36, nos. 5/6, 7/8 and 9/10, Feb. 5, Feb. 19, and Mar. 5, 1919, pp. 17-18, 25-26 and 33-34, 13 figs. Commutator-motor regulation by brush adjustment; various connection schemes. (Concluded.)

Siemens Machinery

Siemens Electrical Equipment (Equipment électrique Siemens). Génie Civil, vol. 75, no. 6, Aug. 9, 1919, pp. 117-120, 6 figs. At steel works of Skinningrove Iron Co. of Yorkshire. Rolls require 19,000 hp. to operate.

Transient Phenomena

Transient Phenomena of a Polyphase Motor at Starting and Those of a Direct-Current Motor (In Japanese), J. Takenchi. Denki Gakkwai Zasshi, no. 372, July 10, 1919.

IGNITION APPARATUS

Condensers

Function of the Condenser in High-Tension Magnetos, Harry F. Geist. Automotive Industries, vol. 41, no. 6, Aug. 7, 1919, pp. 267-272, 6 figs. Diagram showing difference between induced voltages that occur both with and without condenser.

Magnetos

Aircraft Magneto Adapted to Four Cylinder Car. Automotive Industries, vol. 41, no. 8, Aug. 21, 1919, pp. 364-366, 9 figs. British war product in which aluminum enters very largely into construction. Special feature, makers claim, is use of laminated polesboes.

LIGHTING AND LAMP MANUFACTURE

Delco

Lighting Plant Capacity Increased to 3 Kw., P. M. Heldt. Automotive Industries, vol. 41, no. 8, Aug. 21, 1919, pp. 370-374, 7 figs. Unit designed for Delco line for use on large estates, hotels and similar plants, has single-cylinder air-cooled engine with anti-friction crankshaft bearings, direct-connected to six-pole generator.

Gas-Filled Lamps

The Gas-Filled Lamp and Its Effect on Illuminating Engineering. Francis W. Willcox. Illuminating Engr., vol. 12, no. 6, June 1919, pp. 142-161 and (discussion) 161-171, 43 figs. Features of gas-filled lamps that have modified lighting practice and effects of this type of lamp in various fields of lighting, with notes on lighting codes adopted in various parts of U. S.

Incandescent Burners, Inverted

The Regenerative Effect as Influencing the Lighting Efficiency of the Inverted Incandescent Burner, J. S. G. Thomas. Gas Jl., vol. 147, no. 2930, July 8, 1919, pp. 77-78, 2 figs. Experiments interpreted as indicating that increased lighting efficiency is obtained when gaseous mixture of coal gas and primary air is preheated.

Industrial Lighting Systems

Design of Industrial Lighting Systems—II, Ward Harrison and H. H. Magdsick. Elec. World, vol. 74, no. 5, Aug. 2, 1919, pp. 232-234, 5 figs. Concerning selection of correct size and type and location of lighting unit.

Photometers

Extending the Use of the Relative-Photometer (Erweiterte Anwendung das Relativphotometers), L. Weber. Zeitschrift für Beleuchtungswesen, Heizungs- u. Lüftungstechnik, vol. 25, no. 1/2, Jan. 1919, pp. 8-9, 3 figs. For determining intensity of illumination in proportion to the sky, for comparing two illuminating intensities and for comparing two intrinsic brilliances.

Safety Orders, Lighting

General Lighting Safety Orders. Jl. Electricity, vol. 43, no. 4, Aug. 15, 1919, pp. 173-174. Issued by Industrial Accident Commission under Workmen's Compensation Insurance and Safety Act.

Stage Lighting

The Art of Stage Lighting, J. B. Fagan. Illum. Engr., vol. 12, no. 5, May 1919, pp. 118-124 and (discussion) pp. 124-133. Historical account of development of art and notes on practices followed in various countries.

Workshops

Auxiliary Lighting Apparatus for Use in Engineering Workshops, J. Beaumont Harrison. Electrical Review, vol. 85, no. 2175, Aug. 1, 1919, pp. 131-132, 2 figs. Hand lamp-test set. Arrangement consists of bank of connecting sockets, indicator lamps, contactor switch, main fuse and main switch.

MEASUREMENTS AND TESTS

Amplifiers

Use of Amplifiers for Measuring Small Differences of Potential (Emploi des amplificateurs pour la mesure des différences de potential faibles), A. Blondel. Revue générale de électricité, vol. 6, no. 6, Aug. 9, 1919, pp. 163-178, 18 figs. Laboratory methods in which audions may be introduced—thermo-ionic balance, static or deviation bridges, potentiometer methods and oscillations. (To be continued.)

Condenser, High Voltage

Half-Million-Volt Condenser for Testing. Elec. World, vol. 74, no .8, Aug. 23, 1919, pp. 404-405, 4 figs. Built for frequencies up to 60,000 cycles and combined with Poulsen arc converter and inductance for the purpose of testing high-voltage insulators.

Frequency Determination

A New Method for the Absolute Determination of Frequency, Ashutosh Dey. Proc. Roy. Soc., vol. 95, no. A 673, July 15, 1919, pp. 533-545, 1 fig. Principle of method is maintenance of oscillations of sub-synchronous frequency by a periodic field of force.

Hysteresis Curve

The Determination of the Hysteresis Curve, M. Schleicher. Elecn., vol. 83, no. 2148, July 18, 1919, pp 67, 2 figs. By ring method similar to that used for determining commutating curves. From Elektrotechnische Zeitschrift.

Insulator Tester

The Keokuk Insulator Tester, R. B. Howland. Stone & Webster Jl., vol. 110-113, Aug. 1919, 7 figs. on five supp. plates. Said to be specially suited for locating suspension-type insulator units which have become defective, and which can be used to advantage during night hours.

Motors, Railway

Manufacturers' Tests of Materials for Railway Motors, J. S. Dean. Elec. Ry. Jl., vol. 54, no. 7, Aug. 16, 1919, pp. 320-325, 20 figs. Tests, apparatus used and results obtained for determining physical and electrical properties of material entering into construction of railway motors.

Motor Selection

Motor Testing in Industrial Plants, Philip Chapin Jones. Elec. World, vol. 74, no. 6, Aug. 9, 1919, pp. 298-296, 6 figs. Question of selecting motors of correct size to offset their increased cost.

Power Factor Measurement

Measuring Power Factor with Unbalanced Load, Willard S. Wilder. Elec. World, vol. 74, no. 5, Aug. 2, 1919, pp. 239-240, 2 figs. Method of securing permanent record of maximum value and time of occurrence.

Short-Circuit Current Calculation

Calculating Short-Circuit Currents in Networks, W. R. Woodward. Elec. Jl., vol. 16, no. 8, Aug. 1919, pp. 344-345, 4 figs. Testing with miniature networks.

MATERIALS OF CONSTRUCTION

Aluminum Conductors

Aluminum Electrical Conductors (Les conducteurs d'électricité en aluminium), E. Dusaugey. Supplement to Revue générale de l'Electricité, vol. 6, no. 4, July 26, 1919, 20 pp. Recent developments in electrical uses of aluminum and mechanical and physical properties of aluminum presented to show that employment of aluminum as substitute for copper is both feasible and economical. Report of Committee of l'Union des Syndicats de l'Electricité.

Cadmium

Cadmium, C. E. Siebenthal. Brass World, vol. 15, no. 8, Aug. 1919, pp. 246-249. Its use as a substitute for tin and in bronze telegraph and telephone wires.

Insulating Materials

Electrical Insulating Materials, R. P. Jackson. Elec Jl., vol. 16, no. 8, Aug. 1919, pp. 326-333. Classification under two general divisions—organic and inorganic. Characteristic properties of each and of various combinations of several of them.

Industrial Insulators (Etude des diélectriques industriels), Raymond Bonzon. Revue générale de l'Electricité, vol. 6, nos. 5 and 6, Aug. 2 and 9, 1919, pp. 137-148 and 181-187, 20 figs. Aug. 2: Definition of specific qualities of insulators, description of apparatus used for measuring them, their standardization and application. Aug. 9: Manner of measuring losses in insulators due to alternating currents; results of experiments.

POWER APPLICATION

Construction Work

Largest Use of Electric Power on Construction Work. Eng. News-Rec., vol 83, no. 9, Aug. 28, 1919, pp. 417-420, 5 figs. How and why Dayton flood protection works use 8000 hp. from central plant, in motors of 5 to 500 hp., for pumps, excavators, concrete mixers and other equipment scattered over 1000 square miles.

Dredges, Hydraulic

Features of Electrically Operated Hydraulic Dredge, Charles W Geiger. Elec Rev., vol. 75, no. 7, Aug. 16, 1919, pp. 263-265, 5 figs. Advantages of electric drive and savings effected by its operation by City of Oakland, Cal.

Gold Mining

Notes on the Electrical Equipment at the Circular Shaft, New Modderfontein Gold Mining Company, Ltd., R. H. Copeland. Trans. of South African Inst. Elec. Engrs., vol. 10, no. 5, May 1919, pp. 62-69 and (discussion) pp. 69-72, 6 figs., partly on supp. plate. Energy brought to transformer house at 20,000 volts and there stepped down to 2100 volts and 525 volts for direct motor use; mine transformers get it down again to 200 volts between phases and 115 volts between phases and earthed neutral or to $57\frac{1}{2}$ volts for lighting.

Rice Industry

Electricity Makes Rice Industry Possible, W. E. Camp. Jl Electricity, vol. 43, no. 3, Aug. 1, 1919, pp 102-104, 9 figs. Electrical pumps used in irrigation works.

Tube Mills

An Electrically Driven Tube Mill. Iron & Coal Trades Rev., vol. 99, no. 2683, Aug. 1, 1919, p. 139, 3 figs. Principal feature noted is direct driving of two Pilger mills by motor running at speed of mill and driving without flywheel.

Typewriter Industry

Electric Heat in the Typewriter Industry, A. M. Clark. Thirty-sixth General Meeting of Am. Electrochem. Soc., Sept. 23, 1919, advance copy, paper no. 3, pp. 23-26, 2 figs. Electrically heated oven for baking japan on various parts of typewriters. Comparative tables show better economy and larger capacity of electrically heated oven compared with gas- or oil-heated oven.

TELEGRAPHY AND TELEPHONY

Antenna

Calculation of Antenna Capacity, L. W. Austin. Jl. Wash. Acad. Sci., vol. 9, no. 14, Aug. 19, 1919, pp. 393-396. Table giving observed values of capacity of elongated parallel wire antenna, and comparison of capacities calculated according to Bur. Stand. formula.

Cables, Telephone

Investigation and Examination of Telephone Cables. Telephone Engr., vol. 22, no. 2, Aug 1919, pp. 70-73, 3 figs. Francke machine for determining damping effect of homogeneous or composite lines; also account of tests performed with it. From Elektrotechnik u. Maschinenbau.

Direction Finders

The Marconi Direction Finder. Elecn., vol. 83, no. 2151, Aug. 8, 1919, pp. 142-143, 4 figs. Installation having components arranged as separate unit.

Duplex Apparatus

Universal Duplex Apparatus—In Use by the Western Union Telegraph Company. Telegraph & Telephone Age, vol. 15, no. 869, Aug. 1, 1919, pp. 374-377, 2 figs. Circuits of repeater when working differentially on both west and east sides. (Continuation of serial.)

Electrostatically Coupled Circuits

A Study of Electrostatically Coupled Circuits, W. Orland Lytle. Proc. Inst. Radio Engrs., vol. 7, no. 4, Aug. 1919, pp. 427-444, 60 figs. Claims to have found by theory and also by experiment that by one method of tuning, as circuits are coupled closer, one wave length remains constant while other approaches infinity, thereby concentrating and increasing proportion of energy in one wave. It is shown by curves and by Braun tube figures that when ratio of the two wave lengths is a whole number, the root-mean-square value of the current is a maximum.

French Telegraph Construction

Notes on French Telegraph Construction, Capt. P. Dunsheath. Post Office Elec. Engrs. Jl., vol. 12, no. 2, July 1919, pp. 87-91, 7 figs. Comparing French with British methods.

Overland Work

Radio Telegraphy in Competition with Wire Telegraphy in Overland Work, Robert Boyd Black. Proc Inst. Radio Engrs., vol. 7, no. 4, Aug. 1919, pp. 391-407, 1 fig. Recommends radio duplex circuits, reception with loud-speaking receivers and amplifiers, trunk and way circuits from large radio centers of traffic and relaying stations as means to overcome obstacles in way of successful competition of overland radio service versus wire service. Organization and operation of Pacific coast chain of duplex radio stations of Federal Telegraph Company are described.

Quenched Gap

On the Multi-Section Quenched Gap, M. Shuleikin and I. Freiman. Proc. Inst. Radio Engrs., vol. 7, no. 4, Aug. 1919, pp. 417-425, 5 figs. Writers consider relation between breakdown voltage of series of quenched gap sections and that of a single section. Relation of direct proportionality is found not to hold because of electric flux leakage from each plate to nearby plates and neighboring conductors. Limiting value of breakdown voltage of a number of gaps of given length is shown graphically for various values of flux leakage and breakdown voltage of gaps.

A Special Type of Quenched Spark Radio Transmitter, D. Galen McCaa. Proc. Inst. Radio Engrs., vol. 7, no. 4, Aug. 1919, pp. 409-415, 4 figs. Apparatus is so arranged that capacity in highly damped primary circuit is that between a special extra antenna and ground, and primary and secondary circuits are partly capacitively coupled by capacity between special antenna and usual secondary antenna, and partly inductively coupled through common inductance in ground lead.

Radio-Telephones

Radio-Telephone Development in Army, Nugent H Slaughter, Francis Gray and John W. Stokes. Elec. World, vol. 74, no. 7, Aug. 16, 1919, pp. 340-343, 7 figs. Historical and technical summary.

Sending and Receiving

Simultaneous Sending and Receiving, Ernst F. W. Alexanderson. Proc. Inst. Radio Engrs., vol. 7, no. 4, Aug. 1919, pp. 363-378, and (discussion) pp. 379-390, 19 figs. System described involves transferring received speech from separate receiving antenna at some distance from receiving antenna to subscriber's line, and transferring speech originating at subscriber's station to radiophone transmitter. A directional combination of aperiodic antennæ, with unilateral directional characteristic "barrage receiver" is also described.

Telephone Cable Tunnels

Conduit Construction in Telephone Cable Tunnels. Elec. Rev., vol. 75, no. 8, Aug. 23, 1919, pp. 301-303, 6 figs. Average length is about 700 ft. and depth beneath level of sidewalk varies from 80 ft. to 90 ft. Tunnels are built entirely of concrete.

Telephone Control System

West Ham's Telephone Control System. Electric Ry. Jl., vol. 54, no. 8, Aug. 23, 1919, pp. 397-398, 4 figs. Introduction of system for control of traffic conditions in London suburb said to have reduced accident costs.

Telephone Exchanges

Comments on Automatic-Manual Consolidation, H. E. Brockwell. Telephone Engr., vol. 22, no. 2, 1919, pp. 55-58. Converting present central energy manual equipment in Winnipeg exchanges to automatic mechanical operation.

Telephone Line, Current Propagation

Propagation of a Current in a Homogenous Telephonic Line (Propagation du courant sur une ligne téléphonique homogène), J. B. Pomey. Revue Générale de l'Electricité, vol. 6, no. 5, Aug. 2, 1919, pp. 131-134. Formulæ applicable to artificial line formed of identical sections.

Telephone Repeater

The Telephone Repeater. Post Office Elec. Engrs. Jl., vol. 12, no. 2, July 1919, pp. 70-75, 6 figs. Diagram of equal potential system which is used in some cases where Edison difference in circuit has been found unstable. (Continuation of serial.)

Telephone Signalling System

A Modified Common Battery Signalling Telephone System, H. W. White. Post Office Elec. Engrs. Jl., vol. 12, no. 2, July 1919, pp. 115-118, 7 figs. Suggested for use in centers where suitable power supply for charging secondary cells does not exist.

Telephone Systems

Unification of the Manual and Automatic Telephone Systems, D. E. Wiseman. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 8, Aug. 1919, pp. 1011-1026, 10 figs. Operating and construction methods contained in plans for physical union of Bell manual and Automatic Electric telephone systems of Los Angeles, Cal.

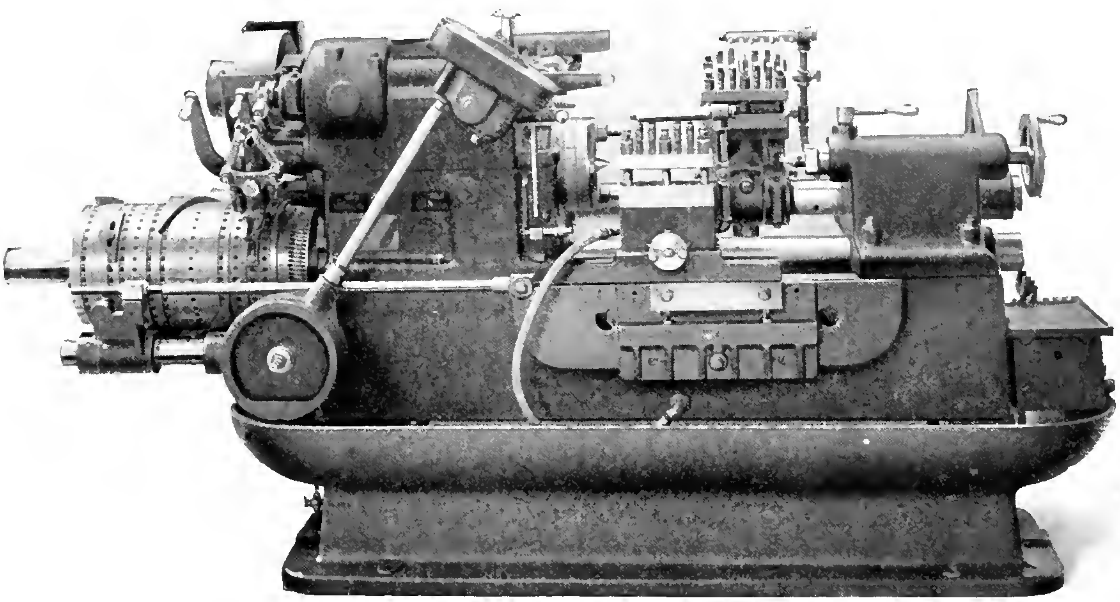
Waves, Electric

The Scientific Problems of Electric Wave Telegraphy, J. A. Fleming. Jl. Roy. Soc. Arts, vol. 67, no. 3481, Aug. 8, 1919, pp. 597-605. Theory of generation and radiation of electric waves.

Wireless Telephone Transmitter

Wireless Telephone Transmitter for Seaplanes. Elec. Rev., vol. 75, no. 6, Aug. 9, 1919, pp. 237-241, 5 figs. Light-weight but powerful set developed for use by Navy's flying boats during war.

The Fay Automatic Lathe



An automatic machine for simultaneous turning, facing and shouldering cuts on bar stock and centered forgings, such as pinion shafts, steering knuckles, cam shafts, etc.

An automatic machine for second operations on work held on centered arbors, such as spur and bevel gear blanks, hubs, pulleys, etc.

Designed with strength and driving power to carry all the tools, speed, and feed the work will stand under balanced cuts.

JONES & LAMSON MACHINE COMPANY

SPRINGFIELD, VERMONT, U. S. A.

109 Queen Victoria Street, London, E. C.

France, Spain and Belgium: F. Auberty & Co., 91 Rue de Maubeuge, Paris
Holland: Spliethoff, Beeuwkes & Co., Rotterdam

SEE OUR DATA IN 1919 A.S.M.E. CONDENSED CATALOGUES OF MECHANICAL EQUIPMENT

C2

TRANSFORMERS, CONVERTERS, FREQUENCY CHANGERS

Amplifiers

Amplifiers for Direct Currents and for Currents of Very Low Frequency (Amplificateurs pour courants continus et pour courants de très basse fréquence), Henri Abraham and Eugène Bloch. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 26, June 30, 1919, pp. 1321-1323. Interconnections by means of auxiliary batteries.

Cores and Coils

Cores and Coils for Transformers-I, Arthur Palme. Power, vol. 50, no. 6, Aug. 5, 1919, pp. 212-215, 16 figs. Structural details.

Electric-Furnace Transformers

Static Transformers for Use with Electric Furnaces. Elecn., vol. 83, nos. 2148 and 2149, July 18 and 25, 1919, pp. 69-70 and 89-90, 6 figs. July 18: Characteristics of British Westinghouse types. July 25: Layout of furnace plant. Also in Iron & Coal Trades Rev., vol. 99, no. 2681, July 18, 1919, pp. 71-72, 5 figs. and Electrical Rev., vol. 85, no. 2174, July 25, 1919, pp. 124-126, 7 figs.

Loading

Loading a Bank of Dissimilar Transformers, H. B. Dwight. Elec. World, vol. 74, no. 5, Aug. 2, 1919, pp. 230-231, 1 fig. Calculations proposed for determination of current in each transformer for balanced load.

Phase Changers

Predetermination of Synchronous Phase-Modifier Performance, Hubert V. Carpenter. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 8, Aug. 1919, pp. 997-1003, 4 figs. Reviews method for showing behavior of transmission lines as developed by Perrine and Baum and then shows how it can be used in determining effect of use of synchronous motor operating without load for improving power factor. Effect of losses in motor shown both on line alone and on line with step-up and step-down transformers.

Rotary Converters

Pulsation of the D. C. Terminal Voltage in Rotary Converters, J. K. Kostko. Elecn., vol. 83, no. 2148 and 2149, July 18 and 25, 1919, pp. 61-63 and 86-88, 3 figs. Pulsations due to the reverse M.M.F. of armature in single-phase converters. Self-induction coefficient of a distributed winding. (Concluded.)

Secondary Connections

Secondary Connections for Constant-Current Transformers, L. Arnold. Gen. Elec. Rev., vol. 22, no. 8, Aug. 1919, pp. 632-633, 4 figs. Single circuit vs. multi-circuit.

Windings

Cores and Coils for Transformers-II, Arthur Palme. Power, vol. 50, no. 7, Aug. 12, 1919, pp. 254-256, 8 figs. Types of windings in modern transformer practice.

See also Cores and Coils.

TRANSMISSION, DISTRIBUTION, CONTROL

Feeders, Voltage Regulation

Selecting Voltage Regulators for Feeders, Frank Hersey. Elec. World, vol. 74, no. 7, Aug. 16, 1919, pp. 344-346, 2 figs. Recommendations regarding application of single and polyphase regulators for lighting and power loads.

Grounded Neutral Transmission Line

Grounded Neutral Transmission Line, W. E. Richards. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 8, Aug. 1919, pp. 1005-1010, 3 figs. Conditions on system which was originally delta-connected. In order to overcome trouble experienced whenever short-circuit occurred specially with synchronous apparatus connected to line, transmission was changed to Y-system with neutral grounded. Effect of short-circuit with new connection is alleged to have been decidedly minimized.

Load-Dispatching

Reinforcing System Operator's Memory, Frank Gillooly. Elec World, vol. 74, no. 7, Aug. 16, 1919, pp. 347-350, 5 figs. Electric chart used in load-dispatching system at Philadelphia Electric Company's plant.

Long-Distance Transmission

Transmission of Electrical Energy at Long Distances (Sur les longes lignes de transmission d'énergie électrique), P. Bunet. Revue Générale de l'Electricité, vol. 6, no. 5, Aug. 2, 1919, pp. 148-158. Comparison of direct-current with alternating-current systems.

Merz-Price System of Cable Protection

The Merz-Price System of Cable Protection, C. W. Marshall. Electrical Review, vol. 85, no. 2176, Aug. 8, 1919, pp. 165-166, 5 figs. Action depends on principle that when feeder is sound the current is the same at both ends; whereas when it is faulty, there is a difference either in magnitude or in phase between currents at two ends.

Network Calculations

Development of Analytical Solutions, Charles Fortescue. Elec. Jl., vol. 16, no. 8, Aug. 1919, pp. 350-352. Suggests separation of networks into invariable and variable portions, the latter constituting supply and load circuits.

Analytical Solutions, Robert D. Evans. Elec. Jl., vol. 16, no. 8, Aug. 1919, pp. 345-349, 21 figs. Concerning methods of solving network of power circuits.

Overhead Conductors

Overhead Conductors (Canalisations Aériennes), Ch. Vallet. Industrie Electrique, vol. 28, no. 649, July 10, 1919, pp. 246-247. Formula for computing maximum length of suspended portion of cable. (Continuation of serial.)

Overhead Mainis: Some Reflections, S. G. Leech. Electrical Rev., vol. 85, no. 2174, July 25, 1919, pp. 99-101, 6 figs. Instances of overhead installations presented as proof that such installations can be erected without visual offence.

Poles

Impregnating Poles for Aerial Lines (über gesetzmässige Aufnahmen von Imprägniermitgesetzmässige Aufnahmen von Imprägniermit-Elektrotschnik u Maschinenbau, vol. 37, no. 11, Mar. 16, 1919, pp. 105-108, 3 figs. It has been found that wood of the same kind, impregnated by the same process, under the same conditions, shows various degrees of saturation and, therefore, of resistance to rotting. Curves given show saturation points of pine poles in tests made by writer.

The Selection of Proper Wooden Poles for Aerial Cables (Uber die wahl geeigneter Holzmaste für elektrische Freileitungen), Willy Kinberg. Elektrotechnik u. Maschinenbau, vol. 37, no. 2, Jan. 12, 1919, pp. 13-17, 3 figs. Tables showing strength ratio, load ratio, breaking stress ratio, etc., of E and D poles.

Power-Factor Correction

Power Factor Correction, J. Humphrey. Colliery Guardian, vol. 118, no. 3056, July 25, 1919, pp. 228-229, 4 figs. Methods used and advantages claimed for each.

Three-Wire Systems

Three-Wire Systems, Burton McCollum and E. R. Shepard. Elec. Traction, vol. 15, no. 8, Aug. 1919, pp. 504-506, 2 figs. Diagrammatic representation of sectionalized three-wire system.

Transient Phenomena

Problems in High Tension Power Transmission, W. P. Dobson. Sibley Jl., vol. 33, no. 6, July-Aug. 1919, pp. 74-78, 6 figs. With special reference to line transients.

Transmission-Line Construction

Analysis of Transmission-Line Construction, D. D. Ewing. Elec. World, vol. 74, no. 8, Aug. 23, 1919, pp. 406-407, 4 figs. Empirical equation and graphs establishing relations between line voltage and line length, service capacity, spacing of conductors and tower height.

WIRING

Wire Capacity

Selecting Conduit Size for Power-Plant Wiring, A. R. Zahorsky. Elec. World, vol. 74, no. 8, Aug. 23, 1919, pp. 399-400, 2 figs. Curves for determining wire capacity of wrought iron in conduit.

Wire Joints and Connections

Various Types of Wire Joints and Connections, Ry. Elec. Engr., vol. 10, no. 8, Aug. 1919, pp. 281-284, 22 figs. With notes on selection of splices according to size of conductors and kind of service required.

VARIA

Appraisals

Practice in making Electric Utility Appraisals, Charles W. McKay. Elec. Rev., vol. 75, no. 6, Aug. 9, 1919, pp. 226-230, 4 figs. Methods used in inventory of land, buildings and outside plant.

Switchboard

A Lighting and Experimental Switchboard, R. Drilhon. Model Engr. & Elecn., vol. 41, no. 951, July 17, 1919, pp. 49-51, 6 figs. Features of board made for controlling light in a photographic dark room and for providing necessary current for electrical experiments.

Theory of Probabilities

Theory of Probabilities Applied to Failures of Suspension Insulators, L. M. Klauber. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 8, Aug. 1919, pp. 959-972, 3 figs. After finding minimum number of insulators per string required for any given operating conditions, writer points out method of determining amount of extra insulation desirable from an insurance standpoint according to law of probabilities. Equations are developed from which probability of failure for any given case or ratio between probabilities for any pair of cases may be determined directly.

Civil Engineering

BRIDGES

Arches

Flat Arches on High Piers, South Side Bridge, Fairmont. Eng. News-Rec., vol. 83, no. 6, Aug. 7, 1919, pp. 270-272, 7 figs. Three equal 116-ft. flat-arch spans preferred to other designs because of symmetrical proportion and simplicity, which are said to have resulted in lower cost.

Cofferdam

Cofferdam Experience at a Bridge in Chicago River, Hugh E. Young and William A. Mulcahy. Eng. News-Rec., vol. 83, no. 6, Aug. 7, 1919, pp. 268-269, 2 figs. Flooding due to inaccurate record of old tunnel. Movement of wall in deep water led to heavier construction.

Condemned Bridge

Rondout Creek Bridge Design Condemned for Excessive Load on Batter Piles. Eng. News-Rec., vol. 83, no. 7, Aug. 14, 1919, pp. 329-332, 3 figs. Outline of design condemned by N. Y. State Highway Commissioner because of considered foundation dangers and belief that superstructure design was not adapted to site.

Concreting

Concreting the Winnipeg Aqueduct. Contracting, vol. 9, no. 3, Aug. 1, 1919, pp. 69-70, 9 figs. Structure consists of concrete conduit having horseshoe-shape cross-section varying from 5 ft. 5 in. high by 5 ft. 4 in. wide to 9 ft. high by 10 ft. 9 in. wide and containing 310,000 yd. of concrete.

Electric Equipment

Utilizing Electric Power at Movable Bridges, Mark H. Reasonu. Ry. Elec. Engr., vol. 10, no. 8, Aug. 1919, pp. 285-287, 4 figs. Methods used in group of five railway bridges built side by side over Calumet river at South Chicago, Ill.

Portland

Cross-River Traffic Problems at Portland, W. A. Scott. Eng. World, vol. 15, no. 4, Aug. 15, 1919, pp. 38-40, 3 figs. Data relative to type and construction of several existing bridges.

Repairs

Extraordinary Repairs Made to a 1900-Ton Drawbridge, Thomas D. Fulton. Eng. News-Rec., vol. 83, no. 8, Aug. 21, 1919, pp. 366-369, 7 figs. Turntable, wheels and drum failing. Number of wheels was increased and new upper treads placed. Drum parts restored by heating and jacking.

Timber Bridges

Timber Bridge Problems on the Alaska Railway. Eng. News-Rec., vol. 83, no. 9, Aug. 28, 1919, pp. 420-422, 5 figs. Standard designs for 121-ft. spans on sheathed pile piers.

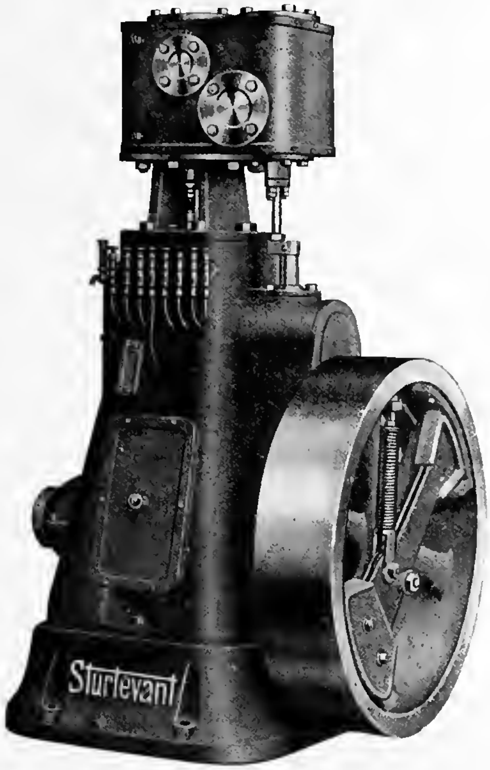
Viaducts

The Bloor Street Viaduct, Toronto, Ontario, Thomas Taylor. Jl. Eng. Inst. Can., vol. 2, no. 7, July 1919, pp. 485-498, 17 figs. Including practice in grading of sand, and testing concrete and other miscellaneous materials.

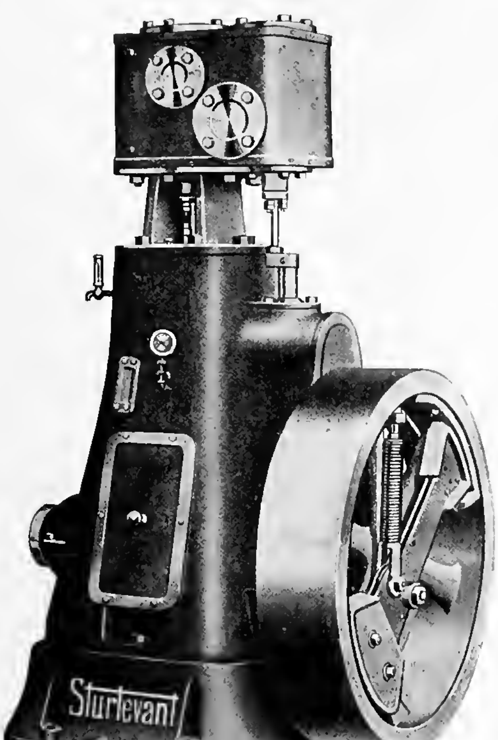
BUILDING AND CONSTRUCTION

Appearance

Aesthetic Treatment of Plant Structures. Iron Age, vol. 104, no. 7, Aug. 14, 1919, pp. 427-429, 6 figs. Details of buildings erected by Steel & Tube Co. of Am. at its Iroquois and Mark plants, which were designed with a view to meet needs of employees.



VS-7 Engine showing sight oil feeders of gravity oiling system



VS-8 Engine with forced feed lubrication

Sturtevant

(REG. U. S. PAT. OFF.)

STEAM ENGINES

are now made in two types only:

VS-7 & VS-8 (Vertical, Single Cylinder)

All others have been eliminated to enable us to meet the demand for these two types.

The difference between these two is one of lubrication—VS-7 is gravity, while the VS-8 is forced feed—both systems have their friends.

These engines were designed to fulfill the U. S. Navy specifications, which means that they must have the utmost reliability under all conditions of service.

Our engine department was 100% engaged in government work, and we are proud of the fact that our standard engines were accepted without a single alteration.

These engines are both used for direct connection to blowers, fans, generators, and for independent power service, automatic and throttling.

There is so much to tell that we have prepared a special catalog, No. 239, giving complete details. It is worth reading, and is yours for the asking.

B. F. STURTEVANT COMPANY

Hyde Park, Boston, Mass.

AND IN ALL PRINCIPAL CITIES

Beams

Reinforced-Concrete Structures (Construcciones de mamposteria armada). L. Ivanissevich. Ingenieria, vol. 23, no. 10, May 16, 1919, pp. 617-628, 9 figs. Formulæ for designing beams.

Block Yard

Block Yard Cheaply Improvised from Old Equipment. Eng. News-Rec., vol. 83, no. 8, Aug. 21, 1919, pp. 356-357, 6 figs. How contractor is being able to produce output of 60 blocks per man per day.

Bridge Construction

Electricity Cuts Construction Plant Power Costs. Eng. News-Rec., vol. 83, no. 7, Aug. 14, 1919, pp. 311-312, 3 figs. System for handling concrete in large arch bridge construction.

Caissons

Telescopic Foundation Caissons Sunk in Bank Basement. Frank H. Eastman. Eng. News-Rec., vol. 83, no. 8, Aug. 21, 1919, pp. 369-370, 1 fig. Support 275-ton vault of Central Union Trust Co., New York City. Columns rest on brick piers supported on quicksand only one ft. below cellar floor.

Cement Stucco

Practice for Portland Cement Stucco. Contract Rec., vol. 33, no. 31, July 30, 1919, pp. 741-743. Recommendations of Am. Concrete Inst. Committee.

See also Finishing.

Churches

Some Principles of Design and Construction in Church Building. Charles H. Moore. Architectural Record, vol. 46, no. 2, Aug. 1919, pp. 115-122. Simple design intended to suit needs of rural community; also considerations in regard to future developments of this branch of architecture in America.

Community Houses

The Community House as a War Memorial. Martha Candler. Am. Architect, vol. 116, no. 2277, Aug. 13, 1919, pp. 195-201 & 205-207, 10 figs. Plans and details of Read Memorial Community House at Purchase, N. Y.

New Principles Governing Planning of Civic Buildings. William Roger Greeley. Am. Architect, vol. 116, no. 2277, Aug. 13, 1919, pp. 208-211, 4 figs. Illustrating various plans for community buildings.

Concrete Foundations

Building Concrete Foundations. Ernest Irving Freese. Building Age, vol. 41, no. 8, Aug. 1919, pp. 250-251, 5 figs. How to proportion mix to make them waterproof.

Cottages

Erect 66 Sea Shore Cottages of Concrete. Concrete, vol. 15, no. 2, Aug. 1919, pp. 51-54, 17 figs. Features of design. Walls are of monolithic construction; cost was 22.4 cents per cu. ft.

Docks

The Building of the Municipal Docks at St. Louis. M. Serkes. Am. City, City Edition, vol. 21, no. 2, Aug. 1919, pp. 113-116, 2 figs. Built with coöperation of city and federal governments.

Factories

Modern Daylight Factories. Albert M. Wolf. Eng. World, vol. 15, no. 3, Aug. 1, 1919, pp. 21-26, 8 figs. Economic value of installing modern improvements in factory buildings.

Finishing

Methods of Finishing Cement Stuccos. Contract Rec., vol. 33, no. 32, Aug. 6, 1919, pp. 753-754. Dash, sand float, and exposed aggregate finishes. From committee report presented to Am. Concrete Inst.

Frame Houses

Bolts in Field Connections of Steel-Frame Buildings: a Study of Data and Experience. R. Fleming. Eng. News-Rec., vol. 83, no. 7, Aug. 14, 1919, pp. 316-321, 4 figs. Experimental investigation to determine whether substitution of bolting for riveting of steelwork can be satisfactorily effected in specifications for steel-frame buildings.

Gardens

Ottawa Housing Commission Has Prepared Ideal Garden Development Plan. Contract Rec., vol. 33, no. 33, Aug. 13, 1919, pp. 775-778, 1 fig. One-eighth of area set aside for open spaces.

Gypsum Construction

Gypsum Construction for Railway Terminals. Curtis F. Columbia. Eng. World, vol. 15, no. 4, Aug. 15, 1919, pp. 33-37, 5 figs. Claimed advantages based on laboratory experiments.

Housing

Keeping the Costs of Building the Government Houses. John C. Prior and Herbert P. Green. Eng. News-Rec., vol. 83, no. 6, Aug. 7, 1919, pp. 252-261, 7 figs. System reporting progress and cost used by U. S. Housing Corporation.

Modern Housing Standards at Dawson, New Mexico. Charles F. Willis. Coal Age, vol. 16, no. 6, Aug. 7, 1919, pp. 220-224, 20 figs. Types of houses erected by Phelps-Dodge Corpn. for use of mine workers.

Workingmen's Houses in Italy-I. Alfredo Melani. Architectural Record, vol. 46, no. 2, Aug. 1919, pp. 176-185, 7 figs. Legislation enacted relative to construction of such dwellings by State.

Solving the Problem of the Low Cost House. Am. Arcaitect, vol. 116, no. 2278, Aug. 20, 1919, pp. 229-234, 14 figs. Typical designs erected by various shipbuilding plants by U. S. Shipping Board Emergency Fleet Corporation.

The Engineering Aspect of the Housing Problem. Eng. Rev., vol. 33, no. 1, July 15, 1919, pp. 9-10. Points out manner of effecting economy in connection with internal woodwork.

The New London Housing Project. Louis L. Tribus. Man. Jl. & Public Works, vol. 47, no. 7, Aug. 16, 1919, pp. 102-104, 4 figs. General plan of procedure in carrying out project involving a million and a quarter dollars.

Japanese Design

The Principles of Japanese Design. Francis Taylor Piggott. Jl. Roy. Soc. of Arts, vol. 67, no. 3478, July 18, 1919, pp. 555-563 and (discussion) pp. 563-566, 13 figs. Architectural characteristics in their relation to artistic beauty.

Moving Houses

Moving Reinforced Concrete Building to a New Site. Jack L. Schnitz. Concrete, vol. 15, no. 2, Aug. 1919, pp. 60-62, 4 figs. Three-story, 3000-ton structure, 60 ft. x 95 ft. moved one city block at Detroit.

Quillet System of Construction

Quillet System of Construction (Système de construction Quillet). Bulletin Technique de la Suisse Romande, vol. 45, no. 16, Aug. 9, 1919, pp. 157-160, 8 figs. Cement bricks are provided with gudgeons which permit them to hold rigidly together, thus making construction quasi-monolithic.

Reservoir

St. Paul Covered Reservoir. Cement & Eng. News, vol. 31, no. 8, Aug. 1919, pp. 24-26, 2 figs. Reinforced-concrete 30,000,000-gal. reservoir built with movable concrete-mixing and spouting plant.

Roofing

Roofing Ordinance Proposed for Indianapolis. Construction, vol. 8, no. 6, June 1919, pp. 273-274. For the purpose of insuring safety against fire in construction.

German Regulations for Reinforced Concrete Roofs (Der neue Ministerialerlass über ebene Steindecken vom 23 November 1918). Beton u. Eisen, vol. 18, no. 4/5, Mar. 5, 1919, pp. 51-52. Stipulate composition of concrete and strength and bending moment of slabs for flat roofs.

Barn Roof Design. J. L. Strahan. Trans. Am. Soc. Agricultural Engrs., vol. 12, Dec. 1918, pp. 57-75, 6 figs. Observes that Shawver truss is not a true truss in the sense that it is truly rigid. Writer recommends modifications to make it so.

Stirrups in Concrete Beams

Diagram for Locating Stirrups in Concrete Beams. M. J. Lorente. Eng. News-Rec., vol. 83, no. 7, Aug. 14, 1919, pp. 310-311, 2 figs. Graphs for spacing vertical stirrups in uniformly loaded beam for two methods of stress distribution.

Tanks

Concrete Fuel-Oil Tank Design and Construction. Eng. News-Rec., vol. 83, no. 7, Aug. 14, 1919, pp. 322-323. Precautions to be observed in building small oil-storage reservoirs for use in industrial plants.

Reinforced Concrete Tanks. F. W. Frerichs. Popular Engr., vol. 12, no. 2, Aug. 1919, pp. 10-12, 3 figs. Details of large storage tanks for ammoniacal liquors. Paper read before Am. Inst. Chem. Engrs.

Tank Construction—XXX. Ernest G. Beck. Mech. World, vol. 66, no. 1699, July 25, 1919, pp. 42-43, 6 figs. Methods of supporting wall sheeting in tanks of large depth. (Continuation of serial.)

Tile Houses

Damp-proofing Hollow Tile Houses. Perry R. MacNeille. Construction, vol. 8, no. 6, June 1919, pp. 279-284, 3 figs. Account of various practices.

CEMENT AND CONCRETE

Boiler House

Concrete Used in Boiler-House Structure and Fittings. George S. Nobles. Eng. News-Rec., vol. 83, no. 6, Aug. 7, 1919, pp. 262-263, 4 figs. Coal hoppers, forced-draft air ducts, and boiler breeching made of reinforced concrete at Brooklyn Navy Supply Base heating plant.

Concrete-Block Casting

Efficient Plant for Casting Concrete Blocks for Miami River Revetment. Eng. & Contracting, vol. 52, no. 8, Aug. 20, 1919, pp. 214-215, 4 figs. Blocks are molded in small flat cars, 16 blocks per car, remaining on cars from time they are cast till they are unloaded in storage yards.

Gravel

Missouri Sand and Gravel-I. Cement, Mill & Quarry, vol. 15, no. 4, Aug. 20, 1919, pp. 11-17, 21 figs. Method of production. From report of Missouri Bur. of Geology and Mines.

Rodding

Effect of Rodding Concrete. F. E. Giesecke. Can. Engr., vol. 37, no. 7, Aug. 14, 1919, pp. 217-218, 2 figs. Tests made at University of Texas to determine physical properties as determined by relative quantity of cement. From University Bul. no. 1815.

Cause of Adherence of Concrete to Steel in Reinforced-Concrete Structures (Sur le cause de l'adhérence du béton au fer dans les constructions en béton armé). Vasilesco Karpen. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 1, July 7, 1919, pp. 21-23. Arguments offered in proof that cohesion is due to friction.

Texas, Concrete Aggregate

Tests of Concrete Aggregates Used in Texas. J. P. Nash. Univ. of Texas Bulletin, no. 1771, Dec. 20, 1917, 80 pp., 8 figs. Aggregates were tested by incorporating them in concrete and determining various properties of resultant concrete. Data are given regarding water used, age, crushing strength, number of specimens tested, weight of concrete and amount of cement per cu. yd. of laid concrete.

Waste-Heat Utilization

The Manufacture of Cement at Bellevue, Mich. C. M. Wright. Cement & Eng. News, vol. 31, no. 8, Aug. 1919, pp. 37-39, 1 fig. Practice in shutting down kiln and method of utilizing waste heat.

Wood for Reinforcing Concrete

Wood as Reinforcement for Concrete (Holz und Schilf als Ersatz des Eisens in der Zugbewehrung). v. Emperger. Beton u. Eisen, vol. 18, no. 4/5, Mar. 5, 1919, pp. 46-48, 7 figs. Well-seasoned impregnated wood, completely covered with concrete, said to have given satisfactory results at Vienna.

EARTHWORK, ROCK EXCAVATION, ETC.

Conduits Under Dams

Miami District Completes Conduits Under Dams. Eng. World, vol. 15, no. 4, Aug. 15, 1919, pp. 13-16, 4 figs. Purpose of conduits is to convey normal discharge of respective streams under dams without holding back water of streams, except during flood stages. Conduits were built in sections with both horizontal and vertical joints.

Dams

Protective and Restoration Work at Chandpatha Dam, Sipri. S. K. Gurtu. Indian Eng., vol. 65, no. 18, May 3, 1919, p. 250, 5 figs. on supp. plate. Examining entire foundation and restoring portion carried away by uplift.

See also Conduits under Dams.

Big Eddy Dam on Spanish River. Contract Rec., vol. 33, no. 34, Aug. 20, 1919, pp. 787-790, 4 figs. Dam is of gravity type, containing approximately 80,000 cu. yd. of slag concrete, 1 :3 :6 mix. Methods of foundation work with caissons described.

The Construction of the Grand River Roller Crest Dam. O. T. Reedy. Reclamation Rec., vol. 10, no. 8, Aug. 1919, pp. 374-378, 8 figs. Dam consists of six bays, each 70 feet wide.

Foundations in Quicksand

Foundations in Quicksand and Watery Gravel. Eng. News-Rec., vol. 83, no. 9, Aug. 28, 1919, pp. 414-415, 2 figs. Sinking wells for concrete cylinder piers for building foundations for Canal St. viaduct in Chicago.

Hudson River Tunnel

Hudson River Tunnel Problems, Walter C Parmley. Eng. World, vol. 15, no. 3, Aug. 1, 1919, pp. 31-34, 2 figs. Structural and construction problems of proposed tunnel.

Hydraulicking

Hydraulicking Dam Embankment on Miami Flood Control Project. Eng. News Rec., vol. 83, no. 8, Aug. 21, 1919, pp. 371-373, 3 figs. Glacial drift excavated by draglines, hauled by train to hog boxes, mixed with water and then pumped to dam.

Piercing

Piercing the Mountain Barrier between France and Spain, F. Honore. Sci. Am., vol. 121, no. 8, Aug. 23, 1919, pp. 186-187, 9 figs. Outline of projects for piercing.

Subways

New Construction Methods in Subway Work Under Philadelphia City Hall. Eng. News-Rec., vol. 83, no. 7, Aug. 14, 1919, pp. 300-309, 16 figs. Subway built from roof downward by continuous underpinning; method determined by poor character of foundation of building.

Tunnels

Chicago's Tunnels for Electric Light and Power Cables, G. B. Springer. Eng. World, vol. 15, no. 3, Aug. 1, 1919, pp. 53-58, 10 figs. Construction methods employed. Relative advantages of tunnels and conduits.

See also Piercing.

Design and Construction of the Telephone and Telegraph Tunnel Under the Chicago River at Harrison Street, William Artingstall. Mun. & County Eng., vol. 57, no. 2, Aug. 1919, pp. 58-59. Tunnel is approximately 500 ft. long and 90 ft. below street surface. Reference is made specially to shaft sinking.

The Austrian Alpine Tunnels. Ry. Engr., vol. 40, no. 475, Aug. 1919, pp. 168-171, 6 figs. Tauern, Karawanken and Wochein. Methods of construction. (Continuation of serial.)

HARBORS

Curtis Bay Pier, B. & O. R.R.

The Curtis Bay Pier of the B. & O. R. R.—I, M. A. Long. Coal Trade Jl., vol. 50, no. 32, Aug. 6, 1919, pp. 953-955, 3 figs. General features of pier said to be capable of handling 12 million tons per annum.

Dock, Stone-Shipping

Stone-Shipping Dock is patterned after Ore-Bin Type. Cement & Eng. News, vol. 31, no. 8, Aug. 1919, pp. 34-35, 1 fig. Cylindrical steel bins, loaded from cars above, discharge by gravity to steamers. Capacity 7880 tons.

Duluth Ore Dock
